To emphasize role of PI-RADS in the evaluation of penile pathologies To illustrate normal MR anatomy of the penis, and its importance in local staging of penile cancer with reference to surgical outcomes To evaluate the role of MRI in evaluation of penile prosthesis To demonstrate role of MRI in diagnosis of unexplained cases of priapism or erectile dysfunction

TABLE OF CONTENTS/OUTLINE

Normal MR anatomy of penis, MR imaging protocol, different protocols (e.g. artificial erection)Etiologies Tumors - primary and metastasis, some rare tumors Trauma - penile fractures, hematoma, urethral injury Infarction- sickle cell disease, intracavernosal injection InfectionPeno-scrotal fistulas Peyronie's disease - diagnosis, follow up, plication, plication failure Penile prosthesis - types, parts, and complications Future directions

GUEE-32 How Fluent Are You in PI-RADS Terminology?

Participants
Ana Cristina Delgado, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The use of standard terminology, correct report organization, clear knowledge of the PI-RADS guides, understanding prostate anatomy, allows radiologist to certainly communicate the image findings of the prostate gland and organize the final report.For radiology residents/radiologists, a good understanding of terminology used on PI-RADS is one prerequisite for starting the image interpretation as well as knowing the anatomy. The idea of this exhibit is to expose residents/radiologist to a series of cases to reinforce concepts in an interactive activity.

TABLE OF CONTENTS/OUTLINE

Prostate anatomy / sector map case / review PI-RADS classification , what to evaluate on each sequence cases / review Benign findings, how to describe them, cases / review Extra prostatic invasion cases / reviewFinal remarks

GUEE-33 Blast From the Past: Post-ablation Imaging of Renal Tumors Post-ablation Imaging of Small Renal Tumors

Participants
Lucas Daniel Pereira Lopes, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Title: Blast from the past: Post-ablation imaging of small renal tumors Teaching Points 1. Review features of renal masses appropriate for ablation 2. Outline timeline for post-ablation survellience 3. Distinguish between expected post-ablation apperance and pathological findings 4. Identify red flags and potential complications to look out for in the post-ablation period Table of Contents • Background o Types and mechanisms of thermal ablative techniques o Features of renal tumors for pre-ablation planning • Post-ablation expectations o Overview of timeline for post-ablation survellience o Technical requirements of imaging o Expected appearance in imaging • Pathological changes in post-ablation o Red flags in appearance o Complications to look out for

TABLE OF CONTENTS/OUTLINE

Title: Blast from the past: Post-ablation imaging of small renal tumors Teaching Points 1. Review features of renal masses appropriate for ablation 2. Outline timeline for post-ablation survellience 3. Distinguish between expected post-ablation apperance and pathological findings 4. Identify red flags and potential complications to look out for in the post-ablation period Table of Contents • Background o Types and mechanisms of thermal ablative techniques o Features of renal tumors for pre-ablation planning • Post-ablation expectations o Overview of timeline for post-ablation survellience o Technical requirements of imaging o Expected appearance in imaging • Pathological changes in post-ablation o Red flags in appearance o Complications to look out for

GUEE-34 Pheochromocytoma and Paraganglioma: Key Findings, Clinical Features, and Their Association with Anatomic and Functional Imaging - Tutorial for Residents

Awards
Certificate of Merit

Participants
Leonela Ramirez Almanza, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pheochromocytoma and paraganglioma are chromaffin cell tumors that require early diagnosis due to their potentially serious and sometimes fatal cardiovascular sequelae.CT density of pheochromocytoma greater than 20 HU in the proper clinical context should be suggestive of this pathology.Hypercellularity in pheochromocytoma results in restricted diffusion and should not be confused with malignancy.Pheochromocytoma and larger paragangliomas may have areas of necrosis and intratumoral vessels with a "salt and pepper" appearance on MRI.Functional imaging is key to the diagnosis of pheochromocytoma and paraganglioma when no tumor is identified on anatomic imaging.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Imaging protocolsa. CT b. MRI c. PET/CT 3. Systematic analysis of images in relation to the clinic. a. Incidental finding b. Clinical Context and findings suggestive of pheochromocytoma and paraganglioma 4. Paraganglioma clinical and imaging features 5. Pheochromocytoma clinical and imaging features6. Differential diagnoses7. Take home messages

GUEE-35 Variant Bladder Cancer: MR Imaging, VIRADS Score, Clinical Feature and Management

Participants
Arisa Kameda, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Variant bladder cancer is relatively rare and associated with increased risks of disease recurrence. Since these subtypes are often more advanced in stage than pure urothelial bladder cancer and is likely to underestimate the myometrial invasion, immediate total bladder resection is recommended in these patients. However, there has been few reports about MR imaging of Variant bladder

cancer. The purpose of this exhibit is To clarify the feature of the MR findings of variant bladder cancer To depict the VIRADS score of variant bladder cancer To discuss the clinical feature and management comparing pure urothelial bladder cancer.

TABLE OF CONTENTS/OUTLINE

1, Over view of histological classification of bladder cancer based on WHO 2016 2, Demonstrate the MR imaging of variant bladder cancer (Glandular differentiation, Squamous differentiation, Micropapillary type, Nested type, Sarcomatoid type) 3, VIRADS scoring of variant bladder cancer with histological correlation 4, Discussion of clinical feature and management of variant bladder cancer 5, Summary

GUEE-36 DCE MRI: A Superhero Or Villain In Prostate MRI?

Participants
Samantha Jayasinghe, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review different rationales and imaging protocols in prostate MRI.2. Discuss the strengths and limitations of using or not using DCE in prostate MRI for diagnosis of clinically significant cancer (csPCa).3. Review the available evidence on the diagnostic performance of prostate MRI without versus with contrast.4. Provide a risk-based workflow to optimize the choice between contrast and non-contrast MRI utilization.

TABLE OF CONTENTS/OUTLINE

1. Imaging Protocols in Prostate MRIa. from standard and optional mpMRIb. MRI without contrastc. "fast MRI".2. Dynamic Contrast enhancement imaging in prostate MRIa. Acquisition technique, Interpretation, and Post-processing methodsb. Strengthsi. Increased detection and confidence of csPCaii. Helpful to inexperienced readersiii. Excellent PI-RADS staging tooliv. Accurate estimation of index PCa volumeLimitationsi. Costii. Timeiii. Nephrotoxicityiv. Limited role in Transitional Zone3. Non-contrast MRI imaging (i.e., bpMRI)Strengths: a. Non-inferior in sensitivity and specificityb. Increased safety and cost effectivenessLimitations: a. Requires higher reader expertiseb. Follow-up safety netIncreased patient in indeterminate category4. When to choose between contrast or non-contrast prostate MRI: Is it always one or the other?5. Risk-based approach to Workflow

GUEE-37 Iatrogenic Injuries of the Urinary System: Radiologic Features and Imaging-guided Intervention

Participants
Emanuele Barabino, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Iatrogenic Injuries of the urinary system could occur during percutaneous/endoscopic procedure involving the urinary system or during surgery; in recent years, due to the diffusion of laparoscopic and robotic surgery, the incidence of these lesions is increasing.• The spectrum of radiologic findings is wide and heterogeneous and depends on the type of injury, the procedure that cause it and time-to-diagnosis.• Imaging-guided intervention maintains a fundamental role in the management of iatrogenic injuries to the urinary system.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Anatomical Considerations3. Mechanisms of Injury3.1 Transection and Avulsion3.2 Ligation3.3 Mixed lesions4. Imaging Techniques5. Radiologic Features5.1 Percutaneous Treatments5.1.1 Thermal Ablation5.1.2 Nephrostomy/Anterograde ureteral stenting5.1.3 Lithotripsy5.2 Endoscopic Treatments5.3 Urologic Surgery5.4 Gastrointestinal Surgery5.5 Gynecologic Surgery5.6 Vascular Surgery and Endovascular Procedures6. Imaging-guided intervention6.1 Kidney derivation6.2 Recanalization and Stenting7. Conclusion

GUEE-38 Pitfalls in Prostate MRI: How to Avoid These Common Errors of Under and Over Diagnosis

Awards
Certificate of Merit

Participants
Omar Kamal, MD, MSc, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Prostate MRI has a steep learning curve and experts suggest attending a course and a minimum of 100 supervised cases prior to independent practice.• There is a tendency for inexperienced readers to overcall normal anatomy and benign lesions as cancer as they do not want to "miss" cancer.• At the same time underdiagnosis is a problem due to poor technique and/or failure to recognize small or subtle cancers.

TABLE OF CONTENTS/OUTLINE

1. Brief overview of typical and atypical appearance of prostate cancer on multiparametric MRI: a. Discussion of learning curve, expert opinion, lack of standardization in training/certification/performance. 2. MRI technique: a. Optimal technique to avoid under- or overdiagnosis. b. Examples of poor technique side by side with proper technique. 3. Pitfalls: a. Overview of the literature in prostate interpretation errors. b. Mimics of peripheral zone cancer. i. Normal central zone ii. Exophytic BPH nodules iii. Midline pseudolesion iv. Periprostatic vein v. Prostatitis/scar/atrophy (PIRADS 2) lesions overcalled as PIRADS 4/5 vi. DWI and coil artifact vii. Post biopsy hemorrhage viii. Calcification c. Mimics of transition zone cancer. i. Failure to recognize encapsulated or heterogeneous nodules ii. Atypical and asymmetric BPH nodules iii. Thick anterior fibromuscular stroma iv. Thickening of the pseudocapsule. d. Underdiagnosis. i. Failure to recognize small/subtle lesions ii. Failure to recognize very large lesions replacing most of the normal gland. e. Other Lesions Mimicking Cancer. i. Seminal vesicle collapse ii. Granulomatous and IgG4 prostatitis iii. Cowper's gland hyperplasia. 4. Practical ideas for self-improvement.

GUEE-4 MR Imaging of Postoperative Endometriosis

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Patricia Dantas I, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1) Discuss the roles of surgical treatment of different types of endometriosis using a didactic approach by illustrations and MR images.2) Clarify significant MRI image postoperative findings and meaningful information to radiology reports.3) Illustrate imaging patterns and pitfalls of postoperative complications, residual endometriosis and recurrence after surgery.

TABLE OF CONTENTS/OUTLINE

1) Review preoperative imaging findings that aid in surgical decisions.2) Describe surgical treatment of different types of endometriosis: endometrioma, posterior compartment, bowel endometriosis, uterus/vagina, bladder and ureters.3) Recognition of patterns normal MR postoperative findings.4) Cased-based imaging of postoperative complications.5) Illustrative key points: residual disease and recurrence after surgery.6) Pitfalls.7) Conclusions and "take home messages": consolidate the acquired knowledge.

GUEE-40 Non-Wilms Kidney Tumors in Childhood - What the Radiologist Should Know

Participants
Elena Paz Calzada, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Wilms tumor is the fifth most common malignant neoplasm in childhood and the most common renal tumor in children. It is estimated that the annual incidence is 1 case per 10,000 children under 15 years of age.However, there are other childhood kidney tumors with which the radiologist should be familiar.The aim is to present epidemiological, clinical and radiological findings that better guide us to a differential diagnosis of renal mass in pediatric patients.

TABLE OF CONTENTS/OUTLINE

We have carried out a review of the cases of non-Wilms kidney tumors in childhood in our institution, spanning from 2008 to 2021.Regarding the case review, a literature research of the main kidney tumors: Wilms and non-Wilms, as well as their characteristics, was performed.We found several cases of:- Clear cell renal carcinoma- Renal clear cell sarcoma- Renal angiomyolipoma- Inferior vena cava thrombosis mimicking a renal tumor- Renal Ewing sarcoma- Chromophobic carcinomaBoth the ultrasound, CT and MRI images of each case are exposed, as well as a brief summary of the epidemiology, symptoms, radiological characteristics and prognosis of each one.

GUEE-41 Propensity for Density: Hyperdense and Calcified Disease throughout the Genitourinary System on CT

Awards
Certificate of Merit

Participants
Virginia Planz, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• A wide spectrum of benign and malignant conditions in the GU system can be readily detected on CT as calcified or hyperdense findings.• Recognizing distinguishing features and characteristic imaging appearances will determine the diagnosis or narrow the differential.• Dual energy CT offers opportunity for further characterization of hyperdense and calcified pathology.

TABLE OF CONTENTS/OUTLINE

• Review the spectrum of diseases associated with GU calcification and intrinsic hyperdensity such as: hemorrhagic cysts, RCC, calculi, nephrocalcinosis, papillary necrosis, ADPKD, multicystic dysplastic kidney, renal transplant rejection, tuberculosis, schistosomiasis, alkaline encrusted pyelitis/cystitis, acute/chronic subcapsular hematoma, renal and gonadal vein thrombosis, renal artery aneurysm, urothelial carcinoma, radiation cystitis, bladder mucinous adenocarcinoma, urachal adenocarcinoma, amyloidosis, malakoplakia, serous ovarian carcinoma, colonic mucous adenocarcinoma ovarian metastasis, dermoid cyst, degenerated fibroids, prostate and vas deferens calcification • Describe and classify hyperdense and calcified findings based on involved organ, distribution, appearance, and other accompanying findings, with an emphasis on pattern recognition in a case-based review.• Apply teaching points to unknown cases.

GUEE-42 Penile MRI - Normal and Abnormal

Participants
Madhura Ghate, MD,MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

After viewing this exhibit, the readers will gain insight into penile anatomy on MRI. They will be able to independently carry out MR imaging of the penis.MR imaging protocol and utility of diffusion weighted imaging and I.V contrast will be discussed. Imaging appearances of various pathologies such as structural abnormalities, inflammatory/infective pathologies, neoplasms will be presented.

TABLE OF CONTENTS/OUTLINE

1)Imaging anatomy of the penis. 2)MRI protocols. 3)MR imaging of various penile and urethral abnormalities including congenital/structural anomalies, infective/inflammatory pathologies, vascular pathologies, neoplasms and post operative assessment.

GUEE-43 Sonography of the Penis: Beyond Erectile Dysfunction - A Primer for Radiology Residents and Fellows

Awards
Identified for RadioGraphics

Participants

Nanda Venkatanarasimha, MRCP, FRCR, Singapore, Singapore (*Presenter*) Nothing to Disclose

TEACHING POINTS

div>

TABLE OF CONTENTS/OUTLINE

1. Case based review of the various pathologies affecting the penis including Doppler studies. Pathologies presented: Non-vascular (Peyronie's disease, Trauma, infection, benign malignant lesions, Idiopathic calcinosis cutis) Vascular (arterial insufficiency, venous insufficiency, mixed disease, iatrogenic malignant priapism, Acute venous thrombosis Mondor's disease)2. Review Ultrasound anatomy3. Illustrate, discuss normal abnormal Doppler wave forms4. Demonstrate Ultrasound technique including pearls pitfalls5. Correlative imaging where appropriate will be discussed and illustrated6. Clinical presentation and management will be highlighted

GUEE-44 Novel Implantable Devices in the Abdomen and Pelvis: A Primer for Radiologiests

Participants
Nabih Nakrour, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: Provide a multimodality review of novel implantable devices in the abdomen and pelvis with a focus on indications, proper anatomical positioning, and expected radiologic features. Recognize radiologic findings of devices malposition, malfunction, and resulting complications. Discuss imaging pearls and pitfalls of novel devices. Discuss imaging techniques and protocol modifications to optimize device assessment.

TABLE OF CONTENTS/OUTLINE

We will address the following novel devices: An artificial male sphincter. Sacrocolpoplexy mesh for pelvic floor descent. Bladder neck suspension. Urethral bulking agent. Midurethral and retropubic sling. Omentopexy and omental packing.Sacral nerve stimulator. Antibiotics beads for intraabdominal or intrapelvic infections. Bariatric intragastric balloon and Sleeve balloon device. Gastric electrical stimulators. Anti-reflux devices.

GUEE-45 Updates on Adrenal Imaging: from A(denomas) to Z(ebras)

Participants
Wendy Tu, MD, Edmonton, AB (*Presenter*) Nothing to Disclose

TEACHING POINTS

Incidental adrenal nodules are common, seen in 4-8% of patients. Although most are benign adenomas, the differential is broad, requiring an algorithmic approach to incidental adrenal nodules. This approach should incorporate relevant recent literature given the evolving use of CT, MRI, and PET-CT and their advantages/disadvantages. Beyond image interpretation, radiology plays a crucial role in guiding biochemical testing, referral, and management. Current literature on adrenal pathology and management outcomes are discussed.

TABLE OF CONTENTS/OUTLINE

1) Case-based comprehensive review of benign and malignant adrenal pathology highlighting clinical and imaging findings.a. Can imaging alone differentiate benign and malignant adrenal masses?b. What are the diagnostic criteria for adenoma?c. What is the radiologic workup?d. What are the strengths/limitations of CT washout and MR chemical shift imaging studies?e. When is PET/CT indicated?f. What are key imaging pitfalls?2) Learn an algorithmic pathway to the incidental adrenal nodule, incorporating current major guidelines.a. What are the first steps after finding an incidental adrenal nodule?b. Which guidelines are available?c. What imaging findings support each step?d. What reporting templates are available?3) Discuss management of adrenal nodules, highlighting the role of the radiologist in directing appropriate specialist referral, biochemical testing, and biopsy.4) Review the treatment options and prognosis of conditions including hormonally active tumors.

GUEE-46 Müllerian Duct Anomalies: New Classification Systems, Clinical Implications, and Treatment Frontiers

Participants
Moataz Ahmed Sayed Mohammed Soliman, MD, MSc, CHICAGO, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understanding the evolution of Mullerian duct anomalies classification systems. • Formulating a stepwise approach to report Mullerian duct anomalies considering the new American Society of Reproductive Medicine (ASRM) classification. • Learning the impact of new classification systems on management. • Familiarize with new surgical approaches for management.

TABLE OF CONTENTS/OUTLINE

• Introduction o Embryological background. o Normal anatomy. • Normal Multimodality imaging of the female genital system: (US, 3D US, MRI, and hysterosalpingography (HSG). • Classification of Mullerian duct anomalies: (American fertility society, ESHRE/ESGE, American society of fertility medicine). o Mullerian duct anomalies: (uterus, cervix, and vagina). o Comparison between old and new classification systems. • Multimodality imaging approach diagnosing Mullerian duct anomalies: (US, 3D US, MRI, hysterosalpingography (HSG), and CT in selected cases) • Clinical implications for fertility and patient outcomes. • Management approach in light of the newly proposed classification systems. • Multimodality imaging post corrective interventions. • New treatment frontiers for the treatment of female infertility. o Hysteroscopic management. o Uterus transplantation.

GUEE-47 Pubic Symphyseal Urinary Fistulae with Osteomyelitis in the Setting of Treated Prostate Carcinoma

Participants
Paul Wojack, MD, Manhasset, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate cancer is the leading cause of cancer in men and a variety treatment options are available. Increasing population size and advancements in prostate cancer treatment has led to an increased number of patients who are living longer with prostate cancer.

Complications of prostate cancer treatment include erectile dysfunction, impotence, incontinence, gastrointestinal issues (such as radiation proctitis), and rarely posterior urethral strictures (secondary to radiation damage). Manipulation of these strictures with urethroplasty, stenting, and other urethral instrumentation can cause breakdown of the friable post-radiation tissues. Patients can develop urinary fistulae to the pubic symphysis which are often complicated by pubic osteomyelitis and often require aggressive surgical interventions. A paucity of literature regarding urosymphyseal fistulae, making this a rare complication of which radiologists should be aware, especially musculoskeletal and body imagers.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Background 3. Prostate Cancer a. Epidemiology b. Treatments c. Complications 4. Urosymphyseal fistulae a. Normal and post-treatment anatomy b. Pathophysiology in the setting of treated prostate cancer c. Pubic osteomyelitis vs osteitis pubis. d. Imaging review of several cases of urosymphyseal fistulae 5. Summary 6. References

GUEE-48 Reporting a Renal Mass: Can We Do It Better?

Participants
Pablo Valdes Solis, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the points that are considered most important when making a radiological report of a renal mass.Analyze why they are important and how to describe them.See examples of each of the points, with practical cases explaining what is reported, how and why.

TABLE OF CONTENTS/OUTLINE

Introduction:Importance of the correct description of the renal mass.Variability in how radiologists and urologists consider the most importan points.Current situation: vision of the radiologist and the urologistPoints to be included in the report. In each point, the what, how and why will be described, accompanied by examples, as well as the importance that radiologists and urologists have given to each point.Examination type and description; CT or MRI, with o without contrast.Mass type: cystic or solid. Mass size, including methodsSize comparison: estudies and measurements included for comparison.Enhancement, including methods. Importance of measurement comparising enhancede and unenhanced scans. Macroscopic fat: importance of detecting and describing the presence of fat in the mass.Mass margins: is there infiltration?NecrosisBosniak classification: a review of the classification of cystic masses. Nephrometry score: something that some urologist use.Estimated probability of malignancy: if included and method Features predictive of indolent growth in solid masses.Lymph node size: how to measure and describe lymph nodes.Tumor thrombus: description, location and extension.Location inside the kidney: axial location, capsular location, distance to sinus fat, position relative to polar lines.Management options mentionedTumor-Node-Metastasis (TNM) staging reported: a reviewConclusions

GUEE-49 Not Kidneying Around: Multimodality Imaging of Renal Infectious and Inflammatory Conditions in Adults- Key Imaging Findings

Participants
Camila Vendrami, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

· Discuss the role of imaging in the evaluation of a wide spectrum of renal infections and inflammatory conditions· Review their main pathophysiologic features · Emphasize specific imaging features of certain renal infections and inflammatory conditions that aid in making the correct diagnosis

TABLE OF CONTENTS/OUTLINE

A wide spectrum of renal infectious and inflammatory conditions exists. Imaging plays a key role in many instances, including in immunocompromised patients, treatment non-responders, transplant patients, and cases with an equivocal clinical diagnosis.1. Introduction 2. What is the role of multimodality imaging (US, CT, MR) in the evaluation of renal infections and inflammatory conditions? 3. What are the key imaging features of acute renal conditions (acute pyelonephritis, renal and perirenal abscesses, pyonephrosis, emphysematous pyelonephritis/cystitis)?4. What are the key imaging features of fungal infections and their complications (such as aspergillus, candida and mucor) as well as of tuberculosis and parasitic infections (renal hydatid disease)?5. What are the key imaging features of chronic renal conditions (chronic pyelonephritis, xanthogranulomatous pyelonephritis, eosinophilic cystitis, renal replacement lipomatosis, struvite stones)?6. Take Home Points

GUEE-5 MR Imaging of the Penis: A Practical Guide for Radiologists

Participants
Renata Nascimento, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review the penile anatomy - Describe our institutional protocol for penile magnetic resonance imaging (MRI) - Create a practical guide to evaluate the penis at MRI - Describe common and uncommon penile imaging findings - Revisit the new TNM staging system used for squamous cell carcinoma of the penis

TABLE OF CONTENTS/OUTLINE

- Introduction Anatomy of the penis - MR Imaging Technique Preparation MRI protocol and how to optimize it - Magnetic resonance imaging findings of the penis Traumatic (eg: fracture) Infectious Inflammatory (eg: Peyronie's disease) Vascular (eg: fistula, segmental thrombosis of the corpus cavernosum, priapism, mondor disease) Penile prosthesis Penile cancer

GUEE-50 The Postoperative Kidney: Multimodality Imaging Manifestations of Common and Uncommon Complications

Participants
Cole Thompson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Postoperative renal complications may be grouped into several broad categories: Fluid collections; vascular, lymphatic, and collecting system injuries; tumor seeding; trauma to adjacent organs; and general complications.-Postoperative fluid collections include hematoma, seroma, urinoma, abscess, and lymphocele, each at varied time intervals following surgery. Discernment of differences in key imaging features allows for appropriate management.-Vascular complications related to renal arterial injury or thrombosis include active hemorrhage, pseudoaneurysm, and renal infarction. Prompt recognition of imaging findings enables early intervention.-Postsurgical complications are not limited to the kidney or collecting system. The adjacent organs may also be injured, including the spleen, adrenal glands, liver, pancreas, bowel, and pleura.

TABLE OF CONTENTS/OUTLINE

-Expected imaging features of the post-operative kidney following partial nephrectomy, radical nephrectomy, and lithotripsy (ESWL) or nephrolithotomy.-Case-based review illustrating the role of imaging (CT, US, MRI, angiography) in complications following renal surgery: Fluid collections; vascular and lymphatic injuries; complications related to the collecting system; tumor seeding and recurrence; and injury to adjacent organs.-Recognition of key imaging features that warrant urgent therapeutic intervention.-Challenging clinical scenarios and strategies for optimal image interpretation to guide subsequent management and follow-up.

GUEE-51 Preoperative Planning In Cancer Of The Urinary Tract: What Surgeon Wants to Know What Radiologists Need to Know

Participants
Patricia E. Ortega Aragon, MD, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Bladder cancer (BC) is the most common cancer of the urinary tract in the United States. In bladder cancer, images play an important role in locoregional staging and remote evaluation of the disease. The RENAL nephrometry scoring system, VI-RADS, and PI-RADS provide preoperative information that is important in predicting long-term outcomes. It is important for radiologists to understand what information to provide in diagnostic reports to support the surgical plan and provide important data for making treatment decisions.

TABLE OF CONTENTS/OUTLINE

- Introduction- Systemic approach: kidney, prostate and bladder- The Rads and Scores.- Clinical radiological Review: pictorial cases.

GUEE-52 Focal MRI-Guided Transurethral Ultrasound Ablation (TULSA) in Men with Prostate Cancer: Lessons Learned in 60+ Patients

Participants
Daniel N. Costa, MD, Dallas, TX (*Presenter*) Research support, Bayer AG

TEACHING POINTS

1. Review the rationale for focal therapy in prostate cancer and the unique aspects of MRI-guided transurethral ablation (TULSA) of the prostate2. Discuss the multidisciplinary patient selection, treatment and follow-up strategies3. Review and discuss strategies to overcome challenging scenarios

TABLE OF CONTENTS/OUTLINE

1. Basic facts about prostate cancer (Disease prevalence and heterogeneity, Over- and under-diagnosis, Morbidity of standard of care treatment options)2. Different focal therapy modalities (Cryoablation, laser, irreversible electroporation, microwave ablation, transrectal high-intensity focused ultrasound; Transurethral ultrasound ablation (TULSA))3. TULSA - Multidisciplinary effort- Patient selection (Inclusion and exclusion criteria, Distances of interest, Critical anatomical relationships, Calcifications, Pre-treatment imaging and biopsy)- Treatment planning and patient-specific customization (Sextant, hemi-, near whole-gland, and whole-gland ablationo Neurovascular bundle and ejaculatory duct sparing, Concurrent benign prostatic hypertrophy treatment)- Procedure duration- Strategies for workflow improvements- Post-treatment follow-up (Imaging - normal and abnormal appearance, PSA trends, Functional (sexual and urinary) recovery, Biopsy, Complications)- Challenging scenarios (Hip prosthesis, Radiation therapy fiducials and seeds, Motion, Calcifications)

GUEE-53 T2-Hyperintense Prostatic and Periprostatic Lesions and Their MRI Characteristics

Participants
Alfonso Iglesias, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Knowledge of the anatomy and embryological development of the inferior male genitourinary tract should allow the radiologist to classify the T2-hyperintense prostatic and periprostatic lesions according to localizationClinical presentation, MRI characteristics with pathological correlation can help us to accurately characterize T2-hyperintense prostatic and periprostatic lesions resulting in appropriate patient management.

TABLE OF CONTENTS/OUTLINE

Define, classify and review the clinical manifestations of T2-Hyperintense prostatic and periprostatic lesions Review imaging findings that can help us shorten the differential diagnosis and perform a correlation of imaging findings with clinical and therapeutic management Describe an imaging algorithm for T2-Hyperintense prostatic and periprostatic lesions that is based on MRI characteristics

GUEE-54 Gonadal Vein - The Omitted by Lane

Participants
Aruna R. Patil, MD, FRCR, (*Presenter*) Research Consultant, Koninklijke Philips NV

TEACHING POINTS

The gonadal veins are paired vessels that drain the testes and ovaries. This exhibit aims to:1. Review the imaging anatomy of

gonadal veins2. Its use as a landmark, collateral 3. Its role in conditions such as pelvic congestion, varicocele4. Its role in spread of tumor and infection.

TABLE OF CONTENTS/OUTLINE

1. Anatomy of gonadal veins- male and female2. Variant anatomy and implications3. Use as landmark - ovaries, testes (normal and pathologies - torsion, germ cell tumor in undescended testes, upper ureter physiological narrowing4. Collateral pathways - varices, varicocele, pelvic congestion syndrome, mesentricogonadal shunts in CLD, Abernathy malformations5. Spread: gonadal vein thrombosis- septic in infections (PID) , bland or tumor thrombosis - leiomyomatosis, leiomyosarcoma, other carcinomas with gonadal vein spread.

GUEE-55 Peritoneal and Retroperitoneal Anatomy as it Relates to Disease Spread

Awards
Identified for RadioGraphics

Participants
Ayman H. Gaballah, MD, FRCR, Columbia, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Review anatomy and anatomic landmarks of peritoneal and retroperitoneal (RP) spaces 2- Illustrate the intercommunications among different spaces and their effect on spread of related diseases 3- Differentiate peritoneal from RP diseases 4- Discuss imaging workup and imaging features of different pathologic entities and pathways of disease spread 5- Provide algorithmic approach to differential considerations 6- Review management options

TABLE OF CONTENTS/OUTLINE

1- Introduction 2- Anatomy of peritoneal and retroperitoneal (RP) spaces with diagrammatic illustrations 3- Differentiation of intraperitoneal from retroperitoneal pathology 4- Imaging features of different pathologic entities including, extraluminal gas, fluid collections, and masses 5- Case presentation 6- Algorithmic approach to differential considerations 7- Peritoneal carcinomatosis index 8- Management options including HIPEC for peritoneal carcinomatosis 9- Summary and conclusion

GUEE-56 Don't Be Outscored - A Practical Guide to VI-RADS, Including Differentials

Awards
Identified for RadioGraphics

Participants
Jonatas Favero Prietto Dos Santos, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) VI-RADS provides a five-point score to determine the risk of detrusor muscle invasion based on tumor appearances in T2WI, DWI and DCE; 2)Despite the high reproducibility verified so far, scoring is a trick process and requires supervised practicing. Along with a series of typical cases, some pitfalls and common errors are discussed; 3)As the VI-RADS only applies for urothelial lesions, it's important to be aware of MRI appearances of other malignant neoplasms and benign conditions that may mimic urothelial cancers.

TABLE OF CONTENTS/OUTLINE

Bladder neoplasms are classified as epithelial and nonepithelial, and they can emerge from any of the bladder layers. Urothelial carcinoma account for the majority of urinary bladder cancer and differentiating muscle-invasive (MI) from non-muscle-invasive (NMI) tumors is vital to choose the appropriate treatment. It is noteworthy that transurethral resection of bladder tumor may not sample the muscularis propria, leading to understaging in 25% to 40% of MI cancers. In this setting, VI-RADS is a reproducible and feasible guide for Radiologists to use a standardized approach to imaging and reporting multiparametric MRI. This system provides a five-point score which effectively indicates the likelihood of detrusor muscle invasion. MRI scoring is based on T2WI, DWI and DCE. It is also important to evaluate the presence of synchronous urothelial lesions, lymph node enlargement and distant metastasis. Aside from an accurate scoring of urothelial lesions, Radiologists should be able to recognize imaging findings of other malignant neoplasms and non-malignant conditions, which may simulate urothelial cancers.

GUEE-57 Altered Nephrogram: What the Radiologist Needs to Know

Participants
Elisa Antolinos Macho, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1 - Understanding what "nephrogram" means and normal kidney behavior in monophasic and multiphasic CT. 2 - Learning the most common abnormalities: absent (global or segmental), delayed, striated, spotted and persistent nephrogram. 3 - Correlating each altered nephrogram with its typical underlying pathophysiology.

TABLE OF CONTENTS/OUTLINE

1. Normal kidney vascularization 2. Normal kidney behavior in multiphasic CT: Normal nephrogram 3. Absent nephrogram - Global absence: Traumatic / Non-traumatic - Segmental absence: Vascular / Others 4. Delayed nephrogram - Vascular - Obstructive - Others 5. Striated nephrogram - Unilateral - Bilateral - Spotted nephrogram 6. Persistent nephrogram 7. Altered nephrogram: tips and tricks - Laterality - How to define it - Most common cause - The "rim sign" - Final diagram with every altered nephrogram

GUEE-58 Urine Luck: Using the Nephrogram to Aid in Diagnosis

Participants
Layne Kelley, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. An understanding of normal patterns of renal enhancement and contrast excretion can be utilized to optimize image acquisition for detection of abnormalities.2. Recognizing abnormal enhancement patterns improves detection of subtle pathology.

TABLE OF CONTENTS/OUTLINE

1. Introduction:A. Review of normal progression of contrast through the kidneys and urinary tract over time on CTB. Provide an overview of abnormal enhancement patterns with a "back to basics" approach referencing the normal and abnormal nephron function.2. Case-based review of abnormal enhancement patterns, including:A. Delayed nephrogram i. Arterial inflow1. Renal artery occlusion2. Renal artery dissectionii. Venous outflow1. Renal vein thrombosis2. Nutcracker syndromeiii. Urine outflow1. Obstructive urolithiasis2. Inflammatory stricture3. Malignancya. Invasive prostate carcinomab. Cervical cancerc. Subtle ureteral tumor implantB. Absent nephrogrami. Renal infarctC. Striated nephrogrami. PyelonephritisD. Persistent nephrogrami. Retained contrast in the setting of acute kidney injury3. Review how an understanding the nephrogram allows optimal evaluation for specific pathologies, with case examples:A. Unenhanced CT for nephrolithiasisB. Nephrographic phase for optimal detection of renal massesC. Excretory phase for detection of urothelial masses and suspected urine leak

GUEE-59 Updated 2019 Bosniak Classification: Examples, Challenges and Future Directions

Participants
Srinivas Saripalli, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Renal cystic lesions are commonly encountered incidentally as part of trauma workups and workup for other diseases, and also as part of workup for symptomatic presentation such as hematuria and flank pain. The management and treatment of these renal cystic lesions has been the focus of multiple efforts from the radiological and urological communities. The challenge posed by cystic renal lesions is to stratify those which are more likely to be malignant and require more invasive treatment and ventricles which can be managed conservatively with serial imaging and thereby avoid the morbidity of invasive treatment. The goal of the updated Bosniak classification in 2019 was to better encompasses the small renal masses that are commonly encountered in practice and to more systematically stratify these lesions such that variability in classification was decreased, with both CT and MRI classification schemes. The updated classification has many simplifications for practice which we will review. We will also show some continued challenges in the classification and how they can be addressed using multiparametric MRI and multimodality correlation.

TABLE OF CONTENTS/OUTLINE

1. Review the 2019 Bosniak classification for cystic renal lesions. 2. Show multiple examples of cystic renal lesions and their classifications in the old and new Bosniak classifications. Particular focus on lesions which have different management in the old versus new classifications. 3. Review the varied appearances of lesions in each category in ultrasound, CT and MRI. 4. Discuss advantages, challenges, pitfalls and clinical implications of the updated system compared to the old.

GUEE-6 Imaging of the Enlarged Scrotum: A Vas(t) Deferens-tial Diagnosis

Participants
Christopher Yu, MD, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Scrotal masses or masslike scrotal enlargement may cause substantial discomfort and anxiety to patients. While the clinical setting is often suggestive of the correct diagnosis, imaging is nearly always requested to confirm the suspected diagnosis, exclude other concerning differential possibilities, evaluate the disease extent, and/or assess for comorbidities and complications.The goal of the current educational exhibit is to review the differential diagnosis of scrotal masses/masslike scrotal enlargement, as outlined below. In addition to the rich imaging illustration of common etiologies, multiple less common but important causes will be provided with corresponding clinical and surgico-pathologic correlation. The exhibit will also include a review of inguino-scrotal fascial anatomy that is often very confusing for both trainees and practicing radiologists. Interactive (board-exam question/answer-type) pointers will also be provided to emphasize key principles.

TABLE OF CONTENTS/OUTLINE

1. Developmental and gross anatomy of the inguino-scrotal region (fascial layers, scrotal contents, inguinal canal);2. Clinical and imaging diagnostic flowcharts;3. Role of imaging (US, CT, and MR);4. Casesa. Intratesticular (mass/cyst; torsion, infection);b. Extratesticular;i. Epididymal (mass/cyst, infection),ii. Spermatic cord (varicocele, masses),iii. Inguino-scrotal hernias (direct versus indirect);c. Scrotal wall:i. Diffuse swelling:1. Infection (cellulitis, Fournier gangrene),2. Lymphedema from systemic process (heart/liver/kidney failure),3. Hidradenitis suppuritiva;ii. Focal masses/collections (hydrocele, abscess, hematoma).

GUEE-60 Renal Cell Carcinomas: Uncommon Clinical and Imaging Presentations and Uncommon Histological Subtypes

Participants
Satomi Kawamoto, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review uncommon clinical and imaging presentations of renal cell carcinomas (RCCs).2. To become familiar with uncommon histological subtypes of RCCs and their clinical features

TABLE OF CONTENTS/OUTLINE

1. Uncommon clinical presentation of RCC. (1) Most RCCs in the developed world are incidentally discovered at imaging studies. (2) However, RCC may be discovered with uncommon presentations. Examples include spontaneous hemorrhage and paraneoplastic syndrome. Review uncommon clinical presentations with imaging findings. 2. Uncommon imaging features. (1) Unenhanging or equivocally enhancing RCCs. (2) RCC mimicking other entity such as renal abscess, lymphoma, pyelonephritis. (3) Other uncommon imaging features. 3. Uncommon histological subtypes of RCCs. (1) RCC subtypes emerged to 2016 WHO classification, and review their imaging and clinical features. (2) Review imaging and clinical features of other uncommon RCC subtypes.

GUEE-62 Direct MRI-Guided In-Bore Targeted Biopsies of the Prostate: Lessons Learned in 800+ Patients

Awards
Identified for RadioGraphics

Participants
Daniel N. Costa, MD, Dallas, TX (*Presenter*) Research support, Bayer AG

TEACHING POINTS

1. Review the unique aspects of direct MRI-guided in-bore biopsies compared to ultrasound-based targeted approaches. 2. Demonstrate strategies to leverage the direct lesion and needle visualization provided by the in-bore approach to overcome challenges encountered during targeted biopsies

TABLE OF CONTENTS/OUTLINE

1. Direct MRI-guided in-bore biopsy vs US-based (cognitive and MRI-TRUS fusion) biopsies• Advantages o Precise lesion-needle location verification• Disadvantages o Cost and duration o Lack of systematic sampling2. Steps of a direct MRI-guided in-bore biopsy • Review of diagnostic, pre-biopsy multiparametric MRI• Patient positioning, moderate sedation and needle guide placement• Pre-biopsy imaging• Target identification and biopsy planning• Needle guide location adjustment(s)• Tissue sampling and needle-lesion location verification• Specimen handling3. Challenging scenarios• Small lesion in large prostate• Tricky lesion location• Tumor heterogeneity• Plaque-like subcapsular lesions• Motion (whole body, rectal, pelvic floor)• Needle deflection• Anatomical changes secondary to hematomas• Suspected post-prostatectomy local recurrence• Prostates with unusual morphology (eg, post focal therapy)• Patients without rectal access• Unusual anorectal anatomy• "MRI-invisible" lesions• Patient selection (e.g., hip prosthesis)• Efficient imaging and tissue sampling

GUEE-63 Prostate Diffusion-weighted Imaging: Insatiable Challenge to Improve Tumor Detection and Characterization in Prostate Cancer

Participants
Tsutomu Tamada, MD, Kurashiki, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this presentation is:1. To learn the role of diffusion-weighted imaging (DWI) in diagnosis of prostate cancer (PC)2. To understand the problems for the detection and characterization of PC using standard DWI with single-shot echo-planar imaging (ssEPI) in patients with elevated PSA levels3. To demonstrate the countermeasures for problems on ssEPI DWI

TABLE OF CONTENTS/OUTLINE

Role of DWI in diagnosis of prostate cancer (PC)- Primary PC detection: DWI scoring system in Prostate Imaging Reporting and Data System v2.1- Local recurrent PC detection: DWI scoring system in Prostate Magnetic Resonance Imaging for Local Recurrence Reporting (PI-RR)- Local staging: extracapsular extension and seminal vesicle invasion- Assessment of tumor aggressiveness in PC using quantitative DWI metrics- MRI-ultrasound Fusion-guided Prostate targeted BiopsyProblems and countermeasures for detection and characterization of PC using ssEPI DWI - Susceptibility artifact and geometric anatomic distortion:Reduced field-of-view DWITurbo spin-echo DWIMulti-shot EPI DWI- Blurring:Multi-shot EPI DWI- Low SNR and CNR in high b-value and high spatial resolution acquisitions:Compressed SENSE- Insufficient image contrast between benign and PC tissues:Ultra-high b value DWI Synthetic DWISynthetic DWI which enable to synthesize DW images with any TR and TE- Insufficient diagnostic performance of tumor aggressiveness in PC using mean apparent diffusion coefficient (ADC)ADC histogram analysisNon-Gaussian fitting models- DWI invisible clinically significant PCMicrostructural MRI which is a quantitative technique that focuses on structural change in three typical microstructures of prostatic tissue

GUEE-64 Prostate Magnetic Resonance Imaging for Local Recurrence Reporting PI-RR in Clinical Practice - A Primer for Novice and Expert Radiologists

Participants
Jorge Abreu Gomez, MD, Pickering, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

* Local recurrence after radical treatment represent a diagnostic challenge for novice and experienced radiologists. Throughout review of oncologic history, MRI and histologic findings of the primary lesion are crucial for adequate assessment/interpretation.* PI-RR system aims to standardize the performance, interpretation and reporting of MRI after radical treatment in order to reduce variability.* Combination of DCE and DWI features of a given observation will determine the likelihood for local recurrence

TABLE OF CONTENTS/OUTLINE

* PI-RR categories and applicability.* PI-RR scoring after radiotherapy. Understanding the sequence with highest score!!* PI-RR scoring after radical prostatectomy. DCE as dominant sequence!!* Beyond PI-RR. MRI assessment of recurrent disease after focal therapy

GUEE-65 Post-treatment Prostatic Cancer: How To Perform an Adequate Imaging Evaluation

Participants
Vivien Bonadio, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Understand the current concepts of biochemical recurrence and its clinical impact ? Address the different treatment modalities used, as well as their indications ? Review the role of functional imaging in follow-up and detection of recurrent disease ? Discuss the highlight findings on post treatment images of patients with prostatic cancer

TABLE OF CONTENTS/OUTLINE

INTRODUCTION ? Brief discussion of epidemiology ? Review of the concept and current criteria of biochemical recurrence in prostate cancer TREATMENT MODALITIES AND THEIR INDICATIONS ? Androgen deprivation therapy ? Brachytherapy ? External radiation therapy ? High Intensity Focused Ultrasound - HIFU ? Prostatectomy INDICATIONS OF IMAGING IN THE ASSESSMENT OF LOCOREGIONAL AND DISTANT RECURRENCE ? MR ? PSMA PET/CT ? PSMA PET/MR IMAGING EVALUATION ? Systematic approach to the interpretation of MR images of patients in post-treatment of prostatic cancer ? Case based-review of PI-RR (Prostate Magnetic Resonance Imaging for Local Recurrence Reporting) ? Pitfalls, challenges, and how to overcome these

GUEE-66 Biparametric and Multiparametric Prostate MRI: How To and When To Use Them Properly

Participants
Mitsuru Takeuchi, MD, PhD, Nagoya, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Multiparametric MRI (mpMRI) is currently the standard imaging method for prostate MRI. All Prostate Imaging Reporting and Data System (PI-RADS) versions emphasized that prostate MRI protocols should include not only T2-weighted imaging (T2WI) but also diffusion-weighted imaging (DWI) and dynamic contrast-enhanced MRI (DCE-MRI). However, in the latest PI-RADS after version 2, DCE-MRI plays a minor role. Biparametric MRI (bpMRI) study excluding DCE-MRI can be performed in a shorter time and is free from the cost and potential risks of gadolinium-based contrast agents compared to mpMRI. Recently, several studies have reported bpMRI is not inferior to mpMRI in the prostate cancer (PCa) detection. In this educational exhibit, we review these articles and explain when to and how to use bpMRI and mpMRI while presenting clinical cases.

TABLE OF CONTENTS/OUTLINE

1) Diagnostic accuracy of bpMRI and mpMRI for the PCa tumor detection in treatment naïve patients (primary PCa). 2) Clinical application of bpMRI bpMRI could be apply to the patients who is suspected primary PCa. mpMRI should be used to T-staging, locally recurrent PCa after radiotherapy and prostatectomy and active surveillance. 3) Imaging protocol of bpMRI High image quality of T2WI and DWI is mandatory for securing the diagnostic accuracy of bpMRI. T2WI should be acquired with multiplanes and high spatial resolution. DWI should be obtained with less artefacts and high contrast between lesion and normal tissue. 4) Clinical cases

GUEE-67 Spectrum of Male and Female Urethral Pathologies at MRI

Participants
Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Recognize variety of pathological conditions of the urethra at MRI 2.Discuss advantages and disadvantages of the MR Imaging of the urethra 3.Describe Imaging techniques for evaluation of urethra

TABLE OF CONTENTS/OUTLINE

Evaluation of the male and female urethra on conventional imaging studies including retrograde urethrography (RUG), voiding cystourethrography (VCUG), and ultrasonography (US) may be helpful in demonstrating urethral abnormalities however limited in providing information regarding the periurethral tissues. MRI due to multiplanar capability and excellent tissue contrast can provide anatomic details about both the urethra and periurethral tissues and also orientation of the lesion in three dimensions. In this presentation conditions affecting the urethra or periurethral tissues will be discussed. Specific topics of discussion will be anatomical detail, MR imaging techniques, diverticulum, inflammation, tumors, strictures and miscellaneous conditions of the male and female urethra. Summary: MRI is a noninvasive technique that does not require ionizing radiation and can provide anatomic and pathological details about both the urethra and periurethral tissues and the orientation of the lesion in three dimensions due its multiplanar capabilities and superior soft tissue contrast.

GUEE-8 Diverse Spectrum of Tumefactive, Non-neoplastic, Proliferative Pseudotumors of the GU Tract: Cross-sectional Imaging Findings

Awards
Identified for RadioGraphics

Participants
Rashmi Balasubramanya, MD, Philadelphia,, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is a wide spectrum of non-neoplastic conditions of the GU tract that show tumefactive growth pattern reminiscent of neoplasms. A diverse spectrum of inflammatory, infective, proliferative and idiopathic disorders with distinct histopathology occur in the kidneys and upper/lower urinary tracts. We present multi-modality cross-sectional imaging findings of a broad spectrum of these pseudo-tumors.To review taxonomy, epidemiology, clinical features, histopathology biology of a wide spectrum of tumefactive, non-neoplastic, proliferative conditions of the genitourinary tract.To describe multimodality cross-sectional imaging findings of these lesions and differentiate from neoplasms.To discuss management and prognosis.

TABLE OF CONTENTS/OUTLINE

OrganizationIntroduction, classification, epidemiology, clinical manifestations, histopathology, CT/MRI findings, management, prognosis, conclusion.Entities discussedXanthogranulomatous pyelonephritis, Actinomycosis, Tuberculosis, Malakoplakia, IgG4 related disease , Amyloidosis, Perinephric myxoid pseudotumor of fat, Erdheim-Chester disease, Pseudosarcomatous myofibroblastic proliferation, Cystitis cystica , endometriosis of the ureters/urinary bladder, Nephrogenic adenoma, Adrenal rest, Echinococcal cyst.

GUEE-9 Unexpected Imaging Findings following Uterine Interventions

Awards
Identified for RadioGraphics

Participants
Allan Brazier, MD, Sterling Heights, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Uterine and endometrial interventions include a spectrum of routine surgical, hysteroscopic, and interventional procedures.2) Familiarity with the spectrum of interventions and recognition of their potential complications on imaging are essential to guide management and optimize patient outcomes.3) An understanding of how these procedures are performed will lead to a better grasp of all potential complications that may ensue.

TABLE OF CONTENTS/OUTLINE

1) A review of uterine and endometrial procedures and their techniques. 2) A case-based presentation of complications that result from these procedures as well as relevant management recommendations.Cases: -Retained fibroid after hysterectomy -Ureteral transection and ureterovaginal fistula after hysterectomy -Active extravasation after hysterectomy-Vesicovaginal fistula after do-it-yourself pessary placement -Regenerating uterine tissue after morcellation -Uterine perforation after dilatation and curettage (D C) -AVM after D C-Synechiae after D C -Hematometra after endometrial ablation -Uterine actinomycosis due to retained intrauterine device (IUD) -Uterine perforation by IUD -Avulsion of pedunculated fibroid after uterine artery embolization (UAE) -Utero-enteric fistula after UAE -Small bowel obstruction after UAE -Fascial dehiscence after cesarean section -Bladder flap hematoma after cesarean section -Vaginal cuff dehiscence and bowel herniation -Endometritis after embryo transfer -Peritoneal inclusion cysts following pelvic surgery -Scar endometriosis

GUEE-1

Imaging of Perirenal Retroperitoneal Lymphatic Systems: Anatomy, Function and Conditions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Identified for RadioGraphics
Cum Laude

Participants
Hiroaki Takahashi, MD, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Normal perirenal lymphatic drain is difficult to identify on conventional imaging. It is partially visualized by CT- and MRI-lymphangiogram. It is also occasionally depicted as pyelolymphatic backflow on retrograde pyelogram, intravenous urogram and CT urogram secondary to acute rise of pressure in the collecting system. However, the knowledge of perirenal lymphatic flow is of clinical importance to understand the conditions involving the perirenal retroperitoneal lymphatics and behavior of lymph node metastases from renal or upper tract urothelial malignancy. This exhibit will review the fundamental concept about perirenal lymphatic systems, and imaging assessment for non-neoplastic and neoplastic conditions involving the perirenal lymphatics. Further, differential diagnosis and treatment strategy of these conditions are discussed. The purposes of this exhibit are: 1. To review the fundamental anatomy, physiology and imaging of normal perirenal lymphatic systems. 2. To review the imaging findings, differential diagnoses and treatment options for various conditions associated with perirenal lymphatic systems.

TABLE OF CONTENTS/OUTLINE

1. Overview of the lymphatic system. 2. Fundamental anatomy and physiology of perirenal lymphatic systems. 3. Imaging of perirenal lymphatics and their communication with other lymphatic chains. 4. Imaging findings of various conditions of perirenal lymphatic systems with discussion of their differential diagnoses and treatment strategies. 5. Summary

GUEE-10

Malignant Neoplasms of the Penis with Radiologic Pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Jamie Marko, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Most malignant tumors of the penis are squamous cell carcinomas (SCC) arising from the mucosal lining of the glans, coronal sulcus and foreskin. Non-epithelial tumors do not demonstrate the same anatomical predilection. 2. HPV infection is associated with subtypes of penile SCC. Additional risk factors are lack of circumcision, phimosis, chronic inflammation, lichen sclerosis, smoking, and radiotherapy. 3. Penile cancer commonly presents as a discrete mass, ulcer or erythematous lesion on the glans or foreskin in a male in their 5th or 6th decade of life. 4. Imaging may be used to evaluate the local extent of a penile neoplasm and to detect metastases. Penile SCC has a predictable pattern of spread from the inguinal lymph nodes (LN) to the pelvic LN and lastly to the periaortic LN. Systemic metastases, including to the liver, lungs, mediastinal LN, are a late event.

TABLE OF CONTENTS/OUTLINE

1. Review penile anatomy with an emphasis on frequent sites of tumor origin and local spread. We will emphasize the anatomic structures that affect local staging and impact management. 2. Illustrate the pathologic spectrum of malignant penile neoplasms. The pathologic descriptions will serve as the basis for understanding the imaging appearances. 3. Describe the multimodality imaging evaluation of penile cancer. 4. Illustrate the spectrum of penile cancer at imaging providing radiologic-pathologic correlation.

GUEE-11

Benign Lesions of the Urinary Tract Mimicking Malignancy - Test Your Skills with this Case-based Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate equivocal imaging findings of upper and lower urinary tract lesions including normal variants, inflammatory/infectious diseases and benign tumors mimicking genitourinary malignancy. To analyze the correlation between cystourethrogram, IVU, US, CT and MR imaging features with pathology in urinary tract lesions. To emphasize pitfalls, diagnostic difficulties and differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Although a mass or a thickening in the upper and lower urinary tract may be caused by urothelial carcinoma, several benign and malignant entities should also be included in differential diagnosis. We review images of the urinary tract (pelvicalyceal system, ureters, bladder and urethra) in different entities mimicking cancers in a quiz format, with clues to interpretation and providing images of malignant lesions for comparison. Imaging findings (cystourethrogram, IVU, US, CT and MR) and pathologic correlation will be presented. How pathologic correlation informs imaging interpretation will be highlighted. The list of cases presented includes: inflammatory diseases (pielitis and cystitis cystica, eosinophilic ureteritis and cystitis, Keratinizing desquamative squamous metaplasia (cholesteatoma) of the ureter, polypoid, papillary, granulomatous BCG), secondary to chemotherapy or irradiation, benign tumors (papilloma, leyomioma), extrinsic lesions (prostate hyperplasia and carcinoma, uterine and ovarian tumors, colonic cancer, diverticulitis, Crohn´s disease, varicose ureteral veins), filling defects (lithiasis, ureterocele, blood clot), addition images (diverticula).

Keeping it Retro: Reflecting on the Spaces, Planes, Pathologies of the Retroperitoneum

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Certificate of Merit

Participants
Jessica Lovett, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Review abdominopelvic anatomy, including the borders of the peritoneum and retroperitoneum. 2. Identify imaging findings to localize abdominal pathology to the peritoneum versus the retroperitoneum. 3. Examine the imaging signs used to localize pathology to a particular organ or space, focusing on retroperitoneal pathology. 4. Distinguish the pathways of spread of disease amongst the retroperitoneal compartments and surrounding compartments. 5. Apply these concepts with illustrative, interactive cases.

TABLE OF CONTENTS/OUTLINE

1. Anatomic borders of the peritoneal and retroperitoneal compartments within the abdomen and pelvis, and communicating foramina. 2. Localizing signs to assist radiologists in localizing pathology to peritoneum, retroperitoneum, or a specific organ. 3. Key imaging findings and differential diagnosis, with focus on retroperitoneal pathology. 4. Relevance of anatomical boundaries and disease spread for surgical planning. 5. Challenging cases to demonstrate teaching points.

GUEE-13

Follow the Yellow Brick Road: An Educational Review of Current Imaging in Urethral Stricture Disease with a Focus on MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Daniel Harris, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Provide important definitions and principles in urethral stricture disease including a brief overview of clinical assessment, treatment, and current diagnostic imaging guidelines as suggested by the AUA and EAU. \2. In-depth discussion of retrograde urethrography, sonourethrography, and magnetic resonance urethrography including their advantages, disadvantages, and best uses with examples from our practice including our own protocol for each imaging modality. \3. Suggest supported uses for magnetic resonance urethrography by compiling case series data from over the last decade. Then, discuss an example case where multiple imaging modalities were used, providing direct comparison of magnetic resonance urethrography to the other modalities. \

TABLE OF CONTENTS/OUTLINE

1. Introduction: definitions, clinical assessment, and treatment modalities for urethral strictures2. Imaging modality sections: Current uses, advantages, disadvantages, potential future applications for each respective modality \2a. Retrograde urethrography, Sonourethrography, Magnetic resonance urethrography \2b. Table summarizing MRU case findings from prominent case series \3. Example case: comparison of modalities

GUEE-14

Adrenal Lesions Inside Out" - A Pictorial Review of the Correlation Between Radiologic and Anatomopathological Patterns of Benign and Malign Adrenal Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Camila Franco, BMedSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review adrenal gland anatomy and discuss how it is important in the evaluation of adrenal lesions 2. Discuss the role of imaging and pathological evaluation in the assessment of adrenal gland lesions 3. Review the most common and uncommon imaging and anatomopathological patterns of benign and malign adrenal lesions. 4. Understand the correlation between radiologic and anatomopathological findings

TABLE OF CONTENTS/OUTLINE

Adrenal gland lesions have a prevalence of 4-7% in imaging tests among adults. The prevalence of these lesions increases with the greater availability of imaging tests and as the population gets older. Once the adrenal gland is made of different types of tissues that produce various types of hormones, adrenal lesions may present different features. This pictorial review will discuss:1. Adrenal gland anatomy and histology review 2. The role of different imaging and anatomopathological techniques in evaluation of adrenal lesions (a) Ultrasound (b) Computed tomography (c) Magnetic resonance (d) PET/CT (e) Gross specimen evaluation (f) Histology - Morphological criteria - Immunohistochemical studies (g). Molecular pathology 3. Different (usual and unusual) imaging and anatomopathological patterns of benign and malign adrenal lesions and how they correlate (a) Adenoma (lipid-rich and lipid-poor) (b) Aldosteronoma (c) Myelolipoma (d) Hematoma (e) Macronodular adrenal bilateral hyperplasia (f) Neural crest tumors (g) Cysts (h) Pheochromocytoma (i) Adrenocortical carcinoma (j) Metastatic neoplasms (k) Miscellaneous

What Do We See When We Don't See the Bladder? Review of the Main Urinary Diversion Techniques and Their Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Certificate of Merit

Participants
Alba Salgado Parente, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the different types of urinary diversion techniques.2. To understand the common findings to be expected in a postoperative study using the different imaging techniques (MDCT, MRI, fluoroscopy).3. To recognize the main postoperative complications, both early and late, grouped according to pathological groups.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Radiological protocol for post-operative evaluation (MDTC, MRI, fluoroscopy, US).3. Main surgical techniques and expected post-operative findings.3.1 Cutaneous incontinent diversions: Cutaneous diversion (Uretero-ureterocutaneostomy), Ileal conduit.3.2 Continent diversions: Indiana pouch, Orthotopic Bladder Replacement.4. Post-operative complications: Pictorial review4.1 Collecting system: Hydronephrosis, Urolithiasis, Urinary leakage, Ureteral stricture.4.2 Intestinal loops: Alteration of the intestinal rhythm, Intestinal leakage, Stomal stricture, Parastomal herniation, Fistulas, ileal conduit necrosis.4.3 Infection: pyelonephritis, abscesses, and other collections (hematoma, lymphocele).4.4 Tumoral: Local recurrence, Distant recurrence.5. Systematic approach to urinary diversions5.1 What type of urinary diversion surgery has been performed?5.2 Points of particular interest when assessing the presence of each type of complication6. Take home messages7. Bibliography

Radiological Lexicon for Renal Mass Characterization: Pictorial Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Rebeca Gil Vallano, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Revise a list of standardized terms employed to describe renal masses: basic imaging, CT, MR and miscellaneous terms.• Correlate each term with several cases from our institution with pathologic correlation.

TABLE OF CONTENTS/OUTLINE

Radiology reports need to employ a standardized language to improve their understanding for the rest of radiologists, clinicians and patients.In february 2021 the Society of Abdominal Radiology disease-focused panel on renal cell carcinoma published a consensus statement of recommended terms to be employed when reporting renal masses at CT and MR. We have revised the 31 terms described in this consensus: 14 basic terms such as definition of solid or cystic mass, 8 CT terms for example macroscopic fat or CT enhancement, 6 MR terms as MR enhancement and 3 miscelaneous terms like growth rate. Each term will be reviewed, explained and illustrated with different cases of our institution. In addition, we will offer an interesting anatomopathological approach to the cases presented.Knowledge of this lexicon will improve radiological reports, decrease interobserver variability, and facilitate communication with physicians.

GUEE-17

To Infinity and Beyond: Present and Future of Contrast Enhanced Ultrasound (CEUS) in Renal Transplant

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Tomas Fernandez, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Assessment of renal transplant complications with CEUS. Review of unusual and latest complications associated with up-to-date surgical techniques and immunosuppressant therapies. Future of CEUS on renal transplant patients, focusing on radiomics.

TABLE OF CONTENTS/OUTLINE

Immediate complications Intrasurgical ultrasound in robot renal transplant. CEUS in hyperacute rejection. CEUS in acute tubular necrosis. CEUS in cortical necrosis. CEUS in arterial and venous thrombosis. CEUS in compartimental syndrome. CEUS in segmentary infarcts. Living renal donor transplant pseudostenosis.Urological complications: CEUS guide for nephrostomy. CEUS anatomy of the intracavitary upper urinary tract (UUT). CEUS in UUT leak. CEUS in the differentiation of benign and malignant diseases of UUT. CEUS in ureteral kinking and stenosis.Collections CEUS in posttransplant collections. Late subcapsular linfocele and sinusal lymphatic ingurgitation due to mTOR. Subcapsular hematoma due to hemorragic cyst. Presurgical ureteral map for marsupialization of lymphoceles. CEUS in renal infection.Malignancies associated with renal transplant: Malignancies associated with immunosuppression and more prevalence of tumors due to extended age inclusion on donor lists. Malignancies associated with acquired cystic disease in long hemodialysis. Known malignancies, partial nephrectomy ex vivo. CEUS in active surveillance of complicated cysts and biopsied benign tumors.Biopsy CEUS as a guide for biopsy. CEUS in arteriovenous fistula and pseudoaneurysm. CEUS in the diagnosis of active bleeding. CEUS in US-guided thrombin treatment of pseudoaneurysm/bleeding.Future: CEUS perfusion. Elastography. Radiomics.

GUEE-19

Biochemical Recurrence of Prostate Cancer: Where Cancer Recurs, Where MRI Fails, and Where PSMA PET Fails?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Identified for RadioGraphics

Participants
Muhammad Awiwi, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate cancer can recur in up to 40% of patients who receive treatment (radical prostatectomy, androgen deprivation therapy, or radiotherapy) and the definition of biochemical recurrence varies according to the treatment type.There are typical sites of prostate cancer recurrence, but the disease can also recur in unusual sites in the pelvis. These sites should be interrogated when interpreting pelvic MRI.Both MRI and PSMA-PET have limitations/pitfalls and they complement each other.

TABLE OF CONTENTS/OUTLINE

To review the definition of biochemical recurrenceTo review expected imaging findings after prostate cancer treatmentDescribe common sites of prostate cancer recurrenceDescribe uncommon sites of prostate cancer recurrence in the pelvisDescribe potential pitfalls of MRI and PSMA-PET in detection of recurrent prostate cancer.

GUEE-2

Renal Mass Imaging with the Clear Cell Likelihood Score v2: A User Guide

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Identified for RadioGraphics

Participants
Anup Shetty, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Solid small renal masses (SSRM), defined as < 4 cm in diameter, are increasingly detected but can be complex to manage. A framework for approaching the SSRM is critical in providing optimal management, as clear cell RCC is the most common and aggressive subtype, and a high likelihood of this diagnosis can influence management. The recently updated MRI clear cell likelihood score (ccLS) provides the radiologist with tools to optimize their assessment of the SSRM. This exhibit will:1) Familiarize the reader with the ccLS and why it was developed2) Discuss key considerations in MRI protocol, eligibility criteria, and imaging features for using the ccLS algorithm3) Illustrate how to use the ccLS algorithm to assess the SSRM through a series of cases4) Highlight pitfalls of the ccLS algorithm and other considerations in MRI of SSRM not included in ccLS

TABLE OF CONTENTS/OUTLINE

- ccLS: rationale (moving beyond "is it enhancing, does it contain fat") and diagnostic performance- MRI protocol- Eligibility criteria and imaging features- How to use the algorithm- Case examples of working through the algorithm and pitfalls, including offramps when the ccLS is inappropriate to utilize (fat-rich angiomyolipoma, cystic renal mass, hemorrhagic renal cysts)- Reporting using ccLS: template and nomenclature- Potential management strategies based on ccLS

Multicenter Lessons from Adrenal Multidisciplinary Tumor Boards: Expert Evidence-Based Views of the Society of Abdominal Radiology Adrenal Neoplasm Disease Focused Panel

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Certificate of Merit

Participants
Ryan Chung, MD, Boston, MA (*Presenter*) Consultant, ScanMed, LLC;Stockholder, ScanMed, LLC

TEACHING POINTS

While some adrenal pathology is easily diagnosed radiologically, there are many common errors in adrenal imaging that may arise due to a lack of familiarity with technical, anatomic, physiologic, hemodynamic, and biologic factors. This is compounded by a deficiency of modern clinical and radiologic knowledge of adrenal pathology. These challenges arise when the radiologist encounters atypical presentations of common benign and malignant adrenal masses, mimics of benign and malignant adrenal masses, and rare adrenal pathology. This may lead to misdiagnosis, suboptimal management, and potentially adverse outcomes. In this exhibit, we present cases commonly encountered in clinical practice and presented to adrenal multidisciplinary tumor boards of major tertiary centers. Evidence-based expert views will be discussed to provide clues to the correct diagnosis and further guide appropriate management. 1. Describe common errors encountered in clinical practice and presented to adrenal multidisciplinary tumor boards of major tertiary centers 2. Illustrate relevant technical, anatomic, pathophysiologic, hemodynamic, and biologic factors leading to these errors 3. Review evidence-based literature and discuss expert opinions to provide useful tips in diagnosis 4. Correlate cross-sectional imaging findings with clinical and pathologic findings

TABLE OF CONTENTS/OUTLINE

1. Technical errors 2. Atypical presentations of common benign masses 3. Atypical presentations of common malignant masses 4. Benign mimics of malignant masses 5. Malignant mimics of benign masses 6. Rare adrenal pathology

GUEE-21

Postoperative Changes and Complications of the Urinary Tract at Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Weibo Fu, BS, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review changes to the anatomy of the genitourinary tract after urological procedures 2) To provide imaging examples of postoperative appearance and complications of the urinary tract 3) To distinguish between expected and unexpected postoperative imaging findings following urological surgery and image-guided procedures

TABLE OF CONTENTS/OUTLINE

The incidence of urological pathologies such as renal cell carcinoma and renal stones has risen over time, in part due to improved detection with increased use of imaging in clinical practice. In turn, rates of urologic interventions performed have also increased, some of which include a) partial nephrectomy, b) ureteroneocystostomy, c) cryoablation, d) diversions, and e) neobladder placement. Potential complications can arise from these procedures such as a) hematomas, b) conduits, c) strictures, and d) lymphoceles. Such complications are important to distinguish from common postoperative changes in clinical practice. Computed tomography scan is the most common imaging modality used when potential complications are suspected, though MRI may be considered for complex cases. For radiologists to provide appropriate recommendations for care following surgical urology procedures, a clear understanding of normal and abnormal post-operative anatomy is necessary.

Imaging Peyronie disease Before and After Treatment: A Guide for Radiologists Urologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Lauren F. Alexander, MD, Jacksonville Beach, FL (*Presenter*) Spouse, Stockholder, Abbott Laboratories;Spouse, Stockholder, AbbVie Inc;Spouse, Stockholder, General Electric Company;Spouse, Stockholder, Myriad Genetics, Inc

TEACHING POINTS

Ultrasound (US) is primary imaging modality for assessment of plaque and erectile dysfunction in patients with Peyronie disease to guide medical vs. surgical treatment planning; however, magnetic resonance imaging (MRI) and computed tomography (CT) can be used in the pretreatment and post treatment setting as well. After reviewing this exhibit the learner will: (1) Understand the pathophysiology of acute and chronic fibrosing Peyronie disease. (2) Recognize US findings of Peyronie plaques and US Doppler features of erectile dysfunction. (3) Describe role of noncontrast CT for calcified Peyronie plaques. (4) Determine when to use imaging after penile surgery. (5) Recognize normal and abnormal imaging findings of penile implants.

TABLE OF CONTENTS/OUTLINE

A. Background (1)Pathophysiology of Peyronie’s disease (2)Clinical exam findings: acute and chronic phases (3) AUA management algorithm B. Pre-treatment imaging with case examples (1) Penile US grayscale: plaque Doppler: erectile function (2) CT and MR when to use, typical protocols, findings (C) Surgical treatment options (1) tunical plication vs. plaque incision/excision +/- grafting (2) role of penile prothesis (D) Post operative imaging (1) typical findings complications

Post-treatment MRI in Cervical Cancer - What To Look For

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Mayra V. Soares, MD, Brasilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Basic technical key points of pelvic MRI for a targeted assessment.Quick review of the latest FIGO MRI staging system, with the anatomical landmarks.Correlation between staging and therapeutic options.MRI findings of post-treatment and post-intervention procedures.Challenges in differentiating post-treatment and tumor recurrence.Identify the main complications of cervical cancer treatments.

TABLE OF CONTENTS/OUTLINE

Introduction: recurrency up to 30% of treated patients, which 66% occur in the next 2 year post initial treatment and 90% until 5 year, and survival rate can reach 15-20%.Technical points: MRI high-resolution oblique T2WI planes (small thickness and FOV) are critical to evaluate lesions.Anatomical landmarks: pelvic intricate anatomy requires the understanding of its compartments, cervix zones, vessels, sidewalls, ligaments, and lymph nodes.Staging and therapeutic correlation: Stage IIB (parametrial invasion) as a landmark for prognosis and therapeutics decision. Lower stages allow surgery with or without RT/QT. Stages IIB requires neoadjuvant treatment before reassessment.Main treatments MRI findings: trachelectomy and fertility-preserving treatment; hysterectomy/lymphadenectomy; RT/QT.Acute (vaginal edema/erythema, cystitis) and chronic (stenosis, fistulations, enteritis, insufficiency fractures, and urological) complications.

GUEE-24

Prostate MRI Quality - A Pictorial Review Using the PI-QUAL Score

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Francesco Giganti, MD, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

The PI-RADS guidelines set out the minimal technical requirements for the acquisition of multiparametric MRI of the prostate.The rapid diffusion of prostate MRI has led to variability in vendor and scan quality across the world. The Prostate Imaging Quality (PI-QUAL) score was created to standardize the reporting of prostate MRI quality.Our education exhibit has 3 teaching points:1) PI-RADS technical requirements for good quality prostate MRI; 2) Application of the PI-QUAL score; 3) Pictorial review of images from different vendors and magnets and quiz.

TABLE OF CONTENTS/OUTLINE

All those involved in the acquisition and interpretation of prostate MRI (radiologists, MR physicists and radiographers) should be aware of the PI-RADS technical recommendations and could benefit from a learning module on the PI-QUAL score. We will: 1) discuss the technical requirements (e.g., FOV, in-plane resolution, b values, etc) for a good quality prostate MR scan for each sequence, as outlined in the PI-RADS document; 2) discuss the PI-QUAL score and its ambition to standardize image quality both at a center level (i.e., up-to-date MR scanners and dedicated radiologists/radiographers highly experienced in prostate MRI) and at a patient level (i.e., patient-related artefacts such as rectal air/stools or movement should be minimized with prior preparation); 3) present a set of images of adequate and suboptimal image quality (ranging from PI-QUAL 1 to PI-QUAL 5) to stress the importance of reducing practice variability in prostate MRI; 4) discuss the current limitations of PI-QUAL and what should be addressed in the next version.

GUEE-25

Beyond Prostatic Adenocarcinoma - Confusing MRI Findings and How to Recognize Them

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Camila Reifegerste, MD, Curitiba, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review normal prostate anatomy and possible neoplasm mimickers. Review benign conditions of the prostate that may mimick neoplasia. Review some rare histological subtypes of prostate neoplasia. To propose a systematic approach of the prostate MRI that allows differentiating findings suggestive of clinically significant neoplasia from the more common pitfalls.

TABLE OF CONTENTS/OUTLINE

Prostate cancer is the most common neoplasm in American men and the second leading cause of cancer death in this population. Its diagnosis is based on rectal examination, elevated prostate specific antigen (PSA), ultrasound-guided prostate biopsy and magnetic resonance imaging (MRI), which has become an important tool in detection of possible neoplasms, risk stratification and follow-up, thanks to the standardization of examination protocols and their interpretation with the development of the Prostate Imaging-Reporting and Data System (PI-RADS). Since prostate MRI is becoming more relevant in clinical decision making, it is important that the radiologist be familiar with pitfalls in its interpretation, whether they are normal anatomical structures, benign prostate changes, or even rare malignant neoplasms, different from traditional adenocarcinoma. That’s why we propose a review of challenging cases, in order to discuss some of these pitfalls.

V Steps to Assess VI-RADS

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Vivianne Reis Guimaraes, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Practice guide for radiologists, identify five steps in the process to create a systematic approach to report bladder MRI findings as well as define the risk of muscle invasion.2. Provide radiologists an overview of Vesical Imaging-Reporting and Data System (VI-RADS) that indicates the possibility of detrusor muscle invasion by bladder cancer through the five-point scoring system.3. Discuss resources for radiologists to improve diagnostic performance through VI-RADS.

TABLE OF CONTENTS/OUTLINE

Step 1: Bladder wall anatomy and appearance of the muscularis propria on MRI.Step 2: Staging and how to subdivide bladder cancer into with and without muscle invasion.Step 3: Technical considerations about MR equipment and protocol.Step 4: Scoring tumors using appearances in T2W images, DWI and DCE to create an overall risk of muscle invasion score.Step 5: Final VI-RADS score and likelihood of muscle invasion.

Gender Affirming Genitourinary Surgeries - What Surgeons Do and What We Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Susana Fernandez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Define the concept of gender incongruence and transgender.Learn different types of genitourinary procedures employed for gender affirming surgery.Review imaging modalities used to evaluate surgical changes and complications.Show different cases presented at our institution.

TABLE OF CONTENTS/OUTLINE

Gender incongruence is defined as a discrepancy between gender identity and the assigned sex. Those individuals in whom gender incongruence exists are referred to as transgender. The gender affirming therapy involves multidisciplinary care that can improve quality of life of transgender people. Genital reconstruction surgery includes vaginoplasty, phalloplasty and metoidioplasty. Radiology department plays an important role in this process. We have reviewed affirming surgeries performed at our institution in the last 10 years.78 patients have undergone this process, 67 transwomen and 11 transmen. Surgical procedures performed were: 67 vaginoplasty, 6 phalloplasties (using most often anterolateral flaps) and 5 metoidioplasties. These surgeries and normal surgical changes will be explained and reviewed. Frequent complications such as fistulas (5), leaks (1) and stenosis (4) which are recurrent in some patients, will be exposed. Retrograde urethrocystography and cystourethrography are the methods of choice for postoperative assessment, allowing the diagnosis of most common complications. TC, RM or enema are other imaging techniques that may be necessary. They will be illustrated with different imaging techniques and images of different surgeries.

Expect the Unexpected - Postoperative and Postintervention Imaging of the GU Tract

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Janelle West, MD, Pelham, AL (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To understand expected appearance of genitourinary structures after common and uncommon surgeries and interventions- To illustrate acute and chronic complications of genitourinary organs following intervention and/or surgery-To briefly discuss potential treatment of complications secondary to genitourinary interventions

TABLE OF CONTENTS/OUTLINE

? Introduction? Renal: Expected appearance post ablation, Expected appearance post partial nephrectomy, Postablation renal infarct, Postablation residual/recurrent tumor, Postablation bleeding, Postablation organ injury/fistula, Post partial nephrectomy pseudoaneurysm? Ureter: Postsurgical stricture, Postsurgical leak/urinoma? Bladder: Expected appearance of augmented urinary bladder/neobladder/ileal conduit/Indiana pouch, Augmented bladder rupture, Ileal conduit leak/rupture, Recurrent tumor in ileal conduit, Bladder neck leak status post prostatectomy? Urethra: Expected appearance post urethroplasty, Expected appearance status post transurethral resection of the prostate, Urethral leak status post urethroplasty, Urethral leak status post diverticulectomy, Recurrent urethral stricture status post TURP and brachytherapy, Urethrocutaneous fistula? Male GU: Expected appearance of penile prosthesis and artificial urinary sphincter, Postintervention arteriovenous fistula, Malfunctioning artificial urinary sphincter, Malpositioned penile prosthesis, Recurrent penile cancer status post penectomy, Puboprostatic fistula status post brachytherapy/pelvic radiation? Female GU: Post DC uterine AVF (and subsequent embolization), Recurrent GYN malignancy, Retained products of conception

Imaging Findings Following Renal Tumor Treatment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Leonardo Kenji Mitsutake, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:- Brief review renal cancer epidemiology and the main societies management guidelines.- Describe CT and MRI renal mass protocols.- Describe and illustrate the main initial and late imaging findings after renal tumor treatment.- Discuss the most frequent complications following renal tumor treatment.

TABLE OF CONTENTS/OUTLINE

1. Introduction:- Renal cancer epidemiology.- Society guidelines (AUA and EUA) for renal cancer management.- Overview the approach for renal cancer treatment (systemic treatment, radical and partial nephrectomy, ablation treatment). 2. Diagnostic Imaging evaluation:- CT and MRI renal mass protocols. 3. Imaging findings after renal tumor treatment:- Procedure complications.- Initial and late expected post-treatment imaging features.- Features of tumor recurrence. 4. Take home messages.

"Mesh Mash"- Multimodality Imaging of Pelvic Floor Repair

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Cum Laude
Identified for RadioGraphics

Participants
Kanupriya Vijay, MBBS, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the expected postsurgical appearances after surgical and non-surgical repair of pelvic floor/urethral dysfunction. 2. Ultrasound is superior to MRI for assessing synthetic slings in suburethral space and evaluate for complications such as urethral erosion and vaginal exposure. 3. Ultrasound can accurately demonstrate the distribution of injected bulking agent, and determine the need and location for reinjection; as well as migrated bulking agent. 4. Radiologists play an important role in the detection of normal and abnormal appearances of postsurgical pelvic floor repair, and guide for future intervention.

TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Briefly review pelvic floor dysfunction and various surgical and nonsurgical treatment options 2. Discuss imaging techniques and protocol: a. Ultrasound b. MRI 3. Case based review of various treatment options: a. Normal imaging appearances b. Complications: i. Misplacement ii. Urethral erosion iii. Vaginal exposure iv. Infection

Ups and Downs in the Andes: Soft Tissue Sarcomas of the Genitourinary Tract with Radiologic-pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Jorge Huayanay, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Soft tissue sarcomas of the genitourinary tract are uncommon, constituting less than 2% of all soft tissue sarcomas. This presentation will Illustrate imaging features of these rare soft tissue sarcomas of the genitourinary tract. 2. The exhibit will review the spectrum of histopathologic correlations. 3. This review will emphasize diagnostic difficulties, potential imaging pitfalls and differential diagnoses of these entities.

TABLE OF CONTENTS/OUTLINE

The goals of this exhibit are to: Provide a pictorial review of the diverse imaging appearances of the soft tissue sarcomas of the genitourinary tract. Discuss specific imaging and pathological characteristics of the soft tissue sarcomas of the genitourinary tract. Familiarize the audience with the imaging features of the soft tissue sarcomas of the genitourinary tract, thereby helping in formulation of a complete differential diagnosis. These major featured entities include: • Renal leiomyosarcoma • Perirenal and pararenal liposarcoma • Vesical rhabdomyosarcoma • Prostate sarcomas • Paratesticular liposarcoma • Penile sarcoma • Uterine rhabdomyosarcoma • Uterine endometrial stromal sarcoma • Uterine adenosarcoma

Pheochromocytoma and Paraganglioma: Key Findings, Clinical Features, and Their Association with Anatomic and Functional Imaging - Tutorial for Residents

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Certificate of Merit

Participants
Leonela Ramirez Almanza, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pheochromocytoma and paraganglioma are chromaffin cell tumors that require early diagnosis due to their potentially serious and sometimes fatal cardiovascular sequelae.CT density of pheochromocytoma greater than 20 HU in the proper clinical context should be suggestive of this pathology.Hypercellularity in pheochromocytoma results in restricted diffusion and should not be confused with malignancy.Pheochromocytoma and larger paragangliomas may have areas of necrosis and intratumoral vessels with a "salt and pepper" appearance on MRI.Functional imaging is key to the diagnosis of pheochromocytoma and paraganglioma when no tumor is identified on anatomic imaging.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Imaging protocolsa. CT b. MRI c. PET/CT 3. Systematic analysis of images in relation to the clinic. a. Incidental finding b. Clinical Context and findings suggestive of pheochromocytoma and paraganglioma 4. Paraganglioma clinical and imaging features 5. Pheochromocytoma clinical and imaging features6. Differential diagnoses7. Take home messages

Variant Bladder Cancer: MR Imaging, VIRADS Score, Clinical Feature and Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Arisa Kameda, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Variant bladder cancer is relatively rare and associated with increased risks of disease recurrence. Since these subtypes are often more advanced in stage than pure urothelial bladder cancer and is likely to underestimate the myometrial invasion, immediate total bladder resection is recommended in these patients. However, there has been few reports about MR imaging of Variant bladder cancer. The purpose of this exhibit is To clarify the feature of the MR findings of variant bladder cancer To depict the VIRADS score of variant bladder cancer To discuss the clinical feature and management comparing pure urothelial bladder cancer.

TABLE OF CONTENTS/OUTLINE

1, Over view of histological classification of bladder cancer based on WHO 2016 2, Demonstrate the MR imaging of variant bladder cancer (Glandular differentiation, Squamous differentiation, Micropapillary type, Nested type, Sarcomatoid type) 3, VIRADS scoring of variant bladder cancer with histological correlation 4, Discussion of clinical feature and management of variant bladder cancer 5, Summary

Emanuele Barabino, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Iatrogenic Injuries of the urinary system could occur during percutaneous/endoscopic procedure involving the urinary system or during surgery; in recent years, due to the diffusion of laparoscopic and robotic surgery, the incidence of these lesions is increasing.• The spectrum of radiologic findings is wide and heterogeneous and depends on the type of injury, the procedure that cause it and time-to-diagnosis.• Imaging-guided intervention maintains a fundamental role in the management of iatrogenic injuries to the urinary system.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Anatomical Considerations3. Mechanisms of Injury3.1 Transection and Avulsion3.2 Ligation3.3 Mixed lesions4. Imaging Techniques5. Radiologic Features5.1 Percutaneous Treatments5.1.1 Thermal Ablation5.1.2 Nephrostomy/Anterograde ureteral stenting5.1.3 Lithotripsy5.2 Endoscopic Treatments5.3 Urologic Surgery5.4 Gastrointestinal Surgery5.5 Gynecologic Surgery5.6 Vascular Surgery and Endovascular Procedures6. GUEE-38

Pitfalls in Prostate MRI: How to Avoid These Common Errors of Under and Over Diagnosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Certificate of Merit

Participants
Omar Kamal, MD, MSc, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Prostate MRI has a steep learning curve and experts suggest attending a course and a minimum of 100 supervised cases prior to independent practice.• There is a tendency for inexperienced readers to overcall normal anatomy and benign lesions as cancer as they do not want to "miss" cancer.• At the same time underdiagnosis is a problem due to poor technique and/or failure to recognize small or subtle cancers.

TABLE OF CONTENTS/OUTLINE

1. Brief overview of typical and atypical appearance of prostate cancer on multiparametric MRI: a. Discussion of learning curve, expert opinion, lack of standardization in training/certification/performance. 2. MRI technique: a. Optimal technique to avoid under- or overdiagnosis. b. Examples of poor technique side by side with proper technique. 3. Pitfalls: a. Overview of the literature in prostate interpretation errors. b. Mimics of peripheral zone cancer. i. Normal central zone ii. Exophytic BPH nodules iii. Midline pseudolesion iv. Periprostatic vein v. Prostatitis/scar/atrophy (PIRADS 2) lesions overcalled as PIRADS 4/5 vi. DWI and coil artifact vii. Post biopsy hemorrhage viii. Calcification c. Mimics of transition zone cancer. i. Failure to recognize encapsulated or heterogeneous nodules ii. Atypical and asymmetric BPH nodules iii. Thick anterior fibromuscular stroma iv. Thickening of the pseudocapsule. d. Underdiagnosis. i. Failure to recognize small/subtle lesions ii. Failure to recognize very large lesions replacing most of the normal gland. e. Other Lesions Mimicking Cancer. i. Seminal vesicle collapse ii. Granulomatous and IgG4 prostatitis iii. Cowper's gland hyperplasia. 4. Practical ideas for self-improvement.

MR Imaging of Postoperative Endometriosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Patricia Dantas I, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:1) Discuss the roles of surgical treatment of different types of endometriosis using a didactic approach by illustrations and MR images.2) Clarify significant MRI image postoperative findings and meaningful information to radiology reports.3) Illustrate imaging patterns and pitfalls of postoperative complications, residual endometriosis and recurrence after surgery.

TABLE OF CONTENTS/OUTLINE

1) Review preoperative imaging findings that aid in surgical decisions.2) Describe surgical treatment of different types of endometriosis: endometrioma, posterior compartment, bowel endometriosis, uterus/vagina, bladder and ureters.3) Recognition of patterns normal MR postoperative findings.4) Cased-based imaging of postoperative complications.5) Illustrative key points: residual disease and recurrence after surgery.6) Pitfalls.7) Conclusions and “take home messages”: consolidate the acquired knowledge.

Non-Wilms Kidney Tumors in Childhood - What the Radiologist Should Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Elena Paz Calzada, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Wilms tumor is the fifth most common malignant neoplasm in childhood and the most common renal tumor in children. It is estimated that the annual incidence is 1 case per 10,000 children under 15 years of age.However, there are other childhood kidney tumors with which the radiologist should be familiar.The aim is to present epidemiological, clinical and radiological findings that better guide us to a differential diagnosis of renal mass in pediatric patients.

TABLE OF CONTENTS/OUTLINE

We have carried out a review of the cases of non-Wilms kidney tumors in childhood in our institution, spanning from 2008 to 2021.Regarding the case review, a literature research of the main kidney tumors: Wilms and non-Wilms, as well as their characteristics, was performed.We found several cases of:- Clear cell renal carcinoma- Renal clear cell sarcoma- Renal angiomyolipoma- Inferior vena cava thrombosis mimicking a renal tumor- Renal Ewing sarcoma- Chromophobic carcinomaBoth the ultrasound, CT and MRI images of each case are exposed, as well as a brief summary of the epidemiology, symptoms, radiological characteristics and prognosis of each one.

Propensity for Density: Hyperdense and Calcified Disease throughout the Genitourinary System on CT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Certificate of Merit

Participants
Virginia Planz, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• A wide spectrum of benign and malignant conditions in the GU system can be readily detected on CT as calcified or hyperdense findings.• Recognizing distinguishing features and characteristic imaging appearances will determine the diagnosis or narrow the differential.• Dual energy CT offers opportunity for further characterization of hyperdense and calcified pathology.

TABLE OF CONTENTS/OUTLINE

• Review the spectrum of diseases associated with GU calcification and intrinsic hyperdensity such as: hemorrhagic cysts, RCC, calculi, nephrocalcinosis, papillary necrosis, ADPKD, multicystic dysplastic kidney, renal transplant rejection, tuberculosis, schistosomiasis, alkaline encrusted pyelitis/cystitis, acute/chronic subcapsular hematoma, renal and gonadal vein thrombosis, renal artery aneurysm, urothelial carcinoma, radiation cystitis, bladder mucinous adenocarcinoma, urachal adenocarcinoma, amyloidosis, malakoplakia, serous ovarian carcinoma, colonic mucous adenocarcinoma ovarian metastasis, dermoid cyst, degenerated fibroids, prostate and vas deferens calcification • Describe and classify hyperdense and calcified findings based on involved organ, distribution, appearance, and other accompanying findings, with an emphasis on pattern recognition in a case-based review.• Apply teaching points to unknown cases.

Penile MRI - Normal and Abnormal

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Madhura Ghate, MD,MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

After viewing this exhibit, the readers will gain insight into penile anatomy on MRI. They will be able to independently carry out MR imaging of the penis.MR imaging protocol and utility of diffusion weighted imaging and I.V contrast will be discussed. Imaging appearances of various pathologies such as structural abnormalities, inflammatory/infective pathologies, neoplasms will be presented.

TABLE OF CONTENTS/OUTLINE

1)Imaging anatomy of the penis. 2)MRI protocols. 3)MR imaging of various penile and urethral abnormalities including congenital/structural anomalies, infective/inflammatory pathologies, vascular pathologies, neoplasms and post operative assessment.

Novel Implantable Devices in the Abdomen and Pelvis: A Primer for Radiologiests

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Nabih Nakrour, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: Provide a multimodality review of novel implantable devices in the abdomen and pelvis with a focus on indications, proper anatomical positioning, and expected radiologic features. Recognize radiologic findings of devices malposition, malfunction, and resulting complications. Discuss imaging pearls and pitfalls of novel devices. Discuss imaging techniques and protocol modifications to optimize device assessment.

TABLE OF CONTENTS/OUTLINE

We will address the following novel devices: An artificial male sphincter. Sacrocolpoplexy mesh for pelvic floor descent. Bladder neck suspension. Urethral bulking agent. Midurethral and retropubic sling. Omentopexy and omental packing.Sacral nerve stimulator. Antibiotics beads for intraabdominal or intrapelvic infections. Bariatric intragastric balloon and Sleeve balloon device. Gastric electrical stimulators. Anti-reflux devices.

Updates on Adrenal Imaging: from A(denomas) to Z(ebras)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Wendy Tu, MD, Edmonton, AB (*Presenter*) Nothing to Disclose

TEACHING POINTS

Incidental adrenal nodules are common, seen in 4-8% of patients. Although most are benign adenomas, the differential is broad, requiring an algorithmic approach to incidental adrenal nodules. This approach should incorporate relevant recent literature given the evolving use of CT, MRI, and PET-CT and their advantages/disadvantages. Beyond image interpretation, radiology plays a crucial role in guiding biochemical testing, referral, and management. Current literature on adrenal pathology and management outcomes are discussed.

TABLE OF CONTENTS/OUTLINE

1) Case-based comprehensive review of benign and malignant adrenal pathology highlighting clinical and imaging findings.a. Can imaging alone differentiate benign and malignant adrenal masses?b. What are the diagnostic criteria for adenoma?c. What is the radiologic workup?d. What are the strengths/limitations of CT washout and MR chemical shift imaging studies?e. When is PET/CT indicated?f. What are key imaging pitfalls?2) Learn an algorithmic pathway to the incidental adrenal nodule, incorporating current major guidelines.a. What are the first steps after finding an incidental adrenal nodule?b. Which guidelines are available?c. What imaging findings support each step?d. What reporting templates are available?3) Discuss management of adrenal nodules, highlighting the role of the radiologist in directing appropriate specialist referral, biochemical testing, and biopsy.4) Review the treatment options and prognosis of conditions including hormonally active tumors.

Müllerian Duct Anomalies: New Classification Systems, Clinical Implications, and Treatment Frontiers

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Moataz Ahmed Sayed Mohammed Soliman, MD, MSc, CHICAGO, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understanding the evolution of Mullerian duct anomalies classification systems. • Formulating a stepwise approach to report Mullerian duct anomalies considering the new American Society of Reproductive Medicine (ASRM) classification. • Learning the impact of new classification systems on management. • Familiarize with new surgical approaches for management.

TABLE OF CONTENTS/OUTLINE

• Introduction o Embryological background. o Normal anatomy. • Normal Multimodality imaging of the female genital system: (US, 3D US, MRI, and hysterosalpingography (HSG). • Classification of Mullerian duct anomalies: (American fertility society, ESHRE/ESGE, American society of fertility medicine). o Mullerian duct anomalies: (uterus, cervix, and vagina). o Comparison between old and new classification systems. • Multimodality imaging approach diagnosing Mullerian duct anomalies: (US, 3D US, MRI, hysterosalpingography (HSG), and CT in selected cases) • Clinical implications for fertility and patient outcomes. • Management approach in light of the newly proposed classification systems. • Multimodality imaging post corrective interventions. • New treatment frontiers for the treatment of female infertility. o Hysteroscopic management. o Uterus transplantation.

Pubic Symphyseal Urinary Fistulae with Osteomyelitis in the Setting of Treated Prostate Carcinoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Paul Wojack, MD, Manhasset, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate cancer is the leading cause of cancer in men and a variety treatment options are available. Increasing population size and advancements in prostate cancer treatment has led to an increased number of patients who are living longer with prostate cancer. Complications of prostate cancer treatment include erectile dysfunction, impotence, incontinence, gastrointestinal issues (such as radiation proctitis), and rarely posterior urethral strictures (secondary to radiation damage). Manipulation of these strictures with urethroplasty, stenting, and other urethral instrumentation can cause breakdown of the friable post-radiation tissues. Patients can develop urinary fistulae to the pubic symphysis which are often complicated by pubic osteomyelitis and often require aggressive surgical interventions. A paucity of literature regarding urosymphyseal fistulae, making this a rare complication of which radiologists should be aware, especially musculoskeletal and body imagers.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Background 3. Prostate Cancer a. Epidemiology b. Treatments c. Complications 4. Urosymphyseal fistulae a. Normal and post-treatment anatomy b. Pathophysiology in the setting of treated prostate cancer c. Pubic osteomyelitis vs osteitis pubis. d. Imaging review of several cases of urosymphyseal fistulae 5. Summary 6. References

Reporting a Renal Mass: Can We Do It Better?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Pablo Valdes Solis, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the points that are considered most important when making a radiological report of a renal mass.Analyze why they are important and how to describe them.See examples of each of the points, with practical cases explaining what is reported, how and why.

TABLE OF CONTENTS/OUTLINE

Introduction:Importance of the correct description of the renal mass.Variability in how radiologists and urologists consider the most importan points.Current situation: vision of the radiologist and the urologistPoints to be included in the report. In each point, the what, how and why will be described, accompanied by examples, as well as the importance that radiologists and urologists have given to each point.Examination type and description; CT or MRI, with o without contrast.Mass type: cystic or solid. Mass size, including methodsSize comparison: estudies and measurements included for comparison.Enhancement, including methods. Importance of measurement comparising enhancede and unenhanced scans. Macroscopic fat: importance of detecting and describing the presence of fat in the mass.Mass margins: is there infiltration?NecrosisBosniak classification: a review of the classification of cystic masses. Nephrometry score: something that some urologist use.Estimated probability of malignancy: if included and method Features predictive of indolent growth in solid masses.Lymph node size: how to measure and describe lymph nodes.Tumor thrombus: description, location and extension.Location inside the kidney: axial location, capsular location, distance to sinus fat, position relative to polar lines.Management options mentionedTumor-Node-Metastasis (TNM) staging reported: a reviewConclusions

Not Kidneying Around: Multimodality Imaging of Renal Infectious and Inflammatory Conditions in Adults- Key Imaging Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Camila Vendrami, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

· Discuss the role of imaging in the evaluation of a wide spectrum of renal infections and inflammatory conditions· Review their main pathophysiologic features · Emphasize specific imaging features of certain renal infections and inflammatory conditions that aid in making the correct diagnosis

TABLE OF CONTENTS/OUTLINE

A wide spectrum of renal infectious and inflammatory conditions exists. Imaging plays a key role in many instances, including in immunocompromised patients, treatment non-responders, transplant patients, and cases with an equivocal clinical diagnosis.1. Introduction 2. What is the role of multimodality imaging (US, CT, MR) in the evaluation of renal infections and inflammatory conditions? 3. What are the key imaging features of acute renal conditions (acute pyelonephritis, renal and perirenal abscesses, pyonephrosis, emphysematous pyelonephritis/cystitis)?4. What are the key imaging features of fungal infections and their complications (such as aspergillus, candida and mucor) as well as of tuberculosis and parasitic infections (renal hydatid disease)?5. What are the key imaging features of chronic renal conditions (chronic pyelonephritis, xanthogranulomatous pyelonephritis, eosinophilic cystitis, renal replacement lipomatosis, struvite stones)?6. Take Home Points

The Postoperative Kidney: Multimodality Imaging Manifestations of Common and Uncommon Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Cole Thompson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Postoperative renal complications may be grouped into several broad categories: Fluid collections; vascular, lymphatic, and collecting system injuries; tumor seeding; trauma to adjacent organs; and general complications.-Postoperative fluid collections include hematoma, seroma, urinoma, abscess, and lymphocele, each at varied time intervals following surgery. Discernment of differences in key imaging features allows for appropriate management.-Vascular complications related to renal arterial injury or thrombosis include active hemorrhage, pseudoaneurysm, and renal infarction. Prompt recognition of imaging findings enables early intervention.-Postsurgical complications are not limited to the kidney or collecting system. The adjacent organs may also be injured, including the spleen, adrenal glands, liver, pancreas, bowel, and pleura.

TABLE OF CONTENTS/OUTLINE

-Expected imaging features of the post-operative kidney following partial nephrectomy, radical nephrectomy, and lithotripsy (ESWL) or nephrolithotomy.-Case-based review illustrating the role of imaging (CT, US, MRI, angiography) in complications following renal surgery: Fluid collections; vascular and lymphatic injuries; complications related to the collecting system; tumor seeding and recurrence; and injury to adjacent organs.-Recognition of key imaging features that warrant urgent therapeutic intervention.-Challenging clinical scenarios and strategies for optimal image interpretation to guide subsequent management and follow-up.

Preoperative Planning In Cancer Of The Urinary Tract: What Surgeon Wants to Know What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Patricia E. Ortega Aragon, MD, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Bladder cancer (BC) is the most common cancer of the urinary tract in the United States. In bladder cancer, images play an important role in locoregional staging and remote evaluation of the disease. The RENAL nephrometry scoring system, VI-RADS, and PI-RADS provide preoperative information that is important in predicting long-term outcomes. It is important for radiologists to understand what information to provide in diagnostic reports to support the surgical plan and provide important data for making treatment decisions.

TABLE OF CONTENTS/OUTLINE

- Introduction- Systemic approach: kidney, prostate and bladder- The Rads and Scores.- Clinical radiological Review: pictorial cases.

Focal MRI-Guided Transurethral Ultrasound Ablation (TULSA) in Men with Prostate Cancer: Lessons Learned in 60+ Patients

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Daniel N. Costa, MD, Dallas, TX (*Presenter*) Research support, Bayer AG

TEACHING POINTS

1. Review the rationale for focal therapy in prostate cancer and the unique aspects of MRI-guided transurethral ablation (TULSA) of the prostate2. Discuss the multidisciplinary patient selection, treatment and follow-up strategies3. Review and discuss strategies to overcome challenging scenarios

TABLE OF CONTENTS/OUTLINE

1. Basic facts about prostate cancer (Disease prevalence and heterogeneity, Over- and under-diagnosis, Morbidity of standard of care treatment options)2. Different focal therapy modalities (Cryoablation, laser, irreversible electroporation, microwave ablation, transrectal high-intensity focused ultrasound; Transurethral ultrasound ablation (TULSA))3. TULSA - Multidisciplinary effort- Patient selection (Inclusion and exclusion criteria, Distances of interest, Critical anatomical relationships, Calcifications, Pre-treatment imaging and biopsy)- Treatment planning and patient-specific customization (Sextant, hemi-, near whole-gland, and whole-gland ablationo Neurovascular bundle and ejaculatory duct sparing, Concurrent benign prostatic hypertrophy treatment)- Procedure duration- Strategies for workflow improvements- Post-treatment follow-up (Imaging - normal and abnormal appearance, PSA trends, Functional (sexual and urinary) recovery, Biopsy, Complications)- Challenging scenarios (Hip prosthesis, Radiation therapy fiducials and seeds, Motion, Calcifications)

Gonadal Vein - The Omitted by Lane

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Aruna R. Patil, MD, FRCR, (*Presenter*) Research Consultant, Koninklijke Philips NV

TEACHING POINTS

The gonadal veins are paired vessels that drain the testes and ovaries. This exhibit aims to:1. Review the imaging anatomy of gonadal veins2. Its use as a landmark, collateral 3. Its role in conditions such as pelvic congestion, varicocele4. Its role in spread of tumor and infection.

TABLE OF CONTENTS/OUTLINE

1. Anatomy of gonadal veins- male and female2. Variant anatomy and implications3. Use as landmark - ovaries, testes (normal and pathologies - torsion, germ cell tumor in undescended testes, upper ureter physiological narrowing4. Collateral pathways - varices, varicocele, pelvic congestion syndrome, mesentricogonadal shunts in CLD, Abernathy malformations5. Spread: gonadal vein thrombosis- septic in infections (PID) , bland or tumor thrombosis - leiomyomatosis, leiomyosarcoma, other carcinomas with gonadal vein spread.

Don't Be Outscored - A Practical Guide to VI-RADS, Including Differentials

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Identified for RadioGraphics

Participants
Jonatas Favero Prietto Dos Santos, MD, Porto Alegre, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) VI-RADS provides a five-point score to determine the risk of detrusor muscle invasion based on tumor appearances in T2WI, DWI and DCE; 2)Despite the high reproducibility verified so far, scoring is a trick process and requires supervised practicing. Along with a series of typical cases, some pitfalls and common errors are discussed; 3)As the VI-RADS only applies for urothelial lesions, it's important to be aware of MRI appearances of other malignant neoplasms and benign conditions that may mimic urothelial cancers.

TABLE OF CONTENTS/OUTLINE

Bladder neoplasms are classified as epithelial and nonepithelial, and they can emerge from any of the bladder layers. Urothelial carcinoma account for the majority of urinary bladder cancer and differentiating muscle-invasive (MI) from non-muscle-invasive (NMI) tumors is vital to choose the appropriate treatment. It is noteworthy that transurethral resection of bladder tumor may not sample the muscularis propria, leading to understaging in 25% to 40% of MI cancers. In this setting, VI-RADS is a reproducible and feasible guide for Radiologists to use a standardized approach to imaging and reporting multiparametric MRI. This system provides a five-point score which effectively indicates the likelihood of detrusor muscle invasion. MRI scoring is based on T2WI, DWI and DCE. It is also important to evaluate the presence of synchronous urothelial lesions, lymph node enlargement and distant metastasis. Aside from an accurate scoring of urothelial lesions, Radiologists should be able to recognize imaging findings of other malignant neoplasms and non-malignant conditions, which may simulate urothelial cancers.

Altered Nephrogram: What the Radiologist Needs to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Elisa Antolinos Macho, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1 - Understanding what "nephrogram" means and normal kidney behavior in monophasic and multiphasic CT. 2 - Learning the most common abnormalities: absent (global or segmental), delayed, striated, spotted and persistent nephrogram. 3 - Correlating each altered nephrogram with its typical underlying pathophysiology.

TABLE OF CONTENTS/OUTLINE

1. Normal kidney vascularization 2. Normal kidney behavior in multiphasic CT: Normal nephrogram 3. Absent nephrogram - Global absence: Traumatic / Non-traumatic - Segmental absence: Vascular / Others 4. Delayed nephrogram - Vascular - Obstructive - Others 5. Striated nephrogram - Unilateral - Bilateral - Spotted nephrogram 6. Persistent nephrogram 7. Altered nephrogram: tips and tricks - Laterality - How to define it - Most common cause - The "rim sign" - Final diagram with every altered nephrogram

Urine Luck: Using the Nephrogram to Aid in Diagnosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Layne Kelley, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. An understanding of normal patterns of renal enhancement and contrast excretion can be utilized to optimize image acquisition for detection of abnormalities.2. Recognizing abnormal enhancement patterns improves detection of subtle pathology.

TABLE OF CONTENTS/OUTLINE

1. Introduction:A. Review of normal progression of contrast through the kidneys and urinary tract over time on CTB. Provide an overview of abnormal enhancement patterns with a "back to basics" approach referencing the normal and abnormal nephron function.2. Case-based review of abnormal enhancement patterns, including:A. Delayed nephrogram i. Arterial inflow1. Renal artery occlusion2. Renal artery dissectionii. Venous outflow1. Renal vein thrombosis2. Nutcracker syndromeiii. Urine outflow1. Obstructive urolithiasis2. Inflammatory stricture3. Malignancya. Invasive prostate carcinomab. Cervical cancerc. Subtle ureteral tumor implantB. Absent nephrogrami. Renal infarctC. Striated nephrogrami. PyelonephritisD. Persistent nephrogrami. Retained contrast in the setting of acute kidney injury3. Review how an understanding the nephrogram allows optimal evaluation for specific pathologies, with case examples:A. Unenhanced CT for nephrolithiasisB. Nephrographic phase for optimal detection of renal massesC. Excretory phase for detection of urothelial masses and suspected urine leak

GUEE-59

Updated 2019 Bosniak Classification: Examples, Challenges and Future Directions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Srinivas Saripalli, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Renal cystic lesions are commonly encountered incidentally as part of trauma workups and workup for other diseases, and also as part of workup for symptomatic presentation such as hematuria and flank pain. The management and treatment of these renal cystic lesions has been the focus of multiple efforts from the radiological and urological communities. The challenge posed by cystic renal lesions is to stratify those which are more likely to be malignant and require more invasive treatment and ventricles which can be managed conservatively with serial imaging and thereby avoid the morbidity of invasive treatment. The goal of the updated Bosniak classification in 2019 was to better encompasses the small renal masses that are commonly encountered in practice and to more systematically stratify these lesions such that variability in classification was decreased, with both CT and MRI classification schemes. The updated classification has many simplifications for practice which we will review. We will also show some continued challenges in the classification and how they can be addressed using multiparametric MRI and multimodality correlation.

TABLE OF CONTENTS/OUTLINE

1. Review the 2019 Bosniak classification for cystic renal lesions. 2. Show multiple examples of cystic renal lesions and their classifications in the old and new Bosniak classifications. Particular focus on lesions which have different management in the old versus new classifications. 3. Review the varied appearances of lesions in each category in ultrasound, CT and MRI. 4. Discuss advantages, challenges, pitfalls and clinical implications of the updated system compared to the old.

GUEE-6

Imaging of the Enlarged Scrotum: A Vas(t) Deferens-tial Diagnosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Christopher Yu, MD, PhD, Los Angeles, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Scrotal masses or masslike scrotal enlargement may cause substantial discomfort and anxiety to patients. While the clinical setting is often suggestive of the correct diagnosis, imaging is nearly always requested to confirm the suspected diagnosis, exclude other concerning differential possibilities, evaluate the disease extent, and/or assess for comorbidities and complications.The goal of the current educational exhibit is to review the differential diagnosis of scrotal masses/masslike scrotal enlargement, as outlined below. In addition to the rich imaging illustration of common etiologies, multiple less common but important causes will be provided with corresponding clinical and surgico-pathologic correlation. The exhibit will also include a review of inguino-scrotal fascial anatomy that is often very confusing for both trainees and practicing radiologists. Interactive (board-exam question/answer-type) pointers will also be provided to emphasize key principles.

TABLE OF CONTENTS/OUTLINE

1. Developmental and gross anatomy of the inguino-scrotal region (fascial layers, scrotal contents, inguinal canal);2. Clinical and imaging diagnostic flowcharts;3. Role of imaging (US, CT, and MR);4. Casesa. Intratesticular (mass/cyst; torsion, infection);b. Extratesticular;i. Epididymal (mass/cyst, infection),ii. Spermatic cord (varicocele, masses),iii. Inguino-scrotal hernias (direct versus indirect);c. Scrotal wall:i. Diffuse swelling:1. Infection (cellulitis, Fournier gangrene),2. Lymphedema from systemic process (heart/liver/kidney failure),3. Hidradenitis suppuritiva;ii. Focal masses/collections (hydrocele, abscess, hematoma).

GUEE-60

Renal Cell Carcinomas: Uncommon Clinical and Imaging Presentations and Uncommon Histological Subtypes

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Satomi Kawamoto, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review uncommon clinical and imaging presentations of renal cell carcinomas (RCCs).2. To become familiar with uncommon histological subtypes of RCCs and their clinical features

TABLE OF CONTENTS/OUTLINE

1. Uncommon clinical presentation of RCC. (1) Most RCCs in the developed world are incidentally discovered at imaging studies. (2) However, RCC may be discovered with uncommon presentations. Examples include spontaneous hemorrhage and paraneoplastic syndrome. Review uncommon clinical presentations with imaging findings. 2. Uncommon imaging features. (1) Unenhanging or equivocally enhancing RCCs. (2) RCC mimicking other entity such as renal abscess, lymphoma, pyelonephritis. (3) Other uncommon imaging features. 3. Uncommon histological subtypes of RCCs. (1) RCC subtypes emerged to 2016 WHO classification, and review their imaging and clinical features. (2) Review imaging and clinical features of other uncommon RCC subtypes.

Direct MRI-Guided In-Bore Targeted Biopsies of the Prostate: Lessons Learned in 800+ Patients

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Identified for RadioGraphics

Participants
Daniel N. Costa, MD, Dallas, TX (*Presenter*) Research support, Bayer AG

TEACHING POINTS

1. Review the unique aspects of direct MRI-guided in-bore biopsies compared to ultrasound-based targeted approaches. 2. Demonstrate strategies to leverage the direct lesion and needle visualization provided by the in-bore approach to overcome challenges encountered during targeted biopsies

TABLE OF CONTENTS/OUTLINE

1. Direct MRI-guided in-bore biopsy vs US-based (cognitive and MRI-TRUS fusion) biopsies• Advantages o Precise lesion-needle location verification• Disadvantages o Cost and duration o Lack of systematic sampling2. Steps of a direct MRI-guided in-bore biopsy • Review of diagnostic, pre-biopsy multiparametric MRI• Patient positioning, moderate sedation and needle guide placement• Pre-biopsy imaging• Target identification and biopsy planning• Needle guide location adjustment(s)• Tissue sampling and needle-lesion location verification• Specimen handling3. Challenging scenarios• Small lesion in large prostate• Tricky lesion location• Tumor heterogeneity• Plaque-like subcapsular lesions• Motion (whole body, rectal, pelvic floor)• Needle deflection• Anatomical changes secondary to hematomas• Suspected post-prostatectomy local recurrence• Prostates with unusual morphology (eg, post focal therapy)• Patients without rectal access• Unusual anorectal anatomy• "MRI-invisible" lesions• Patient selection (e.g., hip prosthesis)• Efficient imaging and tissue sampling

Prostate Diffusion-weighted Imaging: Insatiable Challenge to Improve Tumor Detection and Characterization in Prostate Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Tsutomu Tamada, MD, Kurashiki, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this presentation is:1. To learn the role of diffusion-weighted imaging (DWI) in diagnosis of prostate cancer (PC)2. To understand the problems for the detection and characterization of PC using standard DWI with single-shot echo-planar imaging (ssEPI) in patients with elevated PSA levels3. To demonstrate the countermeasures for problems on ssEPI DWI

TABLE OF CONTENTS/OUTLINE

Role of DWI in diagnosis of prostate cancer (PC)- Primary PC detection: DWI scoring system in Prostate Imaging Reporting and Data System v2.1- Local recurrent PC detection: DWI scoring system in Prostate Magnetic Resonance Imaging for Local Recurrence Reporting (PI-RR)- Local staging: extracapsular extension and seminal vesicle invasion- Assessment of tumor aggressiveness in PC using quantitative DWI metrics- MRI-ultrasound Fusion-guided Prostate targeted BiopsyProblems and countermeasures for detection and characterization of PC using ssEPI DWI - Susceptibility artifact and geometric anatomic distortion:Reduced field-of-view DWITurbo spin-echo DWIMulti-shot EPI DWI- Blurring:Multi-shot EPI DWI- Low SNR and CNR in high b-value and high spatial resolution acquisitions:Compressed SENSE- Insufficient image contrast between benign and PC tissues:Ultra-high b value DWI Synthetic DWISynthetic DWI which enable to synthesize DW images with any TR and TE- Insufficient diagnostic performance of tumor aggressiveness in PC using mean apparent diffusion coefficient (ADC)ADC histogram analysisNon-Gaussian fitting models- DWI invisible clinically significant PCMicrostructural MRI which is a quantitative technique that focuses on structural change in three typical microstructures of prostatic tissue

GUEE-64

Prostate Magnetic Resonance Imaging for Local Recurrence Reporting PI-RR in Clinical Practice - A Primer for Novice and Expert Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Jorge Abreu Gomez, MD, Pickering, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

* Local recurrence after radical treatment represent a diagnostic challenge for novice and experienced radiologists. Throughout review of oncologic history, MRI and histologic findings of the primary lesion are crucial for adequate assessment/interpretation.* PI-RR system aims to standardize the performance, interpretation and reporting of MRI after radical treatment in order to reduce variability.* Combination of DCE and DWI features of a given observation will determine the likelihood for local recurrence

TABLE OF CONTENTS/OUTLINE

* PI-RR categories and applicability.* PI-RR scoring after radiotherapy. Understanding the sequence with highest score!!* PI-RR scoring after radical prostatectomy. DCE as dominant sequence!!* Beyond PI-RR. MRI assessment of recurrent disease after focal therapy

Post-treatment Prostatic Cancer: How To Perform an Adequate Imaging Evaluation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Vivien Bonadio, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Understand the current concepts of biochemical recurrence and its clinical impact ? Address the different treatment modalities used, as well as their indications ? Review the role of functional imaging in follow-up and detection of recurrent disease ? Discuss the highlight findings on post treatment images of patients with prostatic cancer

TABLE OF CONTENTS/OUTLINE

INTRODUCTION ? Brief discussion of epidemiology ? Review of the concept and current criteria of biochemical recurrence in prostate cancer TREATMENT MODALITIES AND THEIR INDICATIONS ? Androgen deprivation therapy ? Brachytherapy ? External radiation therapy ? High Intensity Focused Ultrasound - HIFU ? Prostatectomy INDICATIONS OF IMAGING IN THE ASSESSMENT OF LOCOREGIONAL AND DISTANT RECURRENCE ? MR ? PSMA PET/CT ? PSMA PET/MR IMAGING EVALUATION ? Systematic approach to the interpretation of MR images of patients in post-treatment of prostatic cancer ? Case based-review of PI-RR (Prostate Magnetic Resonance Imaging for Local Recurrence Reporting) ? Pitfalls, challenges, and how to overcome these

GUEE-66

Biparametric and Multiparametric Prostate MRI: How To and When To Use Them Properly

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Mitsuru Takeuchi, MD, PhD, Nagoya, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Multiparametric MRI (mpMRI) is currently the standard imaging method for prostate MRI. All Prostate Imaging Reporting and Data System (PI-RADS) versions emphasized that prostate MRI protocols should include not only T2-weighted imaging (T2WI) but also diffusion-weighted imaging (DWI) and dynamic contrast-enhanced MRI (DCE-MRI). However, in the latest PI-RADS after version 2, DCE-MRI plays a minor role. Biparametric MRI (bpMRI) study excluding DCE-MRI can be performed in a shorter time and is free from the cost and potential risks of gadolinium-based contrast agents compared to mpMRI. Recently, several studies have reported bpMRI is not inferior to mpMRI in the prostate cancer (PCa) detection. In this educational exhibit, we review these articles and explain when to and how to use bpMRI and mpMRI while presenting clinical cases.

TABLE OF CONTENTS/OUTLINE

1) Diagnostic accuracy of bpMRI and mpMRI for the PCa tumor detection in treatment naïve patients (primary PCa). 2) Clinical application of bpMRI bpMRI could be apply to the patients who is suspected primary PCa. mpMRI should be used to T-staging, locally recurrent PCa after radiotherapy and prostatectomy and active surveillance. 3) Imaging protocol of bpMRI High image quality of T2WI and DWI is mandatory for securing the diagnostic accuracy of bpMRI. T2WI should be acquired with multiplanes and high spatial resolution. DWI should be obtained with less artefacts and high contrast between lesion and normal tissue. 4) Clinical cases

GUEE-67

Spectrum of Male and Female Urethral Pathologies at MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Participants
Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Recognize variety of pathological conditions of the urethra at MRI 2.Discuss advantages and disadvantages of the MR Imaging of the urethra 3.Describe Imaging techniques for evaluation of urethra

TABLE OF CONTENTS/OUTLINE

Evaluation of the male and female urethra on conventional imaging studies including retrograde urethrography (RUG), voiding cystourethrography (VCUG), and ultrasonography (US) may be helpful in demonstrating urethral abnormalities however limited in providing information regarding the periurethral tissues. MRI due to multiplanar capability and excellent tissue contrast can provide anatomic details about both the urethra and periurethral tissues and also orientation of the lesion in three dimensions. In this presentation conditions affecting the urethra or periurethral tissues will be discussed. Specific topics of discussion will be anatomical detail, MR imaging techniques, diverticulum, inflammation, tumors, strictures and miscellaneous conditions of the male and female urethra. Summary: MRI is a noninvasive technique that does not require ionizing radiation and can provide anatomic and pathological details about both the urethra and periurethral tissues and the orientation of the lesion in three dimensions due its multiplanar capabilities and superior soft tissue contrast.

GUEE-8

Diverse Spectrum of Tumefactive, Non-neoplastic, Proliferative Pseudotumors of the GU Tract: Cross-sectional Imaging Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Identified for RadioGraphics

Participants
Rashmi Balasubramanya, MD, Philadelphia,, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is a wide spectrum of non-neoplastic conditions of the GU tract that show tumefactive growth pattern reminiscent of neoplasms. A diverse spectrum of inflammatory, infective, proliferative and idiopathic disorders with distinct histopathology occur in the kidneys and upper/lower urinary tracts. We present multi-modality cross-sectional imaging findings of a broad spectrum of these pseudo-tumors.To review taxonomy, epidemiology, clinical features, histopathology biology of a wide spectrum of tumefactive, non-neoplastic, proliferative conditions of the genitourinary tract.To describe multimodality cross-sectional imaging findings of these lesions and differentiate from neoplasms.To discuss management and prognosis.

TABLE OF CONTENTS/OUTLINE

OrganizationIntroduction, classification, epidemiology, clinical manifestations, histopathology, CT/MRI findings, management, prognosis, conclusion.Entities discussedXanthogranulomatous pyelonephritis, Actinomycosis, Tuberculosis, Malakoplakia, IgG4 related disease , Amyloidosis, Perinephric myxoid pseudotumor of fat, Erdheim-Chester disease, Pseudosarcomatous myofibroblastic proliferation, Cystitis cystica , endometriosis of the ureters/urinary bladder, Nephrogenic adenoma, Adrenal rest, Echinococcal cyst.

GUEE-9

Unexpected Imaging Findings following Uterine Interventions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - GU

Awards
Identified for RadioGraphics

Participants
Allan Brazier, MD, Sterling Heights, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Uterine and endometrial interventions include a spectrum of routine surgical, hysteroscopic, and interventional procedures.2) Familiarity with the spectrum of interventions and recognition of their potential complications on imaging are essential to guide management and optimize patient outcomes.3) An understanding of how these procedures are performed will lead to a better grasp of all potential complications that may ensue.

TABLE OF CONTENTS/OUTLINE

1) A review of uterine and endometrial procedures and their techniques. 2) A case-based presentation of complications that result from these procedures as well as relevant management recommendations.Cases: -Retained fibroid after hysterectomy -Ureteral transection and ureterovaginal fistula after hysterectomy -Active extravasation after hysterectomy-Vesicovaginal fistula after do-it-yourself pessary placement -Regenerating uterine tissue after morcellation -Uterine perforation after dilatation and curettage (D C) -AVM after D C-Synechiae after D C -Hematometra after endometrial ablation -Uterine actinomycosis due to retained intrauterine device (IUD) -Uterine perforation by IUD -Avulsion of pedunculated fibroid after uterine artery embolization (UAE) -Utero-enteric fistula after UAE -Small bowel obstruction after UAE -Fascial dehiscence after cesarean section -Bladder flap hematoma after cesarean section -Vaginal cuff dehiscence and bowel herniation -Endometritis after embryo transfer -Peritoneal inclusion cysts following pelvic surgery -Scar endometriosis

HNEE

Head and Neck Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Sub-Events

HNEE-1 A Blurry Confusion-Optic Neuropathy Etiologies And Imaging

Awards
Certificate of Merit

Participants
Luis Souza, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Optic neuropathy is a broad definition that encompasses a myriad of different diagnoses.Objectives: Understand what is expected from the radiologist when faced with this difficult group of diseases, which the imaging findings can be subtle and often missed. To illustrate the most common imaging findings of optic neuropathy. To show the useful imaging hallmarks that help differentiate active disease from sequelar changes and differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Imaging investigation protocol: optic neuropathy standard imaging protocol and useful additional MRI sequences that can help in the diagnosis.General and common imaging findings in optic neuropathy. Differentiating active disease and sequelae?Main imaging characteristics and differential diagnosis of the different etiologies.- Inflammatory / Infectious (Viral, Bacterial, Other).- Inflammatory / Autoimmune. (Demyelinating - NMOSD, MS, Anti-MOG+, Paraneoplastic - and Non-Demyelinating).- Ischemic (anterior and posterior ischemic neuropathy).- Toxic-metabolic.- Compressive.- Infiltrative.- Traumatic.Take-home messages and tips and tricks to differential diagnosis.

HNEE-10 Perimarginal Nodes - An Underestimated Site for Metastatic Squamous Cell Oral Cancer: A CT Pictorial Review

Awards
Certificate of Merit

Participants
Erik Radin, MD, Trieste, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Definition of perimarginal nodes (PMN). (2) To explain the clinical relevance of the PMN. (3) To illustrate the spatial identification of PMN on CT imaging.

TABLE OF CONTENTS/OUTLINE

Head and neck squamous cell cancer is notoriously affected by an elevated risk for metastatic nodal disease, one of the most important prognostic factors. Nodal status represents one of the fundamental parameters of the TNM staging system; it is also essential for the therapeutical approach, with elective neck dissection as the leading treatment. Perimarginal nodes (PMN) are often considered as facial rather than cervical lymph nodes, even though they could be regarded as a submandibular nodal subgroup (level IB). They lie close to the marginal mandibular nerve (MMN), within a clinically defined distance cut-off of 1 to 2 cm from the mandibular border. CECT imaging has high accuracy for PMN identification and allows to divide them into four different sites, depending on their relationship with the anterior facial vein (AFV) and the submandibular gland: preglandular, prevascular, retrovascular, and retroglandular nodes. Perimarginal nodes could represent a miscalculated site for occult metastases in head and neck cancers, especially those located in oral cavity. Unintentionally, small perimarginal nodes could be left in the surgical site in order to protect the MMN during neck dissection through the Hayes Martin maneuver; this would affect the patient's prognosis, precluding a complete therapeutic response, with an increased risk of disease relapse.

HNEE-11 Facial Ultrasound Anatomy of the Aging Skin and the Growing Role of the Radiologist in the Aesthetic Medicine Field

Participants
Slavina Mancheva, MD, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To evaluate the normal facial anatomy. Causes of normal aging visible and quantified by imaging studies. To evaluate pre, during and post-treatment status of beauty treatments using autologous and FDA authorized dermal fillers. The use of ultrasound to guide dermal filler injections.To identify facial danger zones.

TABLE OF CONTENTS/OUTLINE

1.Facial anatomy depiction. Nowadays there is continuous growth of the aesthetic facial treatments using fillers and neurotoxins. In order to prevent complications it is very important to analyze the area of interest using ultrasound- being a safe and handy technique.2.Aging of upper, mid and lower face. In this exhibit a couple of patients in their mid 20s, mid 30s and late 60s are analyzed using ultrasound. Some patients are followed pre and post treatment sessions in order to identify the causes of their individual aging and also offer them follow up of their treatment.3.The difficult case and the role of the radiologist in a multidisciplinary aesthetic medicine team. Many patients has been using different type filler treatments and some appear with different and unknow secondary effects. The radiologist must identify the relevant variation anatomy, possible iatrogenic effects and help during invasive treatments. 4.The facial danger zones. Identify the major danger zones where the practioner must be very careful and decide what options of treatments must be offered in a safe manner.

HNEE-12 A Joint Affair: Radiologic Findings of TMJ Anatomy and Pathology

Awards
Certificate of Merit

Participants
Samantha Platt, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review TMJ anatomy and variation with function through radiologic and medical illustration. 2. Review Wilke's criteria and relevant findings for internal derangement including disc displacement with or without reduction, disc morphology, joint effusion and bony changes such as sclerosis and subcortical cysts.3. Demonstrate imaging findings associated with the diverse spectrum of TMJ disorders through varied modalities. 4. Describe features of TMJ disorders that are helpful to include in report for general radiologists and neuroradiologists.

TABLE OF CONTENTS/OUTLINE

Temporomandibular joint (TMJ) disorders exhibit variable radiographic presentation. Many causes of extra-articular pain (i.e. muscle fatigue, fibromyalgia) do not have imaging findings. The best modalities to evaluate the TMJ include MRI and CT and should be chosen based on clinical symptoms and the anticipated pathology. We have curated images from various modalities for TMJ pathologies: osteoarthritis, mandibular hypoplasia, bifid mandibular condyle, hemicranimegaly, infectious synovitis, osteomyelitis, malignant otitis externa, osteonecrosis, rheumatoid arthritis, ankylosing spondylitis, chondromatosis, giant cell granuloma, squamous cell carcinoma, metastatic disease, nasopharyngeal carcinoma, mandibular fractures, pseudoarthrosis, myositis ossificans, ankylosis, osteoradionecrosis, and surgical implants. Additionally, we have curated MR views that exemplify the pathology seen in each of Wilke's classification for internal derangement along with pictorial representation. Imaging is crucial to noninvasive assessment of the TMJ and subsequent management plans.

HNEE-13 Don't Wait Till Neck Time: Learn the "Spatial" Way to Master Neck Anatomy on Ultrasound Now

Participants
Paran Davari, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the concept of spaces of the neck and highlight spaces that can be evaluated on ultrasound. 2. Provide a sonographic atlas for the spaces using multimodality comparison to better understand spatial relationships. 3. Learn contents of each space to help guide a space specific differential diagnosis.4. Overall increase familiarity with anatomic structures that might often be ignored while interpreting a neck ultrasound obtained for frequent indications such as thyroid gland, cervical lymph node or carotid evaluation, as well as increased knowledge of relevant anatomy for less frequent indications such as parotid or submandibular gland evaluation. 5. Provide examples of clinical applications of this anatomic knowledge on ultrasound for diagnostic and potentially procedural purposes.

TABLE OF CONTENTS/OUTLINE

1. Learning objectives 2. Introduction to neck anatomy on ultrasound: current practices3. Introduction to spaces of the neck4. Describe sonographically visualized spaces of neck, content and clinical considerations A. Superficial space of neck B. Deep neck spaces limited to suprahyoid neck: i. Parotid spaceii. Submandibular spaceiii. Floor of mouth or sublingual spaceiv. Masticator space C. Deep neck spaces limited to infrahyoid neck:i. Visceral spaceii. Anterior cervical spaceiii. Posterior cervical space D. Deep neck spaces spanning entire neck:i. Carotid spaceii. Perivertebral space

HNEE-14 Practical Applications of the Permeability Study in Head and Neck Imaging

Participants
Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Permeability imaging or quantitative DCE-MRI is a functional MRI modality that involves repeated acquisition of images of the same lesion and analyses of the Time-signal intensity curves (TICs) of the tumor and feeding artery to yield various parameters related to perfusion and permeability within the tumor. It has been reported to be useful in the differentiation of head and neck tumors, most commonly of the parotid gland, as well as tumors in other organs.This panel aims to: Define what is the permeability study Review of the technique Cite the main clinical indications for permeability study in head and neck imagingIllustrate through clinical cases the applications of perfusion permeability imaging in head and neck

TABLE OF CONTENTS/OUTLINE

Salivary gland tumors (i.e.: pleomorphic adenoma, Warthins's tumor and carcinoma) Distinction of benign versus malignant tumor (i.e.: lymphoma, spinocellular carcinoma, pagaranglioma and schwannoma) Histologic differentiation among lesions, in combination with DWI and conventional T1 and T2 imaging (i.e.: pleomorphic adenoma, Warthin's tumor, lymphoma, paraganglioma) Differentiation of recurrent tumor versus post-therapeutic changesPrediction of response to radiotherapy and chemotherapy Biopsy guidance Metastatic cervical lymph nodes

HNEE-15 One Nerve is Just Right, Two is Too Many, Three is Not Enough - Unraveling the Trigeminal Nerve and It's Alterations

Participants
Fernanda Guedes, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review the anatomy of the trigeminal nerve from its sensory and motor nucleus, the branches and peripheral segments.-Review the most common trigeminal nerve diseases in each segment and their radiological findings.-Learn more about some important differential diagnoses for each nerve segment.

TABLE OF CONTENTS/OUTLINE

1. Simplify trigeminal nerve anatomy, the largest of the twelve pairs of cranial nerves, and its segments (intraaxial, cisternal, Meckel's cave/cavernous sinus and peripheral). 2. Describe the relationship between trigeminal nerve segments and adjacent anatomical structures like skull base foramina, cavernous sinus, infraorbital canal and pterygopalatine fossa. 3. Summarize the different diseases that affect each trigeminal nerve segment, from the most common injuries, such as neurovascular conflicts, to the rarer pure motor neuropathy, highlighting some pathologies like: - Hypoplasia; - Herpes Zoster; - Trigeminal nerve schwannoma; - Meningioma; - Demyelinating disorders; - IgG4 related disease; - Lymphoproliferative disease; - Dermoid cyst; - Perineural facial tumor spread; - Post surgical trigeminal alterations; - Leptomeningeal carcinomatosis; - Neurosyphilis.

HNEE-16 Post-treatment Head and Neck Cancer Imaging: Anatomical Considerations Based on Cancer Subsites

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Takashi Hiyama, MD, PhD, Kashiwa, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recurrence of head and neck cancer occurs in approximately 10-20% of patients with early stage cancer, and 50-60% of those with advanced cancer. Detecting recurrent tumors at a treatable stage contributes to improved prognosis. The interpretation of follow-up images should be considered separately for each subsite as head and neck cancers can arise at various anatomical subsites. For each subsite, knowledge of normal imaging changes after surgery or chemoradiotherapy and patterns that are prone to recurrence are essential for detecting recurrence. When a lesion is detected, a differential diagnosis of recurrence, posttreatment changes, or other pathologies may be required. NIRADS is a useful tool for these evaluations. In addition, radiologists should assess the extent of recurrent tumors to select optimal salvage treatment. The purposes of this exhibit are: 1) To discuss normal post-treatment imaging at each subsite 2) To discuss the imaging findings of early local recurrence at each subsite, and neck recurrence 3) To discuss how to assess recurrence to allow subsequent optimal treatment

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Overview Epidemiology of head and neck cancer recurrence Roles of CT/MRI and PET/CT in follow-up NIRADS 3. Case illustrations Imaging findings of post-treatment change and recurrence: Oral cavity, Nasopharynx, Oropharynx, Hypopharynx, Sinonasal cavity, Larynx, Neck Imaging evaluation of recurrent tumor extension for salvage treatment 4. Summary 5. Conclusion

HNEE-17 Shedding Light On Lymphoproliferative Disorders: Extranodal and Nodal Lesions of the Head and Neck

Participants
Thayssa Leite, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points:The purpose of this exhibit is:To identify the most common anatomic locations of lymphoproliferative disorders of the head and neck.To review the main imaging modalities, such as ultrasound (US), computed tomography (CT), magnetic resonance imaging (MRI), including functional methods (DCE imaging).To describe the radiological patterns and propose differential diagnosis of lesions including congenital anomalies, neoplasms, vascular, inflammatory or infectious diseases.To suggest practical tips and discuss common pitfalls of lymphoproliferative disorders of the head and neck, emphasizing the utility of a systematic approach for accurate evaluation.

TABLE OF CONTENTS/OUTLINE

Table of contents:Introduction.Anatomy.Imaging modalities.Differential diagnoses and clues to diagnosis.Practical tips and Pitfalls.Conclusion/Take home message.

HNEE-18 Multimodality Imaging of The Lacrimal Drainage System

Awards
Certificate of Merit

Participants
Viviana Loureiro, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To recognize the anatomy of the lacrimal drainage system.To understand the indications and technique of multiple imaging modalities forevaluation of the lacrimal drainage apparatus, as well as the advantages anddrawbacks of each modality.To review the spectrum of imaging findings of various diseases that affect the lacrimal drainage system on multiple modalities.

TABLE OF CONTENTS/OUTLINE

- Introduction- Anatomy- Multimodality Imaging Technique- Congenital and Developmental Lesions- Inflammatory and Infectious Diseases- Traumatic Lesions- Neoplasms- Nasolacrimal Drainage System Surgery- Pearls and Pitfalls- Conclusion

HNEE-19 Awards

Facial Pain: Classification, Clinical Features, and Imaging Findings

Certificate of Merit

Participants
Rodrigo De Azevedo, MD, Santo Andre, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To understand the classification, pathophysiology, and clinical features of facial pain. To review the role of imaging in the assessment of facial pain, including imaging techniques and protocols. To review the spectrum of imaging findings in multiple causes of facial pain.

TABLE OF CONTENTS/OUTLINE

- Introduction - Relevant Anatomy - Classification and etiology of facial pain: nociceptive, neuropathic (neuralgia and painful neuropathy), trigeminal autonomic cephalalgias, and other causes. - Imaging Technique and Protocol (CT, conventional MRI, MRI angiography, and MRI neurography) - Imaging of Trigeminal Neuralgia - Imaging of Glossopharyngeal Neuralgia - Imaging of Painful Cranial Neuropathies - Other Causes of Facial Pain - Imaging after Ablative and Surgical Treatment of Cranial Neuralgia - Conclusions - References

HNEE-2 Neuroendocrine Neoplasms of Head and Neck: Spectrum

Participants
Shreya Shukla, MBBS, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

The spectrum of neuroendocrine neoplasms (NENs) of the head and neck varies from benign neoplasms which may require just observation to poorly differentiated malignant neoplasms that may require multimodality treatment or palliative care. According to the fifth edition Classification of by the World Health Organization (WHO) International Agency for Research on Cancer (IARC) consensus meeting held in Lyon on 2-3 November 2017, NENs can be of epithelial or non-epithelial origin. Epithelial variety can range from well-differentiated NENs known to occur in small intestine, ovary etc to poorly-differentiated neuroendocrine carcinoma NECs (lung, colon). These tumors may be functional or non-functional. Nuclear imaging has an important role.

TABLE OF CONTENTS/OUTLINE

This educational exhibit contains: • Review of classification of neuroendocrine neoplasms (NENs) • Enlists the common site of occurrence of NENs in the head and neck. • Review of the imaging appearance of these neoplasms at various sub-sites. • Briefly reviews the management of these neoplasms.

HNEE-20 Novel Imaging Techniques in the Management of Thyroid Nodules and Diffuse Thyroid Disease

Participants
Thiago Jose Pinheiro Lopes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) The gold standard of thyroid nodules diagnostics is conventional ultrasonography followed by fine-needle aspiration biopsy of qualified lesions, an invasive procedure related to inconclusive cytological results in up to 10-25% patients. 2) There is a need to search for novel imaging procedures or markers, that would allow a non-invasive estimation of malignancy risk with satisfying sensitivity and specificity. 3) Our purpose is to review imaging innovative applications in the management of thyroid nodules and diffuse thyroid disease, with focus in shear wave elastography (SWE) and contrast-enhanced ultrasonography (CEUS).

TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Conventional Techniques: B-mode and Doppler 3) Novel imaging techniques 3.1) Elastography (SWE) 3.2) CEUS 3.3) Next-generation molecular imaging 4) Radiological-pathological correlations 4.1) Thyroid nodules 4.2) Autoimmune thyroid disease 5) Challenges, pearls and pitfalls 5.1) Detecting extra-thyroid extension 5.2) Assessing lymph node metastases 5.3) Thyroid nodules in pediatric population 6) Future directions 6.1) Novel biochemical and genetic markers 6.2) Artificial intelligence (radiomics) 7) Take home messages

HNEE-21 Imaging of Head and Neck Vascular Anomalies (Tumors and Malformations)

Participants
Augusto B. Antunes, MD, MSc, Nova Lima, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vascular tumors and vascular malformations are commonly found in the head and neck region and have distinctive features. Radiologists should be aware of their presentation features and clinical history to establish the correct diagnosis and provide appropriate care. Imaging allows for high spatial and temporal resolutions and is essential for the correct diagnosis of these pathologies, but also for assessing the extension and anatomical relationships, as well as for studying blood flow patterns. We will highlight proliferating vascular tumors and vascular malformations, often misdiagnosed due to confusing definitions and classifications. After completing this reading, participants will be able to comprehend and to recognize specific features for various such anomalies, including infantile hemangioma, congenital hemangioma, lymphatic, venous, arteriovenous and capillary malformations, and combined anomalies.

TABLE OF CONTENTS/OUTLINE

Classification, clinical presentation, and evolutional history of the most common vascular anomalies of the head and neck. Case-based review illustrating the findings of vascular tumors and vascular malformations on different imaging modalitiesTake-home messagesReferences

HNEE-22 Differential Diagnosis Between Chondrosarcoma and Synoival Chondromatosis of the Temporomandibular Joint Using CT and MRI

Participants
Kyung-Hoe Huh, PhD, DDS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chondrosarcoma and synovial chondromatosis are a representative tumor or tumor-like arthropathy of the temporomandibular joint, producing cartilaginous calcification within the mass and causing bone changes of the mandibular condyle and/or articular eminence/glenoid fossa. Imaging differentiation between chondrosarcoma and synovial chondromatosis of the TMJ is very important, because they share clinical and histopathological features. CT and MR imaging features such as lesion epicenter of the mandibular condyle, infiltration into the tendon of the lateral pterygoid muscle, destruction of the mandibular condyle, no destruction/sclerosis of the articular eminence/glenoid fossa, calcification pattern (absence or stippled), periosteal reaction, and internal enhancement can be an effective tool to differentiate between chondrosarcoma and synovial chondromatosis. The single imaging feature with the highest performance for differential diagnosis is infiltration into the tendon of the lateral pterygoid muscle. With combination of the several imaging features, the diagnostic performance can be improved.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Anatomy of the temporomandibular joint a. comparison of lesion epicenter b. infiltration of the tendon of the lateral pterygoid muscle 3. Imaging parameters of the TMJ on CT and MR image 4. Imaging features of chondrosarcoma 5. Imaging features of synovial chondromatosis6. Differentiation between chondrosarcoma and synovial chondromatosis7. Conclusion

HNEE-23 SMARCB1-Deficient Sinonasal Cancer- Imaging Features of An Emerging Entity

Participants
Renuka Ashtekar, MBBS, MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Enumerate the various subtypes of sinonasal malignancies.2. Describe CT and MR imaging features of SMARCB1-deficient sinonasal cancer (SdSNC).3. Distinguishing SdSNC from other close imaging differentials.

TABLE OF CONTENTS/OUTLINE

1. Introduction to sinonasal malignancies and their various subtypes.2. What is SMARCB-1 and how are these tumors diagnosed?3. Imaging characteristics of SdSNC on CT and MRI.4. Common differential diagnoses and their imaging features.5. Case-based review of uncommon presentations of SdSNC.

HNEE-24 The Hidden Windows Between the Neck Spaces

Participants
Daniel Sebastian Chaves Burbano, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To identify the limits, content and communication between the neck spaces, it is useful the understanding that some of them are virtual spaces.- The cervical fasciae are non-continuous connective tissue structures that surround the muscles, nerves, and vessels of the neck and establish the spaces in the neck. Its functions are to be a barrier and reduce friction between structures. These are two: superficial cervical fasciae and deep cervical fasciae.- Some of the neck spaces have no boundaries between them, so they are connected to each other. Identifying the communication between them is an important step approaching the images.- The communication between the spaces of the neck is not only between them, but also with the base of the skull, thorax and the back, and they are not usually easy to find. They can be a route of dissemination of pathologies.

TABLE OF CONTENTS/OUTLINE

- Gross anatomy- Superficial cervical fascia- Deep cervical fascia- Suprahyoid deep neck spaces- Infrahyoid deep neck spaces- Supra and infrahyoid deep neck spaces- The windows between the neck spaces- Conclusions

HNEE-25HC Virtual Reality Module Reinforcing Cranial Nerve Deficits with Physical Examination

Participants
Christopher Lack, MD, PhD, (*Presenter*) Consultant, PhenoMx, Inc

TEACHING POINTS

The relationship between cranial nerve anatomy, function, pathology and physical examination findings requires a deep understanding of multiple domains. Virtual reality has the potential to be a powerful tool in teaching, reinforcing concepts that are not well represented by textbooks. Using our interactive 3D model, the learner can easily examine the important anatomic structures and be exposed to many pathologic states without the need for multiple unique patient encounters. This module could easily be used around the world if the end-user has an appropriate VR headset.

TABLE OF CONTENTS/OUTLINE

Using MRI and CT data, we developed an interactive high-fidelity 3D model, in a virtual environment, that highlights the anatomy of the orbits and cranial nerves II, III, IV, VI. The user can view and interact with the anatomic structures using a VR headset and perform an exam of the extraocular muscles. Using the "Quiz-mode" users will be tested on an unknown cranial nerve deficit and will have to identify the deficit based on an actual physical exam in the virtual environment. The module can be seen both in 3D by wearing the VR goggles but also in 2D on the attached laptop screen. Since the power of 3D and physical exam is best demonstrated using the VR headset, please come to the exhibit to experience the headset demo.Please visit the Learning Center to also view this presentation in hardcopy format.

HNEE-26 Advanced Imaging Biomarkers in Head and Neck Cancer: Precision Diagnosis, Gene Mutation Detection, and Treatment Response Assessment and Prediction

Participants
Yoshiaki Ota, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching point1. To review physics of DWI, CT perfusion, MR spectroscopy, dynamic susceptibility contrast perfusion MRI (DSC-MRI), and dynamic contrast-enhanced MRI (DCE-MRI)2. To demonstrate head and neck tumors and application of advanced imaging for tumor differentiation, gene mutation detection, and assessment of treatment effect3. To demonstrate pitfalls of advanced imaging

TABLE OF CONTENTS/OUTLINE

Outline1. Physics and clinical application- DWI: Assessment of cellularity, cytotoxic/vasogenic edema- CT perfusion: Assessment of vascular space of the lesions- MR spectroscopy: Detection and quantification of abnormal metabolites related to gene mutation- DSC-MRI: Assessment of vascularity, permeability, and hemodynamic pattern (First pass)- DCE-MRI: Assessment of vascularity, permeability, and hemodynamic pattern 2. Head and neck tumors- Infratentorial extra-axial tumorsa. Common tumors/meningiomas, schwannomas, paragangliomasb. Atypical/metastasis, chordoma, chondrosarcoma, endolymphatic sac tumor- Tumors in the head and neck mucosal surface- Tumors in the head and neck deep tissues 3. Clinical and academic application of DWI, CT perfusion, DSC-MRI, and DCE-MRI- Tumor differentiation- Detection of tumor mutation- Assessment of treatment effect- Post-operative risk assessment 4. Pitfalls of applications of DWI, DSC-MRI and DCE-MRI- DWI: Geographic artifact - CT perfusion: Motion artifacts, sever beam-hardening- DSC-MRI: Susceptibility artifacts at tissue interfaces or skull base area- DCE-MRI: Different magnetic field (1.5T or 3T) and parameters (such as TE, TR, or temporal resolution) in DCE-MRI can affect quantitative parameters (Vp, Ve, Ktrans, and Kep).

HNEE-27 Don't Let Your Mouth Water - Everything You Need to Know About the Parotid Glands

Awards
Certificate of Merit

Participants
Marcio Ricardo Garcia, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the anatomy of the parotid gland and adjacent anatomical structures. 2. To review the most common parotid gland diseases and their radiological findings. 3. To learn more about some important differential diagnoses.

TABLE OF CONTENTS/OUTLINE

1. Simplifying the anatomy of the parotid gland and adjacent anatomical structures (temporomandibular joint, external auditory canal and masticator space). 2. Summarize the main key points of some different diseases that affect the parotid gland with a focus on computed tomography and magnetic resonance findings, highlighting some pathologies like: developmental variations, first branquial cleft cyst, lymphatic venous malformation, lipoma, dermoid cyst, acute parotitis, abscess, chronic parotitis, necrotizing otitis externa with parotid extension, Sjögren syndrome, IgG4-related disease, intraparotid facial neuropathy and perineural spread, lithiasis, iatrogenic injury of the Stensen duct after bichectomy, Warthin tumor, pleomorphic adenoma, oncocytoma, mucoepidermoid carcinoma, lymphoma and metastasis. 3. Elaboration of a flowchart to help in the analysis of focal lesions of the parotid gland, including analysis of diffusion and permeability. 4. Conclusion.

HNEE-28 A Head Turner: Diffusion Restricting Head and Neck Lesions

Participants
Yasasvi Tadavarthi, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diffusion-weighted imaging has been shown promising in tissue characterization of primary tumors (benign and malignant), nodal metastases, differentiation of recurrent tumor from post therapeutic changes, monitoring treatment response, and many other clinical scenarios in head and neck. In this presentation we will discuss different aspects of using diffusion weighted imaging in head and neck and their added value over anatomic imaging.

TABLE OF CONTENTS/OUTLINE

1. Brief review of diffusion weighted imaging technique and its use in head and neck imaging.2. Review imaging features of different pathologic conditions seen in the head and neck demonstrating diffusion restriction including:a. Benign neoplasms - Warthin tumor. b. Malignant neoplasms - Lymphoma, Carcinomas (Squamous cell carcinoma and Adenocarcinoma), Rhabdomyosarcoma. c. Infectious and inflammatory lesions - Abscess, Pseudotumor. d. Miscellaneous lesions- Hematoma, Cholesteatoma, Epidermoid cyst, Lymphadenopathy3. Challenges and limitations of diffusion weighted imaging in the head and neck.4. Mimics and special circumstances - Artifacts, Monitoring treatment response

HNEE-29 The Sound of Silence: Clinical and Imaging Aspects of Sudden Hearing Loss

Participants
Stephanie Nagano, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Sudden hearing loss occurs within a 72-hour period. It is essential to define whether the hearing loss is conductive, sensorineural or mixed to guide the investigation.Sudden sensorineural hearing loss is a clinical emergency and must be evaluated quickly to decrease the chances of becoming permanent.The diagnosis is predominantly clinical and imaging tests can provide additional information regarding the etiology. In cases of conductive deafness, the best method is computed tomography and in sensorineural deafness, resonance. Both methods can be used in cases of mixed deafness and surgical planning.Systematic analysis by topography can be useful to identify causes of sudden neurosensory deafness. Is recommended to start the evaluation with retrocochlear causes such as brain lesions, cerebellopontine angle and internal auditory canal, moving on to vestibular and cochlear causes.

TABLE OF CONTENTS/OUTLINE

Definition and clinical aspects of sudden hearing loss: how to define neurosensorial, conductive or mixed?Imaging methods and pertinent ear anatomy in sudden deafness.Sudden conductive hearing loss examples.Neurosensorial hearing loss

examples.Systematic clinical and imaging evaluation in sudden hearing loss: summing up.

HNEE-3 Show some nerve! - Neurography in Head and Neck

Awards
Certificate of Merit

Participants
Samya Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review anatomy and imaging aspects of cranial nerves and their branches.- Discuss specific sequences for nerve evaluation (PSIF, DESS, 3D SPACE).- List the main indications for performing neurography studies.- Illustrate concepts by a case-based review and original drownings.

TABLE OF CONTENTS/OUTLINE

ANATOMY: REVIEW- Review the anatomy, formation and imaging features of the nerves. NEUROGRAPHY IN HEAD AND NECK- Indications- Magnetic Resonance (MR) sequences- Advanced sequences ALTERATED NEUROGRAPHIES- Sample cases to illustrate and solidify the conceptsWHAT'S ON THE HORIZON- What's new on cranial nerves and its branches evaluation.- What do we need to improve?

HNEE-30 Hypopharynx - Beyond Squamous Cell Carcinoma

Participants
Guilherme Chaves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Hypopharynx comprehends the most inferior part of the pharynx, as the continuation of the oropharynx, extending from the hyoid bone level (between C3-C4 vertebral bodies) to the inferior margin of the cricoid cartilage. It´s bounded anteriorly by the laryngeal vestibule (separated by the aryepiglottic folds) and posteriorly by the retropharyngeal space. • Can be divided into piriform sinuses, anterior wall (post cricoid area) and posterior wall. Anterior and posterior walls are usually close to each other, unless there is liquid or gaseous content between them. • The most common pathology of the hypopharynx is squamous cell carcinoma. However, some other pathologies may cause similar symptoms and be quite confusing: congenital, inflammatory, foreign bodies and post treatment complications. • It's extremely important for every radiologist to understand hypopharynx anatomy and pathologies cause some of them can present high morbidity.

TABLE OF CONTENTS/OUTLINE

1. Review hypopharynx anatomy and boundaries. 2. Briefly discuss hypopharynx embryology 3. List non-neoplastic pathologies of the hypopharynx: congenital, inflammatory, foreign bodies and post treatment complications. 4. Identify imaging patterns that facilitate distinction between the entities listed above and neoplastic lesions.

HNEE-31 Tympanoplasty: A Review of Indications, Surgical Techniques and Complications for the Radiologist

Participants
Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Timpanoplasty is the surgical repair of the tympanic membrane with or without grafting and usually performed with reconstruction of the ossicular chain. Encompasses a range of procedures that vary according to the extent of the underlying pathology and required surgical exposure.This panel aims to: Define tympanoplasty Quote the main clinical indications Depict surgical aspects: Types of tympanoplasty Grafting of the tympanic membrane Illustrate complications Discuss and outline through clinical cases the expected postoperative findings and complications after tympanoplasty.

TABLE OF CONTENTS/OUTLINE

Definition of tympanoplasty Main clinical indications of tympanoplasty Types of tympanoplasty: Types 1 to 5 Complications: Thickening, Retraction, and Reperforation of the Tympanic Membrane Recurrent CholesteatomaGranulation TissueExtrusion, Intrusion, or Dislocation of Ossicular ProsthesesInfection

HNEE-32 Clinical Impact of MR Bone Imaging on Head and Neck Diseases

Awards
Cum Laude

Participants
Miho Gomyo, Miraka, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn the basic principles of MR bone imaging that can visualize bony and calcified structures like CT. 2. To know clinical applications to head and neck lesions of MR bone imaging. 3. To review pitfalls of MR bone imaging.

TABLE OF CONTENTS/OUTLINE

1. Basic principles and various scanning methods 2. Clinical applications to depict the following structures/lesions: physiological calcifications (basal ganglia, pineal body, choroid plexus, dura mater), skull tumors (primary and malignant tumors including metastasis), reactive bone sclerosis/erosion, bone deformity by tumors and tumor calcification 3. Applications to vessel wall imaging: segment diagnosis with the vertebral body in the carotid artery stenosis, calcified plaque and arterial wall calcification of the intracranial aneurysm 4. Pitfalls

HNEE-33 Rhinoseptoplasty for Radiologists: Recognizing the Main Early and Late Complications

Participants
Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: To show and exemplify rhinoseptoplasty early and late complicationsTo discuss and illustrative through clinical cases the imaging features of different complications which can be seen in the post operative state;To give some tips of when to raise suspicion of rhinoseptoplasty complications as the main responsible cause of patients symptoms.

TABLE OF CONTENTS/OUTLINE

Introduction.Early and late complications list.Clinical cases and imaging findings of different early and late rhinoseptoplasty complications.Early:InfectionNasal septum perforationNasal septum heamatomaLateEmpty nose syndromeDepression of the nasal dorsumDepression of nasal alaePost septoplasty cystic formationPinch tip deformitySynechiaeNasal cartilage necrosisTake home messages and final remarks.

HNEE-34 Ultrasound of the Post-thyroidectomy Neck in Well Differentiated Thyroid Cancer - Pearls and Pitfalls

Participants
Sepideh Sefidbakht, MD, Powel, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review the imaging appearance of thyroid bed recurrence post-thyroidectomy in well-differentiated thyroid cancers • To review the pitfalls of ultrasound diagnosis of thyroid bed recurrence in well-differentiated thyroid cancers • To review the ultrasound appearance of lymph node recurrence in well-differentiated Thyroid cancer • To review the pitfalls of ultrasound diagnosis of lymph node recurrence in well-differentiated thyroid cancers • To integrate I^{123} images, basic clinical data, including knowledge of surgical technique, cumulative dose of I^{131} already received, laterality of the cancer in the thyroid gland, and basic lab data including Tg TgAb to refine decision-making in ultrasound

TABLE OF CONTENTS/OUTLINE

1-Introduction: • Thyroid cancer, the prevalence, types, and recurrence pattern; implications for ultrasound diagnosis • Thyroid cancer surgery; thyroidectomy, suture, and suture-less techniques; implications for ultrasound diagnosis • Neck lymphadenectomy, central versus peripheral, indications and implications for ultrasound diagnosis • Thyroid cancer; post-op management, surveillance modalities, and their limitations2-The thyroid bed recurrence, appearance • Echogenecity, size, vascularity, calcification • The thyroid bed recurrence, pitfalls • Granulation tissue and edema • Suture granuloma • The upward extension of thymus • The parathyroid gland • EBRT implants3-Lymph node recurrence, • Appearance, Echogenecity, size, shape, central hilum; and location • Lymphadenectomy; central versus peripheral • Pre-operative lymph node mapping; what the surgeon needs and doesn't need to know

HNEE-35 Imaging Aspects of the New Classification for Carotid Body Tumors: Understanding Mehanna Classification Using Computed Tomography Images

Participants
Alessandra d. Borges, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss the new classification for carotid body tumorsReview anatomical neck landmarks of Mehanna classification in computed tomography images

TABLE OF CONTENTS/OUTLINE

Paragangliomas is commonly located in the carotid body, usually in carotid bifurcation. Although histopathologically benign, its involvement in neurovascular structures and intracranial invasion are associated with high morbidity. The surgery of paraganglioma in the carotid body can be very challenging and for that reason,an accurate classification to predict the risk of potential complications is vital for treatment decision-making.Mehanna et al developed a new classification and risk stratification system for carotid body tumors which demonstrated better prognostic power for the risk of developing neurovascular complications after surgery, including the widely used modified Shamblin classification system. It classifies in type 1 to 4 based on the fact that the main cause of complications was the level of cranial extension. The risk of complications increases significantly with increasing Mehanna type.Type 1 extends up to but not above the superior-most aspect of the body of hyoid boneType 2 extends up to but not above the lower border of the angle of mandibleType 3 extends up to but not above the superior-most aspect of the body of C2 vertebra Type 4 extends above superior-most aspect of the body of C2 vertebra An additional subclassification can be added for surgical planning: E: encircling bifurcation, internal or common carotid artery F: functional, secreting catecholamines S: skull base reached.

HNEE-36 Osteoradionecrosis Of Mandible- Addressing The Raging Bull In Head And Neck Surgical Oncology

Participants
Ankush Jajodia, MD, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Treatment of oral cavity malignancies includes primary surgical resection which may include marginalor segmental mandibulectomy followed by adjuvant radiation. Radiation comes at its own cost in producing adverseeffects on neighboring tissues, like osteoradionecrosis (ORN) 2. ORN is a condition in which irradiated bone becomesexposed to an ulcer in the overlying skin or mucosa and persists without healing for a period of 3 to 6 months. Clinicallythe condition may manifest with pain, swelling, oro-cutaneous fistula or trismus. The overall incidence of ORN of themandible is 2.6% -15%. 3. Mandible is a compact bone and has a higher mineral content that may lead to a higherabsorbed dose. The ramus and condylar processes are comparatively resistant to the development of ORN, whereas themandibular body, symphysis, and parasymphysis regions supplied mainly by the inferior alveolar artery are at higher risk todevelop ORN. 4. The pathophysiology of ORN described by Marx in 1983 (3-H principle), radiation therapy causes hypoxia,hypovascularity, and hypocellularity of tissue, thus inhibiting substitution of cells to complete the turnover

for themaintenance of homeostasis and wound cicatrization, leading to a chronic nonhealing wound. The affected cells are theones of vascular endothelium, fibroblasts which make stroma and parenchyma cells. 5. MR imaging during follow-up helpstrained radiologists to detect ORN.

TABLE OF CONTENTS/OUTLINE

Clinical cases with pictorial depiction of Osteoradionecrosis of mandible on conventional MR Imaging

HNEE-37 Multi-modality Imaging Including MR Diffusion, T2 Signal Intensity and 18 FDG PET-CT for Neck Imaging Reporting and Data System Categorization

Participants
Ankush Jajodia, MD, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Previous studies documented an overall PPV of 54-56% for NI-RADS 3 posttreatment PET/CT, which was advocated as low. • NI-RADS favors NPV over PPV to potentially capture treatable lesions, even if it comes at the cost of performing additional biopsies. • Functional imaging like DWI and ADC parameters derived from DWI have shown promise for identifying true disease recurrence with higher specificity than conventional PET-CT, with a reported pooled sensitivity and specificity of 85 % and 93 %, for PET/CT. • NIRADS can serve as an assessment tool, wherein individual radiologists or groups of radiologists can utilize the PPV and NPV, to evaluate their own performance.

TABLE OF CONTENTS/OUTLINE

National Comprehensive Cancer Network suggests posttreatment baseline imaging after six months of therapy for advanced HNSCC but does not formally advocate imaging for asymptomatic patients. Ideal timing and frequency for using PET- CT in the posttreatment context have not yet been established. ACR "Neck Imaging Reporting and Data System" (NI-RADS) lexicon defines NIRADS 2b lesions as deep soft tissue lesions with ill-defined or mildly enhancing soft tissue or soft tissue with only mild FDG uptake. These are indeterminate lesions and should have a short-term interval follow-up. NIRADS 3 lesions should have a short-term interval follow-up or biopsy, depending on the degree of FDG uptake. Recurrence rates in NIRADS 2b and NIRADS 3 lesions were 5.6 % and 60-80%, respectively. The template was initially designed for CECT with concentration on PET-CT for detecting recurrence; MR imaging has been done in few centres. Although diffusion imaging has become a routine sequence in head and neck imaging, it is not yet a criterion in NI-RADS.

HNEE-38 Ultrasound of Neck Masses - Pearls and Pitfalls

Participants
Pooya Iranpour, MD, Shiraz, Iran, Islamic Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the zonal anatomy of the neck• To understand the sonographic anatomy and the surface land marks of neck triangles• To be able to propose a primary differential diagnosis for adult neck masses list based on the location of the lesion• To review the gray scale, color Doppler and elastographic features of most common neck lesions seen in the adult• To review the key sonographic features in adult patients with cervical LAP• To review the similarities and differences of metastatic lymphnodes, versus reactive lymph nodes versus lymphoma• Using the anatomic location, and ultrasound features to determine the mostlikely diagnosis

TABLE OF CONTENTS/OUTLINE

• Neck triangles; Back to the Basics• Ultrasound of normal neck anatomy; Sonographic landmarks• Differential diagnosis of the most common neck lesions; location, location, location• Ultrasound of a neck lump; the good, the bad, and the ugly• Solid neck lesions, an overview• Lymphoma, reactive or metastasis? that is the question!• Cysts; where do they sit?

HNEE-39 Addressing Pertinent Surgical Questions in Skull Base Onco-imaging Reports: Case Based Approach

Participants
Shreya Shukla, MBBS, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiological reporting of cross-sectional oncological imaging including Computed Tomography (CT) and Magnetic Resonance Imaging (MRI) can be inadequate and futile for clinicians if it is unsculpted and descriptive. A checklist of vital imaging findings should be strictly used in radiological reporting to give maximum useful information to the treating clinicians.We have created such a checklist and proposed its use as a standardized synoptic reporting format to address all essential questions that need to be answered to help reach a diagnosis and optimize the management plan in skull base neoplasms. Our checklist has been designed after a thorough discussion of a multitude of skull base neoplasms cases between radiologists and clinicians at weekly multi-disciplinary joint clinics (JCs) in our tertiary cancer centre.

TABLE OF CONTENTS/OUTLINE

This educational exhibit contains:- Checklist of relevant and essential findings in baseline radiological reporting of skull base neoplasms.- Proposed synoptic reporting format for skull base neoplasms.- Case-based approach to understanding how including essential details in the radiology reports can affect the management plan.

HNEE-4 Preoperative Orthognathic Surgery: What Radiologists Should Know

Participants
Andre Formiga, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:- To review the anatomical landmarks of the face and the angles they make on computed tomography images.- To discuss the main facial patterns made from these angles and usual changes in dental occlusion that accompany them.- To review the main osteotomy techniques employed on orthognathic surgeries.- To highlight a few craniofacial cases with either tumoral, malformation or vascular etiologies that could be subjected to orthognathic surgeries.

TABLE OF CONTENTS/OUTLINE

Orthognathic surgery uses repositioning of the mandible and maxilla to correct imbalances in facial proportions that can affect everything from physiological dental occlusion and sleep apnea to aesthetic problems related to asymmetries and facial disharmonies that affect patient self-esteem. The objectives of this presentation are to describe the pre operatory imaging findings and cephalometric parameters, mainly on CT scans, of some of the main conditions where orthognathic surgery can act, their reflections on dental occlusion, and how to report them.

HNEE-40 Imaging Considerations in Head and Neck Reconstruction with 3D Printed Surgical Guides and Implants

Participants
Mark Tan, MBBS, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Common indications for Head and Neck reconstruction:(a) Tumour (i) SCC (ii) ACC(b) Deformity correction (i) post Radiotherapy Osteonecrosis (ii) post Traumatic - midface(iii) Post surgical temporal hollowing2. Options for Head and Neck Reconstruction:(a) Maxillectomy (b) Mandibulectomy (c) Fibula flap (d) PEEK and Titanium3. Radiological interpretation considerations (a) Objectives (i) Differential diagnosis (ii) lesion extent (iii) resectability (iv) fibula vasculature (branching, septocutaneous perforator and periosteal branches)4. Workflow for 3D Printed surgical guide and implant production5. Application of Workflow: Fibula flap reconstruction with 3D printing: Virtual surgical planning: Resection with 3D printed guides, dental implant placement, 3D printed titanium plate6. Imaging acquisition considerations (i) Protocols (ii) Artefacts (iii) Patient positioning(iv) Artefact reduction: MAR (v) Reconstruction algorithms(vi) Reconstruction slice thickness(vii) CT-MRI fusion(viii) Scalar and Vector DICOM Data

TABLE OF CONTENTS/OUTLINE

To appreciate for Head and Neck surgical reconstruction:1. Common indications 2. Surgical options 3. Radiological interpretation considerations 4. Workflow for 3D Printed surgical guide and implant production - Process Overview 5. Application of Workflow: 3D Printed Fibula Resection Guide and Titanium Plate 6. Radiographic imaging acquisition considerations for 3D Printed surgical guides and implants7. Radiographic imaging post-processing considerations for 3D Printed surgical guides and implants

HNEE-41 Layyngeal Protrusion, Prolapse and Eversion - Diagnoses Forgotten by Radiology

Participants
Ricardo Fujiki, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Protrusion, prolapse and eversion are definitions often used as synonyms, but they have totally different clinicopathological entities and have not been updated or revisited in the radiological scientific environment for a long time. Imaging findings in the head and neck were recognized and evaluated and may serve as supporting markers to differentiate protrusion, prolapse and eversion, and thus help to define the clinicopathological causes and the need or not to continue the investigation.

TABLE OF CONTENTS/OUTLINE

- Objectives: 1 - Review definitions and clinicopathological differences between protrusion, prolapse and eversion. 2 - Illustrate through clinical cases the different entities by radiological methods. - Methods: Head and neck imaging findings were highlighted in this pictorial review. We also discussed the imaging findings in order to demonstrate the differences between the laryngeal findings. - Discussion (based on cases): Characteristic radiological findings for the differentiation between protrusion, prolapse and eversion were reported in conjunction with the development of didactic schemes to facilitate learning and recognition and differentiation in clinical practice. - Conclusion: Early and accurate recognition of the causes of laryngeal prolapse through imaging methods can help assisting physicians in defining the need for biopsy.

HNEE-42 What the Eye Can´t See but the Radiologists Do: Clinical-radiological Correlation in the Assessment of Visual Disturbances

Awards
Identified for RadioGraphics

Participants
Ewa Joanna Maciag, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Patients with visual disturbances may present a wide variety of symptoms that can be divided into three main categories: (1) Visual dysfunction, such as blurred vision, vision loss, and visual field defects. (2) Extrinsic ocular motility disorders, which usually cause binocular diplopia. (3) Pupillary motility impairment. This review aims to analyze the correlation between the different radiological presentation patterns and the clinical manifestations, with an emphasis on the anatomical localization of the causative lesion and an approach to an appropriate selection and interpretation of the different imaging techniques.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Main symptoms and anatomical background. 3. Imaging techniques: appropriate selection and application. 4. Intrinsic ocular motility disorders: miosis and mydriasis. 5. Alterations of the extrinsic ocular motility: neurogenic and myogenic causes and an evidence-based diagnostic algorithm of diplopia. 6. Disorders of visual function: a case-based overview of the causative pathology. 7. Diagnostic pathway to determine the cause of the visual disturbances. 8. Conclusions.

HNEE-43 Head and Neck Manifestations of Autoimmune Disease - A Didactical Review

Participants
Mayne Brandao, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Little is said about the manifestations of autoimmune diseases and their imaging aspects in Head and Neck. This panel is intended

to show challenging cases that are part of this group of diseases, which affect the various areas of this region.The diversity of findings shows us the importance of disclosing these imaging aspects and makes it a useful tool for consultation.Unusual places such as ossicular involvement, the Eustachian tube, the sternocleidomastoid muscle and other structures illustrate this diversity of places.There are other diseases that will also be addressed in this exhibit as for example lupus; seronegative spondyloarthropathies; systemic sclerosis.Correlation of the imaging findings with the clinical features and laboratory findings is also important for the diagnosis and the recognition of the disease activity, and the identification of possible complications or even the occurrence of associated neoplasms.

TABLE OF CONTENTS/OUTLINE

Introduction of the main acquired immunologically mediated inflammatory disorders.These disorders may be associated with paranenoplastic syndrome, especially hematologic tumors, or may increase the risk for the development of malignancies, predominantly lymphoproliferative disorders. Also, these patients may be associated with infection and granulomatous lesions of the head and neck.We will provide with didactical cases a review presenting the imaging findings in the head and neck in patients with these diseases.Conclusions.References.

HNEE-44 Temporal Bone Osteodystrophies

Participants
Afonso Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:To exemplify all forms of otospongiosis presentation (typical and atypical) and discuss possible pitfalls (eg, foci at the internal acoustic meatus versus diverticula).To demonstrate other osteodystophies of the temporal bone, including osteogenesis imperfecta, osteopetrosis, Paget's disease and fibrous dysplasia.

TABLE OF CONTENTS/OUTLINE

Introduction.CT and MRI temporal bone studies.Imaging of typical and atypical cases of otospongiosis.Practical tips and pitfalls on otospongiosis analysis.Other osteodystophies of the temporal bone: osteogenesis imperfecta, osteopetrosis, Paget's disease and fibrous dysplasia.Take-home messages.

HNEE-45 Surgical Pitfalls in the Otospongiosis Evaluation: What the Otorhinolaryngologist Needs to Know

Participants
Marcio Ricardo Garcia, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe imaging findings in CT scan evaluation of otosclerosis with preoperative relevance. To warn the radiologists about the detection of relevant features that could lead to surgical failure or complications in the stapedotomy and improve patient outcomes

TABLE OF CONTENTS/OUTLINE

1. Introduction - A brief discussion about physiopathology and classical imaging findings of fenestral and retrofenestral otosclerosis - The role of CT and MR in the diagnosis of otosclerosis - A little explanation about the surgical treatment of otosclerosis with emphasis on stapedotomy and possible postoperative complications (untreatable vertigo, anacusis, facial palsy, and meningitis). 2. Imaging findings on preoperative evaluation before stapedotomy - Oval or round window involvement (atresia, narrowing, thickened stapes footplate) and their relation with close structures - Facial nerve anomalies as congenital abnormalities, deviation of facial nerve, or dehiscence - Vestibular aqueduct anomalies as enlargement or dehiscence - Persistent stapedial artery - Semicircular canal dehiscence- Cochlear-facial nerve dehiscence- Lateral semicircular canal dysplasia- Ossicular chain fixation 3. Conclusion 4. Take-home messages

HNEE-46 Advanced Imaging of Head and Neck Infection

Awards
Cum Laude

Participants
Akira Baba, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

Advanced cross-sectional imaging plays a critical role in providing differential diagnoses, treatment decisions, and prognostic implications in head and neck infections. Contrast-enhanced CT is the imaging modality of choice for head and neck infections; however, other imaging modalities may be complementary and diagnostic. MRI is excellent for evaluation of intracranial spread of inflammation/abscess formation and osteomyelitis, etc. DWI and ADC values are useful in providing differential diagnoses and evaluating treatment response of head and neck infections. 18F-FDG-PET/CT is helpful in the follow-up of skull base osteomyelitis. Dual energy CT allows for various techniques such as metal artifact reduction and material decomposition imaging that can help reduce dental metal artifacts, increase salivary stone detection. Metal artifact reduction algorism can help reduce dental metal artifacts. Subtraction CT techniques are used to reduce dental metal artifacts and detect destructive osseous changes. This presentation will provide an overview of must-know head and neck infections with updated advanced imaging techniques and their imaging findings.

TABLE OF CONTENTS/OUTLINE

1. Imaging techniques 2. Temporal bone/skull base 3. Pharynx 4. Deep neck 5. Oral cavity 6. Salivary Glands

HNEE-47 Skull Base Osteomyelitis in COVID-19 related Acute Invasive Fungal Rhino Sinusitis: Spectrum of Findings

Participants
Gayatri Senapathy, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• SBO is a dreaded condition with high morbidity and mortality and fungal rhinosinusitis is one among the many causes of SBO • Incidence of AIFRS showed a significant increase during the second wave of COVID-19 pandemic and Diabetes Mellitus and Steroid use were found to be the major associated factors. • AIFRS was seen in patients with active or recent COVID-19 infection. SBO was seen as a complication at presentation in some cases of AIFRS, and beyond the 3rd week of onset in treated patients who had progressive disease. • AIFRS has a predilection for both vascular and perineural spread across intact bony boundaries. Patients with early involvement of the pterygopalatine fossa, orbital apex and the cavernous sinus are at high risk of developing SBO due to perineural and vascular spread. • Contrast enhanced MRI (CE MRI) is superior to CT in the early detection of SBO as the marrow signal changes and the adjacent soft tissue changes are detected before bone erosion becomes evident on CT. • Intracranial complications such as meningitis, vascular complications, cerebritis and abscesses are also depicted earlier on MRI.

TABLE OF CONTENTS/OUTLINE

• Revisit skull base anatomy • Elucidate the pathways of spread of sinonasal fungal infection to involve the skull base • Illustrate the various findings of skull base osteomyelitis (SBO) in cases of COVID-19 related Acute Invasive Fungal Rhino Sinusitis (AIFRS) in our institute between March and September 2021 • Demonstrate the associated intracranial and extracranial complications.

HNEE-48 Extraocular Muscle Pathology: That's How Eye Roll

Participants
Juliana Sitta, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the normal orbital imaging anatomy highlighting the advantages of each imaging modality. To discuss the differential diagnosis of extraocular muscle (EOM) pathology including inflammatory, infectious, neoplastic, congenital, and traumatic etiologies. To recognize the importance of systematic EOM assessment in the diagnosis of systemic diseases and potential complications

TABLE OF CONTENTS/OUTLINE

The differential diagnosis of EOM pathology is broad and often challenging including inflammatory, infectious, neoplastic, and traumatic causes. Although eye movement disorders may be unclear on initial imaging, modalities including CT, MRI, and PET-CT along with clinical findings play a key role in identifying or ruling out important differential diagnosis. In this presentation we will review the imaging features of normal orbital anatomy and the spectrum of EOM pathology. We will illustrate a wide range of etiologies including key imaging findings to narrow down the differential diagnosis in various categories of disease such as congenital orbital fibrosis of the EOM, anophthalmia-microphthalmia, spontaneous hematoma, thyroid orbitopathy, orbital metastases, PET-CT findings in nerve palsy, idiopathic orbital inflammation, and IgG4 sclerosing disease of the orbit.

HNEE-49 Branchial Apparatus Lesions and Thyroglossal Duct Lesions: Embryology, Typical Imaging Findings of Those Lesions and Mimics

Participants
Yoshiko Y. Kurihara, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Many structures in the head and neck region arise from branchial apparatus. To learn congenital lesions secondary to abnormal embryogenesis in this region, the knowledge of these structures including embryology can make those diseases easier to understand. The thyroglossal duct also causes abnormal embryogenesis. On this presentation, the embryological changes of branchial clefts, pouches and thyroglossal duct are demonstrated. This presentation shows many developmental abnormalities as 1) fistulae, sinuses and cysts originated from branchial clefts and thyroglossal duct with typical location according to the embryology 2) complicated status of these lesions ; infection, neoplastic change including malignancy 3) ectopic thymus, ectopic parathyroid gland and ectopic thyroid tissue according to their migrating tract 4) neoplastic changes of these ectopic lesions, with CT, MRI, RI images and interpretations. In addition, 5) mimics should be differentiate from these lesions as well.

TABLE OF CONTENTS/OUTLINE

1) Figure of branchial apparatus developing structures anomalies. 2) Embryology of branchial apparatus. 3) Developmental abnormalities related to branchial cleft, complicated lesions and mimics. 4) Developmental abnormalities related to branchial pouch, complicated lesions and mimics. 5) Figure and embryology of thyroglossal duct. 6) Developmental abnormalities related thyroglossal duct, complicated lesions and mimics.

HNEE-5 High Resolution CT Angiography of the Orbits, Skull Base and Pterygopalatine Fossa

Awards
Certificate of Merit

Participants
Norbert Campeau, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To detail the arterial anatomy of the orbit, anterior skull base and pterygopalatine fossa through high resolution CT angiography images and corresponding anatomic legends.2. Discuss several of the more commonly occurring congenital arterial variants.3. Review relevant skull base foramina and fissures.

TABLE OF CONTENTS/OUTLINE

High resolution computed tomography angiography (CTA) of the brain and skull base has continued to improve substantially over the past two decades, now routinely obtained with sub-millimeter voxel resolution. In this educational exhibit, we present a detailed review of the arterial anatomy of the orbit and pterygopalatine fossa using high resolution CTA images obtained from a state of the art 510k cleared photon counting CT scanner. Arterial supply to the optic nerve, ocular globe, lacrimal gland will be detailed. Anatomy of internal maxillary artery branches will also be described, including course of the arteries of the pterygopalatine canal, foramen rotundum, sphenopalatine, greater and lesser palatine arteries. Anastomotic connections between meningeal, external carotid, and internal carotid artery branches via the inferolateral trunk will also be discussed.

HNEE-50 Open Your Eyes and Look Out for All the Windows - Evaluation of the Oval, the Round and Other Windows of the Inner Ear

Participants
Bruna Gherardi, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the pathophysiology of third window syndrome. To demonstrate the most common imaging aspects of oval, round, and other pathologic window changes and the clinical implications.

TABLE OF CONTENTS/OUTLINE

Physiology of air and bone auditory conduction. Imaging protocol. Mastoid trauma involving oval and round windows. Labyrinthine fistula. Fenestral and retrofenestral otospongiosis. Cochleofacial dehiscence. Carotid-cochlear dehiscence. Dehiscence of semicircular canals. Enlarged vestibular aqueduct syndrome. Round window stenosis.

HNEE-51 Facing the Challenge: Imaging of Facial Nerve Paralysis

Participants
Hugo Tames, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the anatomy of the normal facial nerve and its expected normal imaging appearances on CT and MR.To review causes of facial nerve paralysis, ranging from the commonest and less common diseases.To present the imaging appearances on CT and MR of facial nerve when affected by these pathologies.To present different cases of facial paralysis from the teaching files of a tertiary center, including typical appearance and atypical variants.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Review of facial nerve anatomy and its expected normal imaging appearance on CT and MRThe central nervous system segmentThe cisternal segmentThe meatal segmentThe labyrinthine segmentThe tympanic segmentThe mastoid segmentThe extra-temporal segment3. Review of different causes of facial paralysisBell's palsy / idiopathic paralysisFacial nerve arteriovenous malformationFacial nerve schwannomaFacial nerve meningiomaRamsay-Hunt syndromeMoebius syndromeMelkersson-Rosenthal syndromeMetaphyseal chondrodysplasiaFacial nerve paralysis secondary to perineural spread of adenoid cystic carcinoma Central facial paralysis secondary to ischaemic event4. To present the imaging appearances on CT and MR of facial nerve when affected by these pathologies

HNEE-52 Skull Base Osteomyelitis: Imaging checklist

Participants
Sri Lakshmi J P Rao G, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Should be suspected in all cases of infiltrative skull base lesions, particularly in diabetics and immunocompromised people, when repeated biopsies turn negative for malignancy.2. Imaging checklist to be followed while reporting a case of Skull base osteomyelitis.3. Mimics of Skull base osteomyelitis.

TABLE OF CONTENTS/OUTLINE

1. Introduction and types of SBO2. Imaging protocol3. Checklist for SBO reporting4. Role of imaging in follow-up5. Imaging mimics of SBO

HNEE-53 Head and Neck Sarcoma: A Magnetic Resonance Imaging Review Based on the 2020 World Health Organization Classification

Participants
Simone Caprioli, MD, Genova, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Magnetic resonance imaging (MRI) characteristics of head and neck sarcomas are often nonspecific and may be difficult to identify the precise diagnosis. 2. The recognition of the epicenter of the mass allows to differentiate a soft tissue from a bone or cartilage tumor. 3. MRI may narrow the differential diagnosis by analyzing the signal of the matrix of the tumor. 4. MRI is useful for identifying orbital and intracranial invasion.

TABLE OF CONTENTS/OUTLINE

In 2020 a novel classification system for soft tissue and bone tumors was published by the World Health Organization (WHO). Even though it is usually applied for trunk and extremities sarcoma, it may be a guide for characterizing non-epithelial lesions of head and neck. Magnetic resonance imaging (MRI) plays a pivotal role in the diagnosis of head and neck sarcoma, supporting the hypothesis of the non-epithelial origin of a mass and suggesting clues about histology. This work aims to review the MRI characteristics of non-epithelial neoplasms of head and neck as they are grouped in the 2020 WHO classification. Moreover, it offers a guide for precise local staging and for narrowing the differential diagnosis, thanks to a combination of criteria: location, epicenter, and MRI signal characteristics. The present work was based on a ten-years long multicentric record of 248 cases of head and neck sarcomas.

HNEE-54 Unboxing the Voice Box: Imaging in Laryngeal Malignancy

Awards
Identified for RadioGraphics
Certificate of Merit

Participants

Anu Kamalasanan, FRCR, MBBS, East Renfrewshire, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) T1 lesions may be radiologically occult . 2) Nodal disease occurs late in glottic malignancy due to the relative paucity of lymphatic drainage of vocal cords 3) Anterior commissure involvement precludes hemilaryngectomy and may be associated with early cartilage invasion from extension along Broyle ligament 4) Paraglottic/ pre-epiglottic fat infiltration upstages disease to T3. Assessment can be done with CT/ MRI and USS 5) Thyroid cartilage has a variable appearance - unossified thyroid cartilage can make it difficult to differentiate from infiltration. USS and MRI can be used to differentiate between the two.

TABLE OF CONTENTS/OUTLINE

1) Illustrate with images, normal laryngeal anatomy including TNM subsites 2) Describe Imaging modalities for assessment and staging of laryngeal malignancy. 3) Update on Ultrasound and MRI as imaging adjuncts 4) TNM staging with examples 5) Illustrate various patterns of spread6)Discuss management pathway.

HNEE-55 Anatomic Approach to Pharyngeal SCC Staging and Patterns of Spread

Participants
Daniel Warren, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Brief discussion of the revised 8th edition of the American Joint Committee staging of pharyngeal squamous cell carcinomas (SCCs).2. Overview of anatomic landmarks vital for staging of pharyngeal SCCs and discussion of imaging evaluation of invasion and extranodal extension.3. Image-based review of common routes of spread based on the location of origin.

TABLE OF CONTENTS/OUTLINE

1. Background2. HPV status and outcomes3. Nasopharyngeal SCC 3a. Staging 3b. Imaging Features 3c. Common and Easily Missed Locations 3d. Routes of Spread4. HPV/P16(+) Oropharyngeal SCC 4a. Staging 4b. Imaging Features 4c. Common and Easily Missed Locations 4d. Routes of Spread5. HPV/P16(-) Oropharyngeal SCC and Hypopharyngeal SCC 5a. Staging 5b. Imaging Features 5c. Common and Easily Missed Locations 5d. Routes of Spread6. Conclusion

HNEE-56 Fire in the Hole!: Jugular Foramen Pathology and Pitfalls

Participants
Fernando Ferraro IV, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Explain the anatomical continent and content of the jugular foramen.Based on clinical findings, interpret the location of lesions involving the jugular foramen.Review of various lesions, variants and pitfalls involving the jugular foramen.Describe radiological findings secondary to cranial nerve deficit.

TABLE OF CONTENTS/OUTLINE

Technical specifications and protocol to study the jugular foramen.Schematic summary of the anatomy of the jugular foramen, including anatomical variations, and its importance for interpreting clinical examination.Illustrate the principal images findings with clinical examples (such as Vernet's syndrome, schwannomas, desmoid tumor, etc).

HNEE-57 Lymphoproliferative Lesions of the Orbit

Awards
Certificate of Merit

Participants
Taisa Santos, MD, Salvador, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Lymphoproliferative lesions represent the most common primary orbital disease, manifesting mainly in the elderly, and may also be a manifestation of systemic lymphoproliferative disease.Imaging evaluation is essential to guide the diagnosis, follow-up and treatment response, since the clinic presentation is nonspecific signs and symptoms and can mimic other orbital pathologies. CT image pattern is not very specific, usually presenting as a mass that molds to the orbital walls, isoattenuating/hyperattenuating, with homogeneous contrast enhancement. It rarely presents with bone erosion, when present, it is usually associated with diffuse large B-cell lymphoma. MRI is the imaging method of choice and some sequences are essential for distinguishing pathologies that may mimic lymphoproliferative lesions, especially idiopathic orbital inflammatory disease, which may have similar signs and symptoms, being clinically different by association with painful proptosis and findings of image, as high ADC values ??on MRI. The main differential diagnoses include idiopathic orbital inflammatory syndrome, orbital cellulitis, thyroidopathy, sarcoidosis, IgG4, granulomatosis with polyangiitis, and metastases.

TABLE OF CONTENTS/OUTLINE

IntroductionHistological classificationClinical findingsImage protocolImage patternsDiagnósticos diferenciaisPrognosis and follow up

HNEE-58 Breathe In Breathe Out: Obtaining Clarity in Imaging of Sino Nasal Malignancy

Participants
Janani Baradwaj, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

±Sino-nasal malignancies are mostly squamous cell types ±Historically Ohngren's line was used in prognostication and management. It is an imaginary line drawn from the angle of the mandible to the medial canthus of the eye, dividing the antrum. Disease involvement above the line is associated with a poor prognosis. ±CT demonstrates the extent of osseous involvement better. Soft tissue and nodal disease are assessed with post-contrast CT. ±MRI helps differentiate between mass and inflammatory change in

the sinuses.°Tumour - Low T1, Low T2 signal, Heterogeneous enhancement °Mucosa - Low T1, High T2 signal, Intense homogeneous enhancement °Secretions - Low T1, Very high T2 signal, No enhancement ±MRI also helps to assess orbital, intracranial and perineural spread ±MRI is more sensitive for assessment of perineural spread - Enlarged affected nerves have high T2 signal with perineural enhancement, loss of normal T1 fat signal and normal CSF signal in the foramina. ±Perineural spread on CT - Enlargement and erosion of foramina, loss of normal low attenuating fat, Soft tissue attenuation of foramen.±Sino-nasal malignancies have a moderate incidence of loco-regional recurrence with late nodal disease. The presence of positive neck nodes is associated with higher incidence of disease recurrence. Retropharyngeal nodal involvement should be actively looked for on CT and MRI

TABLE OF CONTENTS/OUTLINE

±Describe normal paranasal sinus anatomy with images ±TNM staging of sino-nasal malignancy ±Illustrate with images routes of spread of malignancy ±Describe histopathological types of malignancies involving the sino-nasal cavity with images ±Radiological prognosticating factors ±Discuss management pathway

HNEE-59 What You Need to Know Before Reporting a Nasopharyngeal Tumor

Participants
Maria Rocha, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Simplifying and help less experienced radiologists know how to actively look for the critical areas that changes the treatment and staging of the patient. Review basic anatomy highlighting the main anatomical milestones in tumor staging. Illustrate common path of nasopharyngeal tumor.

TABLE OF CONTENTS/OUTLINE

Introduction to nasopharyngeal tumors A comprehensible guide of key anatomy and correlating to TNM / prognostic information Flowchart that resumes the critical points of the staging Didactical cases following the proposed flowchart

HNEE-6 Temporomandibular Joint Imaging from Basic to Advanced

Participants
Eduardo Valadares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the anatomy and biomechanics of temporomandibular jointExhibit the normal appearance of temporomandibular joint in advanced imaging (CT and MRI)Summarize the main temporomandibular joint disfunctions and disorders with a group-based approach

TABLE OF CONTENTS/OUTLINE

Introduction Anatomy and biomechanics of temporomandibular jointNormal CT and MRI appearanceAbnormal development of the temporomandibular joint (aplasia/hypoplasia/hyperplasia)Temporomandibular joint disfunction (direct and indirect signs)Traumatic lesionsInflammatory arthritis• Osteoarthritis• Rheumatoid arthritis• Juvenile inflammatory arthritis• 7. Tumor and tumorlike lesions• Metastasis• Fibrous dysplasia• Synovial chondromatosis• Pigmented villonodular synovitis Take-home messages/Conclusions

HNEE-60 Multimodality Imaging of Carotid Paragangliomas

Participants
Ingrid Alonso Ramon, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points1. To review general characteristics of paragangliomas for a better understanding of carotid glomus2. To discuss general concepts of a carotid glomus, including the different types and their incidence3. To describe different multimodality imaging characteristics (ultrasound, CT, MRI, PET/CT and angiography) including the recommended protocols and pros and cons of each one. 4. To recognize importance of diagnosis, treatment and follow up

TABLE OF CONTENTS/OUTLINE

Table of contents1. Description of general characteristics of paragangliomas including common sites of occurrence, incidence, pathophysiology and embryology.2. Description of general features of carotid paragangliomasa. Epidemiologyb. Anatomyc. Detailed pathologic characteristicsd. Clinical presentation including functional paragangliomase. Differential diagnosis3. Review of multimodality imaging findings including recommended protocol and expected findings for each one4. Discussion of management and outcome including Shambling classification and prognosis based on pathology or imaging findings

HNEE-61 Postoperative Imaging of Sinonasal Surgery and its Complications: What To Look for?

Participants
Raphael Correia, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To recognize the main sinonasal surgeries and their anatomic landmarks.To understand the expected postoperative findings of sinonasal surgery.To review the clinical presentations and imaging findings of sinonasal surgery complications.

TABLE OF CONTENTS/OUTLINE

Introduction. Sinonasal Anatomy. Main Surgical Procedures and Their Anatomic Landmarks. Imaging Technique and Protocols. Expected Postoperative Appearance, Including Grafts and Prosthesis. Clinical Presentations and Imaging Features of Postoperative Complications With Teaching Cases. Conclusions. References.

HNEE-62 The radiologist´s guide to the Pterygopalatine Fossa

Awards
Identified for RadioGraphics

Participants
Alba Salgado Parente, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review in detail the anatomy and communications of the pterygopalatine fossa (PPF).2. To expose the main keys to recognize and evaluate the perineural extension of tumors.3. To review the main pathologies that can affect this anatomical area.4. To develop a systematic approach to facilitate the evaluation of this space and avoid diagnostic errors.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Imaging anatomy, content and communications of the PPF2.1 Where is and what are the boundaries of the PPF? 2.2 What does the PPF contain?2.3 Anatomical relationships and communications of the PPF.3. Pathology of the PPF3.1 Perineural extension: Concept, radiological signs and pathology (cavum carcinoma, palatal carcinoma and paranasal sinus carcinoma).3.2 Other pathologies: Direct tumor dissemination, masticatory space sarcomas, nasopharyngeal angiofibroma, invasive fungal disease, schwannomas and inflammatory pseudotumor.4. Pitfalls and how to avoid them: post-surgical changes and mimics5. Systematic approach to PPF: The nerve pathways that must be carefully evaluated depending on the pathology we are facing6. Take Home Points7. Bibliography

HNEE-63HC Lessons From Dental School: What the General Radiologist Needs to Know About Teeth

Participants
Cameron Spence, MBChB, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologists who have not attended dental school are at a disadvantage when interpreting OPGs and other oral images such as CT. Whilst radiology curricula include frequently examined pathologies, such as periapical infections and cystic mandibular lesions, limited understanding of the basics of dentistry hamper our interpretation in clinical practice.This pictorial review will highlight the most important background concepts for radiologists that the authors learned during their dental degrees. Understanding these concepts will aid interpretation and help your delegates to provide more useful reports for the extended clinical team and patients.

TABLE OF CONTENTS/OUTLINE

Relevant radiographic dental anatomy. Restorative dentistry - how to recognize different restorations, including composite/amalgam/temporary fillings, root canal fillings, crowns, bridges, dentures, implants, and orthodontic appliances. Dental caries - where this begins, how it spreads through the dentine to the pulp, and how it leads to periapical pathology. Periodontal disease - generalized and localized types, assessing alveolar bone loss and recognizing commonly overlooked acute periodontal infections. Pericoronitis and impacted wisdom teeth. OPG limitations compared with intraoral dental radiographs.Please visit the Learning Center to also view this presentation in hardcopy format.

HNEE-64 Imaging Evaluation of Pulsatile Tinnitus: Case Based Review

Participants
Sang Soo Shin, MD, Gwangju, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the etiologic causes of pulsatile tinnitus2. To review the imaging role and technique in evaluation of pulsatile tinnitus3. To review the imaging findings and differential diagnosis4. To discuss the endovascular treatment of pulsatile tinnitus

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Imaging role and technique in evaluation of pulsatile tinnitus3. Imaging findings and differential diagnosis: case based review1) Neoplastic: glomus tympanicum paraganglioma, glomus jugulare paraganglioma, meningioma2) Osseous: otosclerosis, intraosseous hemangioma, Paget's disease3) Arterial: aberrant ICA, persistent stapedial artery, ICA dissection/stenosis4) Venous: high riding jugular bulb, jugular bulb diverticulum, jugular bulb/sigmoid plate dehiscence, transverse sinus stenosis, dilated emissary vein5) Arteriovenous: dural AV fistula, AVM4. Endovascular treatment5. Summary

HNEE-65 A review of Uncommon Benign Pathologies of Larynx

Participants
Pooja Muddana, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The larynx can be affected by a multitude of pathologies of which squamous cell carcinomas are commonly encountered. Benign pathologies demonstrate typical imaging features, which aid in narrowing the list of differential diagnoses and differentiating them from malignant conditions. In this presentation we will: 1) Review the typical clinical presentation and pathology of the uncommon benign conditions. 2) Review imaging appearance of benign conditions that involve the larynx. 3) Review differential diagnoses for these conditions.

TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Congenital - Laryngeal clefts, congenital high airway obstruction, laryngomalacia3) Laryngocoele and laryngopyocoele4) Infective conditions- Tuberculosis, Actinomycosis, Fungal infections, Scleroma, Leprosy5) Immunological conditions - Granulomatous with polyangiitis, Relapsing polychondritis, Sarcoidosis, Rheumatoid arthritis, Ankylosing spondylitis 6) Amyloidosis 7) Thyroglossal duct cyst 8) Vascular malformations- Lymphatic malformation, Arteriovenous malformations 9) Conclusion

HNEE-66 New Pathways: Postoperative Changes in Aerodigestive Tract After Neck Surgery

Participants
Naomi Murakami SR, MBBS, Niteroi, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review normal neck anatomy in order to identify surgical manipulations.Recognize the anatomic changes that are associated with aerodigestive tract surgery.Discuss important complications of these procedures.

TABLE OF CONTENTS/OUTLINE

Different types of devices are used in surgery for neck injuries and diseases. They can be either parts of organs, such as neoesophagus with colon, or medical devices, such as metallic prosthesis. It's important to Identify correctly these neck changes and complications that may be associated. This pictorial review will discuss.1. Neck anatomy review.2. The role of different imaging techniques in evaluation of medical devices, anatomic changes and complications:a. Computed tomographyb. Magnetic resonance imagingc. Esofagogram3. Surgical techniques and anatomic changes:Esophagectomy: gastric tube and colon interpositionProsthesis in upper airwayEsophageal prosthesisTracheoesophageal phonation prosthesis4. Complications: Collection/ abscessFistulas: tracheoesophageal, esophagocutaneous, pharyngocutaneousNecrosis

HNEE-67 The Face of Beauty: Image Features and Complications of Facial Cosmetics Procedures

Awards
Identified for RadioGraphics

Participants
Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the anatomy of facial fat compartments To discuss and illustrate, through clinical cases, the imaging aspects expected after a facial aesthetic procedure, as well some relevant complications and common diagnostic pitfalls.

TABLE OF CONTENTS/OUTLINE

Anatomy of fat compartments Contribution of different non-invasive imaging methods to detect facial cosmetic material Types of cosmetic proceduresFacial Implants Fillers: Fat filler, hyaluronic acid, polymethylmethacrylate, calcium hydroxyapatite, paraffin, silicone Thread-Lifting BlepharoplastyBichectomy Complications of facial filler injections and role of imagingHematoma and seroma formation Infections Migration of injected substances Asymmetries Formation of foreign body granuloma Vascular occlusion leading to skin necrosis or blindness Inadvertent injury to adjacent structures Pitfalls in image interpretations

HNEE-7 Vocal Cord Paralysis: A Practical Approach

Participants
Thiago Martins Fernandes Vilela, Mogi das Cruzes, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

-- To review the normal anatomy of vagal and recurrent laryngeal nerves and the larynx.-- To illustrate the specific and secondary imaging features found in vocal cord paralysis and its mimics and pitfalls.-- To develop an analysis roadmap that should be performed when faced with a vocal cord paralysis.-- Illustrated review of a series of cases of vocal cord paralysis and lesions that may possible be related to vocal cord paralysis.-- To demonstrate the treatments that can be performed in these cases, their imaging aspects and possible complications.

TABLE OF CONTENTS/OUTLINE

-- Introduction-- Epidemiology-- Clinical scenarios-- Anatomy- Vagus nerves and their nuclei- Recurrent laryngeal nerves- Larynx-- Typical and secondary imaging features-- Pitfalls and mimics-- Analysis roadmap-- Series of cases of vocal cord paralysis-- Treatments and their image appearance-- Conclusion

HNEE-8 Fungal Infections of the Head and Neck: Imaging Spectrum

Participants
Niels Vinicius Padua Carvalho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The aim of this exhibition is to:2. Review the spectrum of fungal infections of the head and neck.3. Discuss the main findings across all imaging techniques, overall CT and MRI4. Unify all this conditions in a single article/presentation.5. Highlight the importance of imaging in the diagnosis and treatment process.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTIONa. Considerations on fungal infections and its prevalence and relevance affecting head and neck structures.2. IMAGING INTERPRETATIONa. Imaging techniques and findings.b. When to do imaging screening, control and surveillance for these diseases.3. INTERACTIVE CASE-BASED DIDATICSa. Sample cases to illustrate and solidify the concepts about the main findings of these diseases, separated through head and neck spaces: i. Temporal bones ii. Pharinx iii. Larynx iv. Orbit v. Sinuses4. FURUE DIRECTIONS AND TAKE HOME MESSAGES

November 27 to December 1 | McCormick Place, Chicago

Abstract Archives of the RSNA, 2022

HNEE-1

A Blurry Confusion-Optic Neuropathy Etiologies And Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Certificate of Merit

Participants
Luis Souza, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Optic neuropathy is a broad definition that encompasses a myriad of different diagnoses.Objectives: Understand what is expected from the radiologist when faced with this difficult group of diseases, which the imaging findings can be subtle and often missed. To illustrate the most common imaging findings of optic neuropathy. To show the useful imaging hallmarks that help differentiate active disease from sequelar changes and differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Imaging investigation protocol: optic neuropathy standard imaging protocol and useful additional MRI sequences that can help in the diagnosis.General and common imaging findings in optic neuropathy. Differentiating active disease and sequelae?Main imaging characteristics and differential diagnosis of the different etiologies.- Inflammatory / Infectious (Viral, Bacterial, Other).- Inflammatory / Autoimmune. (Demyelinating - NMOSD, MS, Anti-MOG+, Paraneoplastic - and Non-Demyelinating).- Ischemic (anterior and posterior ischemic neuropathy).- Toxic-metabolic.- Compressive.- Infiltrative.- Traumatic.Take-home messages and tips and tricks to differential diagnosis.

HNEE-10

Perimarginal Nodes - An Underestimated Site for Metastatic Squamous Cell Oral Cancer: A CT Pictorial Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Certificate of Merit

Participants
Erik Radin, MD, Trieste, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Definition of perimarginal nodes (PMN). (2) To explain the clinical relevance of the PMN. (3) To illustrate the spatial identification of PMN on CT imaging.

TABLE OF CONTENTS/OUTLINE

Head and neck squamous cell cancer is notoriously affected by an elevated risk for metastatic nodal disease, one of the most important prognostic factors. Nodal status represents one of the fundamental parameters of the TNM staging system; it is also essential for the therapeutical approach, with elective neck dissection as the leading treatment. Perimarginal nodes (PMN) are often considered as facial rather than cervical lymph nodes, even though they could be regarded as a submandibular nodal subgroup (level IB). They lie close to the marginal mandibular nerve (MMN), within a clinically defined distance cut-off of 1 to 2 cm from the mandibular border. CECT imaging has high accuracy for PMN identification and allows to divide them into four different sites, depending on their relationship with the anterior facial vein (AFV) and the submandibular gland: preglandular, prevascular, retrovascular, and retroglandular nodes. Perimarginal nodes could represent a miscalculated site for occult metastases in head and neck cancers, especially those located in oral cavity. Unintentionally, small perimarginal nodes could be left in the surgical site in order to protect the MMN during neck dissection through the Hayes Martin maneuver; this would affect the patient's prognosis, precluding a complete therapeutic response, with an increased risk of disease relapse.

Facial Ultrasound Anatomy of the Aging Skin and the Growing Role of the Radiologist in the Aesthetic Medicine Field

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Slavina Mancheva, MD, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To evaluate the normal facial anatomy. Causes of normal aging visible and quantified by imaging studies. To evaluate pre, during and post-treatment status of beauty treatments using autologous and FDA authorized dermal fillers. The use of ultrasound to guide dermal filler injections.To identify facial danger zones.

TABLE OF CONTENTS/OUTLINE

1.Facial anatomy depiction. Nowadays there is continuous growth of the aesthetic facial treatments using fillers and neurotoxins. In order to prevent complications it is very important to analyze the area of interest using ultrasound- being a safe and handy technique.2.Aging of upper, mid and lower face. In this exhibit a couple of patients in their mid 20s, mid 30s and late 60s are analyzed using ultrasound. Some patients are followed pre and post treatment sessions in order to identify the causes of their individual aging and also offer them follow up of their treatment.3.The difficult case and the role of the radiologist in a multidisciplinary aesthetic medicine team. Many patients has been using different type filler treatments and some appear with different and unknow secondary effects. The radiologist must identify the relevant variation anatomy, possible iatrogenic effects and help during invasive treatments. 4.The facial danger zones. Identify the major danger zones where the practioner must be very careful and decide what options of treatments must be offered in a safe manner.

A Joint Affair: Radiologic Findings of TMJ Anatomy and Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Certificate of Merit

Participants
Samantha Platt, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review TMJ anatomy and variation with function through radiologic and medical illustration. 2. Review Wilke's criteria and relevant findings for internal derangement including disc displacement with or without reduction, disc morphology, joint effusion and bony changes such as sclerosis and subcortical cysts.3. Demonstrate imaging findings associated with the diverse spectrum of TMJ disorders through varied modalities. 4. Describe features of TMJ disorders that are helpful to include in report for general radiologists and neuroradiologists.

TABLE OF CONTENTS/OUTLINE

Temporomandibular joint (TMJ) disorders exhibit variable radiographic presentation. Many causes of extra-articular pain (i.e. muscle fatigue, fibromyalgia) do not have imaging findings. The best modalities to evaluate the TMJ include MRI and CT and should be chosen based on clinical symptoms and the anticipated pathology. We have curated images from various modalities for TMJ pathologies: osteoarthritis, mandibular hypoplasia, bifid mandibular condyle, hemicranimegaly, infectious synovitis, osteomyelitis, malignant otitis externa, osteonecrosis, rheumatoid arthritis, ankylosing spondylitis, chondromatosis, giant cell granuloma, squamous cell carcinoma, metastatic disease, nasopharyngeal carcinoma, mandibular fractures, pseudoarthrosis, myositis ossificans, ankylosis, osteoradionecrosis, and surgical implants. Additionally, we have curated MR views that exemplify the pathology seen in each of Wilke's classification for internal derangement along with pictorial representation. Imaging is crucial to noninvasive assessment of the TMJ and subsequent management plans.

Don't Wait Till Neck Time: Learn the "Spatial" Way to Master Neck Anatomy on Ultrasound Now

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Paran Davari, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe the concept of spaces of the neck and highlight spaces that can be evaluated on ultrasound. 2. Provide a sonographic atlas for the spaces using multimodality comparison to better understand spatial relationships. 3. Learn contents of each space to help guide a space specific differential diagnosis.4. Overall increase familiarity with anatomic structures that might often be ignored while interpreting a neck ultrasound obtained for frequent indications such as thyroid gland, cervical lymph node or carotid evaluation, as well as increased knowledge of relevant anatomy for less frequent indications such as parotid or submandibular gland evaluation. 5. Provide examples of clinical applications of this anatomic knowledge on ultrasound for diagnostic and potentially procedural purposes.

TABLE OF CONTENTS/OUTLINE

1. Learning objectives 2. Introduction to neck anatomy on ultrasound: current practices3. Introduction to spaces of the neck4. Describe sonographically visualized spaces of neck, content and clinical considerations A. Superficial space of neck B. Deep neck spaces limited to suprahyoid neck: i. Parotid spaceii. Submandibular spaceiii. Floor of mouth or sublingual spaceiv. Masticator space C. Deep neck spaces limited to infrahyoid neck:i. Visceral spaceii. Anterior cervical spaceiii. Posterior cervical space D. Deep neck spaces spanning entire neck:i. Carotid spaceii. Perivertebral space

Practical Applications of the Permeability Study in Head and Neck Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Permeability imaging or quantitative DCE-MRI is a functional MRI modality that involves repeated acquisition of images of the same lesion and analyses of the Time-signal intensity curves (TICs) of the tumor and feeding artery to yield various parameters related to perfusion and permeability within the tumor. It has been reported to be useful in the differentiation of head and neck tumors, most commonly of the parotid gland, as well as tumors in other organs.This panel aims to: Define what is the permeability study Review of the technique Cite the main clinical indications for permeability study in head and neck imagingIllustrate through clinical cases the applications of perfusion permeability imaging in head and neck

TABLE OF CONTENTS/OUTLINE

Salivary gland tumors (i.e.: pleomorphic adenoma, Warthins's tumor and carcinoma) Distinction of benign versus malignant tumor (i.e.: lymphoma, spinocellular carcinoma, pagaranglioma and schwannoma) Histologic differentiation among lesions, in combination with DWI and conventional T1 and T2 imaging (i.e.: pleomorphic adenoma, Warthin's tumor, lymphoma, paraganglioma) Differentiation of recurrent tumor versus post-therapeutic changesPrediction of response to radiotherapy and chemotherapy Biopsy guidance Metastatic cervical lymph nodes

One Nerve is Just Right, Two is Too Many, Three is Not Enough - Unraveling the Trigeminal Nerve and It's Alterations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Fernanda Guedes, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review the anatomy of the trigeminal nerve from its sensory and motor nucleus, the branches and peripheral segments.-Review the most common trigeminal nerve diseases in each segment and their radiological findings.-Learn more about some important differential diagnoses for each nerve segment.

TABLE OF CONTENTS/OUTLINE

1. Simplify trigeminal nerve anatomy, the largest of the twelve pairs of cranial nerves, and its segments (intraaxial, cisternal, Meckel's cave/cavernous sinus and peripheral). 2. Describe the relationship between trigeminal nerve segments and adjacent anatomical structures like skull base foramina, cavernous sinus, infraorbital canal and pterygopalatine fossa. 3. Summarize the different diseases that affect each trigeminal nerve segment, from the most common injuries, such as neurovascular conflicts, to the rarer pure motor neuropathy, highlighting some pathologies like: - Hypoplasia; - Herpes Zoster; - Trigeminal nerve schwannoma; - Meningioma; - Demyelinating disorders; - IgG4 related disease; - Lymphoproliferative disease; - Dermoid cyst; - Perineural facial tumor spread; - Post surgical trigeminal alterations; - Leptomeningeal carcinomatosis; - Neurosyphilis.

Post-treatment Head and Neck Cancer Imaging: Anatomical Considerations Based on Cancer Subsites

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Takashi Hiyama, MD, PhD, Kashiwa, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recurrence of head and neck cancer occurs in approximately 10-20% of patients with early stage cancer, and 50-60% of those with advanced cancer. Detecting recurrent tumors at a treatable stage contributes to improved prognosis. The interpretation of follow-up images should be considered separately for each subsite as head and neck cancers can arise at various anatomical subsites. For each subsite, knowledge of normal imaging changes after surgery or chemoradiotherapy and patterns that are prone to recurrence are essential for detecting recurrence. When a lesion is detected, a differential diagnosis of recurrence, posttreatment changes, or other pathologies may be required. NIRADS is a useful tool for these evaluations. In addition, radiologists should assess the extent of recurrent tumors to select optimal salvage treatment. The purposes of this exhibit are: 1) To discuss normal post-treatment imaging at each subsite 2) To discuss the imaging findings of early local recurrence at each subsite, and neck recurrence 3) To discuss how to assess recurrence to allow subsequent optimal treatment

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Overview Epidemiology of head and neck cancer recurrence Roles of CT/MRI and PET/CT in follow-up NIRADS 3. Case illustrations Imaging findings of post-treatment change and recurrence: Oral cavity, Nasopharynx, Oropharynx, Hypopharynx, Sinonasal cavity, Larynx, Neck Imaging evaluation of recurrent tumor extension for salvage treatment 4. Summary 5. Conclusion

Neuroendocrine Neoplasms of Head and Neck: Spectrum

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Shreya Shukla, MBBS, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

The spectrum of neuroendocrine neoplasms (NENs) of the head and neck varies from benign neoplasms which may require just observation to poorly differentiated malignant neoplasms that may require multimodality treatment or palliative care. According to the fifth edition Classification of by the World Health Organization (WHO) International Agency for Research on Cancer (IARC) consensus meeting held in Lyon on 2-3 November 2017, NENs can be of epithelial or non-epithelial origin. Epithelial variety can range from well-differentiated NENs known to occur in small intestine, ovary etc to poorly-differentiated neuroendocrine carcinoma NECs (lung, colon). These tumors may be functional or non-functional. Nuclear imaging has an important role.

TABLE OF CONTENTS/OUTLINE

This educational exhibit contains: • Review of classification of neuroendocrine neoplasms (NENs) • Enlists the common site of occurrence of NENs in the head and neck. • Review of the imaging appearance of these neoplasms at various sub-sites. • Briefly reviews the management of these neoplasms.

Novel Imaging Techniques in the Management of Thyroid Nodules and Diffuse Thyroid Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Thiago Jose Pinheiro Lopes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) The gold standard of thyroid nodules diagnostics is conventional ultrasonography followed by fine-needle aspiration biopsy of qualified lesions, an invasive procedure related to inconclusive cytological results in up to 10-25% patients. 2) There is a need to search for novel imaging procedures or markers, that would allow a non-invasive estimation of malignancy risk with satisfying sensitivity and specificity. 3) Our purpose is to review imaging innovative applications in the management of thyroid nodules and diffuse thyroid disease, with focus in shear wave elastography (SWE) and contrast-enhanced ultrasonography (CEUS).

TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Conventional Techniques: B-mode and Doppler 3) Novel imaging techniques 3.1) Elastography (SWE) 3.2) CEUS 3.3) Next-generation molecular imaging 4) Radiological-pathological correlations 4.1) Thyroid nodules 4.2) Autoimmune thyroid disease 5) Challenges, pearls and pitfalls 5.1) Detecting extra-thyroid extension 5.2) Assessing lymph node metastases 5.3) Thyroid nodules in pediatric population 6) Future directions 6.1) Novel biochemical and genetic markers 6.2) Artificial intelligence (radiomics) 7) Take home messages

Imaging of Head and Neck Vascular Anomalies (Tumors and Malformations)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Augusto B. Antunes, MD, MSc, Nova Lima, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vascular tumors and vascular malformations are commonly found in the head and neck region and have distinctive features. Radiologists should be aware of their presentation features and clinical history to establish the correct diagnosis and provide appropriate care. Imaging allows for high spatial and temporal resolutions and is essential for the correct diagnosis of these pathologies, but also for assessing the extension and anatomical relationships, as well as for studying blood flow patterns. We will highlight proliferating vascular tumors and vascular malformations, often misdiagnosed due to confusing definitions and classifications. After completing this reading, participants will be able to comprehend and to recognize specific features for various such anomalies, including infantile hemangioma, congenital hemangioma, lymphatic, venous, arteriovenous and capillary malformations, and combined anomalies.

TABLE OF CONTENTS/OUTLINE

Classification, clinical presentation, and evolutional history of the most common vascular anomalies of the head and neck. Case-based review illustrating the findings of vascular tumors and vascular malformations on different imaging modalitiesTake-home messagesReferences

Differential Diagnosis Between Chondrosarcoma and Synoival Chondromatosis of the Temporomandibular Joint Using CT and MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Kyung-Hoe Huh, PhD, DDS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chondrosarcoma and synovial chondromatosis are a representative tumor or tumor-like arthropathy of the temporomandibular joint, producing cartilaginous calcification within the mass and causing bone changes of the mandibular condyle and/or articular eminence/glenoid fossa. Imaging differentiation between chondrosarcoma and synovial chondromatosis of the TMJ is very important, because they share clinical and histopathological features. CT and MR imaging features such as lesion epicenter of the mandibular condyle, infiltration into the tendon of the lateral pterygoid muscle, destruction of the mandibular condyle, no destruction/sclerosis of the articular eminence/glenoid fossa, calcification pattern (absence or stippled), periosteal reaction, and internal enhancement can be an effective tool to differentiate between chondrosarcoma and synovial chondromatosis. The single imaging feature with the highest performance for differential diagnosis is infiltration into the tendon of the lateral pterygoid muscle. With combination of the several imaging features, the diagnostic performance can be improved.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Anatomy of the temporomandibular joint a. comparison of lesion epicenter b. infiltration of the tendon of the lateral pterygoid muscle 3. Imaging parameters of the TMJ on CT and MR image 4. Imaging features of chondrosarcoma 5. Imaging features of synovial chondromatosis6. Differentiation between chondrosarcoma and synovial chondromatosis7. Conclusion

The Hidden Windows Between the Neck Spaces

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Daniel Sebastian Chaves Burbano, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To identify the limits, content and communication between the neck spaces, it is useful the understanding that some of them are virtual spaces.- The cervical fasciae are non-continuous connective tissue structures that surround the muscles, nerves, and vessels of the neck and establish the spaces in the neck. Its functions are to be a barrier and reduce friction between structures. These are two: superficial cervical fasciae and deep cervical fasciae.- Some of the neck spaces have no boundaries between them, so they are connected to each other. Identifying the communication between them is an important step approaching the images.- The communication between the spaces of the neck is not only between them, but also with the base of the skull, thorax and the back, and they are not usually easy to find. They can be a route of dissemination of pathologies.

TABLE OF CONTENTS/OUTLINE

- Gross anatomy- Superficial cervical fascia- Deep cervical fascia- Suprahyoid deep neck spaces- Infrahyoid deep neck spaces- Supra and infrahyoid deep neck spaces- The windows between the neck spaces- Conclusions

Virtual Reality Module Reinforcing Cranial Nerve Deficits with Physical Examination

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Christopher Lack, MD, PhD, (*Presenter*) Consultant, PhenoMx, Inc

TEACHING POINTS

The relationship between cranial nerve anatomy, function, pathology and physical examination findings requires a deep understanding of multiple domains. Virtual reality has the potential to be a powerful tool in teaching, reinforcing concepts that are not well represented by textbooks. Using our interactive 3D model, the learner can easily examine the important anatomic structures and be exposed to many pathologic states without the need for multiple unique patient encounters. This module could easily be used around the world if the end-user has an appropriate VR headset.

TABLE OF CONTENTS/OUTLINE

Using MRI and CT data, we developed an interactive high-fidelity 3D model, in a virtual environment, that highlights the anatomy of the orbits and cranial nerves II, III, IV, VI. The user can view and interact with the anatomic structures using a VR headset and perform an exam of the extraocular muscles. Using the "Quiz-mode" users will be tested on an unknown cranial nerve deficit and will have to identify the deficit based on an actual physical exam in the virtual environment. The module can be seen both in 3D by wearing the VR goggles but also in 2D on the attached laptop screen. Since the power of 3D and physical exam is best demonstrated using the VR headset, please come to the exhibit to experience the headset demo.Please visit the Learning Center to also view this presentation in hardcopy format.

Advanced Imaging Biomarkers in Head and Neck Cancer: Precision Diagnosis, Gene Mutation Detection, and Treatment Response Assessment and Prediction

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Yoshiaki Ota, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching point1. To review physics of DWI, CT perfusion, MR spectroscopy, dynamic susceptibility contrast perfusion MRI (DSC-MRI), and dynamic contrast-enhanced MRI (DCE-MRI)2. To demonstrate head and neck tumors and application of advanced imaging for tumor differentiation, gene mutation detection, and assessment of treatment effect3. To demonstrate pitfalls of advanced imaging

TABLE OF CONTENTS/OUTLINE

Outline1. Physics and clinical application- DWI: Assessment of cellularity, cytotoxic/vasogenic edema- CT perfusion: Assessment of vascular space of the lesions- MR spectroscopy: Detection and quantification of abnormal metabolites related to gene mutation- DSC-MRI: Assessment of vascularity, permeability, and hemodynamic pattern (First pass)- DCE-MRI: Assessment of vascularity, permeability, and hemodynamic pattern 2. Head and neck tumors- Infratentorial extra-axial tumorsa. Common tumors/meningiomas, schwannomas, paragangliomasb. Atypical/metastasis, chordoma, chondrosarcoma, endolymphatic sac tumor- Tumors in the head and neck mucosal surface- Tumors in the head and neck deep tissues 3. Clinical and academic application of DWI, CT perfusion, DSC-MRI, and DCE-MRI- Tumor differentiation- Detection of tumor mutation- Assessment of treatment effect- Post-operative risk assessment 4. Pitfalls of applications of DWI, DSC-MRI and DCE-MRI- DWI: Geographic artifact - CT perfusion: Motion artifacts, sever beam-hardening- DSC-MRI: Susceptibility artifacts at tissue interfaces or skull base area- DCE-MRI: Different magnetic field (1.5T or 3T) and parameters (such as TE, TR, or temporal resolution) in DCE-MRI can affect quantitative parameters (Vp, Ve, Ktrans, and Kep).

A Head Turner: Diffusion Restricting Head and Neck Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Yasasvi Tadavarthi, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diffusion-weighted imaging has been shown promising in tissue characterization of primary tumors (benign and malignant), nodal metastases, differentiation of recurrent tumor from post therapeutic changes, monitoring treatment response, and many other clinical scenarios in head and neck. In this presentation we will discuss different aspects of using diffusion weighted imaging in head and neck and their added value over anatomic imaging.

TABLE OF CONTENTS/OUTLINE

1. Brief review of diffusion weighted imaging technique and its use in head and neck imaging.2. Review imaging features of different pathologic conditions seen in the head and neck demonstrating diffusion restriction including:a. Benign neoplasms - Warthin tumor. b. Malignant neoplasms - Lymphoma, Carcinomas (Squamous cell carcinoma and Adenocarcinoma), Rhabdomyosarcoma. c. Infectious and inflammatory lesions - Abscess, Pseudotumor. d. Miscellaneous lesions- Hematoma, Cholesteatoma, Epidermoid cyst, Lymphadenopathy3. Challenges and limitations of diffusion weighted imaging in the head and neck.4. Mimics and special circumstances - Artifacts, Monitoring treatment response

The Sound of Silence: Clinical and Imaging Aspects of Sudden Hearing Loss

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Stephanie Nagano, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Sudden hearing loss occurs within a 72-hour period. It is essential to define whether the hearing loss is conductive, sensorineural or mixed to guide the investigation.Sudden sensorineural hearing loss is a clinical emergency and must be evaluated quickly to decrease the chances of becoming permanent.The diagnosis is predominantly clinical and imaging tests can provide additional information regarding the etiology. In cases of conductive deafness, the best method is computed tomography and in sensorineural deafness, resonance. Both methods can be used in cases of mixed deafness and surgical planning.Systematic analysis by topography can be useful to identify causes of sudden neurosensory deafness. Is recommended to start the evaluation with retrocochlear causes such as brain lesions, cerebellopontine angle and internal auditory canal, moving on to vestibular and cochlear causes.

TABLE OF CONTENTS/OUTLINE

Definition and clinical aspects of sudden hearing loss: how to define neurosensorial, conductive or mixed?Imaging methods and pertinent ear anatomy in sudden deafness.Sudden conductive hearing loss examples.Neurosensorial hearing loss examples.Systematic clinical and imaging evaluation in sudden hearing loss: summing up.

Hypopharynx - Beyond Squamous Cell Carcinoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Guilherme Chaves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Hypopharynx comprehends the most inferior part of the pharynx, as the continuation of the oropharynx, extending from the hyoid bone level (between C3-C4 vertebral bodies) to the inferior margin of the cricoid cartilage. It´s bounded anteriorly by the laryngeal vestibule (separated by the aryepiglottic folds) and posteriorly by the retropharyngeal space. • Can be divided into piriform sinuses, anterior wall (post cricoid area) and posterior wall. Anterior and posterior walls are usually close to each other, unless there is liquid or gaseous content between them. • The most common pathology of the hypopharynx is squamous cell carcinoma. However, some other pathologies may cause similar symptoms and be quite confusing: congenital, inflammatory, foreign bodies and post treatment complications. • It's extremely important for every radiologist to understand hypopharynx anatomy and pathologies cause some of them can present high morbidity.

TABLE OF CONTENTS/OUTLINE

1. Review hypopharynx anatomy and boundaries. 2. Briefly discuss hypopharynx embryology 3. List non-neoplastic pathologies of the hypopharynx: congenital, inflammatory, foreign bodies and post treatment complications. 4. Identify imaging patterns that facilitate distinction between the entities listed above and neoplastic lesions.

Tympanoplasty: A Review of Indications, Surgical Techniques and Complications for the Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Beatriz Prado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Timpanoplasty is the surgical repair of the tympanic membrane with or without grafting and usually performed with reconstruction of the ossicular chain. Encompasses a range of procedures that vary according to the extent of the underlying pathology and required surgical exposure.This panel aims to: Define tympanoplasty Quote the main clinical indications Depict surgical aspects: Types of tympanoplasty Grafting of the tympanic membrane Illustrate complications Discuss and outline through clinical cases the expected postoperative findings and complications after tympanoplasty.

TABLE OF CONTENTS/OUTLINE

Definition of tympanoplasty Main clinical indications of tympanoplasty Types of tympanoplasty: Types 1 to 5 Complications: Thickening, Retraction, and Reperforation of the Tympanic Membrane Recurrent CholesteatomaGranulation TissueExtrusion, Intrusion, or Dislocation of Ossicular ProsthesesInfection

Clinical Impact of MR Bone Imaging on Head and Neck Diseases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Cum Laude

Participants
Miho Gomyo, Miraka, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn the basic principles of MR bone imaging that can visualize bony and calcified structures like CT. 2. To know clinical applications to head and neck lesions of MR bone imaging. 3. To review pitfalls of MR bone imaging.

TABLE OF CONTENTS/OUTLINE

1. Basic principles and various scanning methods 2. Clinical applications to depict the following structures/lesions: physiological calcifications (basal ganglia, pineal body, choroid plexus, dura mater), skull tumors (primary and malignant tumors including metastasis), reactive bone sclerosis/erosion, bone deformity by tumors and tumor calcification 3. Applications to vessel wall imaging: segment diagnosis with the vertebral body in the carotid artery stenosis, calcified plaque and arterial wall calcification of the intracranial aneurysm 4. Pitfalls

Imaging Aspects of the New Classification for Carotid Body Tumors: Understanding Mehanna Classification Using Computed Tomography Images

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Alessandra d. Borges, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss the new classification for carotid body tumorsReview anatomical neck landmarks of Mehanna classification in computed tomography images

TABLE OF CONTENTS/OUTLINE

Paragangliomas is commonly located in the carotid body, usually in carotid bifurcation. Although histopathologically benign, its involvement in neurovascular structures and intracranial invasion are associated with high morbidity. The surgery of paraganglioma in the carotid body can be very challenging and for that reason,an accurate classification to predict the risk of potential complications is vital for treatment decision-making.Mehanna et al developed a new classification and risk stratification system for carotid body tumors which demonstrated better prognostic power for the risk of developing neurovascular complications after surgery, including the widely used modified Shamblin classification system. It classifies in type 1 to 4 based on the fact that the main cause of complications was the level of cranial extension. The risk of complications increases significantly with increasing Mehanna type.Type 1 extends up to but not above the superior-most aspect of the body of hyoid boneType 2 extends up to but not above the lower border of the angle of mandibleType 3 extends up to but not above the superior-most aspect of the body of C2 vertebra Type 4 extends above superior-most aspect of the body of C2 vertebra An additional subclassification can be added for surgical planning: E: encircling bifurcation, internal or common carotid artery F: functional, secreting catecholamines S: skull base reached.

Osteoradionecrosis Of Mandible- Addressing The Raging Bull In Head And Neck Surgical Oncology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Ankush Jajodia, MD, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Treatment of oral cavity malignancies includes primary surgical resection which may include marginalor segmental mandibulectomy followed by adjuvant radiation. Radiation comes at its own cost in producing adverseeffects on neighboring tissues, like osteoradionecrosis (ORN) 2. ORN is a condition in which irradiated bone becomesexposed to an ulcer in the overlying skin or mucosa and persists without healing for a period of 3 to 6 months. Clinicallythe condition may manifest with pain, swelling, oro-cutaneous fistula or trismus. The overall incidence of ORN of themandible is 2.6% -15%. 3. Mandible is a compact bone and has a higher mineral content that may lead to a higherabsorbed dose. The ramus and condylar processes are comparatively resistant to the development of ORN, whereas themandibular body, symphysis, and parasymphysis regions supplied mainly by the inferior alveolar artery are at higher risk todevelop ORN. 4. The pathophysiology of ORN described by Marx in 1983 (3-H principle), radiation therapy causes hypoxia,hypovascularity, and hypocellularity of tissue, thus inhibiting substitution of cells to complete the turnover for themaintenance of homeostasis and wound cicatrization, leading to a chronic nonhealing wound. The affected cells are theones of vascular endothelium, fibroblasts which make stroma and parenchyma cells. 5. MR imaging during follow-up helpstrained radiologists to detect ORN.

TABLE OF CONTENTS/OUTLINE

Clinical cases with pictorial depiction of Osteoradionecrosis of mandible on conventional MR Imaging

Multi-modality Imaging Including MR Diffusion, T2 Signal Intensity and 18 FDG PET-CT for Neck Imaging Reporting and Data System Categorization

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Ankush Jajodia, MD, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Previous studies documented an overall PPV of 54-56% for NI-RADS 3 posttreatment PET/CT, which was advocated as low. • NI-RADS favors NPV over PPV to potentially capture treatable lesions, even if it comes at the cost of performing additional biopsies. • Functional imaging like DWI and ADC parameters derived from DWI have shown promise for identifying true disease recurrence with higher specificity than conventional PET-CT, with a reported pooled sensitivity and specificity of 85 % and 93 %, for PET/CT. • NIRADS can serve as an assessment tool, wherein individual radiologists or groups of radiologists can utilize the PPV and NPV, to evaluate their own performance.

TABLE OF CONTENTS/OUTLINE

National Comprehensive Cancer Network suggests posttreatment baseline imaging after six months of therapy for advanced HNSCC but does not formally advocate imaging for asymptomatic patients. Ideal timing and frequency for using PET- CT in the posttreatment context have not yet been established. ACR "Neck Imaging Reporting and Data System" (NI-RADS) lexicon defines NIRADS 2b lesions as deep soft tissue lesions with ill-defined or mildly enhancing soft tissue or soft tissue with only mild FDG uptake. These are indeterminate lesions and should have a short-term interval follow-up. NIRADS 3 lesions should have a short-term interval follow-up or biopsy, depending on the degree of FDG uptake. Recurrence rates in NIRADS 2b and NIRADS 3 lesions were 5.6 % and 60-80%, respectively. The template was initially designed for CECT with concentration on PET-CT for detecting recurrence; MR imaging has been done in few centres. Although diffusion imaging has become a routine sequence in head and neck imaging, it is not yet a criterion in NI-RADS.

Addressing Pertinent Surgical Questions in Skull Base Onco-imaging Reports: Case Based Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Shreya Shukla, MBBS, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiological reporting of cross-sectional oncological imaging including Computed Tomography (CT) and Magnetic Resonance Imaging (MRI) can be inadequate and futile for clinicians if it is unsculpted and descriptive. A checklist of vital imaging findings should be strictly used in radiological reporting to give maximum useful information to the treating clinicians.We have created such a checklist and proposed its use as a standardized synoptic reporting format to address all essential questions that need to be answered to help reach a diagnosis and optimize the management plan in skull base neoplasms. Our checklist has been designed after a thorough discussion of a multitude of skull base neoplasms cases between radiologists and clinicians at weekly multi-disciplinary joint clinics (JCs) in our tertiary cancer centre.

TABLE OF CONTENTS/OUTLINE

This educational exhibit contains:- Checklist of relevant and essential findings in baseline radiological reporting of skull base neoplasms.- Proposed synoptic reporting format for skull base neoplasms.- Case-based approach to understanding how including essential details in the radiology reports can affect the management plan.

Preoperative Orthognathic Surgery: What Radiologists Should Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Andre Formiga, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:- To review the anatomical landmarks of the face and the angles they make on computed tomography images.- To discuss the main facial patterns made from these angles and usual changes in dental occlusion that accompany them.- To review the main osteotomy techniques employed on orthognathic surgeries.- To highlight a few craniofacial cases with either tumoral, malformation or vascular etiologies that could be subjected to orthognathic surgeries.

TABLE OF CONTENTS/OUTLINE

Orthognathic surgery uses repositioning of the mandible and maxilla to correct imbalances in facial proportions that can affect everything from physiological dental occlusion and sleep apnea to aesthetic problems related to asymmetries and facial disharmonies that affect patient self-esteem. The objectives of this presentation are to describe the pre operatory imaging findings and cephalometric parameters, mainly on CT scans, of some of the main conditions where orthognathic surgery can act, their reflections on dental occlusion, and how to report them.

Layyngeal Protrusion, Prolapse and Eversion - Diagnoses Forgotten by Radiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Ricardo Fujiki, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Protrusion, prolapse and eversion are definitions often used as synonyms, but they have totally different clinicopathological entities and have not been updated or revisited in the radiological scientific environment for a long time. Imaging findings in the head and neck were recognized and evaluated and may serve as supporting markers to differentiate protrusion, prolapse and eversion, and thus help to define the clinicopathological causes and the need or not to continue the investigation.

TABLE OF CONTENTS/OUTLINE

- Objectives: 1 - Review definitions and clinicopathological differences between protrusion, prolapse and eversion. 2 - Illustrate through clinical cases the different entities by radiological methods. - Methods: Head and neck imaging findings were highlighted in this pictorial review. We also discussed the imaging findings in order to demonstrate the differences between the laryngeal findings. - Discussion (based on cases): Characteristic radiological findings for the differentiation between protrusion, prolapse and eversion were reported in conjunction with the development of didactic schemes to facilitate learning and recognition and differentiation in clinical practice. - Conclusion: Early and accurate recognition of the causes of laryngeal prolapse through imaging methods can help assisting physicians in defining the need for biopsy.

What the Eye Can´t See but the Radiologists Do: Clinical-radiological Correlation in the Assessment of Visual Disturbances

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Identified for RadioGraphics

Participants
Ewa Joanna Maciag, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Patients with visual disturbances may present a wide variety of symptoms that can be divided into three main categories: (1) Visual dysfunction, such as blurred vision, vision loss, and visual field defects. (2) Extrinsic ocular motility disorders, which usually cause binocular diplopia. (3) Pupillary motility impairment. This review aims to analyze the correlation between the different radiological presentation patterns and the clinical manifestations, with an emphasis on the anatomical localization of the causative lesion and an approach to an appropriate selection and interpretation of the different imaging techniques.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Main symptoms and anatomical background. 3. Imaging techniques: appropriate selection and application. 4. Intrinsic ocular motility disorders: miosis and mydriasis. 5. Alterations of the extrinsic ocular motility: neurogenic and myogenic causes and an evidence-based diagnostic algorithm of diplopia. 6. Disorders of visual function: a case-based overview of the causative pathology. 7. Diagnostic pathway to determine the cause of the visual disturbances. 8. Conclusions.

Head and Neck Manifestations of Autoimmune Disease - A Didactical Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Mayne Brandao, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Little is said about the manifestations of autoimmune diseases and their imaging aspects in Head and Neck. This panel is intended to show challenging cases that are part of this group of diseases, which affect the various areas of this region.The diversity of findings shows us the importance of disclosing these imaging aspects and makes it a useful tool for consultation.Unusual places such as ossicular involvement, the Eustachian tube, the sternocleidomastoid muscle and other structures illustrate this diversity of places.There are other diseases that will also be addressed in this exhibit as for example lupus; seronegative spondyloarthropathies; systemic sclerosis.Correlation of the imaging findings with the clinical features and laboratory findings is also important for the diagnosis and the recognition of the disease activity, and the identification of possible complications or even the occurrence of associated neoplasms.

TABLE OF CONTENTS/OUTLINE

Introduction of the main acquired immunologically mediated inflammatory disorders.These disorders may be associated with paranenoplastic syndrome, especially hematologic tumors, or may increase the risk for the development of malignancies, predominantly lymphoproliferative disorders. Also, these patients may be associated with infection and granulomatous lesions of the head and neck.We will provide with didactical cases a review presenting the imaging findings in the head and neck in patients with these diseases.Conclusions.References.

Advanced Imaging of Head and Neck Infection

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Cum Laude

Participants
Akira Baba, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

Advanced cross-sectional imaging plays a critical role in providing differential diagnoses, treatment decisions, and prognostic implications in head and neck infections. Contrast-enhanced CT is the imaging modality of choice for head and neck infections; however, other imaging modalities may be complementary and diagnostic. MRI is excellent for evaluation of intracranial spread of inflammation/abscess formation and osteomyelitis, etc. DWI and ADC values are useful in providing differential diagnoses and evaluating treatment response of head and neck infections. 18F-FDG-PET/CT is helpful in the follow-up of skull base osteomyelitis. Dual energy CT allows for various techniques such as metal artifact reduction and material decomposition imaging that can help reduce dental metal artifacts, increase salivary stone detection. Metal artifact reduction algorism can help reduce dental metal artifacts. Subtraction CT techniques are used to reduce dental metal artifacts and detect destructive osseous changes. This presentation will provide an overview of must-know head and neck infections with updated advanced imaging techniques and their imaging findings.

TABLE OF CONTENTS/OUTLINE

1. Imaging techniques 2. Temporal bone/skull base 3. Pharynx 4. Deep neck 5. Oral cavity 6. Salivary Glands

Skull Base Osteomyelitis in COVID-19 related Acute Invasive Fungal Rhino Sinusitis: Spectrum of Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Gayatri Senapathy, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• SBO is a dreaded condition with high morbidity and mortality and fungal rhinosinusitis is one among the many causes of SBO • Incidence of AIFRS showed a significant increase during the second wave of COVID-19 pandemic and Diabetes Mellitus and Steroid use were found to be the major associated factors. • AIFRS was seen in patients with active or recent COVID-19 infection. SBO was seen as a complication at presentation in some cases of AIFRS, and beyond the 3rd week of onset in treated patients who had progressive disease. • AIFRS has a predilection for both vascular and perineural spread across intact bony boundaries. Patients with early involvement of the pterygopalatine fossa, orbital apex and the cavernous sinus are at high risk of developing SBO due to perineural and vascular spread. • Contrast enhanced MRI (CE MRI) is superior to CT in the early detection of SBO as the marrow signal changes and the adjacent soft tissue changes are detected before bone erosion becomes evident on CT. • Intracranial complications such as meningitis, vascular complications, cerebritis and abscesses are also depicted earlier on MRI.

TABLE OF CONTENTS/OUTLINE

• Revisit skull base anatomy • Elucidate the pathways of spread of sinonasal fungal infection to involve the skull base • Illustrate the various findings of skull base osteomyelitis (SBO) in cases of COVID-19 related Acute Invasive Fungal Rhino Sinusitis (AIFRS) in our institute between March and September 2021 • Demonstrate the associated intracranial and extracranial complications.

Extraocular Muscle Pathology: That's How Eye Roll

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Juliana Sitta, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the normal orbital imaging anatomy highlighting the advantages of each imaging modality. To discuss the differential diagnosis of extraocular muscle (EOM) pathology including inflammatory, infectious, neoplastic, congenital, and traumatic etiologies. To recognize the importance of systematic EOM assessment in the diagnosis of systemic diseases and potential complications

TABLE OF CONTENTS/OUTLINE

The differential diagnosis of EOM pathology is broad and often challenging including inflammatory, infectious, neoplastic, and traumatic causes. Although eye movement disorders may be unclear on initial imaging, modalities including CT, MRI, and PET-CT along with clinical findings play a key role in identifying or ruling out important differential diagnosis. In this presentation we will review the imaging features of normal orbital anatomy and the spectrum of EOM pathology. We will illustrate a wide range of etiologies including key imaging findings to narrow down the differential diagnosis in various categories of disease such as congenital orbital fibrosis of the EOM, anophthalmia-microphthalmia, spontaneous hematoma, thyroid orbitopathy, orbital metastases, PET-CT findings in nerve palsy, idiopathic orbital inflammation, and IgG4 sclerosing disease of the orbit.

Branchial Apparatus Lesions and Thyroglossal Duct Lesions: Embryology, Typical Imaging Findings of Those Lesions and Mimics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Yoshiko Y. Kurihara, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Many structures in the head and neck region arise from branchial apparatus. To learn congenital lesions secondary to abnormal embryogenesis in this region, the knowledge of these structures including embryology can make those diseases easier to understand. The thyroglossal duct also causes abnormal embryogenesis. On this presentation, the embryological changes of branchial clefts, pouches and thyroglossal duct are demonstrated. This presentation shows many developmental abnormalities as 1) fistulae, sinuses and cysts originated from branchial clefts and thyroglossal duct with typical location according to the embryology 2) complicated status of these lesions ; infection, neoplastic change including malignancy 3) ectopic thymus, ectopic parathyroid gland and ectopic thyroid tissue according to their migrating tract 4) neoplastic changes of these ectopic lesions, with CT, MRI, RI images and interpretations. In addition, 5) mimics should be differentiate from these lesions as well.

TABLE OF CONTENTS/OUTLINE

1) Figure of branchial apparatus developing structures anomalies. 2) Embryology of branchial apparatus. 3) Developmental abnormalities related to branchial cleft, complicated lesions and mimics. 4) Developmental abnormalities related to branchial pouch, complicated lesions and mimics. 5) Figure and embryology of thyroglossal duct. 6) Developmental abnormalities related thyroglossal duct, complicated lesions and mimics.

High Resolution CT Angiography of the Orbits, Skull Base and Pterygopalatine Fossa

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Certificate of Merit

Participants
Norbert Campeau, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To detail the arterial anatomy of the orbit, anterior skull base and pterygopalatine fossa through high resolution CT angiography images and corresponding anatomic legends.2. Discuss several of the more commonly occurring congenital arterial variants.3. Review relevant skull base foramina and fissures.

TABLE OF CONTENTS/OUTLINE

High resolution computed tomography angiography (CTA) of the brain and skull base has continued to improve substantially over the past two decades, now routinely obtained with sub-millimeter voxel resolution. In this educational exhibit, we present a detailed review of the arterial anatomy of the orbit and pterygopalatine fossa using high resolution CTA images obtained from a state of the art 510k cleared photon counting CT scanner. Arterial supply to the optic nerve, ocular globe, lacrimal gland will be detailed. Anatomy of internal maxillary artery branches will also be described, including course of the arteries of the pterygopalatine canal, foramen rotundum, sphenopalatine, greater and lesser palatine arteries. Anastomotic connections between meningeal, external carotid, and internal carotid artery branches via the inferolateral trunk will also be discussed.

Head and Neck Sarcoma: A Magnetic Resonance Imaging Review Based on the 2020 World Health Organization Classification

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Simone Caprioli, MD, Genova, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Magnetic resonance imaging (MRI) characteristics of head and neck sarcomas are often nonspecific and may be difficult to identify the precise diagnosis. 2. The recognition of the epicenter of the mass allows to differentiate a soft tissue from a bone or cartilage tumor. 3. MRI may narrow the differential diagnosis by analyzing the signal of the matrix of the tumor. 4. MRI is useful for identifying orbital and intracranial invasion.

TABLE OF CONTENTS/OUTLINE

In 2020 a novel classification system for soft tissue and bone tumors was published by the World Health Organization (WHO). Even though it is usually applied for trunk and extremities sarcoma, it may be a guide for characterizing non-epithelial lesions of head and neck. Magnetic resonance imaging (MRI) plays a pivotal role in the diagnosis of head and neck sarcoma, supporting the hypothesis of the non-epithelial origin of a mass and suggesting clues about histology. This work aims to review the MRI characteristics of non-epithelial neoplasms of head and neck as they are grouped in the 2020 WHO classification. Moreover, it offers a guide for precise local staging and for narrowing the differential diagnosis, thanks to a combination of criteria: location, epicenter, and MRI signal characteristics. The present work was based on a ten-years long multicentric record of 248 cases of head and neck sarcomas.

Unboxing the Voice Box: Imaging in Laryngeal Malignancy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Anu Kamalasanan, FRCR, MBBS, East Renfrewshire, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) T1 lesions may be radiologically occult . 2) Nodal disease occurs late in glottic malignancy due to the relative paucity of lymphatic drainage of vocal cords 3) Anterior commissure involvement precludes hemilaryngectomy and may be associated with early cartilage invasion from extension along Broyle ligament 4) Paraglottic/ pre-epiglottic fat infiltration upstages disease to T3. Assessment can be done with CT/ MRI and USS 5) Thyroid cartilage has a variable appearance - unossified thyroid cartilage can make it difficult to differentiate from infiltration. USS and MRI can be used to differentiate between the two.

TABLE OF CONTENTS/OUTLINE

1) Illustrate with images, normal laryngeal anatomy including TNM subsites 2) Describe Imaging modalities for assessment and staging of laryngeal malignancy. 3) Update on Ultrasound and MRI as imaging adjuncts 4) TNM staging with examples 5) Illustrate various patterns of spread6)Discuss management pathway.

Lymphoproliferative Lesions of the Orbit

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Awards
Certificate of Merit

Participants
Taisa Santos, MD, Salvador, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Lymphoproliferative lesions represent the most common primary orbital disease, manifesting mainly in the elderly, and may also be a manifestation of systemic lymphoproliferative disease.Imaging evaluation is essential to guide the diagnosis, follow-up and treatment response, since the clinic presentation is nonspecific signs and symptoms and can mimic other orbital pathologies. CT image pattern is not very specific, usually presenting as a mass that molds to the orbital walls, isoattenuating/hyperattenuating, with homogeneous contrast enhancement. It rarely presents with bone erosion, when present, it is usually associated with diffuse large B-cell lymphoma. MRI is the imaging method of choice and some sequences are essential for distinguishing pathologies that may mimic lymphoproliferative lesions, especially idiopathic orbital inflammatory disease, which may have similar signs and symptoms, being clinically different by association with painful proptosis and findings of image, as high ADC values ??on MRI. The main differential diagnoses include idiopathic orbital inflammatory syndrome, orbital cellulitis, thyroidopathy, sarcoidosis, IgG4, granulomatosis with polyangiitis, and metastases.

Breathe In Breathe Out: Obtaining Clarity in Imaging of Sino Nasal Malignancy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Janani Baradwaj, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

±Sino-nasal malignancies are mostly squamous cell types ±Historically Ohngren's line was used in prognostication and management. It is an imaginary line drawn from the angle of the mandible to the medial canthus of the eye, dividing the antrum. Disease involvement above the line is associated with a poor prognosis. ±CT demonstrates the extent of osseous involvement better. Soft tissue and nodal disease are assessed with post-contrast CT. ±MRI helps differentiate between mass and inflammatory change in the sinuses.°Tumour - Low T1, Low T2 signal, Heterogeneous enhancement °Mucosa - Low T1, High T2 signal, Intense homogeneous enhancement °Secretions - Low T1, Very high T2 signal, No enhancement ±MRI also helps to assess orbital, intracranial and perineural spread ±MRI is more sensitive for assessment of perineural spread - Enlarged affected nerves have high T2 signal with perineural enhancement, loss of normal T1 fat signal and normal CSF signal in the foramina. ±Perineural spread on CT - Enlargement and erosion of foramina, loss of normal low attenuating fat, Soft tissue attenuation of foramen.±Sino-nasal malignancies have a moderate incidence of loco-regional recurrence with late nodal disease. The presence of positive neck nodes is associated with higher incidence of disease recurrence. Retropharyngeal nodal involvement should be actively looked for on CT and MRI

TABLE OF CONTENTS/OUTLINE

±Describe normal paranasal sinus anatomy with images ±TNM staging of sino-nasal malignancy ±Illustrate with images routes of spread of malignancy ±Describe histopathological types of malignancies involving the sino-nasal cavity with images ±Radiological prognosticating factors ±Discuss management pathway

Lessons From Dental School: What the General Radiologist Needs to Know About Teeth

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Cameron Spence, MBChB, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologists who have not attended dental school are at a disadvantage when interpreting OPGs and other oral images such as CT. Whilst radiology curricula include frequently examined pathologies, such as periapical infections and cystic mandibular lesions, limited understanding of the basics of dentistry hamper our interpretation in clinical practice.This pictorial review will highlight the most important background concepts for radiologists that the authors learned during their dental degrees. Understanding these concepts will aid interpretation and help your delegates to provide more useful reports for the extended clinical team and patients.

TABLE OF CONTENTS/OUTLINE

Relevant radiographic dental anatomy. Restorative dentistry - how to recognize different restorations, including composite/amalgam/temporary fillings, root canal fillings, crowns, bridges, dentures, implants, and orthodontic appliances. Dental caries - where this begins, how it spreads through the dentine to the pulp, and how it leads to periapical pathology. Periodontal disease - generalized and localized types, assessing alveolar bone loss and recognizing commonly overlooked acute periodontal infections. Pericoronitis and impacted wisdom teeth. OPG limitations compared with intraoral dental radiographs.Please visit the Learning Center to also view this presentation in hardcopy format.

A review of Uncommon Benign Pathologies of Larynx

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - HN

Participants
Pooja Muddana, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The larynx can be affected by a multitude of pathologies of which squamous cell carcinomas are commonly encountered. Benign pathologies demonstrate typical imaging features, which aid in narrowing the list of differential diagnoses and differentiating them from malignant conditions. In this presentation we will: 1) Review the typical clinical presentation and pathology of the uncommon benign conditions. 2) Review imaging appearance of benign conditions that involve the larynx. 3) Review differential diagnoses for these conditions.

TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Congenital - Laryngeal clefts, congenital high airway obstruction, laryngomalacia3) Laryngocoele and laryngopyocoele4) Infective conditions- Tuberculosis, Actinomycosis, Fungal infections, Scleroma, Leprosy5) Immunological conditions - Granulomatous with polyangiitis, Relapsing polychondritis, Sarcoidosis, Rheumatoid arthritis, Ankylosing spondylitis 6) Amyloidosis 7) Thyroglossal duct cyst 8) Vascular malformations- Lymphatic malformation, Arteriovenous malformations 9) Conclusion

INEE-10 Developing a Prostate Cancer Radiologic-Pathologic Correlated Quality Reporting Dashboard

Participants
Ryan Ward, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate cancer is an important cause of morbidity and mortality in men. The Prostate Imaging Reporting and Data System (PI-RADS) provides a framework for systematically scoring lesions on prostate MRI based on clinical suspicion for prostate cancer. Using this data, combined with actual pathologic outcomes, we developed a robust system for tracking patients being evaluated for prostate cancer. The system allows the user to evaluate diagnostic performance at physician, department, and enterprise level and easily identify patients where discordance may exist between MRI findings and pathologic result.

TABLE OF CONTENTS/OUTLINE

1) Provide a brief overview of prostate cancer and the PI-RADS scoring system. 2) Describe the importance of tracking and analyzing prostate MRI data. 3) Describe the underlying technology/architecture for extracting, transforming, and loading the data into the data warehouse. 4) Provide examples of the dashboard and the different visualizations available.

INEE-12 Standardized Operational Log of Events (SOLE) for Artificial Intelligence (AI) Monitoring

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Ali Tejani, MD, Frisco, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Provide an overview of IHE standardized operational log of events (SOLE)2. Review the interoperability advantages of using SOLE application programming interfaces (APIs) and codes in practice3. Describe specific metrics defined by SOLE to monitor deployed AI solutions4. Demonstrate how processes monitored by SOLE codes can be visualized through business analytics/dashboards5. Describe challenges with adopting SOLE APIs and codes in practice

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Describe the problem: lack of interoperability and an efficient means of monitoring AI solutions workflowsb. SOLE for business analytics/process miningi. Review SOLE APIsii. Review select SOLE codesc. Introduce the concept of SOLE for AI monitoring2. Review how SOLE can be applied for AI monitoringa. Describe specific use cases to demonstrate how SOLE codes can be used to monitor AIi. Frequency of AI tool useii. Disagreement rate with AI resultsiii. Effect of AI tool use on time from study ordered to study readiv. Clinical monitoring for the impact of AI on patient care1. Time to treatment based on urgent AI alert2. Time to ED admissionv. Aggregating history of events over an extended time (i.e., if needing to justify ROI for annual budget)b. Demonstrate visualization of processes captured by SOLE codes with business analytics/dashboards3. Challenges associated with adopting SOLE APIs and codesa. Presence of multiple profiles (SYSLOG, ATNA, FHIR)b. Distilling the list of codesc. Encouraging vendor adoptiond. Flexibility to capture all potential AI-radiologist interactions

INEE-13CS Try Before You Buy: A One-Stop-Shop Approach for Testing and Procuring Commercial AI Applications

Participants
Vidur Mahajan, MBBS, New Delhi, India (*Presenter*) Employee, CARPL.ai

TEACHING POINTS

1. There are more than 150 FDA approved AI applications and the new approvals are growing at 50% per annum. There are 100s of other commercial AI applications available around the world.2. This makes it nearly impossible for radiologists to effectively discover and test these AI solutions on their own data.3. We present a software system with pre-integrated commercial AI applications, i.e. an AI marketplace, which allows radiologists to upload their own data and rigorously test the performance of the application.4. The software includes in built data management, anonymisation, cohort creation, annotation and statistical analysis tools.5. The option to ensemble AI outputs to improve performance also exists.

TABLE OF CONTENTS/OUTLINE

Our exhibit will be a computer system with 3 monitors, replicating the radiologists workstation.Radiologists at RSNA would be able to

bring their own data and upload it into this system and choose to run commercial AI applications and compare their performance.This would allow them to make informed purchase decisions, and optimize for productivity / quality gains.We believe that ours is a unique offering which can exponentially drive the adoption of clinical AI.

INEE-14 Ultrasound-guided Peripheral Insertion System using Deep Learning

Participants
Yuina Ezawa, Maebashi, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Puncture of peripheral blood vessels in the elderly and children is a difficult activity. Ultrasound-guided venipuncture is a widely used method to facilitate peripheral venipuncture. In this method, the positional relationship between the target blood vessel and the needle is confirmed, and the target blood vessel is punctured while operating the probe and needle at the same time. However, it is very difficult to confirm the positional relationship between the target blood vessel and the needle. To solve this problem, we propose a method that uses a convolutional neural network (DCNN) to automatically extract blood vessels and needles on the image. It is possible to display the optimum needle approach angle by computer-assisted detection. This method can show the positional relationship between the peripheral vein and the needle and provide useful information to assist in the puncture. The major teaching points of this exhibit are to: 1. automatically extract blood vessels and needles from ultrasound images. 2. understand how to extract blood vessels and needles using DCNN. 3. be useful for ultrasonic-guided venipuncture.

TABLE OF CONTENTS/OUTLINE

To discuss the clinical usefulness for accurate examination in ultrasound-guided venipuncture using DCNN extraction.

INEE-15 The New 3D Slicer Version 5.0 Open Source Platform for Medical Image Analysis, 3D Visualization and Image-guided Intervention

Participants
Sonia M. Pujol, PhD, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

3D Slicer is an open-source and extensible software platform used in clinical research worldwide. The new Slicer 5.0 release version provides hundreds essential core modules and extensions, and builds on the success of the version 4 downloaded over 1 million times since RSNA 2011. The goal of the exhibit is: 1. To review a brief history of 3D Slicer development in the past 20 years; 2. To discover the DICOMweb browser for cloud-based DICOM workflows; 3. To visualize GPU-based volume-rendering of DICOM images; 4. To discover the new Markups features; 5. To perform interactive segmentation of 2D/3D/4D images; 6. To discover the new MONAILabel extension for AI-assisted image annotation; 7. To learn new Slicer features for COVID-19 data analysis; 8. To create 3D solid objects for 3D printing; 9. To perform real-time data fusion for image-guided therapy; 10. To connect Slicer with robots, scanners, and trackers; 11. To interact with 3D scenes using virtual and augmented reality headsets; 12. To perform cloud-based computing in a Web browser using AWS AppStream 2.0, in a Docker container or a Jupyter notebook kernel; 13. To understand how to use 3D Slicer in clinical research applications.

TABLE OF CONTENTS/OUTLINE

Overview of the new 3D Slicer version 5.0; DICOM Standard Interoperability: import/export and structured reporting; DICOMweb features; GPU-based 3D and 4D Volume Rendering; Markups and Automated Measurements; Interactive 2D/3D/4D Image Segmentation; 3D Printing; Artificial Intelligence; Virtual and Augmented Reality; Cloud-based Computing; Clinical Applications in COVID-19, Surgical Navigation, and Image-Guided Intervention; Slicer Community Resources: Forum, Training Compendium, and Documentation.

INEE-16HC Understanding Patient Needs and Gaps in Radiology Reports Through Online Discussion Forum Analysis

Participants
Mohammad Alarifi, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Our objective is to investigate patient needs and understand information gaps in radiology reports using patient questions that were posted on online discussion forums. We leveraged online question and answer platforms to collect questions posted by patients to understand current gaps and patient needs. We retrieved six hundred fifty- nine (659) questions using the following sites: Yahoo Answers, Reddit.com, Quora, and Wiki Answers. The questions retrieved were classified into eight major themes. The themes were related to the following topics: radiology report, safety, price, preparation, procedure, meaning, medical staff, and patient portal. Among the 659 questions, 35.50% were concerned with the radiology report. The most common question topics in the radiology report focused on patient understanding of the radiology report (62 of 234 [26.49%]), image visualization (53 of 234 [22.64%]), and report representation (46 of 234 [19.65%]). We also found that most patients were concerned about understanding the MRI report (32%; n = 143) com- pared with the other imaging modalities (n = 434). Using online discussion forums, we discussed major unmet patient needs and information gaps in radiology reports. These issues could be improved to enhance radiology design in the future.

TABLE OF CONTENTS/OUTLINE

IntroductionMethodsData sources and collectionThematic analysisPatient-centered approachResults(Summary of the four data sources,Analysis of patient question themes, Radiology report results; Safety, Procedure processing, Meaning, Preparation Patient portal, Preparation, The medical staff and PriceConclusionPlease visit the Learning Center to also view this presentation in hardcopy format.

INEE-17 Adding Value in Radiology: 3D Imaging Lab

Participants
Larson Hsu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In contrast to conventional volume rendering static images, segmentations of the patient's anatomy can be exported as a 3D model and further utilized in different applications for better spatial understanding of the disease. For example, the 3D model can be reviewed with an interactive viewer on the computer or other flat-screen devices, or visualized in virtual or augmented realities. It can also be 3D printed as an anatomical model for presurgical planning, or used as the basis to design patient-specific medical devices such as cutting guides or wearable prostheses. In this exhibit we will share the experience of our 3D imaging lab in a cancer center, and demonstrate how it can add value to the Radiology Department and potentially improve patient care.

TABLE OF CONTENTS/OUTLINE

1) Introduction/background: radiology 3D imaging lab 2) Volume rendering vs. 3D segmentation model 3) Advanced visualization using virtual and augmented realities 4) 3D printing of anatomical models and patient-specific medical devices at the point-of-care 5) Showcase and examples of 3D model applications in different disciplines 6) Future directions

INEE-18 Demystifying Coloring and Surface Labeled 3D Printed Anatomical Models

Participants
Muhammad Rehman, BA, Virginia, VA (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Discussion on the relevance and importance of multi-color 3D printing with emphasis on models with special surface characteristics such as text, image and texture ? Highlighting various applications of color 3D models such as educational models, in clinical cases or for research purposes ? Pros and cons of de novo creation of multi-part STL files vs working on pre-existing STL files ? Advantages and disadvantages of graphically designing STL files vs using cross-sectional imaging to 3D reconstruct STL files in the educational setting ? Introducing UV surface mapping ? Detailing multiple software programs that can be used to color, label and imprint images onto the surface of a preexisting STL file and providing brief methodology for each ? Discussion of different 3D printing techniques that allow for color 3D printing, especially highlighting novel Multi Jet Fusion technology that allows for development of highly durable and versatile models with fully customizable surface appearance, not previously as robustly available ? A chart detailing subjective learning curve, user friendliness and cost of the software programs and 3D printers/printing services

TABLE OF CONTENTS/OUTLINE

? Background ? Discussion ? Software programs ? Meshmixer ? Microsoft Paint 3D ? Blender ? Autodesk 3d Studio Max ? Color 3D printing techniques ? PolyJet ? Stereolithography ? Paper Based ? Binder Jetting ? Multi Jet Fusion ? Summary chart

INEE-19 Quantitative Evaluation of a Large-scale Multi-year Artificial Intelligence (AI) Deployment at a Large Academic Radiology Department - Key Metrics, Trends, and Milestones

Participants
Axel Wismueller, MD, PhD, Pittsford, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

A) We present key analytics, trends, and milestones that are extracted from a multi-year large-scale AI clinical deployment of a radiology triage and prioritization solution in a large academic hospital setting. B) The analytics, trends and milestones are extracted from the hospital system's experience of taking a single-pathology AI module and scaling it out to cover nine different pathologies.Our analysis provides a set of recommended metrics to measure growth, performance, and user engagement. C) We present trends for various milestones and how the metrics change as an AI solution scales up to cover a greater number of imaging examinations. D) Our case study may provide insights and value to other radiology practices and hospital systems as a basis for defining best practice guidelines, and for contributing to the calculation of business metrics, such as Return-on-Investment (ROI) or Total Cost of Ownership (TCO) in the clinical adoption of AI solutions.

TABLE OF CONTENTS/OUTLINE

A) Introduction: 1. Description of project goals and timeline 2. Overview of the AI integration into the radiologist workflow B) Metrics: 1. Description and visualization of metrics for measuring: a) Growth of the AI adoption b) Performance of the AI c) User engagement 2. Highlights of the key trends milestones C) Summary of key metrics: 1. Overview of the value of each metric 2. Identified minimum thresholds for success criteria 3. Summary of teaching points

INEE-1CS Using the Open Health Imaging Foundation (OHIF) Framework To Build Web-based Imaging Applications

Participants
Erik Ziegler, MSc,PhD, (*Presenter*) Consultant, Radical Imaging LLC;Consultant, Novometrics LLC;Stockholder, Yunu Inc

TEACHING POINTS

The purpose of this exhibit is to:1. Explain how radiologists can build their own imaging tools and applications using the open source Open Health Imaging Foundation (OHIF) framework to address their custom use cases.2. Discuss the components of a full fledged zero-footprint web-based imaging application and how they interact using various APIs (e.g. DICOMweb).3. Explain how advanced functionality, such as 3D visualization, image fusion, and segmentation, can be incorporated in these applications.4. Demonstrate how to organize specific function sets into custom workflow modes for optimizing efficiency.5. Demonstrate how this type of system can be deployed both securely and cost effectively.

TABLE OF CONTENTS/OUTLINE

- Open source resources for radiology and AI applications- Relationships between components in web imaging applications- Building custom measurement tools- Incorporating advanced visualization and segmentation tools- Building custom workflow modes for the OHIF Viewer (e.g. configuring the application to provide functionality for use cases like ProstateCancer.ai, NCI Imaging Data Commons, XNAT)- Deploying scalable secure web imaging applications locally or using cloud resources- Future directions

INEE-2 Development of A Training Simulator of Plain Radiography Using Augmented Reality Technology

Awards
Certificate of Merit

Participants
Kaito Oikawa, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiographers need to acquire proficient skills through a great deal of experience to perform plain radiography accurately. Lack of such skills may lead to misdiagnosis and unnecessary radiation exposure. Conventional training methods for plain radiography were phantom radiography and radiography role-playing. They were insufficient to develop proficient skills because of the unlike clinical settings. Recently, a radiography training simulator using virtual reality was proposed. This simulator allowed the trainee to perform plain radiography on a virtual subject in a virtual space. However, the trainee cannot touch the virtual subject in this training simulator. This is the same as the conventional training methods in that it is different from the clinical settings. Therefore, we developed a training simulator of plain radiography using augmented reality technology. Our simulator can output virtual x-ray images similar to clinical settings, adapting positions and angles obtained by tracking human subjects in real time. The training using our simulator allows trainees to acquire proficient skills in preclinical training.

TABLE OF CONTENTS/OUTLINE

Lack of skills in plain radiography may lead to misdiagnosis and unnecessary radiation exposure in clinical settings. Our simulator can output the virtual x-ray images that reflect the positions and angles of the subject. Radiographers can acquire proficient skills by training the plain radiography repeatedly using our simulator.

INEE-20HC Taking the Medical Devices Through the Regulatory Gatekeepers: How To Do It Right!

Participants
Bhanushree Bahl, New Delhi, India (*Presenter*) Employee, CARPL.ai

TEACHING POINTS

The clinical trial of AI-based Investigational Devices (AID) will look at the device performance through the lens of business capabilities, while evaluating technologies. Our exhibit will showcase the clinical trial workflow of AI algorithms with multiple scenarios for different regulatory approvals. Regulatory approvals are necessary for an AI model to be used clinically, and to add value to the business.AI companies can run clinical trials, which will help them get comprehensive results through data analysis for improved decision making.Conducting clinical trials on extensive data allows AI companies to detect patterns for enhanced business performanceWe will highlight the steps needed to conduct a successful clinical trial for various scenarios.In addition to this, the exhibit will also feature protocols required to follow for different regulatory approvals.

TABLE OF CONTENTS/OUTLINE

Protocol Synopsis: Study name, objective and type of the study, with the design procedure along with the calculated sample size and investigator selection (Screener / Reader / Gter).Study procedure: Ethical committee approval, Data collection and de-identifying studies, Screening, Ground Truthing , Standalone performance evaluation, Reader test Data Management Plan / Flow: Annotation Platform (Ex: CARPL), System verification and UAT, Security and maintenance of accountExternal Data Management Process: Data collection and archiving and cleaning, Master data Set creationStudy Endpoints and Statistical Analysis: Threshold of study endpoints and statistical analysis, Endpoints in standalone performance testPreparation of Violation ListPlease visit the Learning Center to also view this presentation in hardcopy format.

INEE-21 The Day After Tomorrow: How to Monitor A Deployed AI Model and Automate the Radiologist Feedback Loop

Participants
Victor Menezes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe how an Artificial Intelligence (AI) model can lose performance due to data drift / concept drift;To describe other biases that can affect an AI model;To explain the importance of monitoring an AI model over time;To explain how to sustain and monitor the performance of an AI model after the deployment.To illustrate with an example of how we built an automated feedback loop.To explore a few options on how to maintain performance in the long run and retrain the model if necessary.

TABLE OF CONTENTS/OUTLINE

1. Model degradation: Data drift, Concept drift and Upstream data changes; 2. How to automatically gather and analyze AI model inferences; 3. Types of AI model scenarios and the possible types of analysis; 4. Main metrics to evaluate the performance of an AI model; 5. When and how to retrain an AI model and other options to maintain performance in the long run.

INEE-22HC A Practical Guideline for Safely Deploying Continuous Machine Learning Systems

Participants
Camila Gonzalez, MS, Darmstadt, Germany (*Presenter*) Nothing to Disclose

TEACHING POINTS

A central advantage of successful learning systems is their ability to adapt to new conditions in the dynamic real world. In clinical practice, common changes range from developments in image acquisition protocols to shifts in the patient population. When designing AI-powered systems, building mechanisms that allow such adjustments is necessary for preventing dangerous performance declines. Yet no continuous learning system is in use as of now. In this abstract, we summarize the central obstacles preventing the deployment of such solutions, and present practical advice on how to overcome them. We explore FDA and European Commission regulations (both in-effect and works-on-progress), consider the daily work of clinicians, and review under which conditions continuous learning systems can be a better return on investment than statically trained models. Our guide is useful for all relevant stakeholders, from data scientists to hospital administration.

TABLE OF CONTENTS/OUTLINE

(1) Continuous learning systems: definitions, technical challenges and benefits(2) Regulatory frameworks for the approval of continuous learning solutions in the USA and EU(3) Considerations for medical professionals when deploying continuously trained models in clinical practice(4) Cost-benefit analysis from an economic perspective: why continuous Machine Learning is

advantageous despite the regulatory overheadPlease visit the Learning Center to also view this presentation in hardcopy format.

INEE-23 Selection and Maintenance of Consumer Grade Displays for Home Reading Workstations

Participants
Douglas Nachand, MD, Shaker Heights, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Describe the display specifications of a consumer grade display that meets the suggested guidelines for non-mammographic diagnostic imaging- Design a workflow to properly calibrate the monitor for diagnostic purposes at baseline and at set intervals

TABLE OF CONTENTS/OUTLINE

Choosing a diagnostic display- What are the guidelines and who sets them -- Guidelines for non-mammography displays-- Mammography displays are regulated (specifications and quality control) and will not be covered- Pros and cons of displays marketed as consumer and medical grade- Ensuring your monitor meets the standards and additional features to considerAcceptance Testing and Initial Setup- Necessary equipment and software- Describe baseline and periodic calibration workflows-- How to perform-- Estimated time to completeMaintenance and Quality Control- Expected points of failure- QC tests, frequency, expected radiologist timeConclusions

INEE-24 Educational Applications of Metaverse and XR Extended Reality (VR, AR, MR) for Radiology and Telemedicine

Awards
Identified for RadioGraphics

Participants
Maki Sugimoto, MD, PhD, (*Presenter*) Officer, Holoeyes Inc

TEACHING POINTS

To define the metaverse in radiology and to explain the potential and limitations of its educational applications. 1) To learn the utilization of metaverse and XR (virtual-augmented-mixed reality) in medical imaging. 2) To learn how to segment and export polygons of targeting organs from DICOM data from CT or MRI. 3) To learn how to utilize metaverse systems and XR devices. 4) To show clinical examples, such as in medical education, surgical planning, simulation, and navigation. 5) To learn how to integrate metaverse and XR to improve visual-spatial ability to mentally manipulate medical anatomy in three dimensions.

TABLE OF CONTENTS/OUTLINE

1. Terminology: The representative forms such as XR (VR/AR/MR) are referring to all real-and-virtual combined environments and human-machine interactions generated by computer technology and wearables. 2. Beneficial applications of the XR devices and metaverse. 3. How to integrate the spatial imaging system and metaverse using avatars by interactive superimposing 3D holograms. 4. Effectiveness: Enhancing scene visualization is a feasible strategy for augmenting spatial awareness in complex anatomy education.

INEE-25 Estimating Vascular Age in Carotid Ultrasound using Deep Learning

Participants
Rena Nishimaki, Maebashi, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Heart and cerebrovascular diseases are caused by atherosclerosis, which is associated with the aging of blood vessels. Understanding vascular age plays a major role in the prevention of vascular diseases. The progression of arteriosclerosis is measured by ultrasonography (US), pulse wave velocity, and cardio-ankle vascular index. Carotid US is an excellent examination for early detection and evaluation of patients and indicates the degree of atherosclerosis as a whole body. However, carotid US alone cannot evaluate vascular age as an indicator of atherosclerosis. In this study, we propose estimating vascular age in the carotid US using a deep convolutional neural network (DCNN). It can provide useful information on the appropriate diagnosis of atherosclerosis. The major teaching points of this exhibit are to: 1. classify and regress the carotid US using DCNN. 2. understand how to estimate vascular age with a computer-aided diagnosis (CAD) system. 3. be useful for diagnosing atherosclerosis.

TABLE OF CONTENTS/OUTLINE

To provide CAD using DCNN regarding estimation of vascular age and discuss clinical usefulness toward accurate diagnosis of the arteriosclerosis in ultrasonography.

INEE-26 Unsupervised Learning Classification of Rectum Region for Prostate Cancer During Image-guided Radiation Therapy in CBCT

Participants
Haruyuki Watanabe, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Intensity-modulated radiotherapy (IMRT) is a more effective curative treatment option for prostate cancer patients than surgery. IMRT uses for tumor and normal organ detection to generate treatment plans that confine the prescribed dose to cancer while maximally excluding the adjacent normal organs. Image-guided radiation therapy using cone-beam CT (CBCT) associated with IMRT provides a safe and reliable radiotherapy treatment. Because the rectal size and shape cause prostate motion, it is necessary to confirm in CBCT images. If necessary, after checking the CBCT images, defecation and exhaust gas treatment are required. However, there is no clear standard as to whether to take the treatment. Thus, we propose an unsupervised learning classification to support the decision of treatment such as defecation and exhaust gas. The major teaching points of this exhibit are to: 1. automatically classify the rectum region. 2. understand how to use unsupervised learning schemes. 3. be useful for prostate cancer during image-guided radiation therapy in CBCT.

TABLE OF CONTENTS/OUTLINE

To provide unsupervised learning classification regarding validation of image-guided radiation therapy in CBCT.

INEE-27 Natural Language Processing in Radiology: State of the Art and Future Directions

Awards
Magna Cum Laude

Participants
Pratheek Bobba, BS, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The need for Natural Language Processing (NLP) in Radiology.2. History of NLP and milestones.3. Current clinical applications of NLP in radiology. 4. Applications and future directions of NLP in radiology.

TABLE OF CONTENTS/OUTLINE

1. The need for NLP in radiology: Cures act for radiology benefits and challenges including health literacy, increased anxiety from patients reading reports without guidance, increased calls to clinicians which may disrupt workflow.2. History and milestones: brief review of the history of NLP and the current NLP models, focusing on Bidirectional Encoder Representations from Transformers (BERT).3. Current state of the art: there has been an exponential increase in rate of NLP in radiology publications, with a 3-fold increase in publications about NLP in radiology from 2015 to 2019, focusing on extracting disease information from reports/labelling disease phenotypes rather than clinical applications.4. A review of the need for the following applications of NLP in radiology: text simplification, text summarization, extracting information, cohort creation/entity recognition, reporting accuracy/quality assurance, revenue loss, billing code generation, appropriate communication of disease acuity, and a special focus on structured reporting and NLP.

INEE-28HC Introduction to Clinical Workflow to Engineer 3D Printed Patient Specific Models with Specified Tissue Mechanical Properties

Participants
Kelsey Sommer, PhD, Buffalo, NY (*Presenter*) Stockholder, QAS.AI

TEACHING POINTS

Learn how to design and 3D print patient-specific phantoms on a multi-material anatomical printer which allows selection of specific mechanical properties for various tissues. Exemplification of multi-material 3D printed phantoms with specified mechanical properties: coronary arteries, neurovasculature and spine. Exemplification of using multi-material 3D printed phantoms for testing, residency training and treatment planning. 3D printing of patient specific phantoms is a benchtop tool that has high precision in geometric modelling and material properties. The latest advances in 3D printing allows mixing of polymers to simulate mechanical properties for various tissues and diseased state. Such advances allow performance of precise biomechanical, imaging or flow experimentation with controlled parameters such as pressure, flow rates, compliance, and range of motion.

TABLE OF CONTENTS/OUTLINE

• Exemplification of multi-material use for coronary arteries, neurovasculature and spine • Segmentation workflow, with focus on separation of various tissues • 3D printing process, including optimal selection of materials for a Stratasys J750 Anatomical Printer • Post-processing of 3D printed models • Applications of 3D printed patient-specific anatomical modelling • Discussion of the advantages and limitation of the new materialsPlease visit the Learning Center to also view this presentation in hardcopy format.

INEE-29 Systematic Review of Evidence-Based Medical AI

Participants
Terumasa Kondo, Toyoake, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Deep learning is beginning to be used as an essential tool in radiology. However, the use of deep learning can lead to black-boxing of the technology due to the complexity of the process. To solve these problems, Deep learning visualization methods have attracted attention in recent years. When AI technology surpasses human classification performance, the basis for decision-making by deep learning is expected to bring new knowledge to the human race. This exhibition aims to introduce how deep learning can be visualized, and will also show examples of research using CAM (Class activation map) and the development of a prognosis prediction method for CCU patients using electrocardiogram images.Main teaching point1. Black box problem of deep learning2. What is Explainable AI technology?3. Examples of Explainable AI Technology using GradCAM

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS 1. Black box problem of deep learning 2. What is Explainable AI technology? 3. Various types of Explainable 4. Example of Explainable AI technology 5. Our study

INEE-3 Prognostic AI-imaging Biomarkers: How to Predict the Survival of Patients With Idiopathic Pulmonary Fibrosis (IPF)

Awards
Certificate of Merit

Participants
Chinatsu Watari, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Idiopathic pulmonary fibrosis (IPF) is a major chronic progressive interstitial lung disease, with a median survival of 2-5 years from the time of diagnosis without anti-fibrotic medication. The teaching points of this exhibit are to (1) review currently established clinical prognostic biomarkers for IPF, (2) review the most promising emerging radiomic and AI-based biomarkers for imaging-based prediction of the survival in IPF, and (3) review the comparative performance between clinically established and AI-based prognostic biomarkers in the image-based prediction of the survival in IPF.

TABLE OF CONTENTS/OUTLINE

1. Why IPF is a problem. 2. Clinically established prognostic biomarkers for IPF (visual high-resolution CT (HRCT) pattern; gender, age, and physiology (GAP) index and staging system). 3. Radiomic biomarkers (traditional radiomics; hyper-curvature features; deep-learning radiomics) for survival analysis. 4. Why machine learning for survival analysis (AI-radiomics) outperforms clinical and radiomic biomarkers. 5. Comparative performance in terms of survival prediction and Kaplan-Meier survival curves. 6. Clinical case studies.

INEE-30 Mastering Basic Machine Learning Principles Without Coding Experience: A Tutorial on Googles Teaching Machine

Awards
Certificate of Merit

Participants
Adam Flanders, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Understanding machine learning requires developing a conceptual framework.2) Recognize that fundamental machine learning principles can be learned without coding experience.3) Understand the overall process to train a deep learning model.4) Learn basic concepts on how to assess model generalizability and performance.5) Appreciate that several free and easy to use non-coding solutions exist where you can experience training, validating and testing an image-based machine learning model.6) Understand that adjustment of training hyperparameters and dataset balance/bias significantly affects the performance of your model.

TABLE OF CONTENTS/OUTLINE

I) Introduction: Building a conceptual framework: introduction to hyperparameters (e.g. learning rate, batch size, epochs).II) Introduction to performance metrics: loss function, confusion matrix, accuracy.III) Datasets: tips to build an effective dataset.IV) Introduction to Google's Teachable Machine.V) Creating your classes / loading your data.VI) Train and view the performance live.VII) Adjust hyperparameters and observe the effect on training with loss curve and confusion matrix.VIII) Readjust the distribution of your positive and negative classes in your training dataset.IX) Observe the effects of data redistribution.X) Observe the effect of pre-processing to accuracy of the model.XI) Summary.

INEE-31 Robust AI in Brain MRI's Large-Factor Super-Resolution - And Its Application In Improving Brain CAD System's Precision

Awards
Certificate of Merit

Participants
Tong Zheng, Nagoya, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn the concept of super-resolution (SR) and its applications in brain MRI2. To understand difficulties in brain MRI's SR and how does our proposed AI overcome these difficulties3. To learn how to train a registration-error robust AI for SR on low- and high-resolution images dataset4. To learn our SR AI's application in brain CAD system and how does our AI improve precision of the CAD system

TABLE OF CONTENTS/OUTLINE

1. AI-based super-resolution (SR): fundamental concepts and application in medical imaging- SR technique enhances the resolution of a given image- AI can perform SR of medical images such as brain MRI2. Problems in training an AI for medical image SR- Training the AI needs precisely-registered low- and high-resolution image pairs- Existing AI for SR are not registration-error robust3. Techniques of our registration-error robust AI in medical image SR: newly-designed structure- Pre-train a StyleGAN as latent memory bank- Encoder-decoder structure to decompose images into high- and low-dimensional features4. Techniques of our registration-error robust AI in medical image SR: loss terms and pre-processing- Novel loss term to stabilize training procedure- Multi-channel input to obtain more spatial information5. SR results and its application in improving brain CAD system's precision- Our AI successfully performed SR of brain MRI images, made it easier for radiologists to observe brain structures only from low-resolution (LR) images taken with shorter scanning time- With our AI for SR, CAD systems can proceed more accurate diagnosis from LR MRI

INEE-33 Ready or Not, The Metaverse Will Have a Presence in Radiology

Participants
Aditya Khurana, MD, Scottsdale, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) To present an initial discussion on the metaverse, its current state, and existing but limited literature within healthcare; (2) Present a thought experiment with key thought leaders as to what can the metaverse mean for Radiology in the future; (3) Outline future concepts with specific examples in which the metaverse can enhance the education, application, and visibility of radiology

TABLE OF CONTENTS/OUTLINE

The "metaverse" is a relatively new concept emerging within technology in which humans can interact within a digital environment - it is the intersection of the virtual and real worlds and the emergence of a second digital life. The metaverse will have a presence in healthcare. As of May 1, 2022, Pubmed search for 'Metaverse' identified 33 articles thus far. Because the literature on this topic and its applications in radiology is still in its infancy, we present this exhibit as a thought experiment with key opinion leaders on how the metaverse will enhance radiology. We will discuss the integration of the metaverse with concepts such as: (1) Real time image analysis and insight, (2) Trainee education and experience, (3) Patient education, (4) Teleradiology, (5) Research, (6) Industry relations, (7) Knowledge sharing, and (8) Quality improvement patient safety.

INEE-35 Leveraging Virtual Containers for High-Powered-Collaborative AI Research in Radiology

Participants
Lucas Aronson, BS, Madison, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Multi-institutional collaboration of AI research poses challenges due to variations in hardware and software specifications. (2) No two users are likely to have the exact same requirements to execute their code, so even sharing between members of the same lab can present challenges. (3) Virtual containers alleviate many obstacles related to compatibility and portability and also offer a wide variety of tools to aid developers. (4) Virtual containers: (4a) Streamline remote access to high-powered computers and GPU servers. (4b) Can serve as a foundation for new projects with various base containers tailored to certain project types. This can save developers time as opposed to starting from scratch. (4c) Allow users to create portable, fully functional, self-contained coding environments for seamless operation irrespective of the computer/server employed. (4d) Facilitate multi-institutional collaboration and potential large-scale AI projects.

TABLE OF CONTENTS/OUTLINE

(1) Why do we need virtual containers? (1a) Address hurdles researchers face when collaborating and sharing AI algorithms. (1b) Highlight some features of containers that mitigate these obstacles, including the specification of software versions and dependencies. (2) A guide to getting started with virtual containers. (2a) Demonstrate an example virtual container termed Docker, including: (2a1) The Dockerfile and requirements file (2a2) How to build a Docker Image (2a3) How to run a Docker Container (2a4) Useful commands in Docker (3) An example of how Docker was used to facilitate a large-scale AI project.

INEE-37 International Outreach in Medical Imaging Research: 3D Slicer Internationalization and Localization to French

Participants
Sonia M. Pujol, PhD, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

3D Slicer is an open-source software platform used in medical imaging research around the world. However, the application is currently available in the English language only. While English is the language of science, radiologists and medical imaging researchers in non-English speaking countries work and communicate with their scientific colleagues in their own languages. Through current Essential Open Source Software for Science funding of the Chan Zuckerberg Initiative, we have created a 3D Slicer internationalization team in the US, Canada, and Senegal to facilitate access to the platform for the global medical imaging research community. We have begun internationalizing 3D Slicer and localizing the user interface, tutorials, and documentation to French. The goal of the exhibit is 1. to provide an overview of the current 3D Slicer internationalization effort; 2. to introduce the new internationalization infrastructure for translating 3D Slicer user interface; 3. to present the 3D Slicer glossary for medical imaging research; 4. to teach how to contribute translations in multiple languages on the 3D Slicer translation repository; 5. to showcase 3D Slicer global outreach activities for medical imaging research in Senegal.

TABLE OF CONTENTS/OUTLINE

Overview of 3D Slicer Internationalization effort; Language Packs extension; 3D Slicer Glossary; 3D Slicer Weblate Repository; 3D Slicer Community Resources in French; 3D Slicer Outreach in Senegal.

INEE-38 Statistical Plots in Oncologic Imaging: A Primer for Radiologists

Participants
Sina Bagheri, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Visual illustrations of quantitative information, including graphs and figures, are often practical and powerful methods of presenting scientific research results. Appropriate implementation of graphs improves the accuracy of readers' interpretation and understanding of the data, particularly for complex information. Recently, an increasing number of novel diagrams and plots have been used to visually display the outcome in radio-oncologic and radiogenomic studies. Thus, it is crucial for radiologists to be familiar with these kinds of data representations. In this educational exhibit, we describe the potential application of these various statistical plots and guide radiologists to interpret them in such reports. We also highlight the specific features of each graph type and review its advantages and drawbacks/pitfalls.

TABLE OF CONTENTS/OUTLINE

1. Brief introduction describing different ways for graphical representation of data 2. Graphical illustrations of tumor response 3. Graphical illustrations of survival 4. Graphical illustrations of cancer genotypes 5. Drawbacks and pitfalls 6. Conclusions

INEE-39CS NCI Imaging Data Commons: Towards Transparency and Reproducibility in Imaging AI

Awards
Identified for RadioGraphics

Participants
Andriy Fedorov, PhD, Arlington, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

NCI Imaging Data Commons (IDC) is a cloud-based repository of publicly available cancer imaging data co-located with the analysis and exploration tools and resources. IDC is part of the NCI Cancer Research Data Commons (CRDC) infrastructure that provides secure access to a large, comprehensive, and expanding collection of cancer research data. IDC uses a combination of the commercially available Google Cloud Platform and open source components. The DICOM standard is used for representation and communication of the data. Google Healthcare API enables the use of SQL for DICOM metadata exploration. The IDC portal (https://imaging.datacommons.cancer.gov) enables exploration and visualization of data and cohort building. As of Spring 2022, IDC hosts over 30 TB of public radiology and digital pathology images and image-derived data. IDC is intended for cloud-based data

processing, but data can be freely downloaded for on-premise analysis. Cloud-based workflows co-locating persistent data with software tools and compute resources enable reproducible analysis workflows. Attendees will learn about the scope and status of IDC (e.g., new features of the image viewers and IDC portal), accompanying learning resources (e.g., interactive notebooks with reproducible AI workflows applied to the data within IDC), and plans for future development. Live interactive demonstrations will be presented.

TABLE OF CONTENTS/OUTLINE

Overview of CRDC and IDC; Data curation and the role of The Cancer Imaging Archive; Portal; Viewer; Organization of data; Data versioning; Integration of tools; Use case development; Documentation and user support resources; IDC cloud credit program; Status update and plans for future development.

INEE-40 COVID-19 Surveillance System Based On a Nationwide Medical Image Database and Machine Learning

Participants
Kensaku Mori, PhD, Nagoya, Japan (*Presenter*) Research Grant, Cybernet Systems Co, Ltd;Intellectual Property, Cybernet Systems Co, Ltd;Research Grant, J Morita Corporation;Intellectual Property, J Morita Corporation;Developer, J Morita Corporation

TEACHING POINTS

- To understand what is nationwide CT image database- To understand how cloud-computing environments are constructed for CT image analysis- To understand how a nationwide CT image database is utilized for COVID-19 surveillance- To understand how machine learning techniques can be used for COVID-19 surveillance

TABLE OF CONTENTS/OUTLINE

Introduction- COVID-19 related disease shows several findings on CT images, including GGO.- Machine learning-based methods enable us to anaylze CT images of COVID-19 cases.Nationwide medical image database-A nationwide medical image database is constructed in collaboration with medical societies and National Institutes of Informatics.- Medical images taken at hospitals are transferred daily to the cloud data center through the Japanese academic network SINET in L2VPN connection.- The data center has GPU servers for machine learningCOVID-19 CT image analysis- Machine learning-based COVID-19 CT image analysis algorithm has been developed- The algorithm consist of lung area segmentation and CT image appearance classification (typical COVID-19 cases or atypical COVID-19 cases)- In-house neural network architecture has been developed.COIVD-19 CT daily surveillance- All of CT images having "lung" words in diagnosis reports are targets for analysis- Only CT images, including lung areas, are selected for further analysis.- Number of lung CT cases, typical COVID-19 cases and atypical COVID-19 cases are measured.Discussion-Nationwide CT image database has potential to become one of the information sources to know COVID-19 disease spread in a nation- Surveillance based on automated CT image analysis on a nationwide database can be used for monitoring many disease spreads.

INEE-41 An Overview of Artificial Intelligence for Multiple Sclerosis Analysis in MRI

Participants
Leiner Barba, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Purposes: 1) Provide an overview of artificial intelligence (AI) methods, experts team and technological needs, and their potential use in Radiology; 2) Review of Multiple Sclerosis (MS) affectations and biomarkers from MRI; 3) Discuss about how AI methods have been used for MS analysis; 4) Know the basis for application of AI to MS lesion detection and segmentation.

TABLE OF CONTENTS/OUTLINE

A. Overview of AI methods and MS affectations; B. Segmentation of MS lesions using AI techniques; C. Analysis of MS activity; D. How to use AI for analysis of affected regions in patient with MS; E. Challenges of applying AI for analysis of MS in clinical practice; F. Future trends of AI applied to MS analysis.

INEE-42 Generating Rapid Multiparametric Prostate MRI Protocols Using Deep Learning Reconstruction

Participants
David Wang, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Multiparametric Prostate MRI (mpMRI) protocol consists of high resolution multiplanar T2, diffusion weighted imaging (DWI), and dynamic contrast enhanced acquisitions. An ideal mpMRI protocol meeting or exceeding PIRADS recommendations can take ~25 minutes, even after optimizing protocols using commercially available acceleration techniques. The biggest time sinks within these protocols are the T2 weighted and high b-value DWI acquisitions. Recently, a Deep Learning (DL) reconstruction technology (AIR™ Recon DL, GE Healthcare) was leveraged to reduce the multiplanar T2 acquisition time by 3-fold, without loss in signal-to-noise ratio (SNR). In this exhibit, we will review the application of this DL reconstruction technology to both T2-weighted and DWI acquisitions, focusing on comparisons of the DL reconstruction to conventional reconstructions, as well as benefits in SNR and scan time reduction. Potential pitfalls and remaining artifacts from the accelerated acquisitions will be discussed as well as the requirements and trade-offs needed to achieve a fast and robust PI-RADS 2.1-compliant protocol in less than 10 minutes.

TABLE OF CONTENTS/OUTLINE

1. Key components of mpMRI for prostate cancer 2. Standard acquisitions and associated scan times. 3. Synopsis of DL technique and application to accelerated multiplanar T2-weighted imaging. 4. Application of DL reconstruction for DWI and synthetic b-value calculation. 5. Potential pitfalls and artifacts post DL reconstruction. 6. Overview of PI-RADS 2.1 compliant rapid protocols utilizing DL reconstruction. 7. Summary.

INEE-43 Federated Learning Environment in The ACRs AI Lab: Are Those Rubbers (AI models) Meant For Our Roads (Imaging Data)?

Participants
Lina Karout, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Understanding generalizability, reproducibility, and biases in AI models. (2) Foundation and application of federated learning environment for AI models.(3) Construction and deployment of data for federated learning. (4) Validation of AI models in ACR's AI Lab environment: Steps and Stats

TABLE OF CONTENTS/OUTLINE

(1) Foundational aspects of federated learning in AI model validation: What is it and why do we need it? How does it help? What does it entail? (2) Case-based demonstration of how you can use ACR's AI Lab to test and optimize AI models in a federated learning environment: (a) Understanding steps in data format, gathering, and uploading to the AI Lab. (b) Running AI models in the AI-Lab. (c) Analyzing AI outputs and performance statistics. (d) Improving AI model performance from local to global level. (3) Strengths and limitations of federated learning and its environment

INEE-44CS The Federated Tumor Segmentation Initiative: The Largest To-date Real-World Federation Focusing on NeuroOncology

Participants
Alexander Getka, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is a growing body of literature offering evidence of the potential impact that artificial intelligence (AI) methods can have towards healthcare. To ensure robustness and generalizability of AI methods, ample and diverse multi-site patient datasets are desired. However, there are various factors that hinder access to such data in the current paradigm of multi-site collaborations, which include the tedious bureaucratic processes, data ownership concerns, and legal considerations reflected in patient privacy regulations. To tackle these issues, we introduce the Federated Tumor Segmentation (FeTS) Initiative, which includes an open-source software toolkit for data-private collaborative learning of AI methods across multiple international institutions using federated learning (FL). The goals of the exhibit are to: (i) broaden the understanding of the general community regarding FL, (ii) showcase how a user can leverage FL to train a model across various sites, (iii) present results of the first real-world federation across 71 collaborating sites across 6 continents with 25,256 MRI scans from 6,314 patients focusing on the rare disease of glioblastoma, (iv) discuss privacy and data protection concerns and how FeTS hopes to solve it.

TABLE OF CONTENTS/OUTLINE

This exhibit will present a toolkit to define a FL-based model training problem and deploy it across multiple partnering sites, ensuring a data-private AI training paradigm. Specific principles to protect data privacy will be described, along with common pitfalls to avoid when performing an FL-based study.

INEE-45 A Practical Approach Into Artificial Intelligence: Ultrasonography and Artificial Intelligence Pipeline for Developmental Hip Dysplasia Screening

Participants
Sebastian Gallo-Bernal, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Artificial intelligence (AI) algorithms have demonstrated remarkable progress in image-recognition tasks. • We aim to exemplify AI integration into clinical workflows, by assessing the feasibility of an ultrasound (US) AI (xAI) pipeline to increase the availability of sonographic screening for developmental hip dysplasia (DDH).• US screening for DDH is based on the Graf method. The main drawback of this method is the high inter-operator variability. Primary sources of image acquisition variability arise from the manual selection of anatomical points and the difficulties to acquire images in the adequate anatomical plane.• An AI-based computer-aided diagnosis (CAD) system can standardize image acquisition and reduce diagnosis time, improving the accuracy and objectivity of DDH diagnosis.• Problem-solving in practical approaches towards AI: Class Imbalance. • US x AI pipeline product: preprocessing techniques, image adequacy assessment and diagnosis models, atlas creation and nearest neighbor retrieval modules, and modules for post-hoc quantification of prediction uncertainty

TABLE OF CONTENTS/OUTLINE

INTRODUCTION AND BACKGROUND:• Artificial intelligence and radiology: AI for image quality assessment and image selection and standardization PROBLEM STATEMENT:• Ultrasonography for DDH screening and follow-up. Graf technique: image quality consideration; drawbacks and limitations on radiology workflows US x AI PIPELINE: PRACTICAL APPROACH TOWARDS IMPLEMENTATION• Ultrasonography x AI pipeline architecture and outputs• Comparison of undersampling and class weights for addressing class imbalance• Performance metrics for binary classification of image adequacy LIMITATIONS/FUTURE

INEE-46 A Hands-on Guide to Designing Cloud-based Web Platforms with Radiological Applications

Participants
Adrian Serapio, Berkeley, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learning what goes into the design of cloud-based radiological web platforms will empower radiologists to truly leverage the power of the cloud and enhance their everyday workflow. We will walk through designing one such application, RadSim, an interactive reader performance study application that streamlines the process of conducting image based surveys. We demonstrate: - Why and how to apply cloud-based applications to a radiologist's everyday workflow- How to design a basic web application from ideation to testing- How to use the REST framework to develop the web application (using Node.js, MySQL, AWS)- How to visualize data generated by the web platform (using Python's Matplotlib library)

TABLE OF CONTENTS/OUTLINE

Problem Statement - Paucity of easy-to-learn, open-source, platform-agnostic, cloud-based web applications matching the needs of radiologists- Introduce and walkthrough a product design framework to build simple cloud-based applications in radiologyPrerequisite/Background- Basic understanding of any programming languageWalkthrough1. Product design framework2. Cloud-based web development 3. Data visualization4. Integration to radiological workflowConclusion

INEE-47 Understanding and Mitigating Bias in Artificial Intelligence

Awards
Identified for RadioGraphics
Cum Laude

Participants
Ali Tejani, MD, Frisco, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Define and review categories of bias in AI.2. Raise awareness of the sources of bias to promote mindfulness when using AI solutions in practice.3. Understand how models can perpetuate prejudices and bias inherent in datasets.4. Propose solutions to combat bias in AI.

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Define bias in AIi. Broad categories (i.e., implicit versus explicit, cognitive biases)ii. Model development (i.e., dataset, algorithm, and prediction bias)2. Scope of bias in AIa. Bias in AI along the radiology value chainb. Workflow diagram of the effect of bias in AI beyond the reading room (i.e., referring clinician and enterprise-level effects)i. Exacerbation of healthcare inequities3. Sources of bias in AIa. Model developmenti. Dataset curation1. Training/validation set demographics2. Confounding clinical comorbiditiesii. Technical dataset variables1. Dataset shift2. Data leakage3. Varying post-processing techniquesiii. Annotations1. Varying expertise2. Lack of standard guidelines3. Heterogeneous imaging scanners and protocolsiv. Bias-variance tradeoffb. Model utilization and clinical impacti. Automation biasii. Inequality considerations1. Exacerbation of inherent algorithm bias (i.e., underdiagnosis)2. Amplification of resource inequality and implications of inadequate access to AI tools3. Heterogenous monitoring and adjustment of deployed AI tools4. Proposed solutions to mitigate bias in AIa. "Checkpoints" throughout AI workflowb. Involving statisticians in the model development processc. Require diverse datasetsd. Monitoring AI performance across diverse populations and varying modalities/hardware

INEE-48 Building A Multi-institution and Multi-expert Annotators Dataset for Machine Learning: Experience From

Participants
Felipe C. Kitamura, MD, PhD, Sao Paulo, SP (*Presenter*) Consultant, MD.ai, Inc;Speaker, General Electric Company

TEACHING POINTS

Creating Machine Learning (ML) datasets is a laborious and tricky team effort.Errors in the planning phase can undermine the final result.Baking a refined ML dataset can be viewed as a multi-step process, including use-case definition, IRB approval, multi-institutional agreement, imaging protocol definition, data de-identification, data collection, labeling scheme definition, collaborating with annotators, annotation and data quality control, and license definition.A recipe approach is suggested with a list of ingredients and preparation instructions.

TABLE OF CONTENTS/OUTLINE

Why is it important to create ML datasets?ML dataset recipeKey ingredients of a useful datasetDataset preparation instructionsMost common pitfalls and mistakesLogistics and quality control when generating expert annotationsExamples of RSNA datasetsHow the dataset structure affects model development.

INEE-49 Impact-sensitive Management of Prediction Uncertainty in Artificial Intelligence for Healthcare

Participants
Michelle Chua, Brookline, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Unsafe prediction failure occurs when a machine learning model is unable to convey lack of confidence, or deceitfully conveys high confidence, in an erroneous predictionStandard performance metrics measure overall model performance on limited test data and provide no indication of model confidence in the correctness of individual predictionsPost-hoc prediction uncertainty metrics, such as calibrated classifier confidence, measures of visual similarity, and information entropy, may be used to quantify prediction uncertaintyClassifier confidence and information entropy do not capture out-of-distribution uncertaintyPrevention of unsafe prediction failure requires task-specific and impact-sensitive selection of prediction uncertainty metrics and prediction uncertainty thresholdsPrediction uncertainty metrics may be calibrated to precision if the desired safety threshold is zero tolerance for false positives or to negative predictive value if the desired safety threshold is zero tolerance for false negatives

TABLE OF CONTENTS/OUTLINE

Understanding prediction uncertainty and prediction uncertainty metricsComparative evaluation of prediction uncertainty metricsSelection of prediction uncertainty metrics for zero tolerance and error tolerant clinical applications

INEE-4HC Building the Administrative and Operational Infrastructure for an AI Enabled Radiology Department

Awards
Certificate of Merit

Participants
Holly Meyer, RT, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The goal of this exhibit is to provide an administrator's perspective on building an artificial intelligence (AI) team in the Department of Radiology, as well as the framework for successful discovery, translation, application, and commercialization of AI software technology. To establish a thriving AI program, careful consideration must be given to the organizational structure, key job roles and responsibilities, and an effective program structure must be established within which to operate.

TABLE OF CONTENTS/OUTLINE

1. Radiology AI Ecosystem 2. Program Stakeholder Network 3. Pathways to Navigate a. Technical b. Administrative c. Regulatory 4. Clinical AI Pillars 5. Program Structure a. Leadership b. Organization c. Team d. Roles Responsibilities e. Information Management f. Communication g. Training and Education h. Quality Management System i. Architecture Infrastructure 6. Process a. Idea Submission b. Feasibility Analysis c. Intake d. Discovery e. Translation f. Limited Rollout g. Full Rollout h. Post-ProductionPlease visit the Learning Center to also view this presentation in hardcopy format.

INEE-5 Lessons Learned from a Cyberattack on the Healthcare System: A Radiology Perspective

Participants
Hilary Strong, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

We wish to share our insight and lessons learned from navigating a response to the cyberattack on province-wide healthcare authorities which rendered medical information technology systems inaccessible. Prompt, accurate, and consistent communication with all medical imaging staff, referring physicians, and healthcare authorities, is a crucial first step. Effective communication involves various modalities, such as secure applications, texts, emails, calls, and frequent face-to-face discussions/meetings. Following effective communication, having an existing cyberattack response system in place to immediately modify workflow and adapt to technology limitations is a priority. Finding an effective modified workflow system is not a linear process. However, judicious trial and error of solutions is more effective than remaining idle during a cyberattack. Modified workflow included entirely paper-based medical imaging requisitions and patient safety identification systems, as well as workflow limited to urgent and emergent studies only. With patient-centered care at the forefront of the radiology department's response to the cyberattack, safe and effective medical imaging services were provided to the patients of our province.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Four Lessons Learned from a Cyberattack on Our Provinces' Healthcare Systema. Prompt and consistent communication is paramount.b. (Not completely) out with the old (paper-based system).c. Correct patient identification prioritizes safety.d. Judicious trial and error is the way forward.3. Conclusion

INEE-6 All-in-One workplace for Radiologists: How to Build Your Personal Radiology Knowledge

Participants
Ken Oba, MD, Chuoku, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

At the end of this presentation, you will be able to:-Learn about Notion and Cloud PACS basics and start practicing with simple lessons and review concepts.-Make the all-in-one workspace and notes for research, education, and conference.-Build a system for collecting, maintaining, and serving knowledge to the right person at the right time.

TABLE OF CONTENTS/OUTLINE

-Introduction.-What is Notion, and what is Cloud PACS.-How to start Notion and Cloud PACS.-How to make a database for scientific research.-How to make a database for education.-How to make flashcards for exams.-How to make a database for conferences.-Advanced techniques will be introduced through Twitter using templates and short movies.-Conclusion

INEE-7 Medical imaging AI In the Real World: Decoding Bias in Under-represented Populations

Participants
Eduardo Freire, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Patterns of health inequality permeate artificial intelligence (AI) systems when bias and discrimination become entrenched in the conception, design, and use of these systems. Underserved patients, who have historically faced greater challenges accessing care, including imaging, may be underrepresented in the development of AI systems, leading to bias and compromising model performance. We aim to present a literature review on how to identify and mitigate existing and potential bias related to healthy inequality in medical imaging AI.

TABLE OF CONTENTS/OUTLINE

1) Introduction 1.1) Basic concepts and definitions: diversity, equity and inclusion in the AI era 1.2) Fairness and ethics of artificial intelligence in radiology: where are we?2) Categories of AI bias 3) Sources of bias in AI development lifecycle 3.1) Human factors 3.2) Dataset challenges 4) Identifying bias in medical imaging AI: Case studies 4.1) How gender and race imbalance in a medical imaging dataset influences AI performance 4.2) Transgender population and health care disparities 5) Strategies to managing and mitigating bias in medical imaging AI 5.1) Transparency and data sharing5.2) Policy and Regulations

INEE-8 3D Printing and Digital Surgical Rehearsal in Complex Spine Surgery

Awards
Identified for RadioGraphics

Participants
Lumarie Santiago, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

The approach to complex spine surgery requires a multidisciplinary team and multimodality imaging to delineate the extent of disease as well as the structures at risk during surgery. Integration of the information provided by the various imaging exams may be difficult, particularly as each surgical discipline may have different take away points. This case-based exhibit provides information on the process of 3D printing including segmentation using multimodality imaging exams, validation (QA) and post processing. The use of digital and 3D printed models in surgical rehearsal with a focus on their impact on prescribing digital surgical planes will be discussed. The integration of .STL files into intraoperative navigation systems and validation of the digital surgical plan using the 3D printed model will also be reviewed.

TABLE OF CONTENTS/OUTLINE

1. The 3D printing workflow used to integrate multimodality imaging exams. 2. 3D printing material selection to enhance surgical rehearsal. 3. Quality assurance steps in 3D printing. 4. Prescribing digital surgical planes. 5. Validation of digital surgical planes using the 3D printed mode.l 6. Intraoperative use of digital surgical planes.

INEE-9 3D Printing from Medical Imaging Data: What the Resident Needs to Know

Participants
Nicole Wake, PhD, Aurora, OH (*Presenter*) Employee, General Electric Company

TEACHING POINTS

A. Patient-specific 3D printed anatomic models and guides can aid in surgical planning, can provide intra-operative guidance, can be utilized for simulations, and can be used for trainee and patient education.B. Volumetric medical imaging data with high spatial resolution, good signal-to-noise ratio (SNR), and good contrast-to-noise ratio (CNR) is recommended if 3D printing will be performed.C. The workflow to create 3D printed anatomic models from volumetric imaging data includes image acquisition, image segmentation, conversion to 3D mesh geometries, and printing.D. Reimbursement for 3D printed anatomic models and anatomic guides can be pursued using Category III CPT Codes.E. The medical 3D printing process should be formally documented and recorded in the electronic medical record system and this is required for reimbursement.F. Hospital-based 3D printing labs should establish quality management systems to ensure the accuracy of 3D printed models.

TABLE OF CONTENTS/OUTLINE

1. Review of the common applications of 3D printed medical models.2. Description of major imaging recommendations for the creation of 3D printed anatomic models and guides derived from medical imaging data.3. Overview of the workflow required to create 3D printed patient-specific anatomic models from volumetric medical imaging data.4. Review of CPT codes including the Category III CPT Codes for 3D Printed anatomic models and anatomic guides, and introduction to the RSNA-ACR 3D printed model registry.5. Synopsis of a formal documentation system for 3D printed anatomic models and guides.6. Summary of the quality assurance steps required to ensure the accuracy of 3D printed medical models.

INEE-10

Developing a Prostate Cancer Radiologic-Pathologic Correlated Quality Reporting Dashboard

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Ryan Ward, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate cancer is an important cause of morbidity and mortality in men. The Prostate Imaging Reporting and Data System (PI-RADS) provides a framework for systematically scoring lesions on prostate MRI based on clinical suspicion for prostate cancer. Using this data, combined with actual pathologic outcomes, we developed a robust system for tracking patients being evaluated for prostate cancer. The system allows the user to evaluate diagnostic performance at physician, department, and enterprise level and easily identify patients where discordance may exist between MRI findings and pathologic result.

TABLE OF CONTENTS/OUTLINE

1) Provide a brief overview of prostate cancer and the PI-RADS scoring system. 2) Describe the importance of tracking and analyzing prostate MRI data. 3) Describe the underlying technology/architecture for extracting, transforming, and loading the data into the data warehouse. 4) Provide examples of the dashboard and the different visualizations available.

Standardized Operational Log of Events (SOLE) for Artificial Intelligence (AI) Monitoring

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Ali Tejani, MD, Frisco, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Provide an overview of IHE standardized operational log of events (SOLE)2. Review the interoperability advantages of using SOLE application programming interfaces (APIs) and codes in practice3. Describe specific metrics defined by SOLE to monitor deployed AI solutions4. Demonstrate how processes monitored by SOLE codes can be visualized through business analytics/dashboards5. Describe challenges with adopting SOLE APIs and codes in practice

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Describe the problem: lack of interoperability and an efficient means of monitoring AI solutions workflowsb. SOLE for business analytics/process miningi. Review SOLE APIsii. Review select SOLE codesc. Introduce the concept of SOLE for AI monitoring2. Review how SOLE can be applied for AI monitoringa. Describe specific use cases to demonstrate how SOLE codes can be used to monitor AIi. Frequency of AI tool useii. Disagreement rate with AI resultsiii. Effect of AI tool use on time from study ordered to study readiv. Clinical monitoring for the impact of AI on patient care1. Time to treatment based on urgent AI alert2. Time to ED admissionv. Aggregating history of events over an extended time (i.e., if needing to justify ROI for annual budget)b. Demonstrate visualization of processes captured by SOLE codes with business analytics/dashboards3. Challenges associated with adopting SOLE APIs and codesa. Presence of multiple profiles (SYSLOG, ATNA, FHIR)b. Distilling the list of codesc. Encouraging vendor adoptiond. Flexibility to capture all potential AI-radiologist interactions

Try Before You Buy: A One-Stop-Shop Approach for Testing and Procuring Commercial AI Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Vidur Mahajan, MBBS, New Delhi, India (*Presenter*) Employee, CARPL.ai

TEACHING POINTS

1. There are more than 150 FDA approved AI applications and the new approvals are growing at 50% per annum. There are 100s of other commercial AI applications available around the world.2. This makes it nearly impossible for radiologists to effectively discover and test these AI solutions on their own data.3. We present a software system with pre-integrated commercial AI applications, i.e. an AI marketplace, which allows radiologists to upload their own data and rigorously test the performance of the application.4. The software includes in built data management, anonymisation, cohort creation, annotation and statistical analysis tools.5. The option to ensemble AI outputs to improve performance also exists.

TABLE OF CONTENTS/OUTLINE

Our exhibit will be a computer system with 3 monitors, replicating the radiologists workstation.Radiologists at RSNA would be able to bring their own data and upload it into this system and choose to run commercial AI applications and compare their performance.This would allow them to make informed purchase decisions, and optimize for productivity / quality gains.We believe that ours is a unique offering which can exponentially drive the adoption of clinical AI.

Ultrasound-guided Peripheral Insertion System using Deep Learning

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Yuina Ezawa, Maebashi, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Puncture of peripheral blood vessels in the elderly and children is a difficult activity. Ultrasound-guided venipuncture is a widely used method to facilitate peripheral venipuncture. In this method, the positional relationship between the target blood vessel and the needle is confirmed, and the target blood vessel is punctured while operating the probe and needle at the same time. However, it is very difficult to confirm the positional relationship between the target blood vessel and the needle. To solve this problem, we propose a method that uses a convolutional neural network (DCNN) to automatically extract blood vessels and needles on the image. It is possible to display the optimum needle approach angle by computer-assisted detection. This method can show the positional relationship between the peripheral vein and the needle and provide useful information to assist in the puncture. The major teaching points of this exhibit are to: 1. automatically extract blood vessels and needles from ultrasound images. 2. understand how to extract blood vessels and needles using DCNN. 3. be useful for ultrasonic-guided venipuncture.

TABLE OF CONTENTS/OUTLINE

To discuss the clinical usefulness for accurate examination in ultrasound-guided venipuncture using DCNN extraction.

The New 3D Slicer Version 5.0 Open Source Platform for Medical Image Analysis, 3D Visualization and Image-guided Intervention

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Sonia M. Pujol, PhD, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

3D Slicer is an open-source and extensible software platform used in clinical research worldwide. The new Slicer 5.0 release version provides hundreds essential core modules and extensions, and builds on the success of the version 4 downloaded over 1 million times since RSNA 2011. The goal of the exhibit is: 1. To review a brief history of 3D Slicer development in the past 20 years; 2. To discover the DICOMweb browser for cloud-based DICOM workflows; 3. To visualize GPU-based volume-rendering of DICOM images; 4. To discover the new Markups features; 5. To perform interactive segmentation of 2D/3D/4D images; 6. To discover the new MONAILabel extension for AI-assisted image annotation; 7. To learn new Slicer features for COVID-19 data analysis; 8. To create 3D solid objects for 3D printing; 9. To perform real-time data fusion for image-guided therapy; 10. To connect Slicer with robots, scanners, and trackers; 11. To interact with 3D scenes using virtual and augmented reality headsets; 12. To perform cloud-based computing in a Web browser using AWS AppStream 2.0, in a Docker container or a Jupyter notebook kernel; 13. To understand how to use 3D Slicer in clinical research applications.

TABLE OF CONTENTS/OUTLINE

Overview of the new 3D Slicer version 5.0; DICOM Standard Interoperability: import/export and structured reporting; DICOMweb features; GPU-based 3D and 4D Volume Rendering; Markups and Automated Measurements; Interactive 2D/3D/4D Image Segmentation; 3D Printing; Artificial Intelligence; Virtual and Augmented Reality; Cloud-based Computing; Clinical Applications in COVID-19, Surgical Navigation, and Image-Guided Intervention; Slicer Community Resources: Forum, Training Compendium, and Documentation.

Understanding Patient Needs and Gaps in Radiology Reports Through Online Discussion Forum Analysis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Mohammad Alarifi, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Our objective is to investigate patient needs and understand information gaps in radiology reports using patient questions that were posted on online discussion forums. We leveraged online question and answer platforms to collect questions posted by patients to understand current gaps and patient needs. We retrieved six hundred fifty- nine (659) questions using the following sites: Yahoo Answers, Reddit.com, Quora, and Wiki Answers. The questions retrieved were classified into eight major themes. The themes were related to the following topics: radiology report, safety, price, preparation, procedure, meaning, medical staff, and patient portal. Among the 659 questions, 35.50% were concerned with the radiology report. The most common question topics in the radiology report focused on patient understanding of the radiology report (62 of 234 [26.49%]), image visualization (53 of 234 [22.64%]), and report representation (46 of 234 [19.65%]). We also found that most patients were concerned about understanding the MRI report (32%; n = 143) com- pared with the other imaging modalities (n = 434). Using online discussion forums, we discussed major unmet patient needs and information gaps in radiology reports. These issues could be improved to enhance radiology design in the future.

TABLE OF CONTENTS/OUTLINE

Adding Value in Radiology: 3D Imaging Lab

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Larson Hsu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In contrast to conventional volume rendering static images, segmentations of the patient's anatomy can be exported as a 3D model and further utilized in different applications for better spatial understanding of the disease. For example, the 3D model can be reviewed with an interactive viewer on the computer or other flat-screen devices, or visualized in virtual or augmented realities. It can also be 3D printed as an anatomical model for presurgical planning, or used as the basis to design patient-specific medical devices such as cutting guides or wearable prostheses. In this exhibit we will share the experience of our 3D imaging lab in a cancer center, and demonstrate how it can add value to the Radiology Department and potentially improve patient care.

TABLE OF CONTENTS/OUTLINE

1) Introduction/background: radiology 3D imaging lab 2) Volume rendering vs. 3D segmentation model 3) Advanced visualization using virtual and augmented realities 4) 3D printing of anatomical models and patient-specific medical devices at the point-of-care 5) Showcase and examples of 3D model applications in different disciplines 6) Future directions

Demystifying Coloring and Surface Labeled 3D Printed Anatomical Models

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Muhammad Rehman, BA, Virginia, VA (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Discussion on the relevance and importance of multi-color 3D printing with emphasis on models with special surface characteristics such as text, image and texture ? Highlighting various applications of color 3D models such as educational models, in clinical cases or for research purposes ? Pros and cons of de novo creation of multi-part STL files vs working on pre-existing STL files ? Advantages and disadvantages of graphically designing STL files vs using cross-sectional imaging to 3D reconstruct STL files in the educational setting ? Introducing UV surface mapping ? Detailing multiple software programs that can be used to color, label and imprint images onto the surface of a preexisting STL file and providing brief methodology for each ? Discussion of different 3D printing techniques that allow for color 3D printing, especially highlighting novel Multi Jet Fusion technology that allows for development of highly durable and versatile models with fully customizable surface appearance, not previously as robustly available ? A chart detailing subjective learning curve, user friendliness and cost of the software programs and 3D printers/printing services

TABLE OF CONTENTS/OUTLINE

? Background ? Discussion ? Software programs ? Meshmixer ? Microsoft Paint 3D ? Blender ? Autodesk 3d Studio Max ? Color 3D printing techniques ? PolyJet ? Stereolithography ? Paper Based ? Binder Jetting ? Multi Jet Fusion ? Summary chart

Quantitative Evaluation of a Large-scale Multi-year Artificial Intelligence (AI) Deployment at a Large Academic Radiology Department - Key Metrics, Trends, and Milestones

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Axel Wismueller, MD, PhD, Pittsford, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

A) We present key analytics, trends, and milestones that are extracted from a multi-year large-scale AI clinical deployment of a radiology triage and prioritization solution in a large academic hospital setting. B) The analytics, trends and milestones are extracted from the hospital system's experience of taking a single-pathology AI module and scaling it out to cover nine different pathologies.Our analysis provides a set of recommended metrics to measure growth, performance, and user engagement. C) We present trends for various milestones and how the metrics change as an AI solution scales up to cover a greater number of imaging examinations. D) Our case study may provide insights and value to other radiology practices and hospital systems as a basis for defining best practice guidelines, and for contributing to the calculation of business metrics, such as Return-on-Investment (ROI) or Total Cost of Ownership (TCO) in the clinical adoption of AI solutions.

TABLE OF CONTENTS/OUTLINE

A) Introduction: 1. Description of project goals and timeline 2. Overview of the AI integration into the radiologist workflow B) Metrics: 1. Description and visualization of metrics for measuring: a) Growth of the AI adoption b) Performance of the AI c) User engagement 2. Highlights of the key trends milestones C) Summary of key metrics: 1. Overview of the value of each metric 2. Identified minimum thresholds for success criteria 3. Summary of teaching points

Using the Open Health Imaging Foundation (OHIF) Framework To Build Web-based Imaging Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Erik Ziegler, MSc,PhD, (*Presenter*) Consultant, Radical Imaging LLC;Consultant, Novometrics LLC;Stockholder, Yunu Inc

TEACHING POINTS

The purpose of this exhibit is to:1. Explain how radiologists can build their own imaging tools and applications using the open source Open Health Imaging Foundation (OHIF) framework to address their custom use cases.2. Discuss the components of a full fledged zero-footprint web-based imaging application and how they interact using various APIs (e.g. DICOMweb).3. Explain how advanced functionality, such as 3D visualization, image fusion, and segmentation, can be incorporated in these applications.4. Demonstrate how to organize specific function sets into custom workflow modes for optimizing efficiency.5. Demonstrate how this type of system can be deployed both securely and cost effectively.

TABLE OF CONTENTS/OUTLINE

- Open source resources for radiology and AI applications- Relationships between components in web imaging applications- Building custom measurement tools- Incorporating advanced visualization and segmentation tools- Building custom workflow modes for the OHIF Viewer (e.g. configuring the application to provide functionality for use cases like ProstateCancer.ai, NCI Imaging Data Commons, XNAT)- Deploying scalable secure web imaging applications locally or using cloud resources- Future directions

Development of A Training Simulator of Plain Radiography Using Augmented Reality Technology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Certificate of Merit

Participants
Kaito Oikawa, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiographers need to acquire proficient skills through a great deal of experience to perform plain radiography accurately. Lack of such skills may lead to misdiagnosis and unnecessary radiation exposure. Conventional training methods for plain radiography were phantom radiography and radiography role-playing. They were insufficient to develop proficient skills because of the unlike clinical settings. Recently, a radiography training simulator using virtual reality was proposed. This simulator allowed the trainee to perform plain radiography on a virtual subject in a virtual space. However, the trainee cannot touch the virtual subject in this training simulator. This is the same as the conventional training methods in that it is different from the clinical settings. Therefore, we developed a training simulator of plain radiography using augmented reality technology. Our simulator can output virtual x-ray images similar to clinical settings, adapting positions and angles obtained by tracking human subjects in real time. The training using our simulator allows trainees to acquire proficient skills in preclinical training.

TABLE OF CONTENTS/OUTLINE

Lack of skills in plain radiography may lead to misdiagnosis and unnecessary radiation exposure in clinical settings. Our simulator can output the virtual x-ray images that reflect the positions and angles of the subject. Radiographers can acquire proficient skills by training the plain radiography repeatedly using our simulator.

Taking the Medical Devices Through the Regulatory Gatekeepers: How To Do It Right!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Bhanushree Bahl, New Delhi, India (*Presenter*) Employee, CARPL.ai

TEACHING POINTS

The clinical trial of AI-based Investigational Devices (AID) will look at the device performance through the lens of business capabilities, while evaluating technologies. Our exhibit will showcase the clinical trial workflow of AI algorithms with multiple scenarios for different regulatory approvals. Regulatory approvals are necessary for an AI model to be used clinically, and to add value to the business.AI companies can run clinical trials, which will help them get comprehensive results through data analysis for improved decision making.Conducting clinical trials on extensive data allows AI companies to detect patterns for enhanced business performanceWe will highlight the steps needed to conduct a successful clinical trial for various scenarios.In addition to this, the exhibit will also feature protocols required to follow for different regulatory approvals.

TABLE OF CONTENTS/OUTLINE

Protocol Synopsis: Study name, objective and type of the study, with the design procedure along with the calculated sample size and investigator selection (Screener / Reader / Gter).Study procedure: Ethical committee approval, Data collection and de-identifying studies, Screening, Ground Truthing , Standalone performance evaluation, Reader test Data Management Plan / Flow: Annotation Platform (Ex: CARPL), System verification and UAT, Security and maintenance of accountExternal Data Management Process: Data collection and archiving and cleaning, Master data Set creationStudy Endpoints and Statistical Analysis: Threshold of study endpoints and statistical analysis, Endpoints in standalone performance testPreparation of Violation ListPlease visit the Learning Center to also view this presentation in hardcopy format.

The Day After Tomorrow: How to Monitor A Deployed AI Model and Automate the Radiologist Feedback Loop

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Victor Menezes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe how an Artificial Intelligence (AI) model can lose performance due to data drift / concept drift;To describe other biases that can affect an AI model;To explain the importance of monitoring an AI model over time;To explain how to sustain and monitor the performance of an AI model after the deployment.To illustrate with an example of how we built an automated feedback loop.To explore a few options on how to maintain performance in the long run and retrain the model if necessary.

TABLE OF CONTENTS/OUTLINE

1. Model degradation: Data drift, Concept drift and Upstream data changes; 2. How to automatically gather and analyze AI model inferences; 3. Types of AI model scenarios and the possible types of analysis; 4. Main metrics to evaluate the performance of an AI model; 5. When and how to retrain an AI model and other options to maintain performance in the long run.

A Practical Guideline for Safely Deploying Continuous Machine Learning Systems

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Camila Gonzalez, MS, Darmstadt, Germany (*Presenter*) Nothing to Disclose

TEACHING POINTS

A central advantage of successful learning systems is their ability to adapt to new conditions in the dynamic real world. In clinical practice, common changes range from developments in image acquisition protocols to shifts in the patient population. When designing AI-powered systems, building mechanisms that allow such adjustments is necessary for preventing dangerous performance declines. Yet no continuous learning system is in use as of now. In this abstract, we summarize the central obstacles preventing the deployment of such solutions, and present practical advice on how to overcome them. We explore FDA and European Commission regulations (both in-effect and works-on-progress), consider the daily work of clinicians, and review under which conditions continuous learning systems can be a better return on investment than statically trained models. Our guide is useful for all relevant stakeholders, from data scientists to hospital administration.

TABLE OF CONTENTS/OUTLINE

(1) Continuous learning systems: definitions, technical challenges and benefits(2) Regulatory frameworks for the approval of continuous learning solutions in the USA and EU(3) Considerations for medical professionals when deploying continuously trained models in clinical practice(4) Cost-benefit analysis from an economic perspective: why continuous Machine Learning is advantageous despite the regulatory overheadPlease visit the Learning Center to also view this presentation in hardcopy format.

Selection and Maintenance of Consumer Grade Displays for Home Reading Workstations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Douglas Nachand, MD, Shaker Heights, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Describe the display specifications of a consumer grade display that meets the suggested guidelines for non-mammographic diagnostic imaging- Design a workflow to properly calibrate the monitor for diagnostic purposes at baseline and at set intervals

TABLE OF CONTENTS/OUTLINE

Choosing a diagnostic display- What are the guidelines and who sets them -- Guidelines for non-mammography displays-- Mammography displays are regulated (specifications and quality control) and will not be covered- Pros and cons of displays marketed as consumer and medical grade- Ensuring your monitor meets the standards and additional features to considerAcceptance Testing and Initial Setup- Necessary equipment and software- Describe baseline and periodic calibration workflows-- How to perform-- Estimated time to completeMaintenance and Quality Control- Expected points of failure- QC tests, frequency, expected radiologist timeConclusions

Educational Applications of Metaverse and XR Extended Reality (VR, AR, MR) for Radiology and Telemedicine

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Identified for RadioGraphics

Participants
Maki Sugimoto, MD, PhD, (*Presenter*) Officer, Holoeyes Inc

TEACHING POINTS

To define the metaverse in radiology and to explain the potential and limitations of its educational applications. 1) To learn the utilization of metaverse and XR (virtual-augmented-mixed reality) in medical imaging. 2) To learn how to segment and export polygons of targeting organs from DICOM data from CT or MRI. 3) To learn how to utilize metaverse systems and XR devices. 4) To show clinical examples, such as in medical education, surgical planning, simulation, and navigation. 5) To learn how to integrate metaverse and XR to improve visual-spatial ability to mentally manipulate medical anatomy in three dimensions.

TABLE OF CONTENTS/OUTLINE

1. Terminology: The representative forms such as XR (VR/AR/MR) are referring to all real-and-virtual combined environments and human-machine interactions generated by computer technology and wearables. 2. Beneficial applications of the XR devices and metaverse. 3. How to integrate the spatial imaging system and metaverse using avatars by interactive superimposing 3D holograms. 4. Effectiveness: Enhancing scene visualization is a feasible strategy for augmenting spatial awareness in complex anatomy education.

Estimating Vascular Age in Carotid Ultrasound using Deep Learning

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Rena Nishimaki, Maebashi, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Heart and cerebrovascular diseases are caused by atherosclerosis, which is associated with the aging of blood vessels. Understanding vascular age plays a major role in the prevention of vascular diseases. The progression of arteriosclerosis is measured by ultrasonography (US), pulse wave velocity, and cardio-ankle vascular index. Carotid US is an excellent examination for early detection and evaluation of patients and indicates the degree of atherosclerosis as a whole body. However, carotid US alone cannot evaluate vascular age as an indicator of atherosclerosis. In this study, we propose estimating vascular age in the carotid US using a deep convolutional neural network (DCNN). It can provide useful information on the appropriate diagnosis of atherosclerosis. The major teaching points of this exhibit are to: 1. classify and regress the carotid US using DCNN. 2. understand how to estimate vascular age with a computer-aided diagnosis (CAD) system. 3. be useful for diagnosing atherosclerosis.

TABLE OF CONTENTS/OUTLINE

To provide CAD using DCNN regarding estimation of vascular age and discuss clinical usefulness toward accurate diagnosis of the arteriosclerosis in ultrasonography.

Unsupervised Learning Classification of Rectum Region for Prostate Cancer During Image-guided Radiation Therapy in CBCT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Haruyuki Watanabe, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Intensity-modulated radiotherapy (IMRT) is a more effective curative treatment option for prostate cancer patients than surgery. IMRT uses for tumor and normal organ detection to generate treatment plans that confine the prescribed dose to cancer while maximally excluding the adjacent normal organs. Image-guided radiation therapy using cone-beam CT (CBCT) associated with IMRT provides a safe and reliable radiotherapy treatment. Because the rectal size and shape cause prostate motion, it is necessary to confirm in CBCT images. If necessary, after checking the CBCT images, defecation and exhaust gas treatment are required. However, there is no clear standard as to whether to take the treatment. Thus, we propose an unsupervised learning classification to support the decision of treatment such as defecation and exhaust gas. The major teaching points of this exhibit are to: 1. automatically classify the rectum region. 2. understand how to use unsupervised learning schemes. 3. be useful for prostate cancer during image-guided radiation therapy in CBCT.

TABLE OF CONTENTS/OUTLINE

To provide unsupervised learning classification regarding validation of image-guided radiation therapy in CBCT.

Natural Language Processing in Radiology: State of the Art and Future Directions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Magna Cum Laude

Participants
Pratheek Bobba, BS, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The need for Natural Language Processing (NLP) in Radiology.2. History of NLP and milestones.3. Current clinical applications of NLP in radiology. 4. Applications and future directions of NLP in radiology.

TABLE OF CONTENTS/OUTLINE

1. The need for NLP in radiology: Cures act for radiology benefits and challenges including health literacy, increased anxiety from patients reading reports without guidance, increased calls to clinicians which may disrupt workflow.2. History and milestones: brief review of the history of NLP and the current NLP models, focusing on Bidirectional Encoder Representations from Transformers (BERT).3. Current state of the art: there has been an exponential increase in rate of NLP in radiology publications, with a 3-fold increase in publications about NLP in radiology from 2015 to 2019, focusing on extracting disease information from reports/labelling disease phenotypes rather than clinical applications.4. A review of the need for the following applications of NLP in radiology: text simplification, text summarization, extracting information, cohort creation/entity recognition, reporting accuracy/quality assurance, revenue loss, billing code generation, appropriate communication of disease acuity, and a special focus on structured reporting and NLP.

Introduction to Clinical Workflow to Engineer 3D Printed Patient Specific Models with Specified Tissue Mechanical Properties

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Kelsey Sommer, PhD, Buffalo, NY (*Presenter*) Stockholder, QAS.AI

TEACHING POINTS

Learn how to design and 3D print patient-specific phantoms on a multi-material anatomical printer which allows selection of specific mechanical properties for various tissues. Exemplification of multi-material 3D printed phantoms with specified mechanical properties: coronary arteries, neurovasculature and spine. Exemplification of using multi-material 3D printed phantoms for testing, residency training and treatment planning. 3D printing of patient specific phantoms is a benchtop tool that has high precision in geometric modelling and material properties. The latest advances in 3D printing allows mixing of polymers to simulate mechanical properties for various tissues and diseased state. Such advances allow performance of precise biomechanical, imaging or flow experimentation with controlled parameters such as pressure, flow rates, compliance, and range of motion.

TABLE OF CONTENTS/OUTLINE

• Exemplification of multi-material use for coronary arteries, neurovasculature and spine • Segmentation workflow, with focus on separation of various tissues • 3D printing process, including optimal selection of materials for a Stratasys J750 Anatomical Printer • Post-processing of 3D printed models • Applications of 3D printed patient-specific anatomical modelling • Discussion of the advantages and limitation of the new materialsPlease visit the Learning Center to also view this presentation in hardcopy format.

Systematic Review of Evidence-Based Medical AI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Terumasa Kondo, Toyoake, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Deep learning is beginning to be used as an essential tool in radiology. However, the use of deep learning can lead to black-boxing of the technology due to the complexity of the process. To solve these problems, Deep learning visualization methods have attracted attention in recent years. When AI technology surpasses human classification performance, the basis for decision-making by deep learning is expected to bring new knowledge to the human race. This exhibition aims to introduce how deep learning can be visualized, and will also show examples of research using CAM (Class activation map) and the development of a prognosis prediction method for CCU patients using electrocardiogram images.Main teaching point1. Black box problem of deep learning2. What is Explainable AI technology?3. Examples of Explainable AI Technology using GradCAM

TABLE OF CONTENTS/OUTLINE

Prognostic AI-imaging Biomarkers: How to Predict the Survival of Patients With Idiopathic Pulmonary Fibrosis (IPF)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Certificate of Merit

Participants
Chinatsu Watari, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Idiopathic pulmonary fibrosis (IPF) is a major chronic progressive interstitial lung disease, with a median survival of 2-5 years from the time of diagnosis without anti-fibrotic medication. The teaching points of this exhibit are to (1) review currently established clinical prognostic biomarkers for IPF, (2) review the most promising emerging radiomic and AI-based biomarkers for imaging-based prediction of the survival in IPF, and (3) review the comparative performance between clinically established and AI-based prognostic biomarkers in the image-based prediction of the survival in IPF.

TABLE OF CONTENTS/OUTLINE

1. Why IPF is a problem. 2. Clinically established prognostic biomarkers for IPF (visual high-resolution CT (HRCT) pattern; gender, age, and physiology (GAP) index and staging system). 3. Radiomic biomarkers (traditional radiomics; hyper-curvature features; deep-learning radiomics) for survival analysis. 4. Why machine learning for survival analysis (AI-radiomics) outperforms clinical and radiomic biomarkers. 5. Comparative performance in terms of survival prediction and Kaplan-Meier survival curves. 6. Clinical case studies.

Mastering Basic Machine Learning Principles Without Coding Experience: A Tutorial on Googles Teaching Machine

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Certificate of Merit

Participants
Adam Flanders, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Understanding machine learning requires developing a conceptual framework.2) Recognize that fundamental machine learning principles can be learned without coding experience.3) Understand the overall process to train a deep learning model.4) Learn basic concepts on how to assess model generalizability and performance.5) Appreciate that several free and easy to use non-coding solutions exist where you can experience training, validating and testing an image-based machine learning model.6) Understand that adjustment of training hyperparameters and dataset balance/bias significantly affects the performance of your model.

TABLE OF CONTENTS/OUTLINE

I) Introduction: Building a conceptual framework: introduction to hyperparameters (e.g. learning rate, batch size, epochs).II) Introduction to performance metrics: loss function, confusion matrix, accuracy.III) Datasets: tips to build an effective dataset.IV) Introduction to Google's Teachable Machine.V) Creating your classes / loading your data.VI) Train and view the performance live.VII) Adjust hyperparameters and observe the effect on training with loss curve and confusion matrix.VIII) Readjust the distribution of your positive and negative classes in your training dataset.IX) Observe the effects of data redistribution.X) Observe the effect of pre-processing to accuracy of the model.XI) Summary.

Robust AI in Brain MRI's Large-Factor Super-Resolution - And Its Application In Improving Brain CAD System's Precision

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Certificate of Merit

Participants
Tong Zheng, Nagoya, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn the concept of super-resolution (SR) and its applications in brain MRI2. To understand difficulties in brain MRI's SR and how does our proposed AI overcome these difficulties3. To learn how to train a registration-error robust AI for SR on low- and high-resolution images dataset4. To learn our SR AI's application in brain CAD system and how does our AI improve precision of the CAD system

TABLE OF CONTENTS/OUTLINE

1. AI-based super-resolution (SR): fundamental concepts and application in medical imaging- SR technique enhances the resolution of a given image- AI can perform SR of medical images such as brain MRI2. Problems in training an AI for medical image SR- Training the AI needs precisely-registered low- and high-resolution image pairs- Existing AI for SR are not registration-error robust3. Techniques of our registration-error robust AI in medical image SR: newly-designed structure- Pre-train a StyleGAN as latent memory bank- Encoder-decoder structure to decompose images into high- and low-dimensional features4. Techniques of our registration-error robust AI in medical image SR: loss terms and pre-processing- Novel loss term to stabilize training procedure- Multi-channel input to obtain more spatial information5. SR results and its application in improving brain CAD system's precision- Our AI successfully performed SR of brain MRI images, made it easier for radiologists to observe brain structures only from low-resolution (LR) images taken with shorter scanning time- With our AI for SR, CAD systems can proceed more accurate diagnosis from LR MRI

Ready or Not, The Metaverse Will Have a Presence in Radiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Aditya Khurana, MD, Scottsdale, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) To present an initial discussion on the metaverse, its current state, and existing but limited literature within healthcare; (2) Present a thought experiment with key thought leaders as to what can the metaverse mean for Radiology in the future; (3) Outline future concepts with specific examples in which the metaverse can enhance the education, application, and visibility of radiology

TABLE OF CONTENTS/OUTLINE

The "metaverse" is a relatively new concept emerging within technology in which humans can interact within a digital environment - it is the intersection of the virtual and real worlds and the emergence of a second digital life. The metaverse will have a presence in healthcare. As of May 1, 2022, Pubmed search for 'Metaverse' identified 33 articles thus far. Because the literature on this topic and its applications in radiology is still in its infancy, we present this exhibit as a thought experiment with key opinion leaders on how the metaverse will enhance radiology. We will discuss the integration of the metaverse with concepts such as: (1) Real time image analysis and insight, (2) Trainee education and experience, (3) Patient education, (4) Teleradiology, (5) Research, (6) Industry relations, (7) Knowledge sharing, and (8) Quality improvement patient safety.

Leveraging Virtual Containers for High-Powered-Collaborative AI Research in Radiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Lucas Aronson, BS, Madison, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Multi-institutional collaboration of AI research poses challenges due to variations in hardware and software specifications. (2) No two users are likely to have the exact same requirements to execute their code, so even sharing between members of the same lab can present challenges. (3) Virtual containers alleviate many obstacles related to compatibility and portability and also offer a wide variety of tools to aid developers. (4) Virtual containers: (4a) Streamline remote access to high-powered computers and GPU servers. (4b) Can serve as a foundation for new projects with various base containers tailored to certain project types. This can save developers time as opposed to starting from scratch. (4c) Allow users to create portable, fully functional, self-contained coding environments for seamless operation irrespective of the computer/server employed. (4d) Facilitate multi-institutional collaboration and potential large-scale AI projects.

TABLE OF CONTENTS/OUTLINE

(1) Why do we need virtual containers? (1a) Address hurdles researchers face when collaborating and sharing AI algorithms. (1b) Highlight some features of containers that mitigate these obstacles, including the specification of software versions and dependencies. (2) A guide to getting started with virtual containers. (2a) Demonstrate an example virtual container termed Docker, including: (2a1) The Dockerfile and requirements file (2a2) How to build a Docker Image (2a3) How to run a Docker Container (2a4) Useful commands in Docker (3) An example of how Docker was used to facilitate a large-scale AI project.

International Outreach in Medical Imaging Research: 3D Slicer Internationalization and Localization to French

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Sonia M. Pujol, PhD, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

3D Slicer is an open-source software platform used in medical imaging research around the world. However, the application is currently available in the English language only. While English is the language of science, radiologists and medical imaging researchers in non-English speaking countries work and communicate with their scientific colleagues in their own languages. Through current Essential Open Source Software for Science funding of the Chan Zuckerberg Initiative, we have created a 3D Slicer internationalization team in the US, Canada, and Senegal to facilitate access to the platform for the global medical imaging research community. We have begun internationalizing 3D Slicer and localizing the user interface, tutorials, and documentation to French. The goal of the exhibit is 1. to provide an overview of the current 3D Slicer internationalization effort; 2. to introduce the new internationalization infrastructure for translating 3D Slicer user interface; 3. to present the 3D Slicer glossary for medical imaging research; 4. to teach how to contribute translations in multiple languages on the 3D Slicer translation repository; 5. to showcase 3D Slicer global outreach activities for medical imaging research in Senegal.

TABLE OF CONTENTS/OUTLINE

Overview of 3D Slicer Internationalization effort; Language Packs extension; 3D Slicer Glossary; 3D Slicer Weblate Repository; 3D Slicer Community Resources in French; 3D Slicer Outreach in Senegal.

Statistical Plots in Oncologic Imaging: A Primer for Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Sina Bagheri, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Visual illustrations of quantitative information, including graphs and figures, are often practical and powerful methods of presenting scientific research results. Appropriate implementation of graphs improves the accuracy of readers' interpretation and understanding of the data, particularly for complex information. Recently, an increasing number of novel diagrams and plots have been used to visually display the outcome in radio-oncologic and radiogenomic studies. Thus, it is crucial for radiologists to be familiar with these kinds of data representations. In this educational exhibit, we describe the potential application of these various statistical plots and guide radiologists to interpret them in such reports. We also highlight the specific features of each graph type and review its advantages and drawbacks/pitfalls.

TABLE OF CONTENTS/OUTLINE

1. Brief introduction describing different ways for graphical representation of data 2. Graphical illustrations of tumor response 3. Graphical illustrations of survival 4. Graphical illustrations of cancer genotypes 5. Drawbacks and pitfalls 6. Conclusions

NCI Imaging Data Commons: Towards Transparency and Reproducibility in Imaging AI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Identified for RadioGraphics

Participants
Andriy Fedorov, PhD, Arlington, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

NCI Imaging Data Commons (IDC) is a cloud-based repository of publicly available cancer imaging data co-located with the analysis and exploration tools and resources. IDC is part of the NCI Cancer Research Data Commons (CRDC) infrastructure that provides secure access to a large, comprehensive, and expanding collection of cancer research data. IDC uses a combination of the commercially available Google Cloud Platform and open source components. The DICOM standard is used for representation and communication of the data. Google Healthcare API enables the use of SQL for DICOM metadata exploration. The IDC portal (https://imaging.datacommons.cancer.gov) enables exploration and visualization of data and cohort building. As of Spring 2022, IDC hosts over 30 TB of public radiology and digital pathology images and image-derived data. IDC is intended for cloud-based data processing, but data can be freely downloaded for on-premise analysis. Cloud-based workflows co-locating persistent data with software tools and compute resources enable reproducible analysis workflows. Attendees will learn about the scope and status of IDC (e.g., new features of the image viewers and IDC portal), accompanying learning resources (e.g., interactive notebooks with reproducible AI workflows applied to the data within IDC), and plans for future development. Live interactive demonstrations will be presented.

TABLE OF CONTENTS/OUTLINE

Overview of CRDC and IDC; Data curation and the role of The Cancer Imaging Archive; Portal; Viewer; Organization of data; Data versioning; Integration of tools; Use case development; Documentation and user support resources; IDC cloud credit program; Status update and plans for future development.

COVID-19 Surveillance System Based On a Nationwide Medical Image Database and Machine Learning

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Kensaku Mori, PhD, Nagoya, Japan (*Presenter*) Research Grant, Cybernet Systems Co, Ltd;Intellectual Property, Cybernet Systems Co, Ltd;Research Grant, J Morita Corporation;Intellectual Property, J Morita Corporation;Developer, J Morita Corporation

TEACHING POINTS

- To understand what is nationwide CT image database- To understand how cloud-computing environments are constructed for CT image analysis- To understand how a nationwide CT image database is utilized for COVID-19 surveillance- To understand how machine learning techniques can be used for COVID-19 surveillance

TABLE OF CONTENTS/OUTLINE

Introduction- COVID-19 related disease shows several findings on CT images, including GGO.- Machine learning-based methods enable us to anaylze CT images of COVID-19 cases.Nationwide medical image database-A nationwide medical image database is constructed in collaboration with medical societies and National Institutes of Informatics.- Medical images taken at hospitals are transferred daily to the cloud data center through the Japanese academic network SINET in L2VPN connection.- The data center has GPU servers for machine learningCOVID-19 CT image analysis- Machine learning-based COVID-19 CT image analysis algorithm has been developed- The algorithm consist of lung area segmentation and CT image appearance classification (typical COVID-19 cases or atypical COVID-19 cases)- In-house neural network architecture has been developed.COIVD-19 CT daily surveillance- All of CT images having “lung” words in diagnosis reports are targets for analysis- Only CT images, including lung areas, are selected for further analysis.- Number of lung CT cases, typical COVID-19 cases and atypical COVID-19 cases are measured.Discussion-Nationwide CT image database has potential to become one of the information sources to know COVID-19 disease spread in a nation- Surveillance based on automated CT image analysis on a nationwide database can be used for monitoring many disease spreads.

An Overview of Artificial Intelligence for Multiple Sclerosis Analysis in MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Leiner Barba, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Purposes: 1) Provide an overview of artificial intelligence (AI) methods, experts team and technological needs, and their potential use in Radiology; 2) Review of Multiple Sclerosis (MS) affectations and biomarkers from MRI; 3) Discuss about how AI methods have been used for MS analysis; 4) Know the basis for application of AI to MS lesion detection and segmentation.

TABLE OF CONTENTS/OUTLINE

A. Overview of AI methods and MS affectations; B. Segmentation of MS lesions using AI techniques; C. Analysis of MS activity; D. How to use AI for analysis of affected regions in patient with MS; E. Challenges of applying AI for analysis of MS in clinical practice; F. Future trends of AI applied to MS analysis.

Generating Rapid Multiparametric Prostate MRI Protocols Using Deep Learning Reconstruction

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
David Wang, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Multiparametric Prostate MRI (mpMRI) protocol consists of high resolution multiplanar T2, diffusion weighted imaging (DWI), and dynamic contrast enhanced acquisitions. An ideal mpMRI protocol meeting or exceeding PIRADS recommendations can take ~25 minutes, even after optimizing protocols using commercially available acceleration techniques. The biggest time sinks within these protocols are the T2 weighted and high b-value DWI acquisitions. Recently, a Deep Learning (DL) reconstruction technology (AIR™ Recon DL, GE Healthcare) was leveraged to reduce the multiplanar T2 acquisition time by 3-fold, without loss in signal-to-noise ratio (SNR). In this exhibit, we will review the application of this DL reconstruction technology to both T2-weighted and DWI acquisitions, focusing on comparisons of the DL reconstruction to conventional reconstructions, as well as benefits in SNR and scan time reduction. Potential pitfalls and remaining artifacts from the accelerated acquisitions will be discussed as well as the requirements and trade-offs needed to achieve a fast and robust PI-RADS 2.1-compliant protocol in less than 10 minutes.

TABLE OF CONTENTS/OUTLINE

1. Key components of mpMRI for prostate cancer 2. Standard acquisitions and associated scan times. 3. Synopsis of DL technique and application to accelerated multiplanar T2-weighted imaging. 4. Application of DL reconstruction for DWI and synthetic b-value calculation. 5. Potential pitfalls and artifacts post DL reconstruction. 6. Overview of PI-RADS 2.1 compliant rapid protocols utilizing DL reconstruction. 7. Summary.

Federated Learning Environment in The ACRs AI Lab: Are Those Rubbers (AI models) Meant For Our Roads (Imaging Data)?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Lina Karout, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Understanding generalizability, reproducibility, and biases in AI models. (2) Foundation and application of federated learning environment for AI models.(3) Construction and deployment of data for federated learning. (4) Validation of AI models in ACR's AI Lab environment: Steps and Stats

TABLE OF CONTENTS/OUTLINE

(1) Foundational aspects of federated learning in AI model validation: What is it and why do we need it? How does it help? What does it entail? (2) Case-based demonstration of how you can use ACR's AI Lab to test and optimize AI models in a federated learning environment: (a) Understanding steps in data format, gathering, and uploading to the AI Lab. (b) Running AI models in the AI-Lab. (c) Analyzing AI outputs and performance statistics. (d) Improving AI model performance from local to global level. (3) Strengths and limitations of federated learning and its environment

The Federated Tumor Segmentation Initiative: The Largest To-date Real-World Federation Focusing on NeuroOncology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Alexander Getka, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is a growing body of literature offering evidence of the potential impact that artificial intelligence (AI) methods can have towards healthcare. To ensure robustness and generalizability of AI methods, ample and diverse multi-site patient datasets are desired. However, there are various factors that hinder access to such data in the current paradigm of multi-site collaborations, which include the tedious bureaucratic processes, data ownership concerns, and legal considerations reflected in patient privacy regulations. To tackle these issues, we introduce the Federated Tumor Segmentation (FeTS) Initiative, which includes an open-source software toolkit for data-private collaborative learning of AI methods across multiple international institutions using federated learning (FL). The goals of the exhibit are to: (i) broaden the understanding of the general community regarding FL, (ii) showcase how a user can leverage FL to train a model across various sites, (iii) present results of the first real-world federation across 71 collaborating sites across 6 continents with 25,256 MRI scans from 6,314 patients focusing on the rare disease of glioblastoma, (iv) discuss privacy and data protection concerns and how FeTS hopes to solve it.

TABLE OF CONTENTS/OUTLINE

This exhibit will present a toolkit to define a FL-based model training problem and deploy it across multiple partnering sites, ensuring a data-private AI training paradigm. Specific principles to protect data privacy will be described, along with common pitfalls to avoid when performing an FL-based study.

A Practical Approach Into Artificial Intelligence: Ultrasonography and Artificial Intelligence Pipeline for Developmental Hip Dysplasia Screening

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Sebastian Gallo-Bernal, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Artificial intelligence (AI) algorithms have demonstrated remarkable progress in image-recognition tasks. • We aim to exemplify AI integration into clinical workflows, by assessing the feasibility of an ultrasound (US) AI (xAI) pipeline to increase the availability of sonographic screening for developmental hip dysplasia (DDH).• US screening for DDH is based on the Graf method. The main drawback of this method is the high inter-operator variability. Primary sources of image acquisition variability arise from the manual selection of anatomical points and the difficulties to acquire images in the adequate anatomical plane.• An AI-based computer-aided diagnosis (CAD) system can standardize image acquisition and reduce diagnosis time, improving the accuracy and objectivity of DDH diagnosis.• Problem-solving in practical approaches towards AI: Class Imbalance. • US x AI pipeline product: preprocessing techniques, image adequacy assessment and diagnosis models, atlas creation and nearest neighbor retrieval modules, and modules for post-hoc quantification of prediction uncertainty

TABLE OF CONTENTS/OUTLINE

INTRODUCTION AND BACKGROUND:• Artificial intelligence and radiology: AI for image quality assessment and image selection and standardization PROBLEM STATEMENT:• Ultrasonography for DDH screening and follow-up. Graf technique: image quality consideration; drawbacks and limitations on radiology workflows US x AI PIPELINE: PRACTICAL APPROACH TOWARDS IMPLEMENTATION• Ultrasonography x AI pipeline architecture and outputs• Comparison of undersampling and class weights for addressing class imbalance• Performance metrics for binary classification of image adequacy LIMITATIONS/FUTURE

A Hands-on Guide to Designing Cloud-based Web Platforms with Radiological Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Adrian Serapio, Berkeley, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learning what goes into the design of cloud-based radiological web platforms will empower radiologists to truly leverage the power of the cloud and enhance their everyday workflow. We will walk through designing one such application, RadSim, an interactive reader performance study application that streamlines the process of conducting image based surveys. We demonstrate: - Why and how to apply cloud-based applications to a radiologist's everyday workflow- How to design a basic web application from ideation to testing- How to use the REST framework to develop the web application (using Node.js, MySQL, AWS)- How to visualize data generated by the web platform (using Python's Matplotlib library)

TABLE OF CONTENTS/OUTLINE

Problem Statement - Paucity of easy-to-learn, open-source, platform-agnostic, cloud-based web applications matching the needs of radiologists- Introduce and walkthrough a product design framework to build simple cloud-based applications in radiologyPrerequisite/Background- Basic understanding of any programming languageWalkthrough1. Product design framework2. Cloud-based web development 3. Data visualization4. Integration to radiological workflowConclusion

Understanding and Mitigating Bias in Artificial Intelligence

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Identified for RadioGraphics
Cum Laude

Participants
Ali Tejani, MD, Frisco, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Define and review categories of bias in AI.2. Raise awareness of the sources of bias to promote mindfulness when using AI solutions in practice.3. Understand how models can perpetuate prejudices and bias inherent in datasets.4. Propose solutions to combat bias in AI.

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Define bias in AIi. Broad categories (i.e., implicit versus explicit, cognitive biases)ii. Model development (i.e., dataset, algorithm, and prediction bias)2. Scope of bias in AIa. Bias in AI along the radiology value chainb. Workflow diagram of the effect of bias in AI beyond the reading room (i.e., referring clinician and enterprise-level effects)i. Exacerbation of healthcare inequities3. Sources of bias in AIa. Model developmenti. Dataset curation1. Training/validation set demographics2. Confounding clinical comorbiditiesii. Technical dataset variables1. Dataset shift2. Data leakage3. Varying post-processing techniquesiii. Annotations1. Varying expertise2. Lack of standard guidelines3. Heterogeneous imaging scanners and protocolsiv. Bias-variance tradeoffb. Model utilization and clinical impacti. Automation biasii. Inequality considerations1. Exacerbation of inherent algorithm bias (i.e., underdiagnosis)2. Amplification of resource inequality and implications of inadequate access to AI tools3. Heterogenous monitoring and adjustment of deployed AI tools4. Proposed solutions to mitigate bias in AIa. “Checkpoints” throughout AI workflowb. Involving statisticians in the model development processc. Require diverse datasetsd. Monitoring AI performance across diverse populations and varying modalities/hardware

Impact-sensitive Management of Prediction Uncertainty in Artificial Intelligence for Healthcare

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Michelle Chua, Brookline, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Unsafe prediction failure occurs when a machine learning model is unable to convey lack of confidence, or deceitfully conveys high confidence, in an erroneous predictionStandard performance metrics measure overall model performance on limited test data and provide no indication of model confidence in the correctness of individual predictionsPost-hoc prediction uncertainty metrics, such as calibrated classifier confidence, measures of visual similarity, and information entropy, may be used to quantify prediction uncertaintyClassifier confidence and information entropy do not capture out-of-distribution uncertaintyPrevention of unsafe prediction failure requires task-specific and impact-sensitive selection of prediction uncertainty metrics and prediction uncertainty thresholdsPrediction uncertainty metrics may be calibrated to precision if the desired safety threshold is zero tolerance for false positives or to negative predictive value if the desired safety threshold is zero tolerance for false negatives

TABLE OF CONTENTS/OUTLINE

Understanding prediction uncertainty and prediction uncertainty metricsComparative evaluation of prediction uncertainty metricsSelection of prediction uncertainty metrics for zero tolerance and error tolerant clinical applications

Lessons Learned from a Cyberattack on the Healthcare System: A Radiology Perspective

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Hilary Strong, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

We wish to share our insight and lessons learned from navigating a response to the cyberattack on province-wide healthcare authorities which rendered medical information technology systems inaccessible. Prompt, accurate, and consistent communication with all medical imaging staff, referring physicians, and healthcare authorities, is a crucial first step. Effective communication involves various modalities, such as secure applications, texts, emails, calls, and frequent face-to-face discussions/meetings. Following effective communication, having an existing cyberattack response system in place to immediately modify workflow and adapt to technology limitations is a priority. Finding an effective modified workflow system is not a linear process. However, judicious trial and error of solutions is more effective than remaining idle during a cyberattack. Modified workflow included entirely paper-based medical imaging requisitions and patient safety identification systems, as well as workflow limited to urgent and emergent studies only. With patient-centered care at the forefront of the radiology department's response to the cyberattack, safe and effective medical imaging services were provided to the patients of our province.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Four Lessons Learned from a Cyberattack on Our Provinces' Healthcare Systema. Prompt and consistent communication is paramount.b. (Not completely) out with the old (paper-based system).c. Correct patient identification prioritizes safety.d. Judicious trial and error is the way forward.3. Conclusion

Medical imaging AI In the Real World: Decoding Bias in Under-represented Populations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Eduardo Freire, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Patterns of health inequality permeate artificial intelligence (AI) systems when bias and discrimination become entrenched in the conception, design, and use of these systems. Underserved patients, who have historically faced greater challenges accessing care, including imaging, may be underrepresented in the development of AI systems, leading to bias and compromising model performance. We aim to present a literature review on how to identify and mitigate existing and potential bias related to healthy inequality in medical imaging AI.

TABLE OF CONTENTS/OUTLINE

1) Introduction 1.1) Basic concepts and definitions: diversity, equity and inclusion in the AI era 1.2) Fairness and ethics of artificial intelligence in radiology: where are we?2) Categories of AI bias 3) Sources of bias in AI development lifecycle 3.1) Human factors 3.2) Dataset challenges 4) Identifying bias in medical imaging AI: Case studies 4.1) How gender and race imbalance in a medical imaging dataset influences AI performance 4.2) Transgender population and health care disparities 5) Strategies to managing and mitigating bias in medical imaging AI 5.1) Transparency and data sharing5.2) Policy and Regulations

3D Printing and Digital Surgical Rehearsal in Complex Spine Surgery

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Awards
Identified for RadioGraphics

Participants
Lumarie Santiago, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

The approach to complex spine surgery requires a multidisciplinary team and multimodality imaging to delineate the extent of disease as well as the structures at risk during surgery. Integration of the information provided by the various imaging exams may be difficult, particularly as each surgical discipline may have different take away points. This case-based exhibit provides information on the process of 3D printing including segmentation using multimodality imaging exams, validation (QA) and post processing. The use of digital and 3D printed models in surgical rehearsal with a focus on their impact on prescribing digital surgical planes will be discussed. The integration of .STL files into intraoperative navigation systems and validation of the digital surgical plan using the 3D printed model will also be reviewed.

TABLE OF CONTENTS/OUTLINE

1. The 3D printing workflow used to integrate multimodality imaging exams. 2. 3D printing material selection to enhance surgical rehearsal. 3. Quality assurance steps in 3D printing. 4. Prescribing digital surgical planes. 5. Validation of digital surgical planes using the 3D printed mode.l 6. Intraoperative use of digital surgical planes.

3D Printing from Medical Imaging Data: What the Resident Needs to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IN

Participants
Nicole Wake, PhD, Aurora, OH (*Presenter*) Employee, General Electric Company

TEACHING POINTS

A. Patient-specific 3D printed anatomic models and guides can aid in surgical planning, can provide intra-operative guidance, can be utilized for simulations, and can be used for trainee and patient education.B. Volumetric medical imaging data with high spatial resolution, good signal-to-noise ratio (SNR), and good contrast-to-noise ratio (CNR) is recommended if 3D printing will be performed.C. The workflow to create 3D printed anatomic models from volumetric imaging data includes image acquisition, image segmentation, conversion to 3D mesh geometries, and printing.D. Reimbursement for 3D printed anatomic models and anatomic guides can be pursued using Category III CPT Codes.E. The medical 3D printing process should be formally documented and recorded in the electronic medical record system and this is required for reimbursement.F. Hospital-based 3D printing labs should establish quality management systems to ensure the accuracy of 3D printed models.

TABLE OF CONTENTS/OUTLINE

1. Review of the common applications of 3D printed medical models.2. Description of major imaging recommendations for the creation of 3D printed anatomic models and guides derived from medical imaging data.3. Overview of the workflow required to create 3D printed patient-specific anatomic models from volumetric medical imaging data.4. Review of CPT codes including the Category III CPT Codes for 3D Printed anatomic models and anatomic guides, and introduction to the RSNA-ACR 3D printed model registry.5. Synopsis of a formal documentation system for 3D printed anatomic models and guides.6. Summary of the quality assurance steps required to ensure the accuracy of 3D printed medical models.

IREE-10 Minimally Invasive Prostate Cancer Treatments- An Update

Participants
Riddhi Borse, MD, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1.To provide rationale for minimally invasive prostate cancer (PCa) treatment.The “index” lesion is responsible for driving risk associated with localized PCa. However, imaging underestimates lesion volume it is important to have adequate treatment zone margins.2.To review modalities and devices available for minimally invasive PCa treatment. Understanding the nuances of available devices along with their FDA approval/ reimbursement status and current evidence about their efficacy is crucial towards building a successful PCa treatment program.

TABLE OF CONTENTS/OUTLINE

1. Need for minimally invasive prostate cancer therapy. 2. Defining the index lesion. 3. Treatment margins - How much prostate should you ablate? 4. Treatment modality specific review including device capabilities/limitations, cost, side effect profile and efficacy evidence;Laser Ablation CryoablationIrreversible Electroporation Therapeutic Ultrasound Photodynamic Therapy Aquablation Bipolar radiofrequency ablation5. Post treatment prostate MRI 6. FDA Approval Status and Insurance Reimbursements for minimally invasive PCa treatment.

IREE-12 How to Make It Right When Vessels Go Wrong: Demystifying Abdominal Vascular Anomalies

Participants
Ece Meram, MD, Madison, WI (*Presenter*) Research Grant, Koninklijke Philips NV

TEACHING POINTS

The classification of vascular anomalies has been evolving and remains challenging with limited worldwide adoption and lingering of historically used terminology. Vascular anomalies are divided into two main categories (i.e. mass or malformation) based on their increased mitotic activity and cell turnover. Vascular masses, benign or malignant, are vasoproliferative lesions with increased endothelial cell turnover. Vascular malformations, on the other hand, are congenital, non-neoplastic entities of incorrectly formed vessels. This exhibit aims to 1) describe different types of abdominal vascular anomalies according to International Society for the Study of Vascular Anomalies (ISSVA) classification, 2) demonstrate examples of abdominal vascular tumors and malformations, including those associated with hereditary conditions and 3) highlight the interventional approaches utilized in the management (i.e. correction) of these anomalies.

TABLE OF CONTENTS/OUTLINE

A. When Vessels Go Wrong: Vascular Anomalies a. Definition/Types: Mass vs Malformation b. ISSVA Classification. B. Abdominal Vascular Tumors a. Benign (eg. Hepatic Hemangioma) b. Borderline c. Malignant (eg. Angiosarcoma). C. Abdominal Vascular

Malformations a. Simple i. Low-flow (Capillary, Lymphatic, Venous) ii. High-flow (Arteriovenous malformation or fistula) iii. Portosystemic Fistula (eg. Congenital Portosystemic Shunts) b. Combined c. Anomalies of Major Named Vessels d. Associated with Other Anomalies (Hereditary and/or Syndromic). D. How to Make it Right? a. Surgical Management b. Types of Interventional Procedures c. Case Examples. E. Quiz Cases

IREE-13 Adrenal Venous Sampling: Tips and Tricks for Non-Experts

Awards
Identified for RadioGraphics

Participants
Katsuhiro Kobayashi, MD, , (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review adrenal vein anatomy and anatomical landmarks for right adrenal vein cannulation. 2)Describe adjunctive techniques used for adrenal vein sampling (AVS). 3) Discuss adrenal vein sample interpretation and indication for repeat AVS

TABLE OF CONTENTS/OUTLINE

1) Overview of primary aldosteronism2) Anatomy of adrenal veins relevant to AVS and anatomical landmarks for right adrenal vein cannulation (inferior emissary vein, communicating veins, inferior accessory hepatic vein)3) Pre-procedural work-up including MDCT technique used for adrenal vein assessment4) Protocol for AVS including antihypertensive medication modification, or cosyntropin infusion etc.)5) Techniques used for AVS and adjunctive techniques used for right adrenal vein cannulation (Cone-Bean CT, coaxial guide wire- catheter technique, intraprocedural cortisol measurement)6) Sample interpretation and indication for repeat AVS (double down Aldosterone/Cortisol)7) Complications associated with AVS8) Advances in AVS (subselective AVS)9) Summary of Tips and Tricks

IREE-14 Portal Hypertension: A Comprehensive Clinico-Radiological Review.

Participants
Antonio Hernandez Villegas, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the physiopathology, classification and etiologies of different types of portal hypertension- To illustrate in a case based approach the different types and causes of portal hypertension (acute and chronic) with multimodality imaging findings- To mention key imaging findings that need to be assessed and provided to the clinician (GI, endoscopy and/or surgeon) in order to determine treatment options- To present interventional radiology treatment options for this pathology according to clinical scenario.

TABLE OF CONTENTS/OUTLINE

- Introduction: Epidemiology and risk factors.- Physiopathology: the basics for radiologists in order to understand imaging findings.- Classification: anatomy and timing.- Imaging: role of different imaging modalities and the main findings in the approach, diagnosis and follow-up of patients with portal hypertension.- Case-based approach: imaging findings, diagnosis and interventional treatments.- Take-home points.

IREE-15 Various Interventional Procedures Through Percutaneous Cholecystostomy Tract

Participants
Jong Hyouk Yun, MD, PhD, Busan, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this review is to illustrate the various transcholecystic interventions and to discuss the clinical significance, technical aspects and complications of this alternative access to the biliary tree.

TABLE OF CONTENTS/OUTLINE

Percutaneous cholecystostomy is a well-established procedure for management of acute cholecystitis. It has been used to provide GB decompression, biliary drainage and cholangiography. In patients who underwent previous surgery or who have intolerance or anxiety for endoscopy, in cases of having difficulties to perform PTBD, or in patients who have previously undergone percutaneous cholecystostomy, percutaneous transcholecystic interventions can be performed as an alternative route. Cystic duct (CD) cannulation is necessary to perform various trancholecystic interventions. For the successful cystic duct cannulation perform a GB puncture in the long axis direction of the GB, keep catheter drainage for 3 days or more to reduce inflammation of the biliary tree, insert a 8F sheath into the GB for the back support, and use guide wires with various sizes and tips. Through cystic duct cannulation, various interventional procedures such as CBD stone removal, biopsy, biliary dilation, biliary stent placement, and GI intervention can be performed. Percutaneous transcholecystic interventions seems to be safe, technically feasible and clinically effective procedures. Percutaneous transcholecystic approach can be used as an alternative route for the patient who could not use peroral or transhepatic route.

IREE-16 Cholangioscopy Guidance During Percutaneous Transhepatic Biliary Interventions

Participants
Ayca Kutlu, MD, Madison, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Introduce readers to transhepatic cholangioscopy.• Provide an overview of transhepatic cholangioscopy technique, indications, and utility. • Improve readers' ability to interpret cholangioscopy imaging through representative cases. • Demonstrate through case examples how transhepatic cholangioscopy guidance can improve procedural success.

TABLE OF CONTENTS/OUTLINE

1. Title page 2. Teaching points 3. Background on current transhepatic biliary imaging techniques a. Fluoroscopic cholangiogram b. Intrahepatic cone-beam CT cholangiography 4. Introduction to percutaneous transhepatic cholangioscopy 5. Indications for

percutaneous transhepatic cholangioscopy a. Patients with indwelling biliary catheters with new concern for pathology b. Patients with history of previous failed ERCP or altered anatomy prohibiting ERCP 6. Percutaneous transhepatic cholangioscopy interventions a. Targeted tissue sampling b. Biliary stone/debris management c. Biliary Stent/drain placement 7. Case Examples a. Tissue sampling: Targeted biopsy via direct visualization b. Intraductal stone/debris manipulation: Identification of intrahepatic stone/debris with lithotripsy treatment, extraction, or sweeping c. Complex post-surgical anatomic delineation: Navigation across post-surgical benign biliary strictures 8. Conclusions a. Transhepatic cholangioscopy can improve diagnostic and therapeutic precision in the management of biliary pathology. b. Interventional radiologists becoming comfortable with transhepatic cholangioscopy image interpretation and procedural skill can increase procedural success for complex biliary pathology. 9. Quiz Case

IREE-17 Interventional Management of Ectopic Varices

Awards
Identified for RadioGraphics

Participants
Jin Woo Choi, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ectopic varices may occur around the duodenum, rectum, stoma, hepaticojejunostomy, etc. Although ectopic varices are not common, those can be a source of considerable bleeding. They usually occur in the setting of portal hypertension such as liver cirrhosis or portal vein occlusion/thrombosis. Whereas endoscopic management is commonly ineffective for ectopic varices, various interventional procedures including percutaneous varix embolization or modified retrograde transvenous obliteration can be performed depending on vascular anatomy. The purposes of this exhibit are: (1) To illustrate vascular anatomy related to ectopic varices, (2) To list various interventional procedures and their indications, (3) To review the technical tips and pitfalls of percutaneous varix embolization and modified retrograde transvenous obliteration.

TABLE OF CONTENTS/OUTLINE

1. Vascular anatomy related to ectopic varices. 2. Treatment modalities and indications for ectopic varices: retrograde transvenous obliteration, percutaneous embolization, and their modifications. 3. Technical tips and pitfalls of retrograde transvenous obliteration, percutaneous embolization, and their modifications.

IREE-18 Overview of the Complications of Prostate Artery Embolization and its Management

Participants
Richard Liang, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate Artery Embolization (PAE) is a safe, minimally invasive treatment for lower urinary tract symptoms (LUTS) secondary to benign prostatic hyperplasia (BPH). The purpose of this exhibit is to discuss the complications associated with PAE along with the management of those complications. Complications of PAE can be divided into access site complications, post-embolic complications, non-target embolization and radiation dermatitis. Though the majority of complications are considered self-limiting and can be managed conservatively, more severe complications such as bladder wall ischemia may require cystoscopic surgical resection. While reviewing non-target embolization complications, we will also discuss prostate artery anatomy and its relevance to these complications. Additionally, we will also compare the safety of PAE to some of the other common surgical treatments available for BPH.

TABLE OF CONTENTS/OUTLINE

1. What is PAE?2. How to Perform PAE3. Overview of the Complications in PAE4. Access Site Complications and its Management5. Post-Embolic Complications and its Management6. Arterial Anatomy and Anatomical Variants of the Prostate7. Non-Target Embolization Complications and its Management8. Safety of PAE compared to Surgical Treatments

IREE-19 A Comprehensive Approach to Image-guided Ablation in Primary Aldosteronism

Participants
Mohamed Ibrahim, MBBCh, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Learn appropriate patient selection for image-guided ablation of PA • Learn appropriate clinical evaluation and consultation of PA patients • Understand key pre-procedural patient preparations • Highlight pertinent intra-procedural techniques and considerations • Highlight appropriate post-procedural follow-up and management

TABLE OF CONTENTS/OUTLINE

• Appropriate patient selection for image-guided ablation o Key laboratory analysis for diagnosis of PA o Confirming collateralization of imaging and AVS findings • The PA clinic consult o Pertinent HPI; positives and negatives o Consenting the PA patient, risks and expectations • Pre-procedural patient preparation o Anesthesia clearance o Adrenergic hypertensive crisis, strategies for prevention o Considerations for the day of the procedure • Pertinent intra-procedural techniques and considerations o Patient positioning o Ablation modalities and respective protocols o Accessing adrenal nodules in challenging anatomy • Post-procedural follow-up and management o Next day visit for serum potassium check, blood pressure measurement, and medication adjustments o Three months follow-up o Management of non-responders or relapsing patients

IREE-2 Training of Interventional Radiology Procedures for Medical Students Using Virtual Reality

Participants
Yukiko Honda, MD, Kure, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The COVID-19 pandemic made it difficult to train medical students on procedures that involve direct patient contact, such as interventional radiology (IR). For this reason, we developed training materials for medical students on endovascular procedures of the abdominal pelvis in IR using virtual reality (VR). Advantages of VR-based IR education include the ability to conduct training at

any time, repeated training exercises, no invasiveness to the patients, and no risk of infection to both the patient and the student. The disadvantages are that a large number of funds are needed to purchase or develop VR simulators and that there are few studies that have proven the effectiveness of education using VR. This educational exhibit will provide a brief overview of simulators available for purchase, and our VR-based training software, and discuss its advantages, current issues, and future prospects.

TABLE OF CONTENTS/OUTLINE

1 Features of the currently commercially available VR simulators of endovascular procedures A virtual and augmented reality: VIST(Mentice), ANGIO mentor (Simbionix), ORCAMP (Orzone). 2 Assessment of the educational validity of VR simulators. Face validity, content validity, Construct validity, Concurrent validity, Predictive validity. 3 Assessment tools of VR simulators. I Global rating scales: Likert scales etc, II Surveys: A subjective assessment tool, III Pre- and Post-tests: tests before and after the training, IV Time-action analysis, V Error analysis, VI Simulator metrics: metrics preprogrammed into the simulator to measure performance. 4 Review of reports on the educational validity of VR simulators. 5 Future challenges and our approach.

IREE-20 Superselective Radioembolization for Hepatocellular Carcinoma: Radiation Segmentectomy and Beyond

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radioembolization is an established treatment for unresectable hepatocellular carcinoma. Radioactive microspheres are preferentially deposited into the hypervascular tumor by siphoning effect so that injection of microspheres are commonly performed at the lobar artery level. However, superselective radioembolization is the best way to improve tumor response and to prevent potential complications. The purpose of this exhibit is : (1) To review the rationale of radiation segmentectomy. (2) To learn when superselective radioembolization is needed, (3) technical tips for superselective radioembolization.

TABLE OF CONTENTS/OUTLINE

1) Radiation segmentectomy : rationale and evidence 2) Dosimetry : Practical guide for dosimetry of superselective radioembolization 3) When superselective radioembolization is needed A. small single tumor : radiation segmentectomy B. Large single tumor saddling on both lobes C. Small remnant liver D. Hepatic artery branching at acute angle E. Extrahepatic collateral artery supplying the tumor 4) Technical consideration of superselective radioembolization A. Protection of distal normal liver by using balloon microcatheter and detachable coil B. Combination treatment of lobar and segmental artery C. Combination treatment of 1st and 2nd week dosing of glass microsphere 5) Follow-up imaging after superselective radioembolization A. Early loss of arterial enhancement of the tumor B. Focal radiation necrosis mimicking new hypovascular tumor

IREE-21 Mesenteric Arteriovenous Malformations: A Rare Cause of Colonic Ischemia

Participants
Lindsey Miley, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learn the diagnostic and interventional imaging characteristics of mesenteric arteriovenous malformations. Review the current literature of mesenteric arteriovenous malformations associated with colonic ischemia. Review a case series of mesenteric arteriovenous malformations from our institution including etiology, diagnostic imaging, interventions, and outcomes. Understand the role of the Interventional Radiologist in diagnosis and treatment of these anomalies.

TABLE OF CONTENTS/OUTLINE

1. Define mesenteric arteriovenous malformation • Etiologies and incidence • Clinical versus imaging classification 2. Mesenteric arteriovenous malformations with associated colonic ischemia • Diagnostic imaging work-up • Literature review of treatment and outcomes • Review of case series from our institution 3. Role of the Interventional Radiologist in diagnosis and treatment of mesenteric arteriovenous malformations • Diagnostic angiography • Embolization • Challenges in work-up and treatment • Future directions

IREE-23 Minimally Invasive Image-Guided Treatment of Primary, Recurrent and Metastatic Prostate Cancer

Participants
Daniel Adamo, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.) Learn the diagnostic and treatment approach to prostate cancer within the National Comprehensive Cancer Network (NCCN) guidelines 2.) Learn the imaging appearance of native, in-gland recurrent and metastatic prostate cancer at multimodal imaging 3.) Understand the minimally invasive image-guided therapies for treating focal native, locally recurrent, and metastatic prostate cancer.

TABLE OF CONTENTS/OUTLINE

1. Diagnostic, staging and treatment approach to prostate cancer within the National Comprehensive Cancer Network (NCCN) guidelines • Prostate cancer epidemiology • Diagnostic and staging evaluation (history, physical exam, laboratory evaluation, imaging, biopsy) • NCCN treatment algorithm2. Imaging appearance of native, locally recurrent, and metastatic prostate cancer at multimodal imaging with a focus on MRI and PET. • Ultrasound • CT • Bone Scintigraphy • PET (11C-Choline, 68Ga-PSMA, 18F-PSMA, 18F-Fluciclovine) • Dynamic Contrast Enhanced Multiparametric MRI3. Minimally invasive image-guided therapies for treating focal native, locally recurrent, and metastatic prostate cancer • Focal native and locally recurrent prostate cancero MRI-guided therapies (Cryoablation, Laser ablation, Focused Ultrasound (FUS)) o US-guided therapies (Cryoablation, Irreversible Electroporation (IRE), High-intensity focused ultrasound (HIFU)) • Focal metastatic prostate cancer o Bone metastases (Cryoablation, External beam radiation therapy (EBRT)) o Lymph node metastases (Cryoablation, External beam radiation therapy (EBRT)) o Hepatic metastases (Ablation, Transarterial Embolization). • Emerging targeted therapies o Theranostics o Radioembolization (90Y-TARE)

IREE-24HC Endoscopic Biliary Interventions Performed by Interventional Radiology and Gastroenterology: A

Case Based Review

Participants
Tushar Garg, MD, Baltimore, MD (*Presenter*) Conference Travel, Siemens Healthineers

TEACHING POINTS

1) To learn about the different endoscopes and ancillary devices available for interventional radiology (IR) and gastroenterology (GI) biliary procedures 2) To learn about the basic and advanced endoscopy techniques 3) To review the endoscopic management of benign and malignant lesions of the biliary tree with the help of cases

TABLE OF CONTENTS/OUTLINE

1) Types of devices available a. Endoscopes used in IR: BF-XP160F EVIS Exera video bronchoscope, LithoVue single-use digital flexible ureteroscope, SpyGlass digital catheter, AXIS Single-Use Digital Ureteroscopes b. Endoscopes used in GI: surgical cholangioscope (FCN-15X), Fiberoptic percutaneous cholangioscope (CHF-CB30L/S), SpyGlass direct visualization system c. Accessories used in IR and GI: biopsy forceps, electrohydraulic lithotripsy, laser lithotripsy, retrieval basket, retrieval snare, balloons 2) Basic techniques: a. IR techniques: percutaneous cholangioscopy with manual or pump irrigation b. GI techniques: dual operator mother-daughter per-oral cholangioscopy, single-operator per-oral cholangioscopy, direct per-oral cholangioscopy 3) Clinical applications of IR and GI biliary endoscopy and their outcomes: A case for each application will be shown a. Malignancy: indeterminate biliary stricture, staging of cholangiocarcinoma b. Bile stones treatment c. Primary sclerosing cholangitis diagnosis and treatment d. Selective cannulation of structures like cystic duct, gallbladder, intrahepatic ducts, anastomotic strictures e. Investigational usesPlease visit the Learning Center to also view this presentation in hardcopy format.

IREE-25HC Cryoablation for Vascular Malformations

Participants
Shin Mei Chan, BS, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Venous malformations (VM), the most common vascular anomaly that may cause significant pain, can be treated with percutaneous sclerotherapy. However, many do not achieve pain-free remission; in select patients, percutaneous cryoablation is an option. However, this is not routinely offered and there is a paucity in the literature describing techniques. Herein we review procedural aspects of cryoablation for VM.

TABLE OF CONTENTS/OUTLINE

1. Pre-procedure a. Ultrasound is performed in clinic, in addition to MRI (T2-weighted fat-suppressed and T1-weighted images)2. Procedurea. Under non-contrast CT ± US, a needle access route is selected and skin is marked b. A guiding needle is advanced and position confirmed under CT c. Hydrodissection, whereby a 21-gauge needle is used to instill saline to separate the skin and malformation, can be used for peripheral lesions with < 1 cm of overlying subcutaneous tissue to prevent injury to peripheral structures d. Warm packs applied to surrounding skin may also be used to avoid injury e. Freeze cycles and the number of cryoprobes varies, depending on lesion size and location i. In literature, a common regimen is two ten-minute freeze cycles per cryoprobe ii. When multiple probes are required, they are often placed ~2 cm apart f. Adequate ablation can be considered achieved when the iceball adequately covers the malformation corresponding to symptoms 3. Post-procedure a. Most can be done as an outpatient, with discharge within ~4 hours b. Clinic follow-up at 1 week for wound check, then 6 weeks for US and pain scalePlease visit the Learning Center to also view this presentation in hardcopy format.

IREE-26 Pulmonary Arteriovenous Malformation - General Issues and New Topics

Participants
Ryo Takeshita, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. If possible, all PAVM lesions should be treated regardless of feeding artery diameter. 2. Embolized distal to last normal pulmonary artery branch results in low recanalization rate.3. With a cutoff of 55% of preoperative, drainage vein diameter most accurately assess patency after embolization.4. Diagnosis of Patency by Time-resolved MR Angiography more accurate than CT evaluation.5. Systemic collateral development after PAVM embolization rarely causes hemoptysis.

TABLE OF CONTENTS/OUTLINE

1. Definition and Epidemiology. A:Relationship with Hereditary Hemorrhagic Telangiectasia. B:Mimickers. 2.Life treating complications of Pulmonary Arteriovenous Malformation. A:Hemoptysis. B:Paradoxial embolism. 3.Diagnosis. A: Classification of Pulmonary Arteriovenous Malformation. B:Treatment indications. 3.Embolization Procedure. A:Venous Access. B:Embolic Agents. 4:Catheter Equipments. 5:Embolization position. 4.Evaluation of patency after Embolization A:CT findings of Drainage Vein Diameter. B: Time-resolved Magnetic Resonance Angiography. 5.Systemic collateral development

IREE-27 Review of the Experience of a Reference Hospital in Brazil on the Efficacy and Safety of Radiofrequency Ablation (RFA) of Autonomously Functioning Thyroid Nodules (AFTN)

Participants
Leonardo Machado, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To demonstrate our service's experience using the RFA in AFTN treatment.• To discuss imaging characteristics and distinguishing features of AFTN and post-RAF nodule imaging appearance.• To demonstrate treatment efficacy and its related factors, as well as to compare characteristics of RFA treatment and complications.

TABLE OF CONTENTS/OUTLINE

• Introduction.• Criteria of patient's election.• RFA technique and its limitations.• Post-RFA nodule characteristics and treatment complications.• Patient's follow-up using CEUS.• Treatment efficacy and safety.

IREE-28 The Iceberg Technique: Bringing Diving Thyroid Nodules to the Surface

Participants
Gabriela Merigue, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:Present some cases of a new therapeutic approach to diving thyroid nodules in a minimally invasive way by interventional radiology;To overcome the difficulty of applying the "moving-shot" technique in the mediastinal component;Illustrate this new technique results.

TABLE OF CONTENTS/OUTLINE

Thyroid nodules and its symptoms;Indications of radiofrequency thermal ablation;"Iceberg technique" two steps;Challenging nodules to approach;Outcomesafter first RTAafter second RTA

IREE-29 Middle Meningeal Artery Embolization for the Management of Chronic Subdural Hematoma

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Ángela Huete Schmolling, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To describe the chronic subdural hematoma physiopathology. - To analyze the medial meningeal artery embolization as a novel and effective treatment modality for the management of chronic subdural hematoma.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Incidence, risk factors and physiopathology. 2. Treatment: Surgery vs. medial meningeal artery embolization.3. Protocol (Clinico San Carlos Hospital). 4. Procedure.

IREE-3 Stepwise Percutaneous Approach to Treat Severe Benign Hepaticojejunostomy Strictures

Participants
Charles Shelton, DO, Cincinnati, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Hepaticojejunostomy anastomosis (HJA) can be complicated by severe strictures or complete obstructions. Interventional radiologists should be aware of etiologies, complications, clinical evaluation, and treatment approaches.2. Stepwise algorithm for percutaneous treatments of HJA strictures is provided.3. Percutaneous techniques to treat severe HJA strictures include: a. Conventional antegrade fluoroscopic-guided recanalization b. Direct antegrade visualization with percutaneous cholangioscope and sharp recanalization c. Spyglass cholangioscopy with laser incision of HJA Stricture d. Combined percutaneous trans-jejunal retrograde approach with antegrade approach e. Combined percutaneous and endoscopic rendezvous technique f. Bio-degradable stents for benign strictures 4. Post-procedural complications and clinical outcomes

TABLE OF CONTENTS/OUTLINE

1. Epidemiology and etiology of HJA strictures and complete occlusions. 2. Clinical presentation and evaluation 3. Stepwise management algorithm for HJA stricture recanalization: multi-disciplinary approach 4. Review of percutaneous techniques of biliary recanalization along with pictorial examples of percutaneous antegrade approach, combined approach, and recently developed techniques using cholangioscope and laser incision 5. Short- and long- term clinical outcomes of percutaneous treatments, and management of post-procedural complications

IREE-30 Radioembolization of Hepatocellular Carcinoma with Extrahepatic Collateral Blood Supply: Anatomic and Technical Considerations

Participants
Jin Woo Choi, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radioembolization for hepatocellular carcinoma (HCC) has exploded in recent years. HCC typically received its blood supply from the hepatic artery, however, it can recruit a parasitic blood supply from extrahepatic collateral arteries (EHC). Whereas chemoembolization has been performed through EHC without serious complications, little experiences about radioembolization though EHC have been reported. The purpose of this exhibit is: (1) To review the key anatomy of EHC by using cone-beam CT. (2) To review when we suspect the presence of EHC supplying HCC. (3) To learn how to do safe radioembolization through EHC.

TABLE OF CONTENTS/OUTLINE

1) List of treated EHC 2) Vascular anatomy of EHC by using cone-beam CT and safe point of each EHC 3) Suggestive findings of EHC on CT/MR and cone-beam CT 4) Special considerations for radioembolization through EHC: dosimetry, embolization of pulmonary shunt, protection of normal vessel, and redistribution by proximal embolization.

IREE-31 Updates on Combination TACE and Ablation Therapy for HCC: A Case-Based Review of Technique, Results and Complications

Participants
Surbhi Trivedi, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review the current literature and treatment pathophysiology regarding combination transarterial chemoembolization (TACE) and

radiofrequency ablation (RFA) therapy in unresectable intermediate sized hepatocellular carcinoma. 2) Outline treatment timeline, procedural workflow and TACE-RFA technique. 3) Summarize post-treatment follow-up, patient outcomes and overall survival in our experience. 4) Review alternative forms of combination therapy including TACE and ethanol ablation. 4) Illustrate complications specific to combination therapy and subsequent management. 5) Discuss future directions for combination locoregional therapy in HCC management and emerging role for combination embolization-ablation therapies.

TABLE OF CONTENTS/OUTLINE

1) Hepatocellular carcinoma epidemiology and treatment algorithms 2) Combination therapy patient selection and contraindications 3) Literature review of combination therapy, overall survival and patient outcomes 4) Technique, workflow and timeline for combination therapy 5) Case-based illustration of successful combination therapy and post-procedure tumor response 6) Alternative forms of combination therapy including TACE and ethanol ablation 7) Case-based illustration of procedural complications and management 8) Future directions

IREE-32 Building an Interventional Radiology Consult Service: Considerations for Improving Referring Physician Communication and Patient Care

Participants
Jacob Conroy, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the impact of referring physician communication on inpatient care related to IR services. 2. Recognize barriers that may limit effective communication with referring physicians.3. Understand the methods to implement an IR consult service and how this improves communication and patient care.

TABLE OF CONTENTS/OUTLINE

LEARNING OBJECTIVES: To discuss methods for improving inpatient communication with referring physicians and patients concerning IR services.BACKGROUND: Limited awareness, understanding, and access to IR procedures continue to be limiting factors in patient care and the growth development for IR practices. Effective communication with referring physicians is essential for combatting these limiting factors. Several barriers exist that prevent effective communication with referring physicians and thus, negatively impact patient care and the continued growth of IR services. Recent strategies to overcome these barriers have focused on the development of IR consult services that are prominent and visible on hospital floors, in clinics, and in electronic medical records.CLINICAL FINDINGS/PROCEDURE DETAILS: This exhibit will:1. Summarize the findings of previous studies on referring physician awareness and utilization of IR services.2. Discuss the barriers to effective communication with referring physicians.3. Describe the impact these communication barriers have on patient care and IR practices.4. Explore methods to develop and execute a successful IR consult service, describing experiences from our institution as well as those from the literature.CONCLUSION/TEACHING POINTS:

IREE-33 Making Sense of Stents: An Evidence-Based Review of Classes of Arterial Stents

Participants
Stephanie Jankovic, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-There are several permutations of stents today, including: covered/uncovered; balloon-expandable/self-expanding; drug-eluting/bare metal; and metal/absorbable. These different classes of stents have particular characteristics which make them optimal for various indications in the arteries throughout the body.-Primary, primary-assisted, and secondary patency rates vary amongst the classes of stents in different vascular beds throughout the body.-Appropriate stent choice influences vessel patency, reintervention rate, and resolution of underlying clinical symptoms. An understanding of these factors will allow the interventional radiologist to best treat each patient.

TABLE OF CONTENTS/OUTLINE

1. Brief review of history of stents2. Classes of stents3. Evidence for stent selection is reviewed for the following arteries, highlighting key papers, clinical trials, and device indications for use (IFUs) that guide stent selection, with critique of the quality of evidence:--Subclavian/upper extremity--Celiac axis--Splenic--Hepatic - native and transplant--Superior mesenteric--Renal--Iliac--Superficial femoral--Popliteal (P1, P2, and P3 segments)--Tibial4. Characteristics underlying patency rates, including indication (e.g., atherosclerosis versus aneurysms), size, trackability, radial force, and fracturing are also discussed.

IREE-34 Adrenal Vein Sampling: A Failure Mode Analysis

Participants
Praneeth Kalva, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Adrenal vein sampling (AVS) differentiates unilateral from bilateral adrenal disease and plays a pivotal role in deciding surgical vs medical management in patients with a diagnosis of primary hyperaldosteronism (PA). Canulating the right adrenal vein can be technically challenging with high variability in procedural success rates. Factors contributing to failure of cannulating the right adrenal vein include failure to locate the adrenal vein, misidentification of another vessel as the adrenal vein, and dilution of the sample from accessory vein blood flow.This educational exhibit will cover each of these failure modes. A brief description of the technique with imaging correlates, review of literature and how to identify and overcome the scenarios contributing to the failure with examples will be discussed.

TABLE OF CONTENTS/OUTLINE

A. Introduction to AVS B. Typical success rates and non-procedural determinants of successC. Utility of unilateral adrenal vein sampling using a mathematical model for predictionD. Alternate imaging techniques for localization after failed AVSE. Pre-operative planning a. Medications that affect success of AVS: Physiology and Plasma Renin levelsb. Pre procedural imaging: What to look for to maximize the success during AVSc. Logistics of specimen processing and analysis d. Required catheters/equipmentF. Procedural steps: a. Adrenal vein identification: Anatomical patterns, Role of cone bean CTb. Sampling: End hole vs Side hole catheters, utility of microcathetersc. Complications: Adrenal hematoma contributing to failure of sampling G. Illustrative cases of failed AVS and how

these cases are managed in the author's institutionH. Conclusion

IREE-36 Percutaneous Transjejunal Biliary Intervention: A Primer for the Diagnostic and Interventional Radiologist

Awards
Certificate of Merit

Participants
Ryan Gabos, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review imaging and biliary anatomy of patients selected for percutaneous transjejunal biliary intervention (PTJBI).-Discuss common indications and interventions performed via PTJBI.-Review current techniques, maintenance, advantages, and complications of PTJBI.-Review cases of successful and challenging interventions with periprocedural imaging.

TABLE OF CONTENTS/OUTLINE

IntroductionHistory of PTJBI, modern practice, and role of IR in biliary management.Postsurgical changes and imaging (CT, MRI) following hepaticojejunostomy or roux-en-y reconstruction.Common and uncommon biliary anatomy.Common indications for PTJBI access with periprocedural imaging.Steps, maintenance, and advantages of PTJBI access.Complications of initial PTJBI procedure.Case PresentationsCholangiocarcinomaLiver transplantCholedochal cyst, s/p hepaticojejunostomyCholecystectomy complications, s/p hepaticojejunostomyConclusionClinical ImplicationsPTJBI is a proven method to manage biliary disease in patients with surgically altered small bowel anatomy. In patients requiring repeat intervention or those with diffuse biliary disease, retrograde biliary access via PTJBI represents an attractive and underutilized resource.

IREE-37HC Spinal Dural and Extradural Arteriovenous Fistulas: Imaging Features and Endovascular Treatments

Participants
Hiro Kiyosue, MD, (*Presenter*) Research Grant, Koninklijke Philips NV

TEACHING POINTS

Despite of recent developments in technology of imaging and endovascular treatments, some cases are often incorrectly diagnosed or inadequately treated even now. In this presentation, we demonstrate imaging features and endovascular treatments of spinal dural AVFs and various types of extradural AVFs with illustrative case presentation. 1. Spinal dural AVFs are usually located in the dorsal spinal dura matter at lower thoracic spine, which are fed by small dural feeders from the radiculomeningeal artery or the prelaminar artery and drain into a bridging vein. Typical case shows horizontal T sign on frontal view of spinal angiography. 2. Spinal epidural AVFs are the most common type in extradural AVFs, which are frequently located in the ventral epidural space at lumbar spine. They are fed by multiple epidural feeders from the somatic branches and drains into an epidural venous pouch to a radiculomedullary vein and/or paravertebral veins. 3. Mixed AVFs is the second common type of extradural AVFs, which involve multiple spaces of osseous, epidural, and paravertebral spaces and often associated with spinal arteriovenous metameric syndrome.

TABLE OF CONTENTS/OUTLINE

1. Spinal dural AVFs: Clinical features. Imaging features. Transarterial embolization 2. Spinal extradural AVFs: Classification 2-1 Epidural AVFs: Clinical features, Imaging features, Transarterial and transvenous embolization 2-2 Osseous AVFs: Clinical features, Imaging features, Transarterial and transvenous embolization, and direct puncture embolization 2-3 Paravertebral AVFs: Clinical features, Imaging features, Endovascular techniques 2-4 Mixed AVFs: Clinical features, Imaging features, Endovascular techniquesPlease visit the Learning Center to also view this presentation in hardcopy format.

IREE-38 Irreversible Electroporation in Locally Advanced Pancreatic Cancer

Awards
Certificate of Merit

Participants
Kenneth Huynh, BS, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To provide an overview of the role and literature of percutaneous irreversible electroporation (IRE) in locally advanced pancreatic cancer (LAPC) including a review of ongoing trials. 2. To present, through case-based review, the techniques utilized in percutaneous IRE to safely target pancreatic lesions. 3. To illustrate the multi-modality imaging fusion and navigation for IRE of LAPC, with emphasis on intra-procedural cone-beam computed tomography (CBCT).

TABLE OF CONTENTS/OUTLINE

Locally advanced pancreatic cancer (LAPC) is considered unresectable due to tumoral encasement of the superior mesenteric or celiac arteries or non-reconstructable venous involvement. Percutaneous irreversible electroporation (IRE) in LAPC has shown promising outcomes with respect to median overall survival, especially when combined with chemotherapy. IRE provides non-thermal ablation of LAPC while mitigating risk of thermal injury to nearby structures compared to thermal techniques. Given the location of the pancreas and proximity to nearby structures, safe percutaneous targeting may be difficult with high risk of complication. This educational exhibit will: (1) provide an overview of the role and literature of percutaneous IRE in LAPC including ongoing trials, (2) present different procedural techniques used to safely target pancreatic lesions and minimize complications. Techniques including electrode steering, gantry tilting, bolus chasing, and CT arteriography will be discussed, and (3) illustrate the multi-modality imaging fusion and navigation for IRE of LAPC with emphasis on intra-procedural CBCT.

IREE-39 Priapism: Types and Interventional Treatment

Participants
Benjamin Reichardt, Hattingen, Germany (*Presenter*) Nothing to Disclose

TEACHING POINTS

Priapism is defined as a sustained tumescence or erection lasting more than 6 hours. The erection is limited to the erectile tissue

Priapism is defined as a sustained tumescence or erection lasting more than 6 hours. The erection is limited to the erectile tissue without affecting the corpus spongiosum.There are two different types of priapism: 1. Low flow (ischemic / venous occlusive) 2. High flow (non-ischemic or arterial): Does not require emergency treatment. Genitoperitoneal trauma is the most common etiology. The trauma results in a rupture in the cavernous artery with subsequent development of a high flow fistula or a pseudoaneurysm.Interventional Therapeutic options: 1. Autologous blood clot2. Gel foam3. Polyvinyl alcohol (PVA) 4. Spherical Particles5. Micro-spirals6. Alcohol - lipiodol mixture7. N-butyl cyanoacrylate (NBCA)

TABLE OF CONTENTS/OUTLINE

The success rates are up to 89%. Sexual function may be impaired after embolization, although potency is fully restored in about 80% of cases. With decongestion and potency rates of 100% and 86-91%; superior to surgery.Relapse: rates vary between 7% and 27%, regardless of the type of embolotherapy. Erectile dysfunction: occurs in around 39% of the time with the use of permanent embolic agents and in only 5% with the use of temporary embolic agents. Conclusion: Superselective embolization is the gold standard in the treatment of HFP because of its safety and efficacy profile. The type of embolic agent does not appear to be a major factor influencing treatment outcomes in terms of recurrence of priapism or deterioration in erectile quality. The embolic product should be tailored to each patient and the procedures should be performed by well trained and experienced operators, who should know his embolic materials.

IREE-4 Finding the Adenoma in Cushing's Disease: Bilateral Inferior Petrosal Sinus Sampling and Pituitary MRI

Participants
Celia Alonso, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The objective of this educational exhibit is to emphasize the role of bilateral inferior petrosal sinus sampling (BIPSS) in the diagnosis of Cushing's disease. After reading it, you will:- Learn the pathophysiology underlying Cushing's syndrome. Differentiation between ACTH-dependent and ACTH-independent hypercortisolism.- Comprehend the relevance of radiological techniques identifying the etiology of hypercortisolism, focusing on the diagnosis of ACTH-secreting pituitary microadenomas.- Deepen the knowledge about BIPSS indications, technique, safety and possible complications.

TABLE OF CONTENTS/OUTLINE

- Introduction.- Cushing's syndrome diagnostic algorithm: clinical, biochemical and radiological analyses. BIPSS as the gold standard test in Cushing's disease and comparison with pituitary MRI. Experience in our institution, a tertiary care center, in the last sixteen years.- BIPSS technique and rationale. Indications, relevant venous anatomy and variants, technical considerations and possible complications.- Conclusion.

IREE-40 Magnetic Resonance Lymphangiography (MRL): Past, Present, and Future Directions

Awards
Identified for RadioGraphics

Participants
Ahmed Negm, MBBCh, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learn the lymphatic system anatomy and the historical development of MRL. Review the MRI sequences and techniques currently used for transpedal and intranodal MRL. Understand current indications and applications of MRL including diagnosis and treatment of lymphatic disorders.

TABLE OF CONTENTS/OUTLINE

1. Lymphatic system anatomy and Historical development of MRL • Embryological development of peripheral and central lymphatic system • Location and territorial drainage of central, hepatic, and mesenteric lymphatics • Other methods of lymphatic imaging (Lymphoscintigraphy, Fluoroscopic lymphangiography, Fluorescence lymphography) • Historical development of MRL 2. MRI sequences and techniques currently used in MRL • Intranodal Dynamic contrast-enhanced MRL (DCE-MRL) • Interstitial transpedal MRL (tMRL) • Intra-hepatic DCE-MRL (IH-DCE-MRL) • Retrograde thoracic duct dynamic contrast-enhanced MRL • Utility of T2W MR Sequences • Procedural aspects (Saline, Contrast, Needles, Catheters, Scanner, Anesthesia, ±Ultrasound) 3. Indications and applications of MRL • DCE-MRL o Evaluation of lymphatic flow (Pulmonary lymphatic perfusion syndrome, Plastic bronchitis, Protein-losing enteropathy, Chylothorax, Chylous ascites, Leaks, Edema) o Lymphatic malformations o Identification of aberrant lymphatic vessels for embolization o Localization (Sentinel lymph nodes, Leaks, Pre-operative planning) • tMRL o Alternative to DCE-MRL (Simple, Fast, No ultrasound) o Diagnosis pre-treatment plan o Localization (Peripheral or Central lymphatic leakage) • IH-DCE-MRL o Diagnosis (Protein-losing enteropathy, Chylous ascites, Contrast leakage to peritoneum/duodenum) • Limitations of DCE-MRL tMRL

IREE-41 Hydro, Pneumo, and Balloon-assisted Separation of Critical Structures in Ablation Procedures

Participants
Mohamed Ibrahim, MBBCh, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Learn the role and limitation of hydro-dissection in the separation of critical structure during image-guided ablation procedures • Learn the role and limitation of pneumo-dissection in the separation of critical structure during image-guided ablation procedures • Learn the role and limitation of balloon-assisted separation of the critical structure during image-guided ablation procedures

TABLE OF CONTENTS/OUTLINE

• Role and limitation of hydro-dissection of critical structures o Appropriate clinical scenarios for hydro-dissection o Limitations of hydro-dissection and how to manage them; avoiding streak artifact and fluid redistribution • Role and limitation of pneumo-dissection of critical structures o Appropriate clinical scenarios for pneumo-dissection o Limitations of pneumo-dissection and how to manage them; gas absorption and redistribution • Role and limitation of balloon-assisted separation of critical structures o Appropriate clinical scenarios for balloon-assisted separation o Limitations of balloon-assisted separation and how to manage them; placement of multiple balloons

IREE-42 Principles of Tissue Sampling, Handling, and Processing: A Primer for Procedural Radiologists

Participants
Majid Chalian, MD, Seattle, WA (*Presenter*) Grant, The Boeing Company

TEACHING POINTS

1) Provide a broad overview of pathology to demystify subdivisions and associated protocols and procedures 2) Discuss best practices for tissue sampling and handling, based on organ system (including thyroid, breast, lung, liver, kidney, bone, and musculoskeletal soft tissue)3) Familiarize with different sample media, their functions, and indications4) Learn about common histopathology artifacts and mitigation strategies 5) Learn how to implement clinical and imaging findings to sample adequately and handle tissue appropriately

TABLE OF CONTENTS/OUTLINE

Introduction? Significance of collaboration between radiology and pathology departments and impact on patient care? Pathology subdivisions? Anatomic pathology? Clinical pathology (AKA "laboratory medicine") Anatomic pathology workflow ? Pre-analytical steps ? Gross examination and description? Tissue processing ? Tissue staining? Final diagnosis and pathology report Best practices for specimen sampling ? Small lesions? Metastases? Location dependent ? Thyroid? Breast? Lung? Liver? Kidney? Bone? Musculoskeletal soft tissue? Uncertain cases that may benefit from pathology's consultation/presence before and/or during the procedure Best practices for specimen handling/processing? Formalin? Saline/RPMI? EM fixative (glutaraldehyde)? Decalcifying agents? RDO (dilute hydrochloric acid) ? EDTA? Fresh tissue ? How the differential impacts handling/processing Common Artifacts and Mitigation Techniques ? Fixation ? Crush ? Cautery? Air Dry Core Needle Biopsy vs FNA ? Specimen processing basics ? Advantages of each? Disadvantages of each Tips to use clinical and imaging findings for proper tissue sampling and handling

IREE-43 Interventional Pain Management in Extraspinal Osseous Metastases

Awards
Certificate of Merit

Participants
Kenneth Huynh, BS, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the indications and procedural considerations for percutaneous management of extraspinal osseous metastases. 2. To review cases of interventional pain management of extraspinal osseous metastases including embolization, thermal ablation, and bone stabilization.

TABLE OF CONTENTS/OUTLINE

Extraspinal bone metastases can cause significant morbidity to many patients due to localized pain, referred pain, impaired mobility, and pathological fractures. This commonly leads to long-term narcotic use, prolonged bedrest, and poor quality of life. Percutaneous interventions have been shown to provide sustained palliative relief of pain associated with metastatic osseous disease, in addition to improving mobility and quality of life. A multi-disciplinary approach to oncologic pain associated with bony lesions including interventional radiology can improve patient's pain and quality of life. This educational exhibit will: (1) review the indications and procedural considerations for percutaneous management of extraspinal osseous metastases with palliative intent, and (2) present different procedural techniques used in pain palliation and bone stabilization. Techniques include embolization for hypervascular metastatic lesions, radiofrequency ablation, microwave ablation, cryoablation, and cementoplasty. An overview on these techniques and possible procedural complications with measures for prevention and management will also be discussed.

IREE-44 Interventional Approach to the Cancer Pain Patient: A Case-Based Review

Awards
Cum Laude

Participants
Omair Ali, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chronic pain is a common concern among patients with cancer, resulting in frequent utilization of emergency room visits and hospitalizations. Pharmacotherapy is a widely used approach for cancer pain relief, although long-term opioid use is often inadequate in treating cancer pain and has a significant side effect profile. Interventions for cancer pain offer unique solutions to improve quality of life and provide more effective long-term pain relief. The purpose of this exhibit is to provide a case-based approach to interventional radiology's role in the management of cancer pain.

TABLE OF CONTENTS/OUTLINE

1) Introduction to cancer pain a) Nociceptive pain b) Neuropathic pain 2) Decision-making algorithm for cancer pain interventions a) Correlation of pain to imaging b) Source and location of cancer pain i) Nerve-related pain ii) Bone pain (spinal pain, non-spinal pain, and presence of fracture in the setting of bone pain) c) Available non-IR treatment options d) Available IR treatment options 3) Cancer pain intervention cases: clinical history, imaging, decision-making, intervention a) Celiac plexus neurolysis b) Intercostal cryoneurolysis c) Vertebral augmentation for pathologic compression fractures d) Thermal ablation for painful bone metastasis e) Percutaneous screw fixation for pelvic metastasis f) Palliative embolization of bone metastasis

IREE-45 Insulinoma: Role of the Interventional Radiologist

Participants
Ali Abbas Saifuddin, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologically occult insulinomas should be assessed with selective arterial calcium stimulation test (SACST) with hepatic venous sampling prior to surgical treatment.

TABLE OF CONTENTS/OUTLINE

Insulinomas typically present with Whipple's triad which is composed of hypoglycemia, low fasting plasma glucose, and alleviation of symptoms by glucose administration. Factitious hypoglycemia (i.e., exogenous insulin administration) must be excluded to make a diagnosis of insulinoma, and this is accomplished by a supervised 72-hour (or 48-hour) fast. Localization of tumor can be accomplished using transabdominal ultrasound (TUS), triple phase CT, gadolinium enhanced MR abdomen, gallium-68 dotatate PET/CT, Octreoscan, or a combination of these tests. If non-invasive modalities cannot localize the tumor, then invasive tests, such SACST with hepatic venous sampling or endoscopic ultrasound (EUS), can be utilized. SACST involves injecting calcium solution at a dose of 0.0125 mmol Ca 2+/kg (0.005 mmol Ca2+/kg for obese patients) into the superior mesenteric, proximal splenic, mid-splenic, gastroduodenal, and proper hepatic arteries. 5 mL right hepatic venous samples at 0, 20, 40, and 60 seconds are obtained after calcium solution injection in each artery. Diagnostic criterion for a positive response is an insulin response 2x of baseline. Positive response when injecting the gastroduodenal artery or the superior mesenteric artery localizes to the pancreatic head or neck. Positive response when injecting the splenic artery localizes to the pancreatic body or tail. Positive response when injecting the proper hepatic artery suggests liver metastases. Localization is critical prior to surgical treatment.

IREE-46 Introducing Pre-Clinical Medical Students to IR - Medical Student IR Symposia 2.0

Participants
Robert Weinstein, Baltimore, MD (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the importance of introducing IR to pre-clinical medical students. To learn about the different methods by which pre-clinical medical students are introduced to IR. To recognize that the traditional medical student IR symposium relying solely on didactic lectures is being replaced by a new IR symposium consisting of interactive and hands-on exercises and simulation sessions. To review the available literature regarding the use of new IR symposia consisting of interactive and hands-on simulations sessions.

TABLE OF CONTENTS/OUTLINE

Why is introducing IR into pre-clinical medical training important? The new integrated IR residency. IR Residency Match competitiveness. The evolution of medical student symposia. Traditional didactic lecture-based symposia. Interactive and hands-on symposia. Target audience. Factors effecting participation in medical student symposia. Choosing the right format. In-person vs. virtual formats. Didactic vs. interactive/hands-on vs. mix. Choosing the appropriate faculty. Involving trainees/medical students. Data Collection. The importance of pre- and post-symposia surveys. Polling questions during the event Performance during simulations. Feedback allows for improvements Future directions. Simulation and clinical IR bootcamps. The role of national meetings

IREE-47 Fistula Fix: Maturation, Maintenance, and De-Clots

Awards
Identified for RadioGraphics
Cum Laude

Participants
Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss epidemiology, cases, and clinical presentations of hemodialysis (HD) access failure requiring intervention and literature based treatment interventions. 2. Review role of imaging in the diagnosis of hemodialysis access malfunction/failure.3. Briefly review characteristic area of stenosis/failure based on HD access anatomy.4. Review main interventional therapies for management of HD access with emphasis on angioplasty, stent placement and DeClot interventions.

TABLE OF CONTENTS/OUTLINE

1. Ultrasound and conventional angiogram evaluation and function and HD access maturity (rules of sixes), including common artifacts and pitfalls and advanced ultrasound techniques.2. Overview of the anatomy and physiology of characteristic HD areas of stenosis.3. Overview of the current literature of HD access failure treatment: drug-coated vs non-drug-coated balloons, covered vs bare-metal stents, etc.4. Case-based review of various endovascular techniques in management of fistula malfunction including: failure to mature, outflow stenosis treatment (characteristic HD access areas of stenosis such as the swing-point in BVT fistulas, cephalic arch stenosis, etc.), Declot (traditional vs IJ access), coil embolization of accessory veins to aid in maturation, anastomotic narrowing, and intraprocedural complications.

IREE-48 Various Approaches to the Portal Venous System

Awards
Certificate of Merit

Participants
Yoshitaka Tamura, Kumamoto, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Portal venous (PV) interventions including transjugular intrahepatic portosystemic shunt (TIPS), antegrade transportal obliteration (ATO), PV stenting, PV embolization (PVE), and islet transplantation have developed for a few decades. Approach to the PV system is an essential step in PV intervention. Various approaches are described. Transjugular approach is usually as a part of TIPS procedure. Puncture from the proximal portion of the right hepatic vein to the right PV is often done under fluoroscopy. Intravascular ultrasonographic guidance can facilitate the safety. Transhepatic approach is a classical approach for various interventions. It has potential risks of bleeding and transpleural puncture. Transsplenic approach is useful for cases with PV/splenic vein occlusion. Tract embolization is important because of higher risk of bleeding from puncture site. Transumbilical venous and portosystemic collateral approaches are the safest approaches. Catheterization through the tortuous way is required. Surgical approaches (transiliocolic venous approach and round ligament approach) are reliable for catheterization. They provide good controllability of devices, and effective for selected cases.

TABLE OF CONTENTS/OUTLINE

1 Basics of PV interventions (TIPS, ATO, stenting, PVE and islet transplantation) 2 Transjugular approach 3 Transhepatic approach

4 Trassplenic approach 5 Transumbilical venous and portosystemic collateral approach 6 Surgical approach (Transiliocolic venous approach and round ligament approach)

IREE-49 Percutaneous Management of Post-Liver Transplant Complications

Participants
Ahsun Riaz, MD, Chicago, IL (*Presenter*) Consultant, Boston Scientific Corporation

TEACHING POINTS

1. Describe the complications of liver transplant (LT)2. Diagnosis of post-LT complications using various imaging modalities3. Highlight the techniques employed by interventional radiologists to manage post-transplant complications

TABLE OF CONTENTS/OUTLINE

Introduction1. Types of liver transplants and various anastomoses2. Normal imaging after transplant3. Pathophysiology of complicationsClinical Presentation, Risk Factors and Diagnostic ImagingComplications and Their Management by IR1. Vascular complicationsa) Transplant hepatic artery stenosis/thrombosis- Angioplasty/stenting/catheter-directed thrombolysisb) Arterial dissection/aneurysm/pseudoaneurysm and arterioportal fistulas- Coiling/stent grafting/stentingc) Splenic steal syndrome/"small-for-size" syndrome- Splenic artery embolization via coils/vascular plugsd) Transplant portal vein stenosis/thrombosis- Venoplasty/stentinge) Transplant hepatic vein stenosis- Venoplasty/stentingf) Inferior vena cava complications- Venoplasty/stenting2. Biliary Complicationsa) Biliary stricture- Percutaneous transhepatic/transjejunal cholangioplasty/stenting- Role of endoscopyb) Biliary leak/biloma- Percutaneous drainage- Embolization of leaking ductc) Stones/casts/debris

IREE-50 Intraoperative Nerve Monitoring to Prevent Nerve Damage on Image-Guided Percutaneous Tumor Ablation

Participants
Robert Weinstein, Baltimore, MD (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the use of intraoperative nerve monitoring as a tool to prevent iatrogenic peripheral nerve injury during percutaneous thermal and cryo-ablation of tumors. Percutaneous ablation is a potentially curative minimally invasive treatment option for patients. Intraoperative Nerve Monitoring (IONM) is a group of electrophysiological modalities that can provide intraoperative assessment of neural structures to prevent iatrogenic nerve injury. IONM been shown to be valuable in reducing nerve injury during percutaneous thermal and cryo-ablation of tumors.

TABLE OF CONTENTS/OUTLINE

Percutaneous tumor ablation has become a popular tool for tumor treatment due to its minimally invasive approach and low risk profile. However, it has the potential to damage both sensory and motor nerves. Neurophysiologists can use several modalities to stimulate and measure responsiveness of at-risk neural pathways. IONM includes somatosensory evoked potentials (SSEPs) and motor nerve conduction studies (MNCSs). SSEPs monitor sensory pathways and MNCSs monitor peripheral motor nerve integrity. The interventional radiologist can be guided to avoid further ablation in each region as signal changes occur, which can limit long-term nerve damage. Regional anatomy of relevant nerves in the operational area is also key. Radiofrequency can produce interference which inhibits monitoring of neurotronic activity, and as such must be paused to record IONM signals. Cryoablation does not produce artifacts and as such real time monitoring is possible. Studies have shown the risk of major motor injury is significantly increased with persistent motor evoked potential change compared to transient or no motor evoked potential change.

IREE-51HC Arterio-Biliary Fistula as a Rare Cause of Upper Gastrointestinal Bleed: Diagnostic and Procedural Considerations

Participants
Mark Edelstein, MD, Bala Cynwyd, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Arterio-biliary fistula is a rare cause of upper gastrointestinal bleeding.2. The most common clinical presentation of an arterio-biliary fistula is hemobilia, which refers to bleeding into the biliary tree.3. In the majority of cases, arterio-biliary fistulas are iatrogenic in etiology, such as occurring after transhepatic biliary interventions or transarterial chemoembolization.4. There is a scarcity of existing literature describing spontaneous arterio-biliary fistula in the absence of prior relevant intervention. In the absence of such procedural history, the possibility of a communication between the arterial and biliary systems may not be on a clinician’s diagnostic radar when responding to a patient with active gastrointestinal bleeding.

TABLE OF CONTENTS/OUTLINE

1. Introduction to arterio-biliary fistula as a cause of upper gastrointestinal bleeding.2. Multimodality image-rich review of multiple cases of arterio-biliary fistula of both iatrogenic and spontaneous etiology.3. Angiographic demonstration of arterio-biliary fistula and unique considerations for the managing interventional radiologist.4. Conclusion.Please visit the Learning Center to also view this presentation in hardcopy format.

IREE-52 A Practical Guide to RF Ablation for Treating Locoregional Recurrence of Well-Differentiated Thyroid Cancer

Participants
Eun Ju Ha, MD, Suwon, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

While the mortality rate for well-differentiated thyroid cancer tends to be favorable, the risk of recurrent papillary thyroid cancer can range from 20 - 59% depending on patient and tumor risk factors. Various thermal ablative techniques (RFA, LA or MA) and chemical ablative approaches (ethanol ablation) can be used as an alternative method in patients deemed to be at high surgical risk, those in whom the surgeon deems non-operable or for those refusing to undergo repeat surgery. In this educational exhibit, we would like to 1) provide updated evidences of RFA for recurrent thyroid cancers and to 2) describe practical tips regarding

indication, pre-procedural evaluation, techniques, post-procedural evaluation and complications.

TABLE OF CONTENTS/OUTLINE

1. A systematic review of the current evidences 2. Practical tips for RFA to treat recurrent thyroid cancers 2-1) How to select patients - curative vs. palliative management strategies 2-2) Pre-procedural checklist before RFA - US, CT, and laboratory tests 2-3) Standard techniques - approach route based on the tumor location, hydro-dissection technique, moving-shot/fixed-electrode technique 2-4) Post-procedural checklist after RFA- US, CT, and laboratory tests 2-5) How to prevent complications- US-based nerve anatomy, cold 5% dextrose injection, medication

IREE-53HC Applicability of Irreversible Electroporation for Therapeutic Management of Pancreatic Adenocarcinoma

Participants
Raquel Moreno, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review fundamental concepts about pancreatic ductal adenocarcinoma (PDAC), including relevant vascular anatomy in axial image; disease staging and therapeutic management according to each stage. Introduce the participant to the fundamentals of Irreversible Electroporation (IRE) ablation therapy, including its eligibility criteria and contraindications. Present a pictorial essay to illustrate IRE indications based on imaging criteria of key anatomic structures involvement - arteries, veins and miscellaneous - highlighting teaching points in each case. Summarize the role of the IRE in the Therapeutic Management of the PDAC through a Flowchart.

TABLE OF CONTENTS/OUTLINE

- Introduction: PDAC- Relevant Anatomy- Irreversible Electroporation (IRE): Fundamentals- Irreversible Electroporation (IRE): Applications- Imaging Criteria: Arterial Involvement- Imaging Criteria: Venous Involvement- Imaging Criteria: Non-vascular Involvement- Final ConsiderationsPlease visit the Learning Center to also view this presentation in hardcopy format.

IREE-54HC Development of a New Drug-eluting Stent for Peripheral Arterial Diseases by General Radiologists: What You Need to Know Before You Start

Participants
Shunsuke Kamei, MD, Hachioji, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

What do you need to know to develop a new stent? The first author, a general radiologist with no specific background, has played a central role in developing a stent platform for below-the-knee (BTK) atherosclerotic diseases. Based on this experience, we will explain the tangible and intangible methods how to develop a new stent system in general practice.

TABLE OF CONTENTS/OUTLINE

1. Arteriosclerosis in BTK lesions is a severe disease, and the treatment is still underdeveloped. Therefore, we are developing a new drug-eluting stent for BTK. 2. The first step in stent fabrication is to draw stent design using 3-dimensional Computer-Aided Design (CAD) software. 3. Self-expanding stents are manufactured through laser cutting, diameter expansion, annealing, and electropolishing. The prototype is intended to improve the design through mechanical evaluation. However, since prototyping takes a long time, effective simulation (Finite element analysis using Abaqus®) can shorten the development period. 4. The stent is completed by applying our original technology, hybrid nano-coating (anti-thrombogenic base-coating with drug-eluting polymer), on the newly developed stent platform. We have evaluated the ability of the device to withstand a 10-year equivalent fatigue life due to the cyclic pulsation from blood flow. 5. In animal studies on the requirements of FDA's Good Laboratory Practices (GLP) regulations, we should confirm stent coverage by the vascular endothelium, drug-release profiles, and good stent patency rate at six months after implantation. After approval by FDA, a pivotal clinical trial can be started in humans using a newly developed stent system.Please visit the Learning Center to also view this presentation in hardcopy format.

IREE-55 Interventional Radiology and Childbirth: From Conception through Delivery and Beyond

Awards
Identified for RadioGraphics

Participants
Joseph Moirano, BS, Massapequa, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review radiation exposure risk at different points in pregnancy and assess how to decrease exposure risk during IR procedures2. To discuss the role of IR in promoting male and female fertility3. To highlight the various procedures that interventionalists perform during the antepartum and postpartum period.

TABLE OF CONTENTS/OUTLINE

1. Pregnancy and Radiation Exposurea. Radiation Effects on Fetal Developmentb. Ways to Minimize Fetal Exposure Risk2. Procedures to Promote Fertilitya. Male Infertility Treatments (Varicocele Embolization)b. Female Infertility Treatments (Fallopian Tube Recanalization, Uterine Artery Embolization (for fibroids), and Management of Complications of Ovarian Hyperstimulation Syndrome)3. Procedures in the Pregnant Patienta. Venous Access (Midline and Peripherally Inserted Central Catheter, Dialysis Access, Medi-port)b. Genitourinary Interventions (Percutaneous Nephrostomy Tube/Nephroureterostomy Tube, Ureteral Stent Placement)c. Biliary Interventions (Cholecystostomy Tube, Percutaneous Biliary Drainage Catheter Placement)d. Venous Thromboembolism Interventions (IVC Filter Placement, Venous/Pulmonary Artery Thrombectomy)e. Ectopic Pregnancy Managementf. Ovarian Cyst Aspirationg. Trauma Interventions (Arterial Embolization)4. Procedures in the Peri/Postpartum Perioda. Invasive Placenta Spectrum Management (Pre-operative Balloon Occlusion)b. Postpartum Hemorrhage after Vaginal Delivery (Prophylactic Uterine/Internal Iliac Artery Embolization, Retained POC, Uterine AVM)c. Post-Cesarean Section Procedures (Abscess Drainage, Embolization of Surgically Injured Vessel, Urinary Diversion after Ureteral Injury)

IREE-56 Magnetic Resonance Guided Focused Ultrasound (MRgFUS) for Treatment of Uterine Fibroids: Patient Selection, Contraindications and Operative Execution

Participants
Monica Mattone, MD, Roma, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

Different treatments have been proposed for uterine fibroids. Magnetic Resonance Focused Ultrasound (MRgFUS) has been proposed in the last years as a new non invasive method to treat symptomatic fibroids without any complication. It associates the spatial resolution of a MR scanner with a focused high intensity ultrasound beam.The purpose of this educational exhibit is to illustrate indications to MRgFUS treatment for uterine fibroids, contraindications and possible risks related to the procedure. We are going to describe how this system works, to show expected results after the procedure and to discuss results from the literature.

TABLE OF CONTENTS/OUTLINE

1. Current treatment for uterine fibroids: their indications, contraindications and complications.2. Patient selection and contraindications to MRgFUS.3. MRgFUS system and how does it work.4. Imaging technique to evaluate size, number, accessibility, viability and texture of fibroids.5. Results from the literature.

IREE-58 Radioembolization for Hepatocellular Carcinomas: Consideration of Non-hepatic Artery Originating from the Hepatic Artery

Awards
Certificate of Merit

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radioembolization is increasingly used for the treatment of patients with hepatocellular carcinoma. The knowledge of the hepatic artery anatomy is pivotal for effective and safe treatment. Several non-hepatic arteries, which should not be treated or should be protected, can originate from the hepatic artery. However, non-hepatic arteries may be frequently overlooked or be inadvertently treated, resulting in variable consequences from mild postembolization syndrome to catastrophic gastrointestinal radiation ulcer. The purpose of this exhibit is : (1) To list non-hepatic arteries originating from the hepatic artery. (2) To review the vascular anatomy of non-hepatic arteries on digital subtraction angiography (DSA) and cone-beam CT. (3) To learn how to deal with non-hepatic arteries prior to/during radioembolization. (4) To review the possible complications when they are inadvertently treated.

TABLE OF CONTENTS/OUTLINE

1) Cystic artery, right gastric artery, accessory left gastric artery, hepatic falciform artery, left inferior phrenic artery, and supraduodenal artery 2) Vascular anatomy of non-hepatic artery on CT/MR, DSA and cone-beam CT 3) Tips of non-hepatic artery detection on cone-beam CT as well as planning angiography and SPECT/CT 4) Technical considerations : permanent embolization, temporary embolization, and by-pass 5) Complications related with non-hepatic artery and their management : ischemic cholecystitis, radiation cholecystitis, radiation gastroduodenal ulcer, radiation dermatitis, epigastric pain.

IREE-59 Interventional Radiologic Procedures in Pelvic Bone Tumors

Participants
Yet Yen Yan, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pelvic bone tumours are frequently encountered in the daily practice of the musculoskeletal radiologists. In addition, the pelvis is the 2nd most common site for bone metastases. As the array of pelvic bone interventional procedures have gradually widened from diagnostic to therapeutic, the musculoskeletal radiologist plays an important role in the care of such patients in terms of relieving pain, disease control and improving quality of life. This educational exhibit aims to equip the radiologist with the necessary information on the various interventions that be performed.

TABLE OF CONTENTS/OUTLINE

Bone biopsy, embolisation, osteoplasty and osteosynthesis will be covered.

IREE-6 Balloon Pulmonary Angioplasty for Chronic Thromboembolic Pulmonary Hypertension: Indications, Preparation, Technique, Results and Complications.

Awards
Certificate of Merit

Participants
Mario Matute Gonzalez, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the clinical manifestations, imaging findings, and diagnostic and therapeutic algorithms available in patients with chronic thromboembolic pulmonary hypertension (CTEPH) amenable to balloon pulmonary angioplasty (BPA).To discuss the importance of a proper selection, evaluation, and preparation of patients undergoing BPA, including protocols, applications, and a systematic clinical and imaging management proposal.To explain the technique, intraprocedural clinical evaluation, expected clinical and imaging findings, results and complications of BPA.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Management of patients with CTEPH.2.1. Clinical manifestations.2.2. Imaging modalities and typical findings.2.3. Diagnostic algorithm.2.4. Therapeutic algorithm.3. Assessment before BPA.3.1. Patient selection.3.2. Preprocedural evaluation and preparation.3.3. Proposal of a systematic protocol used in our institution.4. BPA procedure.4.1. 10-step technique.4.2. Intraprocedural clinical evaluation.4.3. Immediate clinical and imaging findings.4.4. Complications.5. BPA Follow-up.5.1. Clinical and imaging evaluation.5.2. Results.6. Summarize.7. Conclusion.

IREE-60 Bariatric Arterial Embolization: How To Build a Clinical Program

Participants
Adham Khalil, MD, Baltimore, MD (*Presenter*) Research Grant, Siemens AG

TEACHING POINTS

Obesity is a major public health issue that contributes to significant disability, cardiovascular risk, mortality, and healthcare costs. Over the last 50 years, there has been a dramatic increase in the prevalence of obesity in the United States. Obesity is associated with an increased risk of all-cause mortality and a significant reduction in life expectancy. For these reasons, obesity has been labeled a major healthcare epidemic in the United States. Thus, there is an urgent need to develop new therapies for obesity.BAE is an emerging, minimally-invasive therapy for patients with obesity. This image-guided transcatheter procedure involves occlusion of the arteries supplying the gastric fundus, which contains the majority of ghrelin-producing cells. BAE has an excellent safety profile with more than 100 patients with obesity having undergone the procedure worldwide, without any significant adverse sequelae. These early findings suggest that BAE may represent an additional tool in the treatment of patients with obesity that could be used alone or in conjunction with a dedicated lifestyle management program.The goal of the exhibit is to educate the reader on our experience with building a clinical, insurance-supported BAE program and how to integrate BAE as a part of the care path for treating obesity.

TABLE OF CONTENTS/OUTLINE

1. Structure of the bariatric program2. Patient acquisition and workflow3. Patient referral and assessment4. Multidisciplinary discussion5. Peri-procedural patient care6. Procedure technique7. Insurance and billing8. Pearls / Lessons learnt

IREE-61 Transjugular Venous Access in Upper Extremity Hemodialysis Arteriovenous Fistula / Graft Interventions

Participants
Louis Fanucci, DO, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the indications for use of transjugular venous access in upper extremity hemodialysis arteriovenous fistula / graft (AVF / AVG) interventions2. To describe the procedural technique involved with transjugular venous access3. To discuss the specific clinical applications for transjugular venous access

TABLE OF CONTENTS/OUTLINE

Transjugular venous approaches were originally described in the context of upper extremity AVF / AVG interventions in 1998, for patients with thrombosed dialysis grafts. A clotted fistula / graft presents a situation where a direct puncture into that AVF / AVG is undesirable. A transjugular approach facilitates intervention using a single puncture site that does not involve the AVF / AVG outflow vein.Pre-procedure access assessment includes ultrasound evaluation of anastomotic sites, inflow artery and outflow vein, and patency of the internal jugular veins. IV access is obtained with a micropuncture system under ultrasound guidance, followed by insertion of 7-French vascular sheath. A guidewire and reverse-curve catheter are most commonly used to perform retrograde catheterization of the outflow vein of interest. After successful retrograde access is established and the procedure completed, hemostasis is achieved by simply applying pressure at the puncture site of the internal jugular vein.Clinical applications of the transjugular access approach include interventions to assist an AVF's maturation and de-clotting of an AVF. This approach is a safe and effective alternative approach to AVF / AVG interventions for patients whose target arteriovenous systems are not amenable to direct puncture.

IREE-62 History of Histotripsy: Bench to Clinical Translation

Participants
Nathan Loudon, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

Histotripsy is a new non-invasive, non-thermal, non-radiation ablative modality that uses mechanical cavitation to destroy tissues.Histotripsy began as a basic science bioengineering research project, where the investigation of ultrasound generated cavitation eventually progressed to small and large animal trials, ultimately leading to clinical translation with a Phase I FDA approved clinical trial in the US and Europe. This exhibit will review the basic physics of the technology, review the history of development from small animal to large animal to clinical translation, and finally review the clinical applications and early clinical data.

TABLE OF CONTENTS/OUTLINE

Overview of the technologyReview of basic science and animal trialsSmall animal feasibility studiesLarge animal feasibility studies pre-clinical translationSmall animal abscopal trialsEarly clinical trials Review of early human clinical trialsPhase I efficacy trial: TERESA trial in Spain Phase I safety and efficacy trial: #HOPE4LIVER trial in the U.S. and Europe

IREE-63HC Common Vascular and Bleeding Complications of Percutaneous Biliary Interventions

Participants
Aziz Tejani, (*Presenter*) Nothing to Disclose

TEACHING POINTS

With the increase in percutaneous biliary tract interventions (PBTI) being performed over the past few years, it is important for radiologists to be aware of the many associated post-procedural complications. While there are a several complications that are commonly seen, bleeding can be one of the more serious ones that should readily be assessed for. Bleeding is typically seen in 2-3% of all PBTI cases (3). Injuries to the portal vein, hepatic artery, hepatic vein, and pseudoaneurysms are common vascular injuries that are encountered. Signs and symptoms of such vascular injury can be subtle and non-specific. Although morbidity and mortality is rare, a delay in detection may lead to significant adverse outcomes in some patients. After reviewing this educational exhibit, the individual will be able to: 1. Detect the various vascular and bleeding complications of PBTI on imaging modalities2. Understand the best practices for diagnostic evaluation3. Understand the therapeutic percutaneous interventions for treatment

TABLE OF CONTENTS/OUTLINE

This Exhibit Will Provide:1. An overview of the various types of iatrogenic vascular injury seen with percutaneous biliary interventions2. Demonstrate the clinical signs and symptoms of vascular injury for the clinician to be aware of3. Review appropriate imaging modalities and how to detect such vascular complications on the particular studies4. An overview of therapeutic procedures from an interventional radiology standpoint to manage these bleeding complications5. An assessment of future direction and summary of teaching pointsPlease visit the Learning Center to also view this presentation in hardcopy format.

IREE-65 Tips for TIPS: An Update on Transjugular Intrahepatic Portosystemic Shunt Complications for Radiologists

Participants
Andrew Ni, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learning Objectives:Present common TIPS complications and their etiologyPresent an update for the diagnostic radiologist in early detection and management of TIPS complicationsReview management of common TIPS complications

TABLE OF CONTENTS/OUTLINE

Content/Outline IntroductionProcedural complications, imaging findings, and management:Venous access complications: pneumothorax, carotid artery puncture, cardiac perforationPortal access needle punctures: puncture (hepatic artery, biliary ducts, gallbladder), hemoperitoneum, and liver capsule perforationStent related: stent length, occlusion, and deployment issuesPost-procedural complications, imaging findings, and management:Shunt thrombosis: stent occlusion, portal vein thrombosis, Budd Chiari syndromeDevice-related: stent migration, hemolysisHepatic pathology: liver failure, encephalopathy, hepatic abscess, hepatic infarctOther: sepsis, radiation injury, right sided cardiac failure, hernia incarceration Routine and clinically indicated follow-up imaging Ultrasound to ensure patency and for long-term observation Imaging for detection and treatment of stent stenosis and obstruction Contrast enhanced CT to determine etiology of acute hepatic failure (vessel occlusion, thrombosis)

IREE-66 Thoracic Central Venous Occlusion: Pathogenesis, Imaging Findings, and Recanalization Techniques

Participants
Carlos Ortiz, MD, San Antonio, TX (*Presenter*) Consultant, Argon Medical Devices, Inc

TEACHING POINTS

- Discuss the pathophysiology, imaging findings, and common presentations of thoracic central venous occlusions (TCVOs)- Review collateral pathways formed in response to TCVO and associated findings on imaging- Discuss current endovascular techniques for central venous recanalization- Review the role of imaging in assessing stent patency and complications after venous recanalization

TABLE OF CONTENTS/OUTLINE

Introduction - Pathogenesis of TCVOs in the context of hemodialysis, indwelling catheters, extrinsic compression, and associated pathophysiology- Imaging of TCVOs on CT and diagnostic venogram, including review of collateral venous pathway formation- Current recanalization techniques employed in the treatment of TCVOs and indications for specific techniques (standard wire crossing, sharp recanalization, radiofrequency wire, and endovascular stenting)- Immediate complications (hemothorax, pneumothorax, hemopericardium) and subsequent complications (stent thrombosis, occlusion, dialysis issues) after endovascular recanalization- Medical management after TCVO endovascular stentingConclusionIdentification of a TCVO is important for patients as symptoms can be life altering and compromise hemodialysis. Successful recanalization requires technical skill, appropriate planning, and postprocedural management. Complications from TCVO revascularization can be severe and familiarity with this procedure is important for radiologists.

IREE-67 "Burning Questions": What Every Radiologist Should Know about the Diagnosis and Management of Bleeding Duodenal Ulcers

Participants
Roberto Chavez Appendini, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Vascular supply of the duodenum arises from the anterior and posterior division of the superior pancreaticoduodenal arteries which are branches of the gastroduodenal artery, these arteries anastomose with the inferior pancreaticoduodenal artery which is a branch of the superior mesenteric artery.2. Diagnosis and treatment of bleeding duodenal ulcers are traditionally endoscopic, when bleeding is refractory to treatment, Three-phase GI bleed CT protocol (non-contrast, arterial and venous phases) is an important diagnostic tool, nuclear medicine studies are helpful when CT contraindicated.3. CT findings of duodenal ulcers are subtle and include, mural enhancement of the duodenum, fat stranding, submucosal edema, regional lymphadenopathy, and active extravasation of contrast into the duodenal lumen.4. Endovascular treatment must be considered for bleeding ulcer refractory to endoscopic treatment. Selective embolization of the GDA is done when active bleeding is identified either on CT or angiographically. Empiric embolization of the GDA is an effective alternative, especially for clinically unstable patients.5. Selective and empiric embolization of the GDA for bleeding duodenal ulcers refractory to endoscopic treatment has a low complication rate, for which rebleeding is the most common, in these cases angiogram with potential re-embolization can be considered as well as surgical treatment.

TABLE OF CONTENTS/OUTLINE

1. Introduction and epidemiology2.Diagnostic approach for suspected bleeding duodenal ulcer3.Treatment modalities4.Case series5.Conclusion

IREE-68 Complications After Radioembolization of Hepatic Tumors: Spectrum of Imaging Findings

Awards
Certificate of Merit

Participants

Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radioembolization is a potent intra-arterial therapy used to treat primary liver tumors and liver metastases. However, this treatment may result in various hepatic and extrahepatic complications which could be alleviated or prevented. The common complications include biliary necrosis, benign biliary stricture, liver abscess, radioembolization-induced liver disease, radiation cholecystitis, gastrointestinal radiation ulcer, radiation pneumonitis, and radiation dermatitis. The purpose of this exhibit is : (1) To review the hepatic and extrahepatic complications related with radioembolization. (2) To learn how to manage these complications. (3) To learn how to prevent or alleviate these complications.

TABLE OF CONTENTS/OUTLINE

1) Hepatic complications associated with radioembolization A. biliary complication (biliary necrosis, biliary stricture, biloma, liver abscess) B. radiation hepatitis and focal radiation necrosis C. radiation-induced liver disease 2) Extrahepatic complications associated with radioembolization A. Radiation cholecystitis B. Radiation ulcer C. Radiation pneumonitis D. Radiation dermatitis 3) Management of each complication 4) Prevention method of each complication

IREE-69 Percutaneous Sclerotherapy for Orbital Low Flow Lympho-venous Malformations (LFVM)

Participants
Shyamal Patel, MBBS, FRCR, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Orbital sclerotherapy is effective with low complication rates, and is therefore an important minimally invasive option in the management of orbital low flow lympho-venous malformations. 2. Bleomycin is the sclerosant of choice as it is associated with less local inflammatory response - important for lesions in/around the orbit where significant swelling can result in visual loss. 3. Treatment is performed under a general anaesthetic and prior to bleomycin use, adequate pre-assessment is required including appropriate imaging and ophthalmology review. 4. The entire team should be aware of specific precautions related to bleomycin use including potential for lung fibrosis, skin marking and the need for cytotoxic precautions. 5. Important complications to be aware of are retro-orbital haemorrhage, requiring emergency lateral canthotomy and the oculocardiac reflex which is rare but may result in bradycardia, arrythmias and potentially asystole.

TABLE OF CONTENTS/OUTLINE

1. What are orbital LFVMs (Primary vs Secondary; Venous, lymphatic and mixed). 2. Imaging appearances (US, CT, MRI). 3. Bleomycin use: pre-assessment, bleomycin precautions. 4. Sclerotherapy procedure - dosage, technique and assessment for deep venous drainage. 5. Complications (retro-orbital haemorrhage, oculocardiac reflex.

IREE-7 Recent Development of Augmented Reality and Mixed Reality for Needle Guidance

Awards
Certificate of Merit

Participants
Satoru Morita, MD, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Augmented reality (AR) and mixed reality (MR) can expand the possibilities of image guidance procedures. Some needle guidance applications using AR/MR on smartphones and smartglasses have been developed recently. Various resources are available for developing applications using AR/MR. The purpose of this exhibit is to 1). Review the current situations of AR/MR for image guidance procedures. 2). Introduce the recent needle guidance applications using AR/MR and discuss each advantage and disadvantage. 3). Introduce how to develop needle guidance applications using AR/MR.

TABLE OF CONTENTS/OUTLINE

1). Introduction 2). Definitions of AR/MR 3). Devices for AR/MR 4). Platforms to develop AR/MR applications 5). Registration methods for AR/MR 6). Current needle guidance applications using AR/MR 7). Limitations 8). Future perspectives 9). Conclusions and take home messages

IREE-70 Interventional Pain Frontiers: Role of IR in Median Arcuate Ligament Syndrome (MALS) Management

Awards
Certificate of Merit

Participants
Mohamed Ibrahim, MBBCh, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understand the current hypothesis of MALS etiology and highlight pertinent anatomy • Learn the role of IR in the diagnosis and determination of surgical candidacy for MALS patients • Learn the role of IR in the treatment of MALS patients

TABLE OF CONTENTS/OUTLINE

• MALS etiology and pertinent anatomy o A neurogenic disorder rather than a compression syndrome o Celiac plexus and splanchnic plexus anatomy • Role of IR in the diagnosis and determination of surgical candidacy MALS patients o Role of celiac plexus block in the diagnosis of MALS o Common approaches and protocols for celiac plexus block in the diagnosis of MALS • Role of IR in treatment of MALS patients o Celiac plexus neurolysis; technical considerations, and expected outcomes o Splanchnic plexus neurolysis; technical considerations, and expected outcomes

IREE-71 Interventional Management of Portal Vein Thrombosis: A Problem-solving Approach

Participants
Daniel Cardoso, MD, Fortaleza, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize the anatomy of the portal venous system (PVS) and its most common variants. Understand the causes of Portal Vein thrombosis (PVT) and related clinical features. Comprehend imaging patterns of PVT through a wide variety of imaging modalities. Recognize the complications associated to PVT and its imaging patterns. Understand PVT treatment methods and criteria.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION: PVS anatomy and most common anatomical variations. Definition of PVT (acute x recent x chronic). Epidemiology of the most common causes of PVT. Signs and symptoms associated to the obstruction site (Portal Vein (PV), Superior Mesenteric Vein (SMV) and Splenic Vein (SV)). 2. DIAGNOSIS AND IMAGING FINDINGS: PV: Benign PV / Cirrhotic and non-cirrhotic PVT / Infectious/septic PVT - thrombophlebitis / Transplant-associated PVT. Malignant PVT: Tumor Invasion/PV Tumor Thrombosis (Hepatocellular carcinoma) / External Constriction of the PV within a Tumor (Pancreatic Cancer or Cholangiocarcinoma) / Complications associated to PVT. SMV: SMV thrombosis / Complications associated to SMV thrombosis. SV: SV thrombosis / Complications associated to SV thrombosis. 3. MANAGEMENT OF PVT: Fundamentals of Anticoagulation Therapy / Interventional Approach / Techniques / Follow-up and Early Identification of Possible Complications.

IREE-73 Venous Access Ports: What Every Radiology Resident Should Know

Participants
Nicholas Champagne-Aves, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

List indications and contraindications of venous access portsDescribe port placement and confirmatory imagingDescribe associated complications, imaging findings, and management

TABLE OF CONTENTS/OUTLINE

IndicationsLong term intravascular access with minimal disruption to patient's life (medications, transfusions, blood draws)ContraindicationsAbsolute: bacteremia/sepsis, infection at access siteRelative: coagulopathy, chest wall deformity, pneumothorax, distorted anatomy (trauma/thrombosis)Procedural StepsVisualize desired vein under ultrasound (US) guidanceSterilize fieldObtain planned venous access with micropuncture kit under US guidanceMeasure desired length of catheter using micropuncture guidewireExchange for 0.035" wire and place in the SVCCreate port reservoir site and tunnel catheter to venotomyTrim catheter to length and ensure adequate port connectionAdvance peel away sheath over wire, remove inner dilator Insert catheter completely through sheath and peel away sheathConfirm proper placement with fluoroscopyTest and flush port with heparin, close incisionComplications, imaging findings, management Early: malposition, hemorrhage, hemothorax, pneumothorax, air embolismLate: infection, catheter occlusion/thrombosis, catheter pinch off/migrationPort Removal: catheter calcification, fracture, pseudo-fractureA systematic approach to venous access port placement minimizes complications and improves outcomes. Radiologists must be familiar with indications, procedural steps, and complications for accurate management.

IREE-74HC Acute Calculous Cholecystitis: The Role of the Radiologist in Diagnosis and Treatment

Participants
Darius Jonasch, BEng, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review diagnostic approach for Acute Calculous Cholecystitis2. Define the grading of Acute Calculous Cholecystitis3. Discuss treatment options based on the patient's presentation and history

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Anatomy of the Hepatobiliary Systemb. Pathophysiology of Acute Calculous Cholecystitisc. Epidemiology and Clinical Presentation of Acute Calculous Cholecystitis2. Imaging Appearancea. Ultrasoundb. Cholescintigraphyc. Magnetic Resonance Cholangiopancreatographyd. Computed Tomographye. Endoscopic Retrograde Cholangiopancreatographyf. Percutaneous Biliary Endoscopy3. Clinical Severitya. Introduction to Tokyo Guidelinesi. Grade Iii. Grade IIiii. Grade III4. Risk Stratification and Treatmenta. Low Risk Patientsi. Surgical Therapy1. Surgical Cholecystectomyb. High Risk Patientsi. Medical Therapy1. Antibioticsii. Endoscopic Therapy1. Endoscopic Drainageiii. Interventional Radiology Therapy1. Percutaneous Drainage2. Percutaneous Transhepatic Stone Retrievaliv. Surgical Therapy1. Surgical Candidacy2. Surgical Timing5. Potential Complicationsa. Complications of Acute Cholecystitis - Sepsis, Choledocholithiasis, Gangrenous Cholecystitis, Gallbladder Perforation, Emphysematous Cholecystitis, Cholecystoenteric Fistula, Gallstone Ileusb. Complications of Treatment of Acute Calculous Cholecystitis - Hemorrhage, Bile Leak, Biloma, Common Bile Duct Injury, Bowel Injury, Tube ComplicationsPlease visit the Learning Center to also view this presentation in hardcopy format.

IREE-75 Biliary Leaks: There Are Many Ways to Fix

Awards
Identified for RadioGraphics

Participants
Christopher Mao, Sugar Land, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Biliary leaks are most seen in patients as iatrogenic complications after surgeries such as cholecystectomy. Postoperative leaks occur in 1% of laparoscopic cholecystectomies and 0.5% of open cholecystectomies but can occur in other procedures such as RFA (Radiofrequency Ablation) of primary and secondary liver tumors. As the number of hepatobiliary surgeries performed continue to increase, biliary leaks will become even more prevalent. Since clinical signs and symptoms of bile leaks are nonspecific and delay in the recognition of bile leaks is associated with high morbidity and mortality rates, imaging is crucial for establishing an early diagnosis and guiding the treatment algorithm. After reviewing this exhibit, learners should be able to: 1. Recognize emergent biliary leaks from key image findings. 2. Use best practices for diagnosing biliary leaks. 3. Understand the options for percutaneous management.

TABLE OF CONTENTS/OUTLINE

1. Provide an overview of the different types of biliary leaks. 2. Illustrate the clinical and imaging features of biliary leaks with a focus on iatrogenic etiologies. 3. Review the framework for selecting the best imaging practice of the biliary duct system. 4. Address relevant management as applicable to the interventional radiologist to aid in expedient and appropriate management. 5. Discuss future directions. 6. Conclude with a summary of key teaching points.

IREE-76 MRI Guided Transurethral Ultrasound Ablation (TULSA) of Prostate: Initial Experience at Wellspan Hospital

Participants
Edward Steiner, MD, (*Presenter*) Key Opinion Leader, Koninklijke Philips NV ;Speaker, Koninklijke Philips NV;Speaker, Quantib BV;Research support, Profound Medical Inc ;Speaker, Profound Medical Inc

TEACHING POINTS

Teaching points - To present the capabilities of TULSATULSA-PRO is a minimally invasive procedure that combines real-time MRI with robotically-driven directional thermal ultrasound to treat prostate cancer, with the goal of achieving comparable disease control to radiation therapy or prostatectomy and significantly improved functional preservation. TULSA can also treat BPH concurrent with cancer in a single procedure. Examples of TULSA whole-gland and hemi-ablation procedures performed at our institution are provided. - To report lessons learned with the TULSA procedure Critical lessons and technical points are presented including patient preparation, considerations on treating radio-recurrent disease, sparing of sphincter and bladder tissue, maintaining ejaculatory function, and workup of patients with intermediate to high grade lesions with PSMA scans. - To report early functional, oncological, and safety outcomes Discussion of post procedure care and follow-up, monitoring, repeat MRI and PSA trends, continence and erectile function data analysis as well as preliminary tumor recurrence data.

TABLE OF CONTENTS/OUTLINE

Table of contents - Basics of TULSA procedure and workflow - Lessons learned, and treatment planning strategies - Early functional, oncological, and safety outcomes - Applications of TULSA for sparing functionally important structures and treating radio-recurrent disease

IREE-77 Intra-arterial Treatment for Hepatocellular Carcinomas: How to Manage Shunting From the Artery

Awards
Magna Cum Laude

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Intra-arterial therapy including chemoembolization and radioembolization is a workhorse for the treatment of patients with hepatocellular carcinomas. Occasionally, the operators encounter shunts from the artery (arterioportal, arteriovenous, and arteriopulmonary shunts) that prevent effective treatment. The causes of these shunts include tumor invasion to the vessels, previous percutaneous procedures, chronic inflammation, and congenital acquisition. Unless the shunt is properly occluded, embolic material can pass through the shunt and cause non-target embolization or serious complications. The purpose of this exhibit is : (1) To review radiologic appearance of arterioportal, arteriovenous, and arteriopulmonary shunts. (2) To learn how to manage these shunts with proper embolic materials. (3) To list the possible complications and their management.

TABLE OF CONTENTS/OUTLINE

1) List of shunts Arterioportal shunt (hepatic artery - portal vein), Arteriovenous shunt (hepatic artery - hepatic vein), Arteriopulmonary shunt (hepatic artery - pulmonary artery/vein), 2) Imaging findings on CT/MR and angiography according to the cause (tumorous vs non-tumorous condition) 3) Embolization strategy and materials for shunts 4) Complications related with non-target embolization and their management

IREE-78 To Glue or Not to Glue, That Was the Question - Misadventures with Glue Embolization in Peripheral Applications

Participants
Jorge Lopera, MD, San Antonio, TX (*Presenter*) Shareholder, Tecnostent SA;Consultant, Merit Medical Systems, Inc;Research Grant, AngioDynamics, Inc

TEACHING POINTS

Embolization using N butyl acrylate (NBCA) or glue is showing very promising results with better and faster occlusion results than particles or coils in areas that are susceptible to recanalization after embolization such as bronchial arteries, portal vein embolization and endoleaks after EVAR, among others. Emerging uses of glue include trauma, uterine artery embolization in placental insertion abnormalities , cyst sclerosis and gastrointestinal bleeding . As with other liquid embolization agents , using glue has a steep learning curve and serious complications can occur . The purpose of this exhibit is to illustrate in a case by case presentation , different complications with the use of glue with emphasis in ways to prevent them.

TABLE OF CONTENTS/OUTLINE

1. When to use and not to use glue 2. How to prepare glue; basic steps 3. Complications a. Lung glue embolization after portal vein embolization . b. Portal vein embolization after treatment of arterio-portal fistula in HCC c. SMA glue migration after percutaneous aneurysm embolization d. Iliac artery glue embolization after trans lumbar endoleak embolization e. Glue cast adhered to catheter in the aorta- ways to fix this . f. Stroke after peripheral glue embolization, beware of PFO .Conclusions : Glue is a very versatile embolization agent, showing very promising results with lesser recanalization rates than particles or coils in many areas. As a liquid embolization agent, serious complications can occur that require a clear understanding of the different mechanisms of glue migration and ways to mitigate them.

IREE-79 Benign Prostatic Hyperplasia Treatments: A Review of the Fundamentals to Assist in Optimal Prostate Artery Embolization Patient Selection

Participants

Miltiadis Tembelis, Mineola, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. A thorough understanding of benign prostatic hyperplasia (BPH) pathophysiology and management options is essential before embarking on developing a prostate artery embolization (PAE) program.2. While the risks of PAE are low when done with proper technique, major complications can occur and have negative impact on a patient and/or a PAE program.3. An understanding of PAE indications as well as alternative BPH treatment is essential to ensure appropriate patient selection and PAE procedural advocacy.

TABLE OF CONTENTS/OUTLINE

-Review BPH pathophysiology-Discuss lower urinary tract symptoms (LUTS), their diagnosis, and that a variety of causes exist (not just bladder outlet obstruction from BPH)-Provide the learner with a thorough review of BPH management options, including medications, minimally invasive surgical therapies, PAE, and more invasive surgical interventions (TURP, HoLEP, and prostatectomy)-Review relevant literature on indications and outcomes of these procedures, with the goal of providing radiologists and trainees with key fundamental knowledge to allow for optimal PAE patient selection and also for guiding patients towards other management options when more appropriate

IREE-8 The Pelvic Venous Disease Continuum: Nutcracker Phenomenon, Non-thrombotic Iliac Vein Lesion (NIVL), Ovarian and Pelvic Vein Reflux

Participants
Navpreet Khurana, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the complex pathophysiological interactions between Nutcracker syndrome, Nonthrombotic Iliac Vein Lesion (NIVL), and ovarian pelvic venous reflux leading to the constellation of findings known as Pelvic Venous Disease (PeVD). PeVD is often misdiagnosed and inappropriately treated. 2. Describe the key imaging findings in the diagnosis of PeVD. 3. Review the algorithm and pearls pitfalls of IR management.

TABLE OF CONTENTS/OUTLINE

1. Key anatomical and pathophysiological concepts a) Nutcracker Phenomenon - Compression between aorta and superior mesenteric artery results in stenosis and increased pressure in the left renal vein, often with blow-out retrograde flow down the ovarian vein resulting in pelvic varicosities to act as collateral. b) NIVL - Stenosis of left common iliac vein between right common iliac artery and aorta, either by mechanical compression or with superimposed chronic microtrauma secondary to proximity and pulsatility causing venous wall thickening and/or webs. c) Ovarian Pelvic Vein Reflux - Incompetence and reflux of ovarian and/or pelvic veins resulting in pooling of blood into "reservoirs", classically in the pelvis. Blood may also leak out of the pelvis from "escape points" due to gravity and venous hypertension. 2. Diagnostic imaging algorithm and findings with a case-based discussion. 3. Role of Interventional Radiology: a) Initial consultation with focused history physical exam. b) Diagnostic evaluation for PeVD - US, CT Venography, MR Venography. c) Nutcracker Phenomenon its dynamic role in PeVD. d) In NIVL, understanding the interplay of iliac stenosis with ovarian reflux, role of its treatment in PeVD. 4. Complications/misdiagnosis case examples of PeVD.

IREE-80 Prostate Artery Embolization Practice Building - With a Focus on Understanding the Current Literature

Participants
Nathan Mickinac, MD, Mineola, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. A thorough understanding of benign prostatic hyperplasia (BPH) pathophysiology and management options is essential before embarking on developing a PAE program.2. While the risks of PAE are low when done with proper technique, major complications can occur and have negative impact on a patient and/or a PAE program.3. Thoughtful implementation, careful patient selection, meticulous procedural technique, collaboration with other specialties, and appropriate marketing are keys to building a successful PAE program.

TABLE OF CONTENTS/OUTLINE

-Review BPH pathophysiology and epidemiology-Brief review of BPH treatment options, with a focus on PAE-Review relevant literature on PAE, including large prostates (>80g), acute urinary retention, and/or hematuria-Provide basic review of sexual health relating to BPH, including erectile dysfunction (ED) and ejaculatory dysfunction (EjD), and review relevant evaluation tools/scales-Highlight data regarding ED and EjD across multiple BPH procedures, including PAE-Review current AUA BPH guidelines and discuss why PAE is not supported in those guidelines currently-Detail current data regarding repeat PAE-Share practice building advice, with a focus on utilizing PAE data to engage other specialties as a part of building a successful program

IREE-9 Cryoablation of Aneurysmal Bone Cyst: Current Status and Management

Participants
Elisabet Vila, (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will:1) Describe imaging features of primary ABC using different imaging modalities.2) Discuss this novel interventional technique and how it works (low dose CT protocol, needle placement method and ice ball formation).3) Illustrate normal post treatment imaging findings of aneurysmal bone cyst using cryoablation on MRI.4) Characterize the radiological appearance of relapse.

TABLE OF CONTENTS/OUTLINE

Aneurysmal bone cysts are benign and expansile bone lesions with locally aggressive behavior. Diagnosis is achieved using different imaging modalities.Cryoablation is a percutaneous ablation technique that uses extreme low temperatures for tumor destruction and is becoming increasingly accepted for treatment of aneurysmal bone cysts. It uses liquefied gas (nitrogen or argon), through cryoprobes that expands into a gaseous state at the end of the probe to create temperatures as low as -190 °C. Intra-procedure computed tomography (CT) is used to identify the ablated zone in real time appearing as a low-density area which corresponds to

the generated ice ball.In this exhibit we will review how cryoablation works, procedure planning and imaging appearance of post procedural interventions, showing different examples of normal findings and relapse.

IREE-1

Arterial Embolization for Gynecological and Obstetric Hemorrhage - Indications, Preparation, Technique, Results, and Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Certificate of Merit

Participants
Mario Matute Gonzalez, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe the diagnostic and therapeutic management of patients with gynecological and obstetric hemorrhage (GOH) suitable to transcatheter embolization.2. To review main gynecologic and obstetric indications for arterial embolization, providing key imaging findings before and after embolization.3. To explain the technique and intraprocedural considerations, results and complications of GOH embolization.

TABLE OF CONTENTS/OUTLINE

1. Introduction.1.1. Vascular anatomy of the female pelvis.2. Management of patients with GOH.2.1. Therapeutic algorithm.2.2. Pre-treatment imaging assessment.3. Indications for arterial embolization: imaging findings.3.1. Obstetric hemorrhage.- Abnormal placentation.- Postpartum hemorrhage.3.2. Gynecological hemorrhage.- Malignancies.- Post-surgical bleeding.- Vascular anomalies: Uterine AVMs and AV fistulas.3.3. Beyond hemostasis.- Uterine fibroids.- Pelvic Congestion Syndrome.4. Procedural features.4.1. Patient preparation.4.2. Materials.4.3. Technical considerations.4.4. Results.4.5. Complications.5. Summarize.6. Conclusion.

Minimally Invasive Prostate Cancer Treatments- An Update

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Riddhi Borse, MD, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1.To provide rationale for minimally invasive prostate cancer (PCa) treatment.The "index" lesion is responsible for driving risk associated with localized PCa. However, imaging underestimates lesion volume it is important to have adequate treatment zone margins.2.To review modalities and devices available for minimally invasive PCa treatment. Understanding the nuances of available devices along with their FDA approval/ reimbursement status and current evidence about their efficacy is crucial towards building a successful PCa treatment program.

TABLE OF CONTENTS/OUTLINE

1. Need for minimally invasive prostate cancer therapy. 2. Defining the index lesion. 3. Treatment margins - How much prostate should you ablate? 4. Treatment modality specific review including device capabilities/limitations, cost, side effect profile and efficacy evidence;Laser Ablation CryoablationIrreversible Electroporation Therapeutic Ultrasound Photodynamic Therapy Aquablation Bipolar radiofrequency ablation5. Post treatment prostate MRI 6. FDA Approval Status and Insurance Reimbursements for minimally invasive PCa treatment.

How to Make It Right When Vessels Go Wrong: Demystifying Abdominal Vascular Anomalies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Ece Meram, MD, Madison, WI (*Presenter*) Research Grant, Koninklijke Philips NV

TEACHING POINTS

The classification of vascular anomalies has been evolving and remains challenging with limited worldwide adoption and lingering of historically used terminology. Vascular anomalies are divided into two main categories (i.e. mass or malformation) based on their increased mitotic activity and cell turnover. Vascular masses, benign or malignant, are vasoproliferative lesions with increased endothelial cell turnover. Vascular malformations, on the other hand, are congenital, non-neoplastic entities of incorrectly formed vessels. This exhibit aims to 1) describe different types of abdominal vascular anomalies according to International Society for the Study of Vascular Anomalies (ISSVA) classification, 2) demonstrate examples of abdominal vascular tumors and malformations, including those associated with hereditary conditions and 3) highlight the interventional approaches utilized in the management (i.e. correction) of these anomalies.

TABLE OF CONTENTS/OUTLINE

A. When Vessels Go Wrong: Vascular Anomalies a. Definition/Types: Mass vs Malformation b. ISSVA Classification. B. Abdominal Vascular Tumors a. Benign (eg. Hepatic Hemangioma) b. Borderline c. Malignant (eg. Angiosarcoma). C. Abdominal Vascular Malformations a. Simple i. Low-flow (Capillary, Lymphatic, Venous) ii. High-flow (Arteriovenous malformation or fistula) iii. Portosystemic Fistula (eg. Congenital Portosystemic Shunts) b. Combined c. Anomalies of Major Named Vessels d. Associated with Other Anomalies (Hereditary and/or Syndromic). D. How to Make it Right? a. Surgical Management b. Types of Interventional Procedures c. Case Examples. E. Quiz Cases

Adrenal Venous Sampling: Tips and Tricks for Non-Experts

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Identified for RadioGraphics

Participants
Katsuhiro Kobayashi, MD, , (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review adrenal vein anatomy and anatomical landmarks for right adrenal vein cannulation. 2)Describe adjunctive techniques used for adrenal vein sampling (AVS). 3) Discuss adrenal vein sample interpretation and indication for repeat AVS

TABLE OF CONTENTS/OUTLINE

1) Overview of primary aldosteronism2) Anatomy of adrenal veins relevant to AVS and anatomical landmarks for right adrenal vein cannulation (inferior emissary vein, communicating veins, inferior accessory hepatic vein)3) Pre-procedural work-up including MDCT technique used for adrenal vein assessment4) Protocol for AVS including antihypertensive medication modification, or cosyntropin infusion etc.)5) Techniques used for AVS and adjunctive techniques used for right adrenal vein cannulation (Cone-Bean CT, coaxial guide wire- catheter technique, intraprocedural cortisol measurement)6) Sample interpretation and indication for repeat AVS (double down Aldosterone/Cortisol)7) Complications associated with AVS8) Advances in AVS (subselective AVS)9) Summary of Tips and Tricks

Portal Hypertension: A Comprehensive Clinico-Radiological Review.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Antonio Hernandez Villegas, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the physiopathology, classification and etiologies of different types of portal hypertension- To illustrate in a case based approach the different types and causes of portal hypertension (acute and chronic) with multimodality imaging findings- To mention key imaging findings that need to be assessed and provided to the clinician (GI, endoscopy and/or surgeon) in order to determine treatment options- To present interventional radiology treatment options for this pathology according to clinical scenario.

TABLE OF CONTENTS/OUTLINE

- Introduction: Epidemiology and risk factors.- Physiopathology: the basics for radiologists in order to understand imaging findings.- Classification: anatomy and timing.- Imaging: role of different imaging modalities and the main findings in the approach, diagnosis and follow-up of patients with portal hypertension.- Case-based approach: imaging findings, diagnosis and interventional treatments.- Take-home points.

Various Interventional Procedures Through Percutaneous Cholecystostomy Tract

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Jong Hyouk Yun, MD, PhD, Busan, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this review is to illustrate the various transcholecystic interventions and to discuss the clinical significance, technical aspects and complications of this alternative access to the biliary tree.

TABLE OF CONTENTS/OUTLINE

Percutaneous cholecystostomy is a well-established procedure for management of acute cholecystitis. It has been used to provide GB decompression, biliary drainage and cholangiography. In patients who underwent previous surgery or who have intolerance or anxiety for endoscopy, in cases of having difficulties to perform PTBD, or in patients who have previously undergone percutaneous cholecystostomy, percutaneous transcholecystic interventions can be performed as an alternative route. Cystic duct (CD) cannulation is necessary to perform various trancholecystic interventions. For the successful cystic duct cannulation perform a GB puncture in the long axis direction of the GB, keep catheter drainage for 3 days or more to reduce inflammation of the biliary tree, insert a 8F sheath into the GB for the back support, and use guide wires with various sizes and tips. Through cystic duct cannulation, various interventional procedures such as CBD stone removal, biopsy, biliary dilation, biliary stent placement, and GI intervention can be performed. Percutaneous transcholecystic interventions seems to be safe, technically feasible and clinically effective procedures. Percutaneous transcholecystic approach can be used as an alternative route for the patient who could not use peroral or transhepatic route.

Cholangioscopy Guidance During Percutaneous Transhepatic Biliary Interventions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Ayca Kutlu, MD, Madison, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Introduce readers to transhepatic cholangioscopy.• Provide an overview of transhepatic cholangioscopy technique, indications, and utility. • Improve readers' ability to interpret cholangioscopy imaging through representative cases. • Demonstrate through case examples how transhepatic cholangioscopy guidance can improve procedural success.

TABLE OF CONTENTS/OUTLINE

1. Title page 2. Teaching points 3. Background on current transhepatic biliary imaging techniques a. Fluoroscopic cholangiogram b. Intrahepatic cone-beam CT cholangiography 4. Introduction to percutaneous transhepatic cholangioscopy 5. Indications for percutaneous transhepatic cholangioscopy a. Patients with indwelling biliary catheters with new concern for pathology b. Patients with history of previous failed ERCP or altered anatomy prohibiting ERCP 6. Percutaneous transhepatic cholangioscopy interventions a. Targeted tissue sampling b. Biliary stone/debris management c. Biliary Stent/drain placement 7. Case Examples a. Tissue sampling: Targeted biopsy via direct visualization b. Intraductal stone/debris manipulation: Identification of intrahepatic stone/debris with lithotripsy treatment, extraction, or sweeping c. Complex post-surgical anatomic delineation: Navigation across post-surgical benign biliary strictures 8. Conclusions a. Transhepatic cholangioscopy can improve diagnostic and therapeutic precision in the management of biliary pathology. b. Interventional radiologists becoming comfortable with transhepatic cholangioscopy image interpretation and procedural skill can increase procedural success for complex biliary pathology. 9. Quiz Case

Interventional Management of Ectopic Varices

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Identified for RadioGraphics

Participants
Jin Woo Choi, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ectopic varices may occur around the duodenum, rectum, stoma, hepaticojejunostomy, etc. Although ectopic varices are not common, those can be a source of considerable bleeding. They usually occur in the setting of portal hypertension such as liver cirrhosis or portal vein occlusion/thrombosis. Whereas endoscopic management is commonly ineffective for ectopic varices, various interventional procedures including percutaneous varix embolization or modified retrograde transvenous obliteration can be performed depending on vascular anatomy. The purposes of this exhibit are: (1) To illustrate vascular anatomy related to ectopic varices, (2) To list various interventional procedures and their indications, (3) To review the technical tips and pitfalls of percutaneous varix embolization and modified retrograde transvenous obliteration.

TABLE OF CONTENTS/OUTLINE

1. Vascular anatomy related to ectopic varices. 2. Treatment modalities and indications for ectopic varices: retrograde transvenous obliteration, percutaneous embolization, and their modifications. 3. Technical tips and pitfalls of retrograde transvenous obliteration, percutaneous embolization, and their modifications.

Overview of the Complications of Prostate Artery Embolization and its Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Richard Liang, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate Artery Embolization (PAE) is a safe, minimally invasive treatment for lower urinary tract symptoms (LUTS) secondary to benign prostatic hyperplasia (BPH). The purpose of this exhibit is to discuss the complications associated with PAE along with the management of those complications. Complications of PAE can be divided into access site complications, post-embolic complications, non-target embolization and radiation dermatitis. Though the majority of complications are considered self-limiting and can be managed conservatively, more severe complications such as bladder wall ischemia may require cystoscopic surgical resection. While reviewing non-target embolization complications, we will also discuss prostate artery anatomy and its relevance to these complications. Additionally, we will also compare the safety of PAE to some of the other common surgical treatments available for BPH.

TABLE OF CONTENTS/OUTLINE

1. What is PAE?2. How to Perform PAE3. Overview of the Complications in PAE4. Access Site Complications and its Management5. Post-Embolic Complications and its Management6. Arterial Anatomy and Anatomical Variants of the Prostate7. Non-Target Embolization Complications and its Management8. Safety of PAE compared to Surgical Treatments

A Comprehensive Approach to Image-guided Ablation in Primary Aldosteronism

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Mohamed Ibrahim, MBBCh, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Learn appropriate patient selection for image-guided ablation of PA • Learn appropriate clinical evaluation and consultation of PA patients • Understand key pre-procedural patient preparations • Highlight pertinent intra-procedural techniques and considerations • Highlight appropriate post-procedural follow-up and management

TABLE OF CONTENTS/OUTLINE

• Appropriate patient selection for image-guided ablation o Key laboratory analysis for diagnosis of PA o Confirming collateralization of imaging and AVS findings • The PA clinic consult o Pertinent HPI; positives and negatives o Consenting the PA patient, risks and expectations • Pre-procedural patient preparation o Anesthesia clearance o Adrenergic hypertensive crisis, strategies for prevention o Considerations for the day of the procedure • Pertinent intra-procedural techniques and considerations o Patient positioning o Ablation modalities and respective protocols o Accessing adrenal nodules in challenging anatomy • Post-procedural follow-up and management o Next day visit for serum potassium check, blood pressure measurement, and medication adjustments o Three months follow-up o Management of non-responders or relapsing patients

Training of Interventional Radiology Procedures for Medical Students Using Virtual Reality

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Yukiko Honda, MD, Kure, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The COVID-19 pandemic made it difficult to train medical students on procedures that involve direct patient contact, such as interventional radiology (IR). For this reason, we developed training materials for medical students on endovascular procedures of the abdominal pelvis in IR using virtual reality (VR). Advantages of VR-based IR education include the ability to conduct training at any time, repeated training exercises, no invasiveness to the patients, and no risk of infection to both the patient and the student. The disadvantages are that a large number of funds are needed to purchase or develop VR simulators and that there are few studies that have proven the effectiveness of education using VR. This educational exhibit will provide a brief overview of simulators available for purchase, and our VR-based training software, and discuss its advantages, current issues, and future prospects.

TABLE OF CONTENTS/OUTLINE

1 Features of the currently commercially available VR simulators of endovascular procedures A virtual and augmented reality: VIST(Mentice), ANGIO mentor (Simbionix), ORCAMP (Orzone). 2 Assessment of the educational validity of VR simulators. Face validity, content validity, Construct validity, Concurrent validity, Predictive validity. 3 Assessment tools of VR simulators. I Global rating scales: Likert scales etc, II Surveys: A subjective assessment tool, III Pre- and Post-tests: tests before and after the training, IV Time-action analysis, V Error analysis, VI Simulator metrics: metrics preprogrammed into the simulator to measure performance. 4 Review of reports on the educational validity of VR simulators. 5 Future challenges and our approach.

Superselective Radioembolization for Hepatocellular Carcinoma: Radiation Segmentectomy and Beyond

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radioembolization is an established treatment for unresectable hepatocellular carcinoma. Radioactive microspheres are preferentially deposited into the hypervascular tumor by siphoning effect so that injection of microspheres are commonly performed at the lobar artery level. However, superselective radioembolization is the best way to improve tumor response and to prevent potential complications. The purpose of this exhibit is : (1) To review the rationale of radiation segmentectomy. (2) To learn when superselective radioembolization is needed, (3) technical tips for superselective radioembolization.

TABLE OF CONTENTS/OUTLINE

1) Radiation segmentectomy : rationale and evidence 2) Dosimetry : Practical guide for dosimetry of superselective radioembolization 3) When superselective radioembolization is needed A. small single tumor : radiation segmentectomy B. Large single tumor saddling on both lobes C. Small remnant liver D. Hepatic artery branching at acute angle E. Extrahepatic collateral artery supplying the tumor 4) Technical consideration of superselective radioembolization A. Protection of distal normal liver by using balloon microcatheter and detachable coil B. Combination treatment of lobar and segmental artery C. Combination treatment of 1st and 2nd week dosing of glass microsphere 5) Follow-up imaging after superselective radioembolization A. Early loss of arterial enhancement of the tumor B. Focal radiation necrosis mimicking new hypovascular tumor

Mesenteric Arteriovenous Malformations: A Rare Cause of Colonic Ischemia

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Lindsey Miley, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learn the diagnostic and interventional imaging characteristics of mesenteric arteriovenous malformations. Review the current literature of mesenteric arteriovenous malformations associated with colonic ischemia. Review a case series of mesenteric arteriovenous malformations from our institution including etiology, diagnostic imaging, interventions, and outcomes. Understand the role of the Interventional Radiologist in diagnosis and treatment of these anomalies.

TABLE OF CONTENTS/OUTLINE

1. Define mesenteric arteriovenous malformation • Etiologies and incidence • Clinical versus imaging classification 2. Mesenteric arteriovenous malformations with associated colonic ischemia • Diagnostic imaging work-up • Literature review of treatment and outcomes • Review of case series from our institution 3. Role of the Interventional Radiologist in diagnosis and treatment of mesenteric arteriovenous malformations • Diagnostic angiography • Embolization • Challenges in work-up and treatment • Future directions

Minimally Invasive Image-Guided Treatment of Primary, Recurrent and Metastatic Prostate Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Daniel Adamo, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.) Learn the diagnostic and treatment approach to prostate cancer within the National Comprehensive Cancer Network (NCCN) guidelines 2.) Learn the imaging appearance of native, in-gland recurrent and metastatic prostate cancer at multimodal imaging 3.) Understand the minimally invasive image-guided therapies for treating focal native, locally recurrent, and metastatic prostate cancer.

TABLE OF CONTENTS/OUTLINE

1. Diagnostic, staging and treatment approach to prostate cancer within the National Comprehensive Cancer Network (NCCN) guidelines • Prostate cancer epidemiology • Diagnostic and staging evaluation (history, physical exam, laboratory evaluation, imaging, biopsy) • NCCN treatment algorithm2. Imaging appearance of native, locally recurrent, and metastatic prostate cancer at multimodal imaging with a focus on MRI and PET. • Ultrasound • CT • Bone Scintigraphy • PET (11C-Choline, 68Ga-PSMA, 18F-PSMA, 18F-Fluciclovine) • Dynamic Contrast Enhanced Multiparametric MRI3. Minimally invasive image-guided therapies for treating focal native, locally recurrent, and metastatic prostate cancer • Focal native and locally recurrent prostate cancero MRI-guided therapies (Cryoablation, Laser ablation, Focused Ultrasound (FUS)) o US-guided therapies (Cryoablation, Irreversible Electroporation (IRE), High-intensity focused ultrasound (HIFU)) • Focal metastatic prostate cancer o Bone metastases (Cryoablation, External beam radiation therapy (EBRT)) o Lymph node metastases (Cryoablation, External beam radiation therapy (EBRT)) o Hepatic metastases (Ablation, Transarterial Embolization). • Emerging targeted therapies o Theranostics o Radioembolization (90Y-TARE)

Endoscopic Biliary Interventions Performed by Interventional Radiology and Gastroenterology: A Case Based Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Tushar Garg, MD, Baltimore, MD (*Presenter*) Conference Travel, Siemens Healthineers

TEACHING POINTS

1) To learn about the different endoscopes and ancillary devices available for interventional radiology (IR) and gastroenterology (GI) biliary procedures 2) To learn about the basic and advanced endoscopy techniques 3) To review the endoscopic management of benign and malignant lesions of the biliary tree with the help of cases

TABLE OF CONTENTS/OUTLINE

1) Types of devices available a. Endoscopes used in IR: BF-XP160F EVIS Exera video bronchoscope, LithoVue single-use digital flexible ureteroscope, SpyGlass digital catheter, AXIS Single-Use Digital Ureteroscopes b. Endoscopes used in GI: surgical cholangioscope (FCN-15X), Fiberoptic percutaneous cholangioscope (CHF-CB30L/S), SpyGlass direct visualization system c. Accessories used in IR and GI: biopsy forceps, electrohydraulic lithotripsy, laser lithotripsy, retrieval basket, retrieval snare, balloons 2) Basic techniques: a. IR techniques: percutaneous cholangioscopy with manual or pump irrigation b. GI techniques: dual operator mother-daughter per-oral cholangioscopy, single-operator per-oral cholangioscopy, direct per-oral cholangioscopy 3) Clinical applications of IR and GI biliary endoscopy and their outcomes: A case for each application will be shown a. Malignancy: indeterminate biliary stricture, staging of cholangiocarcinoma b. Bile stones treatment c. Primary sclerosing cholangitis diagnosis and treatment d. Selective cannulation of structures like cystic duct, gallbladder, intrahepatic ducts, anastomotic strictures e. Investigational usesPlease visit the Learning Center to also view this presentation in hardcopy format.

Cryoablation for Vascular Malformations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Shin Mei Chan, BS, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Venous malformations (VM), the most common vascular anomaly that may cause significant pain, can be treated with percutaneous sclerotherapy. However, many do not achieve pain-free remission; in select patients, percutaneous cryoablation is an option. However, this is not routinely offered and there is a paucity in the literature describing techniques. Herein we review procedural aspects of cryoablation for VM.

TABLE OF CONTENTS/OUTLINE

1. Pre-procedure a. Ultrasound is performed in clinic, in addition to MRI (T2-weighted fat-suppressed and T1-weighted images)2. Procedurea. Under non-contrast CT ± US, a needle access route is selected and skin is marked b. A guiding needle is advanced and position confirmed under CT c. Hydrodissection, whereby a 21-gauge needle is used to instill saline to separate the skin and malformation, can be used for peripheral lesions with < 1 cm of overlying subcutaneous tissue to prevent injury to peripheral structures d. Warm packs applied to surrounding skin may also be used to avoid injury e. Freeze cycles and the number of cryoprobes varies, depending on lesion size and location i. In literature, a common regimen is two ten-minute freeze cycles per cryoprobe ii. When multiple probes are required, they are often placed ~2 cm apart f. Adequate ablation can be considered achieved when the iceball adequately covers the malformation corresponding to symptoms 3. Post-procedure a. Most can be done as an outpatient, with discharge within ~4 hours b. Clinic follow-up at 1 week for wound check, then 6 weeks for US and pain scalePlease visit the Learning Center to also view this presentation in hardcopy format.

Stepwise Percutaneous Approach to Treat Severe Benign Hepaticojejunostomy Strictures

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Charles Shelton, DO, Cincinnati, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Hepaticojejunostomy anastomosis (HJA) can be complicated by severe strictures or complete obstructions. Interventional radiologists should be aware of etiologies, complications, clinical evaluation, and treatment approaches.2. Stepwise algorithm for percutaneous treatments of HJA strictures is provided.3. Percutaneous techniques to treat severe HJA strictures include: a. Conventional antegrade fluoroscopic-guided recanalization b. Direct antegrade visualization with percutaneous cholangioscope and sharp recanalization c. Spyglass cholangioscopy with laser incision of HJA Stricture d. Combined percutaneous trans-jejunal retrograde approach with antegrade approach e. Combined percutaneous and endoscopic rendezvous technique f. Bio-degradable stents for benign strictures 4. Post-procedural complications and clinical outcomes

TABLE OF CONTENTS/OUTLINE

1. Epidemiology and etiology of HJA strictures and complete occlusions. 2. Clinical presentation and evaluation 3. Stepwise management algorithm for HJA stricture recanalization: multi-disciplinary approach 4. Review of percutaneous techniques of biliary recanalization along with pictorial examples of percutaneous antegrade approach, combined approach, and recently developed techniques using cholangioscope and laser incision 5. Short- and long- term clinical outcomes of percutaneous treatments, and management of post-procedural complications

Radioembolization of Hepatocellular Carcinoma with Extrahepatic Collateral Blood Supply: Anatomic and Technical Considerations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Jin Woo Choi, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radioembolization for hepatocellular carcinoma (HCC) has exploded in recent years. HCC typically received its blood supply from the hepatic artery, however, it can recruit a parasitic blood supply from extrahepatic collateral arteries (EHC). Whereas chemoembolization has been performed through EHC without serious complications, little experiences about radioembolization though EHC have been reported. The purpose of this exhibit is: (1) To review the key anatomy of EHC by using cone-beam CT. (2) To review when we suspect the presence of EHC supplying HCC. (3) To learn how to do safe radioembolization through EHC.

TABLE OF CONTENTS/OUTLINE

1) List of treated EHC 2) Vascular anatomy of EHC by using cone-beam CT and safe point of each EHC 3) Suggestive findings of EHC on CT/MR and cone-beam CT 4) Special considerations for radioembolization through EHC: dosimetry, embolization of pulmonary shunt, protection of normal vessel, and redistribution by proximal embolization.

Updates on Combination TACE and Ablation Therapy for HCC: A Case-Based Review of Technique, Results and Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Surbhi Trivedi, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review the current literature and treatment pathophysiology regarding combination transarterial chemoembolization (TACE) and radiofrequency ablation (RFA) therapy in unresectable intermediate sized hepatocellular carcinoma. 2) Outline treatment timeline, procedural workflow and TACE-RFA technique. 3) Summarize post-treatment follow-up, patient outcomes and overall survival in our experience. 4) Review alternative forms of combination therapy including TACE and ethanol ablation. 4) Illustrate complications specific to combination therapy and subsequent management. 5) Discuss future directions for combination locoregional therapy in HCC management and emerging role for combination embolization-ablation therapies.

TABLE OF CONTENTS/OUTLINE

1) Hepatocellular carcinoma epidemiology and treatment algorithms 2) Combination therapy patient selection and contraindications 3) Literature review of combination therapy, overall survival and patient outcomes 4) Technique, workflow and timeline for combination therapy 5) Case-based illustration of successful combination therapy and post-procedure tumor response 6) Alternative forms of combination therapy including TACE and ethanol ablation 7) Case-based illustration of procedural complications and management 8) Future directions

Building an Interventional Radiology Consult Service: Considerations for Improving Referring Physician Communication and Patient Care

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Jacob Conroy, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the impact of referring physician communication on inpatient care related to IR services. 2. Recognize barriers that may limit effective communication with referring physicians.3. Understand the methods to implement an IR consult service and how this improves communication and patient care.

TABLE OF CONTENTS/OUTLINE

LEARNING OBJECTIVES: To discuss methods for improving inpatient communication with referring physicians and patients concerning IR services.BACKGROUND: Limited awareness, understanding, and access to IR procedures continue to be limiting factors in patient care and the growth development for IR practices. Effective communication with referring physicians is essential for combatting these limiting factors. Several barriers exist that prevent effective communication with referring physicians and thus, negatively impact patient care and the continued growth of IR services. Recent strategies to overcome these barriers have focused on the development of IR consult services that are prominent and visible on hospital floors, in clinics, and in electronic medical records.CLINICAL FINDINGS/PROCEDURE DETAILS: This exhibit will:1. Summarize the findings of previous studies on referring physician awareness and utilization of IR services.2. Discuss the barriers to effective communication with referring physicians.3. Describe the impact these communication barriers have on patient care and IR practices.4. Explore methods to develop and execute a successful IR consult service, describing experiences from our institution as well as those from the literature.CONCLUSION/TEACHING POINTS:

Making Sense of Stents: An Evidence-Based Review of Classes of Arterial Stents

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Stephanie Jankovic, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-There are several permutations of stents today, including: covered/uncovered; balloon-expandable/self-expanding; drug-eluting/bare metal; and metal/absorbable. These different classes of stents have particular characteristics which make them optimal for various indications in the arteries throughout the body.-Primary, primary-assisted, and secondary patency rates vary amongst the classes of stents in different vascular beds throughout the body.-Appropriate stent choice influences vessel patency, reintervention rate, and resolution of underlying clinical symptoms. An understanding of these factors will allow the interventional radiologist to best treat each patient.

TABLE OF CONTENTS/OUTLINE

1. Brief review of history of stents2. Classes of stents3. Evidence for stent selection is reviewed for the following arteries, highlighting key papers, clinical trials, and device indications for use (IFUs) that guide stent selection, with critique of the quality of evidence:--Subclavian/upper extremity--Celiac axis--Splenic--Hepatic - native and transplant--Superior mesenteric--Renal--Iliac--Superficial femoral--Popliteal (P1, P2, and P3 segments)--Tibial4. Characteristics underlying patency rates, including indication (e.g., atherosclerosis versus aneurysms), size, trackability, radial force, and fracturing are also discussed.

Adrenal Vein Sampling: A Failure Mode Analysis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Praneeth Kalva, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Adrenal vein sampling (AVS) differentiates unilateral from bilateral adrenal disease and plays a pivotal role in deciding surgical vs medical management in patients with a diagnosis of primary hyperaldosteronism (PA). Canulating the right adrenal vein can be technically challenging with high variability in procedural success rates. Factors contributing to failure of cannulating the right adrenal vein include failure to locate the adrenal vein, misidentification of another vessel as the adrenal vein, and dilution of the sample from accessory vein blood flow.This educational exhibit will cover each of these failure modes. A brief description of the technique with imaging correlates, review of literature and how to identify and overcome the scenarios contributing to the failure with examples will be discussed.

TABLE OF CONTENTS/OUTLINE

A. Introduction to AVS B. Typical success rates and non-procedural determinants of successC. Utility of unilateral adrenal vein sampling using a mathematical model for predictionD. Alternate imaging techniques for localization after failed AVSE. Pre-operative planning a. Medications that affect success of AVS: Physiology and Plasma Renin levelsb. Pre procedural imaging: What to look for to maximize the success during AVSc. Logistics of specimen processing and analysis d. Required catheters/equipmentF. Procedural steps: a. Adrenal vein identification: Anatomical patterns, Role of cone bean CTb. Sampling: End hole vs Side hole catheters, utility of microcathetersc. Complications: Adrenal hematoma contributing to failure of sampling G. Illustrative cases of failed AVS and how these cases are managed in the author's institutionH. Conclusion

Percutaneous Transjejunal Biliary Intervention: A Primer for the Diagnostic and Interventional Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Certificate of Merit

Participants
Ryan Gabos, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review imaging and biliary anatomy of patients selected for percutaneous transjejunal biliary intervention (PTJBI).-Discuss common indications and interventions performed via PTJBI.-Review current techniques, maintenance, advantages, and complications of PTJBI.-Review cases of successful and challenging interventions with periprocedural imaging.

TABLE OF CONTENTS/OUTLINE

IntroductionHistory of PTJBI, modern practice, and role of IR in biliary management.Postsurgical changes and imaging (CT, MRI) following hepaticojejunostomy or roux-en-y reconstruction.Common and uncommon biliary anatomy.Common indications for PTJBI access with periprocedural imaging.Steps, maintenance, and advantages of PTJBI access.Complications of initial PTJBI procedure.Case PresentationsCholangiocarcinomaLiver transplantCholedochal cyst, s/p hepaticojejunostomyCholecystectomy complications, s/p hepaticojejunostomyConclusionClinical ImplicationsPTJBI is a proven method to manage biliary disease in patients with surgically altered small bowel anatomy. In patients requiring repeat intervention or those with diffuse biliary disease, retrograde biliary access via PTJBI represents an attractive and underutilized resource.

Spinal Dural and Extradural Arteriovenous Fistulas: Imaging Features and Endovascular Treatments

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Hiro Kiyosue, MD, (*Presenter*) Research Grant, Koninklijke Philips NV

TEACHING POINTS

Despite of recent developments in technology of imaging and endovascular treatments, some cases are often incorrectly diagnosed or inadequately treated even now. In this presentation, we demonstrate imaging features and endovascular treatments of spinal dural AVFs and various types of extradural AVFs with illustrative case presentation. 1. Spinal dural AVFs are usually located in the dorsal spinal dura matter at lower thoracic spine, which are fed by small dural feeders from the radiculomeningeal artery or the prelaminar artery and drain into a bridging vein. Typical case shows horizontal T sign on frontal view of spinal angiography. 2. Spinal epidural AVFs are the most common type in extradural AVFs, which are frequently located in the ventral epidural space at lumbar spine. They are fed by multiple epidural feeders from the somatic branches and drains into an epidural venous pouch to a radiculomedullary vein and/or paravertebral veins. 3. Mixed AVFs is the second common type of extradural AVFs, which involve multiple spaces of osseous, epidural, and paravertebral spaces and often associated with spinal arteriovenous metameric syndrome.

TABLE OF CONTENTS/OUTLINE

1. Spinal dural AVFs: Clinical features. Imaging features. Transarterial embolization 2. Spinal extradural AVFs: Classification 2-1 Epidural AVFs: Clinical features, Imaging features, Transarterial and transvenous embolization 2-2 Osseous AVFs: Clinical features, Imaging features, Transarterial and transvenous embolization, and direct puncture embolization 2-3 Paravertebral AVFs: Clinical features, Imaging features, Endovascular techniques 2-4 Mixed AVFs: Clinical features, Imaging features, Endovascular techniquesPlease visit the Learning Center to also view this presentation in hardcopy format.

IREE-38

Irreversible Electroporation in Locally Advanced Pancreatic Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Certificate of Merit

Participants
Kenneth Huynh, BS, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To provide an overview of the role and literature of percutaneous irreversible electroporation (IRE) in locally advanced pancreatic cancer (LAPC) including a review of ongoing trials. 2. To present, through case-based review, the techniques utilized in percutaneous IRE to safely target pancreatic lesions. 3. To illustrate the multi-modality imaging fusion and navigation for IRE of LAPC, with emphasis on intra-procedural cone-beam computed tomography (CBCT).

TABLE OF CONTENTS/OUTLINE

Locally advanced pancreatic cancer (LAPC) is considered unresectable due to tumoral encasement of the superior mesenteric or celiac arteries or non-reconstructable venous involvement. Percutaneous irreversible electroporation (IRE) in LAPC has shown promising outcomes with respect to median overall survival, especially when combined with chemotherapy. IRE provides non-thermal ablation of LAPC while mitigating risk of thermal injury to nearby structures compared to thermal techniques. Given the location of the pancreas and proximity to nearby structures, safe percutaneous targeting may be difficult with high risk of complication. This educational exhibit will: (1) provide an overview of the role and literature of percutaneous IRE in LAPC including ongoing trials, (2) present different procedural techniques used to safely target pancreatic lesions and minimize complications. Techniques including electrode steering, gantry tilting, bolus chasing, and CT arteriography will be discussed, and (3) illustrate the multi-modality imaging fusion and navigation for IRE of LAPC with emphasis on intra-procedural CBCT.

Priapism: Types and Interventional Treatment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Benjamin Reichardt, Hattingen, Germany (*Presenter*) Nothing to Disclose

TEACHING POINTS

Priapism is defined as a sustained tumescence or erection lasting more than 6 hours. The erection is limited to the erectile tissue without affecting the corpus spongiosum.There are two different types of priapism: 1. Low flow (ischemic / venous occlusive) 2. High flow (non-ischemic or arterial): Does not require emergency treatment. Genitoperitoneal trauma is the most common etiology. The trauma results in a rupture in the cavernous artery with subsequent development of a high flow fistula or a pseudoaneurysm.Interventional Therapeutic options: 1. Autologous blood clot2. Gel foam3. Polyvinyl alcohol (PVA) 4. Spherical Particles5. Micro-spirals6. Alcohol - lipiodol mixture7. N-butyl cyanoacrylate (NBCA)

TABLE OF CONTENTS/OUTLINE

The success rates are up to 89%. Sexual function may be impaired after embolization, although potency is fully restored in about 80% of cases. With decongestion and potency rates of 100% and 86-91%; superior to surgery.Relapse: rates vary between 7% and 27%, regardless of the type of embolotherapy. Erectile dysfunction: occurs in around 39% of the time with the use of permanent embolic agents and in only 5% with the use of temporary embolic agents. Conclusion: Superselective embolization is the gold standard in the treatment of HFP because of its safety and efficacy profile. The type of embolic agent does not appear to be a major factor influencing treatment outcomes in terms of recurrence of priapism or deterioration in erectile quality. The embolic product should be tailored to each patient and the procedures should be performed by well trained and experienced operators, who should know his embolic materials.

Finding the Adenoma in Cushing's Disease: Bilateral Inferior Petrosal Sinus Sampling and Pituitary MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Celia Alonso, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The objective of this educational exhibit is to emphasize the role of bilateral inferior petrosal sinus sampling (BIPSS) in the diagnosis of Cushing's disease. After reading it, you will:- Learn the pathophysiology underlying Cushing's syndrome. Differentiation between ACTH-dependent and ACTH-independent hypercortisolism.- Comprehend the relevance of radiological techniques identifying the etiology of hypercortisolism, focusing on the diagnosis of ACTH-secreting pituitary microadenomas.- Deepen the knowledge about BIPSS indications, technique, safety and possible complications.

TABLE OF CONTENTS/OUTLINE

- Introduction.- Cushing's syndrome diagnostic algorithm: clinical, biochemical and radiological analyses. BIPSS as the gold standard test in Cushing's disease and comparison with pituitary MRI. Experience in our institution, a tertiary care center, in the last sixteen years.- BIPSS technique and rationale. Indications, relevant venous anatomy and variants, technical considerations and possible complications.- Conclusion.

Magnetic Resonance Lymphangiography (MRL): Past, Present, and Future Directions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Identified for RadioGraphics

Participants
Ahmed Negm, MBBCh, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learn the lymphatic system anatomy and the historical development of MRL. Review the MRI sequences and techniques currently used for transpedal and intranodal MRL. Understand current indications and applications of MRL including diagnosis and treatment of lymphatic disorders.

TABLE OF CONTENTS/OUTLINE

1. Lymphatic system anatomy and Historical development of MRL • Embryological development of peripheral and central lymphatic system • Location and territorial drainage of central, hepatic, and mesenteric lymphatics • Other methods of lymphatic imaging (Lymphoscintigraphy, Fluoroscopic lymphangiography, Fluorescence lymphography) • Historical development of MRL 2. MRI sequences and techniques currently used in MRL • Intranodal Dynamic contrast-enhanced MRL (DCE-MRL) • Interstitial transpedal MRL (tMRL) • Intra-hepatic DCE-MRL (IH-DCE-MRL) • Retrograde thoracic duct dynamic contrast-enhanced MRL • Utility of T2W MR Sequences • Procedural aspects (Saline, Contrast, Needles, Catheters, Scanner, Anesthesia, ±Ultrasound) 3. Indications and applications of MRL • DCE-MRL o Evaluation of lymphatic flow (Pulmonary lymphatic perfusion syndrome, Plastic bronchitis, Protein-losing enteropathy, Chylothorax, Chylous ascites, Leaks, Edema) o Lymphatic malformations o Identification of aberrant lymphatic vessels for embolization o Localization (Sentinel lymph nodes, Leaks, Pre-operative planning) • tMRL o Alternative to DCE-MRL (Simple, Fast, No ultrasound) o Diagnosis pre-treatment plan o Localization (Peripheral or Central lymphatic leakage) • IH-DCE-MRL o Diagnosis (Protein-losing enteropathy, Chylous ascites, Contrast leakage to peritoneum/duodenum) • Limitations of DCE-MRL tMRL

Hydro, Pneumo, and Balloon-assisted Separation of Critical Structures in Ablation Procedures

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Mohamed Ibrahim, MBBCh, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Learn the role and limitation of hydro-dissection in the separation of critical structure during image-guided ablation procedures • Learn the role and limitation of pneumo-dissection in the separation of critical structure during image-guided ablation procedures • Learn the role and limitation of balloon-assisted separation of the critical structure during image-guided ablation procedures

TABLE OF CONTENTS/OUTLINE

• Role and limitation of hydro-dissection of critical structures o Appropriate clinical scenarios for hydro-dissection o Limitations of hydro-dissection and how to manage them; avoiding streak artifact and fluid redistribution • Role and limitation of pneumo-dissection of critical structures o Appropriate clinical scenarios for pneumo-dissection o Limitations of pneumo-dissection and how to manage them; gas absorption and redistribution • Role and limitation of balloon-assisted separation of critical structures o Appropriate clinical scenarios for balloon-assisted separation o Limitations of balloon-assisted separation and how to manage them; placement of multiple balloons

Principles of Tissue Sampling, Handling, and Processing: A Primer for Procedural Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Majid Chalian, MD, Seattle, WA (*Presenter*) Grant, The Boeing Company

TEACHING POINTS

1) Provide a broad overview of pathology to demystify subdivisions and associated protocols and procedures 2) Discuss best practices for tissue sampling and handling, based on organ system (including thyroid, breast, lung, liver, kidney, bone, and musculoskeletal soft tissue)3) Familiarize with different sample media, their functions, and indications4) Learn about common histopathology artifacts and mitigation strategies 5) Learn how to implement clinical and imaging findings to sample adequately and handle tissue appropriately

TABLE OF CONTENTS/OUTLINE

Introduction? Significance of collaboration between radiology and pathology departments and impact on patient care? Pathology subdivisions? Anatomic pathology? Clinical pathology (AKA “laboratory medicine”) Anatomic pathology workflow ? Pre-analytical steps ? Gross examination and description? Tissue processing ? Tissue staining? Final diagnosis and pathology report Best practices for specimen sampling ? Small lesions? Metastases? Location dependent ? Thyroid? Breast? Lung? Liver? Kidney? Bone? Musculoskeletal soft tissue? Uncertain cases that may benefit from pathology’s consultation/presence before and/or during the procedure Best practices for specimen handling/processing? Formalin? Saline/RPMI? EM fixative (glutaraldehyde)? Decalcifying agents? RDO (dilute hydrochloric acid) ? EDTA? Fresh tissue ? How the differential impacts handling/processing Common Artifacts and Mitigation Techniques ? Fixation ? Crush ? Cautery? Air Dry Core Needle Biopsy vs FNA ? Specimen processing basics ? Advantages of each? Disadvantages of each Tips to use clinical and imaging findings for proper tissue sampling and handling

Interventional Pain Management in Extraspinal Osseous Metastases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Certificate of Merit

Participants
Kenneth Huynh, BS, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the indications and procedural considerations for percutaneous management of extraspinal osseous metastases. 2. To review cases of interventional pain management of extraspinal osseous metastases including embolization, thermal ablation, and bone stabilization.

TABLE OF CONTENTS/OUTLINE

Extraspinal bone metastases can cause significant morbidity to many patients due to localized pain, referred pain, impaired mobility, and pathological fractures. This commonly leads to long-term narcotic use, prolonged bedrest, and poor quality of life. Percutaneous interventions have been shown to provide sustained palliative relief of pain associated with metastatic osseous disease, in addition to improving mobility and quality of life. A multi-disciplinary approach to oncologic pain associated with bony lesions including interventional radiology can improve patient's pain and quality of life. This educational exhibit will: (1) review the indications and procedural considerations for percutaneous management of extraspinal osseous metastases with palliative intent, and (2) present different procedural techniques used in pain palliation and bone stabilization. Techniques include embolization for hypervascular metastatic lesions, radiofrequency ablation, microwave ablation, cryoablation, and cementoplasty. An overview on these techniques and possible procedural complications with measures for prevention and management will also be discussed.

Interventional Approach to the Cancer Pain Patient: A Case-Based Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Cum Laude

Participants
Omair Ali, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chronic pain is a common concern among patients with cancer, resulting in frequent utilization of emergency room visits and hospitalizations. Pharmacotherapy is a widely used approach for cancer pain relief, although long-term opioid use is often inadequate in treating cancer pain and has a significant side effect profile. Interventions for cancer pain offer unique solutions to improve quality of life and provide more effective long-term pain relief. The purpose of this exhibit is to provide a case-based approach to interventional radiology's role in the management of cancer pain.

TABLE OF CONTENTS/OUTLINE

1) Introduction to cancer pain a) Nociceptive pain b) Neuropathic pain 2) Decision-making algorithm for cancer pain interventions a) Correlation of pain to imaging b) Source and location of cancer pain i) Nerve-related pain ii) Bone pain (spinal pain, non-spinal pain, and presence of fracture in the setting of bone pain) c) Available non-IR treatment options d) Available IR treatment options 3) Cancer pain intervention cases: clinical history, imaging, decision-making, intervention a) Celiac plexus neurolysis b) Intercostal cryoneurolysis c) Vertebral augmentation for pathologic compression fractures d) Thermal ablation for painful bone metastasis e) Percutaneous screw fixation for pelvic metastasis f) Palliative embolization of bone metastasis

Insulinoma: Role of the Interventional Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Ali Abbas Saifuddin, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologically occult insulinomas should be assessed with selective arterial calcium stimulation test (SACST) with hepatic venous sampling prior to surgical treatment.

TABLE OF CONTENTS/OUTLINE

Insulinomas typically present with Whipple's triad which is composed of hypoglycemia, low fasting plasma glucose, and alleviation of symptoms by glucose administration. Factitious hypoglycemia (i.e., exogenous insulin administration) must be excluded to make a diagnosis of insulinoma, and this is accomplished by a supervised 72-hour (or 48-hour) fast. Localization of tumor can be accomplished using transabdominal ultrasound (TUS), triple phase CT, gadolinium enhanced MR abdomen, gallium-68 dotatate PET/CT, Octreoscan, or a combination of these tests. If non-invasive modalities cannot localize the tumor, then invasive tests, such SACST with hepatic venous sampling or endoscopic ultrasound (EUS), can be utilized. SACST involves injecting calcium solution at a dose of 0.0125 mmol Ca 2+/kg (0.005 mmol Ca2+/kg for obese patients) into the superior mesenteric, proximal splenic, mid-splenic, gastroduodenal, and proper hepatic arteries. 5 mL right hepatic venous samples at 0, 20, 40, and 60 seconds are obtained after calcium solution injection in each artery. Diagnostic criterion for a positive response is an insulin response 2x of baseline. Positive response when injecting the gastroduodenal artery or the superior mesenteric artery localizes to the pancreatic head or neck. Positive response when injecting the splenic artery localizes to the pancreatic body or tail. Positive response when injecting the proper hepatic artery suggests liver metastases. Localization is critical prior to surgical treatment.

Introducing Pre-Clinical Medical Students to IR - Medical Student IR Symposia 2.0

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Robert Weinstein, Baltimore, MD (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the importance of introducing IR to pre-clinical medical students. To learn about the different methods by which pre-clinical medical students are introduced to IR. To recognize that the traditional medical student IR symposium relying solely on didactic lectures is being replaced by a new IR symposium consisting of interactive and hands-on exercises and simulation sessions. To review the available literature regarding the use of new IR symposia consisting of interactive and hands-on simulations sessions.

TABLE OF CONTENTS/OUTLINE

Why is introducing IR into pre-clinical medical training important? The new integrated IR residency. IR Residency Match competitiveness. The evolution of medical student symposia. Traditional didactic lecture-based symposia. Interactive and hands-on symposia. Target audience. Factors effecting participation in medical student symposia. Choosing the right format. In-person vs. virtual formats. Didactic vs. interactive/hands-on vs. mix. Choosing the appropriate faculty. Involving trainees/medical students. Data Collection. The importance of pre- and post-symposia surveys. Polling questions during the event Performance during simulations. Feedback allows for improvements Future directions. Simulation and clinical IR bootcamps. The role of national meetings

Fistula Fix: Maturation, Maintenance, and De-Clots

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Identified for RadioGraphics
Cum Laude

Participants
Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss epidemiology, cases, and clinical presentations of hemodialysis (HD) access failure requiring intervention and literature based treatment interventions. 2. Review role of imaging in the diagnosis of hemodialysis access malfunction/failure.3. Briefly review characteristic area of stenosis/failure based on HD access anatomy.4. Review main interventional therapies for management of HD access with emphasis on angioplasty, stent placement and DeClot interventions.

TABLE OF CONTENTS/OUTLINE

1. Ultrasound and conventional angiogram evaluation and function and HD access maturity (rules of sixes), including common artifacts and pitfalls and advanced ultrasound techniques.2. Overview of the anatomy and physiology of characteristic HD areas of stenosis.3. Overview of the current literature of HD access failure treatment: drug-coated vs non-drug-coated balloons, covered vs bare-metal stents, etc.4. Case-based review of various endovascular techniques in management of fistula malfunction including: failure to mature, outflow stenosis treatment (characteristic HD access areas of stenosis such as the swing-point in BVT fistulas, cephalic arch stenosis, etc.), Declot (traditional vs IJ access), coil embolization of accessory veins to aid in maturation, anastomotic narrowing, and intraprocedural complications.

Various Approaches to the Portal Venous System

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Certificate of Merit

Participants
Yoshitaka Tamura, Kumamoto, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Portal venous (PV) interventions including transjugular intrahepatic portosystemic shunt (TIPS), antegrade transportal obliteration (ATO), PV stenting, PV embolization (PVE), and islet transplantation have developed for a few decades. Approach to the PV system is an essential step in PV intervention. Various approaches are described. Transjugular approach is usually as a part of TIPS procedure. Puncture from the proximal portion of the right hepatic vein to the right PV is often done under fluoroscopy. Intravascular ultrasonographic guidance can facilitate the safety. Transhepatic approach is a classical approach for various interventions. It has potential risks of bleeding and transpleural puncture. Transsplenic approach is useful for cases with PV/splenic vein occlusion. Tract embolization is important because of higher risk of bleeding from puncture site. Transumbilical venous and portosystemic collateral approaches are the safest approaches. Catheterization through the tortuous way is required. Surgical approaches (transiliocolic venous approach and round ligament approach) are reliable for catheterization. They provide good controllability of devices, and effective for selected cases.

TABLE OF CONTENTS/OUTLINE

1 Basics of PV interventions (TIPS, ATO, stenting, PVE and islet transplantation) 2 Transjugular approach 3 Transhepatic approach 4 Trassplenic approach 5 Transumbilical venous and portosystemic collateral approach 6 Surgical approach (Transiliocolic venous approach and round ligament approach)

Intraoperative Nerve Monitoring to Prevent Nerve Damage on Image-Guided Percutaneous Tumor Ablation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Robert Weinstein, Baltimore, MD (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the use of intraoperative nerve monitoring as a tool to prevent iatrogenic peripheral nerve injury during percutaneous thermal and cryo-ablation of tumors. Percutaneous ablation is a potentially curative minimally invasive treatment option for patients. Intraoperative Nerve Monitoring (IONM) is a group of electrophysiological modalities that can provide intraoperative assessment of neural structures to prevent iatrogenic nerve injury. IONM been shown to be valuable in reducing nerve injury during percutaneous thermal and cryo-ablation of tumors.

TABLE OF CONTENTS/OUTLINE

Percutaneous tumor ablation has become a popular tool for tumor treatment due to its minimally invasive approach and low risk profile. However, it has the potential to damage both sensory and motor nerves. Neurophysiologists can use several modalities to stimulate and measure responsiveness of at-risk neural pathways. IONM includes somatosensory evoked potentials (SSEPs) and motor nerve conduction studies (MNCSs). SSEPs monitor sensory pathways and MNCSs monitor peripheral motor nerve integrity. The interventional radiologist can be guided to avoid further ablation in each region as signal changes occur, which can limit long-term nerve damage. Regional anatomy of relevant nerves in the operational area is also key. Radiofrequency can produce interference which inhibits monitoring of neurotronic activity, and as such must be paused to record IONM signals. Cryoablation does not produce artifacts and as such real time monitoring is possible. Studies have shown the risk of major motor injury is significantly increased with persistent motor evoked potential change compared to transient or no motor evoked potential change.

Arterio-Biliary Fistula as a Rare Cause of Upper Gastrointestinal Bleed: Diagnostic and Procedural Considerations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Mark Edelstein, MD, Bala Cynwyd, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Arterio-biliary fistula is a rare cause of upper gastrointestinal bleeding.2. The most common clinical presentation of an arterio-biliary fistula is hemobilia, which refers to bleeding into the biliary tree.3. In the majority of cases, arterio-biliary fistulas are iatrogenic in etiology, such as occurring after transhepatic biliary interventions or transarterial chemoembolization.4. There is a scarcity of existing literature describing spontaneous arterio-biliary fistula in the absence of prior relevant intervention. In the absence of such procedural history, the possibility of a communication between the arterial and biliary systems may not be on a clinician’s diagnostic radar when responding to a patient with active gastrointestinal bleeding.

TABLE OF CONTENTS/OUTLINE

1. Introduction to arterio-biliary fistula as a cause of upper gastrointestinal bleeding.2. Multimodality image-rich review of multiple cases of arterio-biliary fistula of both iatrogenic and spontaneous etiology.3. Angiographic demonstration of arterio-biliary fistula and unique considerations for the managing interventional radiologist.4. Conclusion.Please visit the Learning Center to also view this presentation in hardcopy format.

A Practical Guide to RF Ablation for Treating Locoregional Recurrence of Well-Differentiated Thyroid Cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Eun Ju Ha, MD, Suwon, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

While the mortality rate for well-differentiated thyroid cancer tends to be favorable, the risk of recurrent papillary thyroid cancer can range from 20 - 59% depending on patient and tumor risk factors. Various thermal ablative techniques (RFA, LA or MA) and chemical ablative approaches (ethanol ablation) can be used as an alternative method in patients deemed to be at high surgical risk, those in whom the surgeon deems non-operable or for those refusing to undergo repeat surgery. In this educational exhibit, we would like to 1) provide updated evidences of RFA for recurrent thyroid cancers and to 2) describe practical tips regarding indication, pre-procedural evaluation, techniques, post-procedural evaluation and complications.

TABLE OF CONTENTS/OUTLINE

1. A systematic review of the current evidences 2. Practical tips for RFA to treat recurrent thyroid cancers 2-1) How to select patients - curative vs. palliative management strategies 2-2) Pre-procedural checklist before RFA - US, CT, and laboratory tests 2-3) Standard techniques - approach route based on the tumor location, hydro-dissection technique, moving-shot/fixed-electrode technique 2-4) Post-procedural checklist after RFA- US, CT, and laboratory tests 2-5) How to prevent complications- US-based nerve anatomy, cold 5% dextrose injection, medication

Applicability of Irreversible Electroporation for Therapeutic Management of Pancreatic Adenocarcinoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Raquel Moreno, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review fundamental concepts about pancreatic ductal adenocarcinoma (PDAC), including relevant vascular anatomy in axial image; disease staging and therapeutic management according to each stage. Introduce the participant to the fundamentals of Irreversible Electroporation (IRE) ablation therapy, including its eligibility criteria and contraindications. Present a pictorial essay to illustrate IRE indications based on imaging criteria of key anatomic structures involvement - arteries, veins and miscellaneous - highlighting teaching points in each case. Summarize the role of the IRE in the Therapeutic Management of the PDAC through a Flowchart.

TABLE OF CONTENTS/OUTLINE

- Introduction: PDAC- Relevant Anatomy- Irreversible Electroporation (IRE): Fundamentals- Irreversible Electroporation (IRE): Applications- Imaging Criteria: Arterial Involvement- Imaging Criteria: Venous Involvement- Imaging Criteria: Non-vascular Involvement- Final ConsiderationsPlease visit the Learning Center to also view this presentation in hardcopy format.

Development of a New Drug-eluting Stent for Peripheral Arterial Diseases by General Radiologists: What You Need to Know Before You Start

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Shunsuke Kamei, MD, Hachioji, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

What do you need to know to develop a new stent? The first author, a general radiologist with no specific background, has played a central role in developing a stent platform for below-the-knee (BTK) atherosclerotic diseases. Based on this experience, we will explain the tangible and intangible methods how to develop a new stent system in general practice.

TABLE OF CONTENTS/OUTLINE

1. Arteriosclerosis in BTK lesions is a severe disease, and the treatment is still underdeveloped. Therefore, we are developing a new drug-eluting stent for BTK. 2. The first step in stent fabrication is to draw stent design using 3-dimensional Computer-Aided Design (CAD) software. 3. Self-expanding stents are manufactured through laser cutting, diameter expansion, annealing, and electropolishing. The prototype is intended to improve the design through mechanical evaluation. However, since prototyping takes a long time, effective simulation (Finite element analysis using Abaqus®) can shorten the development period. 4. The stent is completed by applying our original technology, hybrid nano-coating (anti-thrombogenic base-coating with drug-eluting polymer), on the newly developed stent platform. We have evaluated the ability of the device to withstand a 10-year equivalent fatigue life due to the cyclic pulsation from blood flow. 5. In animal studies on the requirements of FDA's Good Laboratory Practices (GLP) regulations, we should confirm stent coverage by the vascular endothelium, drug-release profiles, and good stent patency rate at six months after implantation. After approval by FDA, a pivotal clinical trial can be started in humans using a newly developed stent system.Please visit the Learning Center to also view this presentation in hardcopy format.

Interventional Radiology and Childbirth: From Conception through Delivery and Beyond

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Identified for RadioGraphics

Participants
Joseph Moirano, BS, Massapequa, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review radiation exposure risk at different points in pregnancy and assess how to decrease exposure risk during IR procedures2. To discuss the role of IR in promoting male and female fertility3. To highlight the various procedures that interventionalists perform during the antepartum and postpartum period.

TABLE OF CONTENTS/OUTLINE

1. Pregnancy and Radiation Exposurea. Radiation Effects on Fetal Developmentb. Ways to Minimize Fetal Exposure Risk2. Procedures to Promote Fertilitya. Male Infertility Treatments (Varicocele Embolization)b. Female Infertility Treatments (Fallopian Tube Recanalization, Uterine Artery Embolization (for fibroids), and Management of Complications of Ovarian Hyperstimulation Syndrome)3. Procedures in the Pregnant Patienta. Venous Access (Midline and Peripherally Inserted Central Catheter, Dialysis Access, Medi-port)b. Genitourinary Interventions (Percutaneous Nephrostomy Tube/Nephroureterostomy Tube, Ureteral Stent Placement)c. Biliary Interventions (Cholecystostomy Tube, Percutaneous Biliary Drainage Catheter Placement)d. Venous Thromboembolism Interventions (IVC Filter Placement, Venous/Pulmonary Artery Thrombectomy)e. Ectopic Pregnancy Managementf. Ovarian Cyst Aspirationg. Trauma Interventions (Arterial Embolization)4. Procedures in the Peri/Postpartum Perioda. Invasive Placenta Spectrum Management (Pre-operative Balloon Occlusion)b. Postpartum Hemorrhage after Vaginal Delivery (Prophylactic Uterine/Internal Iliac Artery Embolization, Retained POC, Uterine AVM)c. Post-Cesarean Section Procedures (Abscess Drainage, Embolization of Surgically Injured Vessel, Urinary Diversion after Ureteral Injury)

Magnetic Resonance Guided Focused Ultrasound (MRgFUS) for Treatment of Uterine Fibroids: Patient Selection, Contraindications and Operative Execution

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Monica Mattone, MD, Roma, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

Different treatments have been proposed for uterine fibroids. Magnetic Resonance Focused Ultrasound (MRgFUS) has been proposed in the last years as a new non invasive method to treat symptomatic fibroids without any complication. It associates the spatial resolution of a MR scanner with a focused high intensity ultrasound beam.The purpose of this educational exhibit is to illustrate indications to MRgFUS treatment for uterine fibroids, contraindications and possible risks related to the procedure. We are going to describe how this system works, to show expected results after the procedure and to discuss results from the literature.

TABLE OF CONTENTS/OUTLINE

1. Current treatment for uterine fibroids: their indications, contraindications and complications.2. Patient selection and contraindications to MRgFUS.3. MRgFUS system and how does it work.4. Imaging technique to evaluate size, number, accessibility, viability and texture of fibroids.5. Results from the literature.

IREE-58

Radioembolization for Hepatocellular Carcinomas: Consideration of Non-hepatic Artery Originating from the Hepatic Artery

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Certificate of Merit

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radioembolization is increasingly used for the treatment of patients with hepatocellular carcinoma. The knowledge of the hepatic artery anatomy is pivotal for effective and safe treatment. Several non-hepatic arteries, which should not be treated or should be protected, can originate from the hepatic artery. However, non-hepatic arteries may be frequently overlooked or be inadvertently treated, resulting in variable consequences from mild postembolization syndrome to catastrophic gastrointestinal radiation ulcer. The purpose of this exhibit is : (1) To list non-hepatic arteries originating from the hepatic artery. (2) To review the vascular anatomy of non-hepatic arteries on digital subtraction angiography (DSA) and cone-beam CT. (3) To learn how to deal with non-hepatic arteries prior to/during radioembolization. (4) To review the possible complications when they are inadvertently treated.

TABLE OF CONTENTS/OUTLINE

1) Cystic artery, right gastric artery, accessory left gastric artery, hepatic falciform artery, left inferior phrenic artery, and supraduodenal artery 2) Vascular anatomy of non-hepatic artery on CT/MR, DSA and cone-beam CT 3) Tips of non-hepatic artery detection on cone-beam CT as well as planning angiography and SPECT/CT 4) Technical considerations : permanent embolization, temporary embolization, and by-pass 5) Complications related with non-hepatic artery and their management : ischemic cholecystitis, radiation cholecystitis, radiation gastroduodenal ulcer, radiation dermatitis, epigastric pain.

Interventional Radiologic Procedures in Pelvic Bone Tumors

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Yet Yen Yan, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pelvic bone tumours are frequently encountered in the daily practice of the musculoskeletal radiologists. In addition, the pelvis is the 2nd most common site for bone metastases. As the array of pelvic bone interventional procedures have gradually widened from diagnostic to therapeutic, the musculoskeletal radiologist plays an important role in the care of such patients in terms of relieving pain, disease control and improving quality of life. This educational exhibit aims to equip the radiologist with the necessary information on the various interventions that be performed.

TABLE OF CONTENTS/OUTLINE

Bone biopsy, embolisation, osteoplasty and osteosynthesis will be covered.

Bariatric Arterial Embolization: How To Build a Clinical Program

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Adham Khalil, MD, Baltimore, MD (*Presenter*) Research Grant, Siemens AG

TEACHING POINTS

Obesity is a major public health issue that contributes to significant disability, cardiovascular risk, mortality, and healthcare costs. Over the last 50 years, there has been a dramatic increase in the prevalence of obesity in the United States. Obesity is associated with an increased risk of all-cause mortality and a significant reduction in life expectancy. For these reasons, obesity has been labeled a major healthcare epidemic in the United States. Thus, there is an urgent need to develop new therapies for obesity.BAE is an emerging, minimally-invasive therapy for patients with obesity. This image-guided transcatheter procedure involves occlusion of the arteries supplying the gastric fundus, which contains the majority of ghrelin-producing cells. BAE has an excellent safety profile with more than 100 patients with obesity having undergone the procedure worldwide, without any significant adverse sequelae. These early findings suggest that BAE may represent an additional tool in the treatment of patients with obesity that could be used alone or in conjunction with a dedicated lifestyle management program.The goal of the exhibit is to educate the reader on our experience with building a clinical, insurance-supported BAE program and how to integrate BAE as a part of the care path for treating obesity.

TABLE OF CONTENTS/OUTLINE

Transjugular Venous Access in Upper Extremity Hemodialysis Arteriovenous Fistula / Graft Interventions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Louis Fanucci, DO, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the indications for use of transjugular venous access in upper extremity hemodialysis arteriovenous fistula / graft (AVF / AVG) interventions2. To describe the procedural technique involved with transjugular venous access3. To discuss the specific clinical applications for transjugular venous access

TABLE OF CONTENTS/OUTLINE

Transjugular venous approaches were originally described in the context of upper extremity AVF / AVG interventions in 1998, for patients with thrombosed dialysis grafts. A clotted fistula / graft presents a situation where a direct puncture into that AVF / AVG is undesirable. A transjugular approach facilitates intervention using a single puncture site that does not involve the AVF / AVG outflow vein.Pre-procedure access assessment includes ultrasound evaluation of anastomotic sites, inflow artery and outflow vein, and patency of the internal jugular veins. IV access is obtained with a micropuncture system under ultrasound guidance, followed by insertion of 7-French vascular sheath. A guidewire and reverse-curve catheter are most commonly used to perform retrograde catheterization of the outflow vein of interest. After successful retrograde access is established and the procedure completed, hemostasis is achieved by simply applying pressure at the puncture site of the internal jugular vein.Clinical applications of the transjugular access approach include interventions to assist an AVF's maturation and de-clotting of an AVF. This approach is a safe and effective alternative approach to AVF / AVG interventions for patients whose target arteriovenous systems are not amenable to direct puncture.

Common Vascular and Bleeding Complications of Percutaneous Biliary Interventions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Aziz Tejani, (*Presenter*) Nothing to Disclose

TEACHING POINTS

With the increase in percutaneous biliary tract interventions (PBTI) being performed over the past few years, it is important for radiologists to be aware of the many associated post-procedural complications. While there are a several complications that are commonly seen, bleeding can be one of the more serious ones that should readily be assessed for. Bleeding is typically seen in 2-3% of all PBTI cases (3). Injuries to the portal vein, hepatic artery, hepatic vein, and pseudoaneurysms are common vascular injuries that are encountered. Signs and symptoms of such vascular injury can be subtle and non-specific. Although morbidity and mortality is rare, a delay in detection may lead to significant adverse outcomes in some patients. After reviewing this educational exhibit, the individual will be able to: 1. Detect the various vascular and bleeding complications of PBTI on imaging modalities2. Understand the best practices for diagnostic evaluation3. Understand the therapeutic percutaneous interventions for treatment

TABLE OF CONTENTS/OUTLINE

This Exhibit Will Provide:1. An overview of the various types of iatrogenic vascular injury seen with percutaneous biliary interventions2. Demonstrate the clinical signs and symptoms of vascular injury for the clinician to be aware of3. Review appropriate imaging modalities and how to detect such vascular complications on the particular studies4. An overview of therapeutic procedures from an interventional radiology standpoint to manage these bleeding complications5. An assessment of future direction and summary of teaching pointsPlease visit the Learning Center to also view this presentation in hardcopy format.

Thoracic Central Venous Occlusion: Pathogenesis, Imaging Findings, and Recanalization Techniques

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Carlos Ortiz, MD, San Antonio, TX (*Presenter*) Consultant, Argon Medical Devices, Inc

TEACHING POINTS

- Discuss the pathophysiology, imaging findings, and common presentations of thoracic central venous occlusions (TCVOs)- Review collateral pathways formed in response to TCVO and associated findings on imaging- Discuss current endovascular techniques for central venous recanalization- Review the role of imaging in assessing stent patency and complications after venous recanalization

TABLE OF CONTENTS/OUTLINE

Introduction - Pathogenesis of TCVOs in the context of hemodialysis, indwelling catheters, extrinsic compression, and associated pathophysiology- Imaging of TCVOs on CT and diagnostic venogram, including review of collateral venous pathway formation- Current recanalization techniques employed in the treatment of TCVOs and indications for specific techniques (standard wire crossing, sharp recanalization, radiofrequency wire, and endovascular stenting)- Immediate complications (hemothorax, pneumothorax, hemopericardium) and subsequent complications (stent thrombosis, occlusion, dialysis issues) after endovascular recanalization- Medical management after TCVO endovascular stentingConclusionIdentification of a TCVO is important for patients as symptoms can be life altering and compromise hemodialysis. Successful recanalization requires technical skill, appropriate planning, and postprocedural management. Complications from TCVO revascularization can be severe and familiarity with this procedure is important for radiologists.

"Burning Questions": What Every Radiologist Should Know about the Diagnosis and Management of Bleeding Duodenal Ulcers

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Roberto Chavez Appendini, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Vascular supply of the duodenum arises from the anterior and posterior division of the superior pancreaticoduodenal arteries which are branches of the gastroduodenal artery, these arteries anastomose with the inferior pancreaticoduodenal artery which is a branch of the superior mesenteric artery.2. Diagnosis and treatment of bleeding duodenal ulcers are traditionally endoscopic, when bleeding is refractory to treatment, Three-phase GI bleed CT protocol (non-contrast, arterial and venous phases) is an important diagnostic tool, nuclear medicine studies are helpful when CT contraindicated.3. CT findings of duodenal ulcers are subtle and include, mural enhancement of the duodenum, fat stranding, submucosal edema, regional lymphadenopathy, and active extravasation of contrast into the duodenal lumen.4. Endovascular treatment must be considered for bleeding ulcer refractory to endoscopic treatment. Selective embolization of the GDA is done when active bleeding is identified either on CT or angiographically. Empiric embolization of the GDA is an effective alternative, especially for clinically unstable patients.5. Selective and empiric embolization of the GDA for bleeding duodenal ulcers refractory to endoscopic treatment has a low complication rate, for which rebleeding is the most common, in these cases angiogram with potential re-embolization can be considered as well as surgical treatment.

TABLE OF CONTENTS/OUTLINE

Complications After Radioembolization of Hepatic Tumors: Spectrum of Imaging Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Certificate of Merit

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radioembolization is a potent intra-arterial therapy used to treat primary liver tumors and liver metastases. However, this treatment may result in various hepatic and extrahepatic complications which could be alleviated or prevented. The common complications include biliary necrosis, benign biliary stricture, liver abscess, radioembolization-induced liver disease, radiation cholecystitis, gastrointestinal radiation ulcer, radiation pneumonitis, and radiation dermatitis. The purpose of this exhibit is : (1) To review the hepatic and extrahepatic complications related with radioembolization. (2) To learn how to manage these complications. (3) To learn how to prevent or alleviate these complications.

TABLE OF CONTENTS/OUTLINE

1) Hepatic complications associated with radioembolization A. biliary complication (biliary necrosis, biliary stricture, biloma, liver abscess) B. radiation hepatitis and focal radiation necrosis C. radiation-induced liver disease 2) Extrahepatic complications associated with radioembolization A. Radiation cholecystitis B. Radiation ulcer C. Radiation pneumonitis D. Radiation dermatitis 3) Management of each complication 4) Prevention method of each complication

Percutaneous Sclerotherapy for Orbital Low Flow Lympho-venous Malformations (LFVM)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Shyamal Patel, MBBS, FRCR, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Orbital sclerotherapy is effective with low complication rates, and is therefore an important minimally invasive option in the management of orbital low flow lympho-venous malformations. 2. Bleomycin is the sclerosant of choice as it is associated with less local inflammatory response - important for lesions in/around the orbit where significant swelling can result in visual loss. 3. Treatment is performed under a general anaesthetic and prior to bleomycin use, adequate pre-assessment is required including appropriate imaging and ophthalmology review. 4. The entire team should be aware of specific precautions related to bleomycin use including potential for lung fibrosis, skin marking and the need for cytotoxic precautions. 5. Important complications to be aware of are retro-orbital haemorrhage, requiring emergency lateral canthotomy and the oculocardiac reflex which is rare but may result in bradycardia, arrythmias and potentially asystole.

TABLE OF CONTENTS/OUTLINE

1. What are orbital LFVMs (Primary vs Secondary; Venous, lymphatic and mixed). 2. Imaging appearances (US, CT, MRI). 3. Bleomycin use: pre-assessment, bleomycin precautions. 4. Sclerotherapy procedure - dosage, technique and assessment for deep venous drainage. 5. Complications (retro-orbital haemorrhage, oculocardiac reflex.

Recent Development of Augmented Reality and Mixed Reality for Needle Guidance

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Certificate of Merit

Participants
Satoru Morita, MD, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Augmented reality (AR) and mixed reality (MR) can expand the possibilities of image guidance procedures. Some needle guidance applications using AR/MR on smartphones and smartglasses have been developed recently. Various resources are available for developing applications using AR/MR. The purpose of this exhibit is to 1). Review the current situations of AR/MR for image guidance procedures. 2). Introduce the recent needle guidance applications using AR/MR and discuss each advantage and disadvantage. 3). Introduce how to develop needle guidance applications using AR/MR.

TABLE OF CONTENTS/OUTLINE

1). Introduction 2). Definitions of AR/MR 3). Devices for AR/MR 4). Platforms to develop AR/MR applications 5). Registration methods for AR/MR 6). Current needle guidance applications using AR/MR 7). Limitations 8). Future perspectives 9). Conclusions and take home messages

Interventional Pain Frontiers: Role of IR in Median Arcuate Ligament Syndrome (MALS) Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Certificate of Merit

Participants
Mohamed Ibrahim, MBBCh, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understand the current hypothesis of MALS etiology and highlight pertinent anatomy • Learn the role of IR in the diagnosis and determination of surgical candidacy for MALS patients • Learn the role of IR in the treatment of MALS patients

TABLE OF CONTENTS/OUTLINE

• MALS etiology and pertinent anatomy o A neurogenic disorder rather than a compression syndrome o Celiac plexus and splanchnic plexus anatomy • Role of IR in the diagnosis and determination of surgical candidacy MALS patients o Role of celiac plexus block in the diagnosis of MALS o Common approaches and protocols for celiac plexus block in the diagnosis of MALS • Role of IR in treatment of MALS patients o Celiac plexus neurolysis; technical considerations, and expected outcomes o Splanchnic plexus neurolysis; technical considerations, and expected outcomes

Interventional Management of Portal Vein Thrombosis: A Problem-solving Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Daniel Cardoso, MD, Fortaleza, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize the anatomy of the portal venous system (PVS) and its most common variants. Understand the causes of Portal Vein thrombosis (PVT) and related clinical features. Comprehend imaging patterns of PVT through a wide variety of imaging modalities. Recognize the complications associated to PVT and its imaging patterns. Understand PVT treatment methods and criteria.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION: PVS anatomy and most common anatomical variations. Definition of PVT (acute x recent x chronic). Epidemiology of the most common causes of PVT. Signs and symptoms associated to the obstruction site (Portal Vein (PV), Superior Mesenteric Vein (SMV) and Splenic Vein (SV)). 2. DIAGNOSIS AND IMAGING FINDINGS: PV: Benign PV / Cirrhotic and non-cirrhotic PVT / Infectious/septic PVT - thrombophlebitis / Transplant-associated PVT. Malignant PVT: Tumor Invasion/PV Tumor Thrombosis (Hepatocellular carcinoma) / External Constriction of the PV within a Tumor (Pancreatic Cancer or Cholangiocarcinoma) / Complications associated to PVT. SMV: SMV thrombosis / Complications associated to SMV thrombosis. SV: SV thrombosis / Complications associated to SV thrombosis. 3. MANAGEMENT OF PVT: Fundamentals of Anticoagulation Therapy / Interventional Approach / Techniques / Follow-up and Early Identification of Possible Complications.

Biliary Leaks: There Are Many Ways to Fix

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Identified for RadioGraphics

Participants
Christopher Mao, Sugar Land, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Biliary leaks are most seen in patients as iatrogenic complications after surgeries such as cholecystectomy. Postoperative leaks occur in 1% of laparoscopic cholecystectomies and 0.5% of open cholecystectomies but can occur in other procedures such as RFA (Radiofrequency Ablation) of primary and secondary liver tumors. As the number of hepatobiliary surgeries performed continue to increase, biliary leaks will become even more prevalent. Since clinical signs and symptoms of bile leaks are nonspecific and delay in the recognition of bile leaks is associated with high morbidity and mortality rates, imaging is crucial for establishing an early diagnosis and guiding the treatment algorithm. After reviewing this exhibit, learners should be able to: 1. Recognize emergent biliary leaks from key image findings. 2. Use best practices for diagnosing biliary leaks. 3. Understand the options for percutaneous management.

TABLE OF CONTENTS/OUTLINE

1. Provide an overview of the different types of biliary leaks. 2. Illustrate the clinical and imaging features of biliary leaks with a focus on iatrogenic etiologies. 3. Review the framework for selecting the best imaging practice of the biliary duct system. 4. Address relevant management as applicable to the interventional radiologist to aid in expedient and appropriate management. 5. Discuss future directions. 6. Conclude with a summary of key teaching points.

MRI Guided Transurethral Ultrasound Ablation (TULSA) of Prostate: Initial Experience at Wellspan Hospital

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Edward Steiner, MD, (*Presenter*) Key Opinion Leader, Koninklijke Philips NV ;Speaker, Koninklijke Philips NV;Speaker, Quantib BV;Research support, Profound Medical Inc ;Speaker, Profound Medical Inc

TEACHING POINTS

Teaching points - To present the capabilities of TULSATULSA-PRO is a minimally invasive procedure that combines real-time MRI with robotically-driven directional thermal ultrasound to treat prostate cancer, with the goal of achieving comparable disease control to radiation therapy or prostatectomy and significantly improved functional preservation. TULSA can also treat BPH concurrent with cancer in a single procedure. Examples of TULSA whole-gland and hemi-ablation procedures performed at our institution are provided. - To report lessons learned with the TULSA procedure Critical lessons and technical points are presented including patient preparation, considerations on treating radio-recurrent disease, sparing of sphincter and bladder tissue, maintaining ejaculatory function, and workup of patients with intermediate to high grade lesions with PSMA scans. - To report early functional, oncological, and safety outcomes Discussion of post procedure care and follow-up, monitoring, repeat MRI and PSA trends, continence and erectile function data analysis as well as preliminary tumor recurrence data.

TABLE OF CONTENTS/OUTLINE

Table of contents - Basics of TULSA procedure and workflow - Lessons learned, and treatment planning strategies - Early functional, oncological, and safety outcomes - Applications of TULSA for sparing functionally important structures and treating radio-recurrent disease

Intra-arterial Treatment for Hepatocellular Carcinomas: How to Manage Shunting From the Artery

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Awards
Magna Cum Laude

Participants
Hyo-Cheol Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Intra-arterial therapy including chemoembolization and radioembolization is a workhorse for the treatment of patients with hepatocellular carcinomas. Occasionally, the operators encounter shunts from the artery (arterioportal, arteriovenous, and arteriopulmonary shunts) that prevent effective treatment. The causes of these shunts include tumor invasion to the vessels, previous percutaneous procedures, chronic inflammation, and congenital acquisition. Unless the shunt is properly occluded, embolic material can pass through the shunt and cause non-target embolization or serious complications. The purpose of this exhibit is : (1) To review radiologic appearance of arterioportal, arteriovenous, and arteriopulmonary shunts. (2) To learn how to manage these shunts with proper embolic materials. (3) To list the possible complications and their management.

TABLE OF CONTENTS/OUTLINE

1) List of shunts Arterioportal shunt (hepatic artery - portal vein), Arteriovenous shunt (hepatic artery - hepatic vein), Arteriopulmonary shunt (hepatic artery - pulmonary artery/vein), 2) Imaging findings on CT/MR and angiography according to the cause (tumorous vs non-tumorous condition) 3) Embolization strategy and materials for shunts 4) Complications related with non-target embolization and their management

To Glue or Not to Glue, That Was the Question - Misadventures with Glue Embolization in Peripheral Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Jorge Lopera, MD, San Antonio, TX (*Presenter*) Shareholder, Tecnostent SA;Consultant, Merit Medical Systems, Inc;Research Grant, AngioDynamics, Inc

TEACHING POINTS

Embolization using N butyl acrylate (NBCA) or glue is showing very promising results with better and faster occlusion results than particles or coils in areas that are susceptible to recanalization after embolization such as bronchial arteries, portal vein embolization and endoleaks after EVAR, among others. Emerging uses of glue include trauma, uterine artery embolization in placental insertion abnormalities , cyst sclerosis and gastrointestinal bleeding . As with other liquid embolization agents , using glue has a steep learning curve and serious complications can occur . The purpose of this exhibit is to illustrate in a case by case presentation , different complications with the use of glue with emphasis in ways to prevent them.

TABLE OF CONTENTS/OUTLINE

1. When to use and not to use glue 2. How to prepare glue; basic steps 3. Complications a. Lung glue embolization after portal vein embolization . b. Portal vein embolization after treatment of arterio-portal fistula in HCC c. SMA glue migration after percutaneous aneurysm embolization d. Iliac artery glue embolization after trans lumbar endoleak embolization e. Glue cast adhered to catheter in the aorta- ways to fix this . f. Stroke after peripheral glue embolization, beware of PFO .Conclusions : Glue is a very versatile embolization agent, showing very promising results with lesser recanalization rates than particles or coils in many areas. As a liquid embolization agent, serious complications can occur that require a clear understanding of the different mechanisms of glue migration and ways to mitigate them.

IREE-79

Benign Prostatic Hyperplasia Treatments: A Review of the Fundamentals to Assist in Optimal Prostate Artery Embolization Patient Selection

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Miltiadis Tembelis, Mineola, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. A thorough understanding of benign prostatic hyperplasia (BPH) pathophysiology and management options is essential before embarking on developing a prostate artery embolization (PAE) program.2. While the risks of PAE are low when done with proper technique, major complications can occur and have negative impact on a patient and/or a PAE program.3. An understanding of PAE indications as well as alternative BPH treatment is essential to ensure appropriate patient selection and PAE procedural advocacy.

TABLE OF CONTENTS/OUTLINE

-Review BPH pathophysiology-Discuss lower urinary tract symptoms (LUTS), their diagnosis, and that a variety of causes exist (not just bladder outlet obstruction from BPH)-Provide the learner with a thorough review of BPH management options, including medications, minimally invasive surgical therapies, PAE, and more invasive surgical interventions (TURP, HoLEP, and prostatectomy)-Review relevant literature on indications and outcomes of these procedures, with the goal of providing radiologists and trainees with key fundamental knowledge to allow for optimal PAE patient selection and also for guiding patients towards other management options when more appropriate

IREE-8

The Pelvic Venous Disease Continuum: Nutcracker Phenomenon, Non-thrombotic Iliac Vein Lesion (NIVL), Ovarian and Pelvic Vein Reflux

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Navpreet Khurana, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the complex pathophysiological interactions between Nutcracker syndrome, Nonthrombotic Iliac Vein Lesion (NIVL), and ovarian pelvic venous reflux leading to the constellation of findings known as Pelvic Venous Disease (PeVD). PeVD is often misdiagnosed and inappropriately treated. 2. Describe the key imaging findings in the diagnosis of PeVD. 3. Review the algorithm and pearls pitfalls of IR management.

TABLE OF CONTENTS/OUTLINE

1. Key anatomical and pathophysiological concepts a) Nutcracker Phenomenon - Compression between aorta and superior mesenteric artery results in stenosis and increased pressure in the left renal vein, often with blow-out retrograde flow down the ovarian vein resulting in pelvic varicosities to act as collateral. b) NIVL - Stenosis of left common iliac vein between right common iliac artery and aorta, either by mechanical compression or with superimposed chronic microtrauma secondary to proximity and pulsatility causing venous wall thickening and/or webs. c) Ovarian Pelvic Vein Reflux - Incompetence and reflux of ovarian and/or pelvic veins resulting in pooling of blood into "reservoirs", classically in the pelvis. Blood may also leak out of the pelvis from "escape points" due to gravity and venous hypertension. 2. Diagnostic imaging algorithm and findings with a case-based discussion. 3. Role of Interventional Radiology: a) Initial consultation with focused history physical exam. b) Diagnostic evaluation for PeVD - US, CT Venography, MR Venography. c) Nutcracker Phenomenon its dynamic role in PeVD. d) In NIVL, understanding the interplay of iliac stenosis with ovarian reflux, role of its treatment in PeVD. 4. Complications/misdiagnosis case examples of PeVD.

Prostate Artery Embolization Practice Building - With a Focus on Understanding the Current Literature

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Nathan Mickinac, MD, Mineola, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. A thorough understanding of benign prostatic hyperplasia (BPH) pathophysiology and management options is essential before embarking on developing a PAE program.2. While the risks of PAE are low when done with proper technique, major complications can occur and have negative impact on a patient and/or a PAE program.3. Thoughtful implementation, careful patient selection, meticulous procedural technique, collaboration with other specialties, and appropriate marketing are keys to building a successful PAE program.

TABLE OF CONTENTS/OUTLINE

-Review BPH pathophysiology and epidemiology-Brief review of BPH treatment options, with a focus on PAE-Review relevant literature on PAE, including large prostates (>80g), acute urinary retention, and/or hematuria-Provide basic review of sexual health relating to BPH, including erectile dysfunction (ED) and ejaculatory dysfunction (EjD), and review relevant evaluation tools/scales-Highlight data regarding ED and EjD across multiple BPH procedures, including PAE-Review current AUA BPH guidelines and discuss why PAE is not supported in those guidelines currently-Detail current data regarding repeat PAE-Share practice building advice, with a focus on utilizing PAE data to engage other specialties as a part of building a successful program

Cryoablation of Aneurysmal Bone Cyst: Current Status and Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - IR

Participants
Elisabet Vila, (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will:1) Describe imaging features of primary ABC using different imaging modalities.2) Discuss this novel interventional technique and how it works (low dose CT protocol, needle placement method and ice ball formation).3) Illustrate normal post treatment imaging findings of aneurysmal bone cyst using cryoablation on MRI.4) Characterize the radiological appearance of relapse.

TABLE OF CONTENTS/OUTLINE

Aneurysmal bone cysts are benign and expansile bone lesions with locally aggressive behavior. Diagnosis is achieved using different imaging modalities.Cryoablation is a percutaneous ablation technique that uses extreme low temperatures for tumor destruction and is becoming increasingly accepted for treatment of aneurysmal bone cysts. It uses liquefied gas (nitrogen or argon), through cryoprobes that expands into a gaseous state at the end of the probe to create temperatures as low as -190 °C. Intra-procedure computed tomography (CT) is used to identify the ablated zone in real time appearing as a low-density area which corresponds to the generated ice ball.In this exhibit we will review how cryoablation works, procedure planning and imaging appearance of post procedural interventions, showing different examples of normal findings and relapse.

MKEE

Musculoskeletal Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Sub-Events

MKEE-1 Achilles-calcaneus-plantar fascia system: Anatomy, Biomechanics and Patterns of Injury

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

The Achilles tendon, calcaneus and plantar fascia comprise an interconnected complex or system of structures that play a vital role in the load distribution of the foot, including absorbing mechanical shock, stabilizing and preventing the collapse of the longitudinal arch during propulsion. Failure, overload or repetitive stress to any or a combination of these structures leads to a multitude of disorders and imaging findings. The objectives of this educational exhibit are: • Review normal anatomy and biomechanics of the Achilles tendon, calcaneus and plantar fascia • Discuss patterns of failure and injury involving the Achilles tendon, calcaneus and plantar fascia • Identify imaging findings that may aid in differentiating these disorders when clinical findings are equivocal

TABLE OF CONTENTS/OUTLINE

Pertinent anatomy and biomechanics • Calcaneal crescent • Windlass mechanism Imaging techniques Disorders Achilles Complete and partial tear Insertional tendinopathy and tendinitis Peritendinitis Peri-Achilles bursal fluid Calcaneus Stress fracture Haglund syndrome Posterior ankle impingement Plantar fascia Fasciitis Rupture Fibromatosis Plantar fat pad abnormalities

MKEE-10 Current Trends in Total Ankle Arthroplasty

Awards
Identified for RadioGraphics

Participants
Jason Ha, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe indications for total ankle arthroplasty (TAA) vs. arthrodesis.Recognize different types of TAA, including semi-constrained and minimally constrained designs.Understand normal tibiotalar and distal anterior tibia angles.Define normal and abnormal imaging appearance of TAA.

TABLE OF CONTENTS/OUTLINE

1. Indications for TAA vs. arthrodesis. 2. Types of TAA: Differences between 1st generation, 2nd generation, 3rd generation. Comparison of Agility, Salto-Talaris, Inbone, STAR, Hintegra, Mobility, and Zimmer Trabecular Metal. 3. Normal imaging appearance: Radiolucency, Tibiotalar Angle, Distal Anterior Tibia Angle. 4. Complications: Radiolucency, Hardware Subsidence, Perihardware fracture, Syndesmotic screw loosening, Heterotopic ossification, Increased varus or valgus angulation of the ankle, Ankle gutter narrowing, Infection, Syndesmotic or fibula osteotomy nonunion, Aseptic loosening, Expansile osteolysis (also known as ballooning osteolysis, periprosthetic cysts)

MKEE-100 Pain in the Rear-Exploration of MRI Findings Useful in Distinguishing Septic Arthritis from Inflammatory Spondyloarthritis of the Sacroiliac (SI) joints

Participants
Matin Goldooz, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the sacroiliac joint anatomy. Illustrate MRI findings specific for inflammatory sacroiliitis and review updated Assessment of SpondyloArthritis international Society (ASAS) criteria. Illustrate common MR findings in infectious sacroiliitis. Review manifestations of degenerative sacroiliitis. Discuss common procedures for SI joint aspiration and therapeutic injection.

TABLE OF CONTENTS/OUTLINE

Infectious sacroiliitis is a destructive, monoarticular arthropathy typically caused by hematogenous seeding of bacterial pathogen. Clinical symptoms of SI joint disease are often nonspecific and may be attributed to pathology in hips or spine. Early recognition and prompt treatment of the condition is important to prevent permanent joint damage or abscess formation. Spondyloarthritides such as ankylosing spondylitis commonly involve the SI joints. The most recently updated classification criteria of axial

spondyloarthropathies are based on specific MRI findings, which facilitates prompt diagnosis.Differentiation between infectious and spondyloarthropathy associated sacroiliitis is incredibly important given the different prognosis and treatment regimens. MRI is the most relevant modality in evaluation of sacroiliitis, that can assist in differentiation of infectious and inflammatory etiology. Radiologists should be familiar with the MRI features that are more indicative of infectious sacroiliitis given the urgency required in making this diagnosis.In this educational exhibit we illustrate MRI findings of infectious and inflammatory sacroiliitis with emphasis on findings useful in differentiation of the two and in distinguishing both from degenerative sacroiliitis.

MKEE-101 Cervical Spine Infections and their Mimics

Awards
Certificate of Merit

Participants
Samantha Salmon, MD, Columbia, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss shared key clinical and imaging characteristics of inflammatory and infectious diseases of the cervical spine2. To detail, in a case-based format, typical imaging features of infection of the cervical spine, organized by the site of origin3. To detail, in a case-based format, disease states that mimic infection and highlight key imaging and clinical factors that assist in the differentiation

TABLE OF CONTENTS/OUTLINE

This presentation will be a case-based discussion reviewing cervical infections, differentiated by their site of origin. Cases will be presented alongside cases that mimic infection.· Overview of shared presentation of infection and inflammatory diseases· Features of perivertebral infections· Prevertebral infection compared to longus coli tendinitis· Spondylodiscitis compared to renal osteodystrophy· Epidural infection, highlighting progression from phlegmon to abscess, compared to epidural tumor and hematoma· Intramedullary abscess compared to demyelination and infarction· Facet septic arthritis compared to CPPD arthropathy and neoplasm· Posterior soft tissue infections compared to post-operative seroma

MKEE-102 3T Magnetic Resonance Neurography - From Head to Toe!

Awards
Cum Laude

Participants
Flavia M. Costa, MD, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) 3T MR neurography is a technique involving regional MRI that allows evaluation of the peripheral nerves and is more effective than electrodiagnostic studies in the evaluation of deep structures. 2) Create a didactic script of what should be evaluated in neurography exams and how to recognize a normal or altered nerve. 3) Make a pictorial essay of the main peripheral nerves and their differential diagnoses.

TABLE OF CONTENTS/OUTLINE

1) Overview of what is magnetic resonance neurography and the examination technique. 2) 3T magnetic resonance of a traumatic lesion. 3) Tumoral lesion. 4) Inflammatory neuronal lesion. 5) Step by step for the evaluation of lesions and table with a summary of findings expected.

MKEE-104 Pediatric Spine and Spinal Cord Tumors: Imaging Answers to Clinical and Surgical Needs

Awards
Certificate of Merit

Participants
VINICIUS BRAMBILLA, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the most frequent spinal, spinal cord and paravertebral tumors in childhood; Briefly discuss imaging modalities and protocols; Discuss differential diagnosis; Illustrate pseudotumoral findings and pitfalls.

TABLE OF CONTENTS/OUTLINE

INTRODUCTIONOverview of spinal and paravertebral tumors in childhood seeking to illustrate and review the lesions split by compartiments (paravertebral, vertebral, extradural and intradural) based on clinical cases from our institutional database.PARAVERTEBRAL NEOPLASMSIncluding neurofibromatosis benign findings and malign degeneration, neuroblastic tumors, paravertebral primary PNET.VERTEBRAL NEOPLASMS Including Langerhans cell histiocytosis, metastasis, osteoblastoma, chondrosarcoma;EXTRADURAL NEOPLASMS Including chloroma, primary extradural lymphoma; epidural metastasis.INTRADURAL NEOPLASMS Including astrocytoma, ependimoma, hemangioblastoma, intradural lipomatous lesions, primary diffuse leptomeningeal glioneuronal tumor, meningioma;PSEUDOTUMORS Including infectious diseases, extramedullary hematopoiesis, chronic recurrent multifocal osteomyelitis, arachnoid cysts; vascular lesions, spinal dysraphisms.

MKEE-105 A Nocturnal Nuisance: Diagnosis and Treatment of Osteoid Osteoma

Participants
Meghan Jardon, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Osteoid osteoma is a benign tumor of bone that presents with nocturnal pain in children and young adults, classically relieved by non-steroidal anti-inflammatory drugs (NSAIDs). Common locations include the femur, tibia, and posterior elements of the spine. 2. The classic imaging appearance of a calcified nidus with surrounding sclerosis that is described on CT can be difficult to appreciate

on MRI. Thus, the radiologist must maintain a high level of suspicion when interpreting MRI, as misinterpretation may delay appropriate patient management. 3. Radiofrequency ablation provides a safe and effective means of treating osteoid osteomas, but additional consideration should be given in difficult locations (i.e. adjacent to neural elements, articular cartilage, etc.)

TABLE OF CONTENTS/OUTLINE

1. Background/Introduction2. Clinical and Imaging Manifestations of Osteoid Osteomas3. Case Examples from a variety of different anatomic locations A. Long bones: femur, tibia B. Spine: T12 posterior elements C. Others: talus, calcaneus D. Intra-articular examples: hip, elbow4. Differential Diagnostic considerations for osteoid osteoma5. Management of Osteoid OsteomaA. Medical managementB. Radiofrequency ablation: Equipment, technique, special considerations in difficult locationsC. Surgical resection

MKEE-106 Many Faces of Bone Metastasis: How to Detect and Not be Surprised

Participants
Eduarda Bernal, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points? Be prepared to do early detection of skeletal metastases.? Understand the biological mechanisms by which tumors metastasize to bone.? Recognize the appearance of skeletal metastases.? Review typical and atypical forms of secondary musculoskeletal involvement in different imaging methods

TABLE OF CONTENTS/OUTLINE

Introduction and objectivesMetastases are the most common malignant tumors of the skeleton, and bone is the third most frequent site of metastasis, behind only the lung and liver.Early detection of skeletal metastases is essential for accurate staging and optimal treatment, in addition to improving the patient's quality of life. Bone metastases are a major cause of morbidity in cancer patients, characterized by severe pain, impaired mobility, pathological fractures and spinal cord compression. Understanding of the biological mechanisms by which tumors metastasize to bone and the diverse image appearance of skeletal metastases are important to detect disseminated disease. MethodsWe will review typical and atypical forms of secondary musculoskeletal involvement in different imaging methods through several cases and discuss the ideal method for diagnosis and monitoring of response to treatment of skeletal metastases. ConclusionsBone metastases have an important impact on the quality of life of cancer patients, and therefore, new strategies are needed to detect skeletal disease and attenuate established skeletal events. Radiologists are essential for this diagnosis since most bone metastases are asymptomatic at the beginning and knowing typical and atypical forms of skeletal metastatic involvement helps in early diagnosis and monitoring of response to treatment.

MKEE-107 Recognizing Pediatric Bone Tumors: Growing Your Knowledge

Participants
Vitor Cardoso Linhares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is a vast variety of bone tumors proposed by WHO 2020 classification, divided, among other aspects, into its tissue matrix type and biological behavior (benign, intermediate and malign). Considering the bone tumors of the pediatric population, the most common malign tumours are osteosarcoma and ewing sarcoma, and the most common benign tumours includes simple bone cyst and aneurysmal bone cyst.To identify the main characteristic of this tumours, especially in the pediatric age, can help patients to receive the adequate treatment and avoid unnecessary procedures.The purpose of this exhibit is to:• Briefly review the most recent World Health Organization (WHO) bone tumours classification.• Demonstrate cases of the most prevalent pediatric bone tumours. • Review the image findings of radiographic, CT and MRI studies of the most prevalent bone neoplasms in children.

TABLE OF CONTENTS/OUTLINE

(1) Briefly review the World Health Organization (WHO) bone tumours classification, and correlacionate with the most prevalent tumours in the pediatric population. (2) Approach the characteristics and image findings to help distinguish non aggressive and aggressive bone neoplasms. (3) Classify the most prevalent groups of benign, intermediate and malignant bone tumours in the pediatric population. (4) Describe radiographic, CT and MRI findings of each of the most prevalent groups of bone neoplasm in children. (5) Systematic approach to help the radiologist in the correct diagnosis of the bone tumours in the pediatric population.

MKEE-108 Fractures of the Appendicular Skeleton and Criteria for Their Surgical Management: What the Orthopedic Surgeon Wants to Know

Participants
Lucas Miyahara, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review and illustrate some of the main appendicular skeleton fractures with surgical management, with emphasis on radiography and computed tomography, methods most commonly used in the emergency.2. Didactically summarize the imaging findings that indicate the surgical treatment of appendicular skeleton fractures.

TABLE OF CONTENTS/OUTLINE

Introduction: general illustration of the fractures to be addressed.Demonstrate didactic and illustrative cases contemplating the following fractures: proximal humerus fracture, terrible triad of the elbow, Monteggia fracture-dislocation, Galeazzi fracture-dislocation, Barton fracture, scaphoid fracture, pelvic ring fracture, intertrochanteric fracture, femoral neck fracture, tibial plateau fracture, ankle fracture and Lisfranc fracture-dislocation.Provide schematic illustrations reviewing fracture classifications and discussing important concepts to understand the imaging findings.Present two tables that summarizes the trauma mechanisms and imaging findings that indicate the surgical treatment of appendicular skeleton fractures in each affected segment.Bibliographical references.

MKEE-109 Uncommon Manifestations of Bone Trauma: Focus on Medullary Fat

Participants
Pablo Rengifo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Following a high energy bone injury, a macroscopic fracture or a bone contusion (trabecular microfactures) is produced. In either case, medullary fat is compromised and typically shows high signal on fluid-sensitive MRI sequences. However, medullary fat might have other manifestations secondary to bone injuries.2. Uncommon manifestations of medullary fat related to bone trauma can be classified in intramedullary and extramedullary (extraosseus) fat acumulation. The last one could be categorized in intra-articular, intra-tendon sheath, intra-bursal, subperiosteal and systemic (fat embolism).3. Familiarity with imaging characteristics of intramedullary and extramedullary fat accumulation related to a high energy bone injury is essential in order to prompt further studies to demonstrate a possible occult fracture.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Anatomy of the Medullary Cavity.3. Types of uncommon manifestations of medullary fat after bone trauma: Overview.4. Intramedullary fat acumulation after bone trauma.5. Extramedullary (extraosseus) fat acumulation after bone trauma.5.1. Intra-articular.5.2. Intra-tendon sheath. 5.3. Intra-bursal. 5.4. Subperiosteal. 5.5. Systemic (fat embolism).5. Summary.6. References.

MKEE-11 Gluteal Tendon Injuries: Anatomy, Pathological Conditions and Postoperative Imaging

Participants
Carlos H. Longo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: • Review and illustrate the anatomy of the gluteal tendons and their relationship to adjacent structures; • Illustrate and discuss the patterns of injuries involving these structures with didactic cases and their clinical relevance; • Illustrate and discuss types of surgical treatment and postoperative imaging findings of gluteal tendon injuries, and discuss its relation to hip arthroplasty.

TABLE OF CONTENTS/OUTLINE

The gluteus medius and minimus muscles are hip abductors, with a crucial hole in maintaining pelvic stability and normal gait. Although gluteal lesions are common, there is a relative paucity of detailed descriptions of features and patterns of tendon pathology in the literature compared to upper limb rotator cuff tendinopathy. Anatomy: • Imaging of gluteal bundles, subgluteus bursa and insertional anatomy exemplified by cases and didactic illustrations. Pathological conditions: • Function considerations and clinical relevance: Tendinopathy of the gluteus tendons are a cause of lateral hip pain and gait instability, particularly in older adults. Asymptomatic gluteal tendinopathies have been shown to have a negative effect on the outcomes of total hip arthroplasty. Surgical treatment and postoperative imaging: • Surgical indications and types of surgeries, modalities and complications.

MKEE-110 World Cup is Coming - Recall the Typical Soccer Lesions

Participants
Gillis Lago, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibition is:1. Review the main orthopedic injuries that occur in soccer.2. Correlate the trauma mechanism with the type of injury found3. Discuss the most common injuries, including muscle strains and injuries that occur in the knee, ankle and foot, as well as less common injuries that can occur in the upper limbs, through imaging methods in a multimodality approach.

TABLE OF CONTENTS/OUTLINE

1 - Most common orthopedic injuries that occur after playing soccer, correlated with the main imaging findings in a multimodality approach (CR, US, CT and MRI).2 - Correlate the trauma mechanism with the main injuries found.3 - Most common orthopedic injuries and imaging findings in a multimodal approach, including:- Muscle injuries: - Acute; - Chronic;- Hip and pelvis: - Symphysis pubic disfunction.- Knee injuries: - Ligament injuries, especially rupture of the anterior cruciate, medial collateral and posterior cruciate ligaments (less common). - Meniscal injuries; - Posterolateral corner injuries;- Ankle/foot injuries: - Ligament injuries, especially the lateral complex, which is the most affected; - Less common injuries, such as foot plate and ligament injuries;- Upper limb injuries: - Acute injuries to the shoulder, wrist and finger.- Miscellaneous and pediatric skeletal injuries, as osteochondrosis.

MKEE-111 The Great Pretender: Benign Soft Tissue Tumors Mimicking Malignancy

Participants
Tina Shiang, MD, Worcester, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this educational exhibit is to present a case-based multimodality review of benign soft tissue tumors mimicking malignancy and provide a systematic approach to challenging cases of "lumps and bumps."1. Review the systematic approach to evaluating "lumps and bumps" and general principles for distinguishing benign vs malignant soft tissue masses.2. Present a series of challenging soft tissue tumor/pseudotumor cases that provided a diagnostic dilemma for the radiologist using a multimodality approach.3. Highlight the importance of a multidisciplinary approach in improving patient experience, including clinical, radiologic, and histopathologic correlation.

TABLE OF CONTENTS/OUTLINE

1. Systematic approach to evaluating "lumps and bumps" in MSK practice.2. Presentation of benign soft tissue masses with imaging features suggestive of malignancy (XR, US, CT and MRI). a. Trauma: Myositis ossificans b. Neurologic: granular cell tumor, schwannoma c. Vascular: glomus tumor, vascular malformation d. Inflammatory: rheumatoid nodule e. Other: desmoplastic fibroelastoma, nodular fasciitis, pigmented villonodular synovitis3. Discussion of challenging aspects of clinical decision-making, management, and patient outcome.

MKEE-112 Soft Tissue Tumors: What to Include in the Report - A Primer for General Radiologists

Awards
Cum Laude

Identified for RadioGraphics

Participants
Geoffrey M. Riley, MD, Portola Valley, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Provide general facts about soft tissue tumors2. List the 10 most important items that should be described in an MRI report on soft tissue tumors3. Show examples of how to report each item

TABLE OF CONTENTS/OUTLINE

1. Introduction-General facts on imaging of soft tissue tumors2. Top 10 important components of the report-Compartment-Anatomic structure-Size and shape-Location relative to bony landmark-Description of borders-Relationship to adjacent structures-Signal characteristics and contrast enhancement-Peritumoral signal and tail-Feeding and draining vessels-Lymph nodes3. Conclusion4. References

MKEE-113 I Feel Something in My Hand - What Could it Be?

Participants
Cecilia Ruiz de Castaneda, Toledo, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review the spectrum of soft tissue tumors of the hand and illustrate the typical and atypical imaging features. 2. To describe the main tumor-like lesions of the hand and wrist. 3. To analyze the differential diagnosis and provide diagnostic keys to identify pitfalls.

TABLE OF CONTENTS/OUTLINE

Soft tissue masses of the hand and wrist are very prevalent in clinical practice. For this reason, the radiologist should be familiar with the most common benign and malignant tumors to develop and narrow the differential diagnosis. Multimodality imaging approach is mandatory for therapeutic planning. Although magnetic resonance imaging is an important imaging modality to diagnose soft tissue tumors, other initially ordered imaging modalities such as radiographs and ultrasound can also add valuable information about the lesions. We provide a comprehensive approach to tumors and tumor-like lesions of the hand, including demographics, clinical presentation, and imaging findings required to make an appropriate differential diagnosis

MKEE-114 Vascular Changes that Every Musculoskeletal Radiologist Should be Aware of

Awards
Certificate of Merit

Participants
Eduarda Bernal, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points- MRI of joints is often performed for presumed musculoskeletal conditions. There is a wide variety of variant vascular anatomy and vascular pathology that can occur around the joint, including an aberrant artery, vascular trauma that occurs with joint dislocation, artery aneurysm, vein thrombosis, cystic adventitial disease, and vascular anomalies like arteriovenous malformation.- Peripheral artery disease (PAD) is currently the leading cause of morbidity and mortality in the western world. The identification of PAD incidentally in a musculoskeletal examination can make the diagnosis and improve the survival of this patient.- Venous thrombosis is an important and frequent diagnosis with clinical signs and symptoms that can mimic musculoskeletal pathologies.- Cystic adventitial disease is an uncommon vascular pathology that have a predilection in the popliteal region, manifesting rapidly progressive calf claudication and lower extremity pain.

TABLE OF CONTENTS/OUTLINE

IntroductionVascular abnormalities are an important and frequent diagnosis with clinical signs and symptoms that can mimic musculoskeletal pathologies. Due to this clinical similarity, MR examinations are frequently requested for patients with vascular abnormalities, under an equivocate suspicion of a musculotendineous or articular injury.ObjectivesThe purpose of this study is review unexpected and expected vascular findings, that can mimic musculoskeletal pathologies with the same clinical signs and symptoms.ConclusionsReviewing cases with vascular abnormalities on musculoskeletal examinations can help the radiologist to detect some patterns and extend the differential diagnosis.

MKEE-115 More Than Just a Pinch: A Comprehensive Review of Ankle Impingement Syndromes

Participants
Hira Qureshi, BA, Mason, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review anatomy of the ankle and spaces at risk for impingement2. Describe clinical presentation and spectrum3. Discuss causes of impingement4. Imaging overview5. Discuss treatment

TABLE OF CONTENTS/OUTLINE

-Introduction-Background-Review of anatomy-Role of imaging-Impingement syndromes: presentation, pathophysiology, imaging -Anterolateral-Soft tissue pathology-MRI: High signal intensity and thickening of ATFL andAITFL, synovial hypertrophy and distortion of anterolateral gutter-Tx: Conservative, arthroscopy-Anterior -Osseous outgrowth causing synovial reactivity-Radiographs: anterior tibiotalar osseous prominence-MRI: osteophytes, synovial thickening, scarring-Tx: Conservative, arthroscopy-Anteromedial-Soft tissue and osseous pathology-Radiographs: Medial malleolar osteophytes-MRI: Anterior deltoid thickening, synovitis, osteophyte formation-Tx: Conservative, arthroscopy-Posteromedial-Soft tissue pathology-MRI: intermediate signal of posterior tibiotalar ligament with thickening and loss of normal fibrillation-Tx: Conservative, arthroscopy-Posterior-Soft tissue pathology with anatomic predisposition, os trigonum -MRI: Bone marrow edema, edema at synchondrosis, thickening of posterior ligaments-Tx: Conservative, arthroscopy-Extra-articular-Biomechanical-MRI: cystic changes and bone marrow edema of lateral

talus-Tx: osseous correction or arthrodesis-Summary

MKEE-116 Do Not Let It Go:Frozen Shoulder and Capsulitis At Other Sinovial Joints

Participants
Deodato Cartaxo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the normal anatomy of shoulder, hip and other joints.Describe the pathophysiological mechanism and clinical evolution of adhesive capsulitis.Review the main image findings present on MRI, ultrasound and arthrography through didactically illustrative cases of adhesive capsulitis and its differential diagnosis.Exemplify the importance of a precise diagnosis in terms of treatment planning.

TABLE OF CONTENTS/OUTLINE

Review anatomy, pathophysiological mechanism and discuss about the different radiological findings of adhesive capsulitis of the shoulder and other joints, based on cases obtained from the digital file of our magnetic resonance institution and other methods. We also provide literature review, teaching points, take home message and references.

MKEE-117 Ultrasound-guided Intervention of Small Joints

Awards
Certificate of Merit

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound-guided intervention of small joints can be technically challenging because of irregular bony contour, size of joints disproportionately small compared to utilized tools and superficial location of intended targets. The objectives of this educational exhibit are: • 1. To identify clinical manifestations and indications of US-guided small joint interventions • 2. To describe the various indications for, contraindications to and expected outcomes associated with US-guided small joint interventions • 3. To demonstrate techniques, tips and tricks in performing these procedures by correlating with cross sectional images and graphic illustrations

TABLE OF CONTENTS/OUTLINE

Axial skeleton • Temporomandibular joint • Sternoclavicular • Symphysis Upper extremity • Tenotomies at the elbow • Ulnar nerve at cubital tunnel • De Quervain’s tenosynovitis • Trigger finger • Median nerve at carpal tunnel • DRUJ Lower extremity • PeriAchilles region • Plantar fascia • Morton's neuroma

MKEE-118 Extensor Pollicis Longus: Imaging Review of Anatomy, Function and Pathology

Participants
Cedric Bohyn, MD, Antwerp, Belgium (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Learn normal anatomy and variants2. Learn the EPL’s function3. How to image and normal findings4. Learn specific pathology:- Tenosynovitis- Distal intersection syndrome- Tendon tear- Delayed tendon rupture- Tendon subluxation and dislocation- Tendon entrapment

TABLE OF CONTENTS/OUTLINE

1. Anatomy, variants and associated structures:- Extensor Pollicis Longus- Lister’s tubercle- Extensor retinaculum- Sagittal band of the first metacarpal joint2. Function3. Imaging Considerations3. Dysfunction/Pathology- Tenosynovitis- Distal intersection syndrome- Tendon tear- Delayed tendon rupture- Tendon subluxation and dislocation- Tendon entrapment

MKEE-119 Anything is Possible if You've Got Enough Nerve! Ultrasound (US) Approach to the Upper Limb Nerves

Participants
Michaela Cellina, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To show the US approach to the nerves of the upper limb, involving the technique, patient's positioning, and anatomical landmarks. To describe dimensional and echo-structural characteristics of non-pathological nerves.

TABLE OF CONTENTS/OUTLINE

Thanks to its spatial resolution, wide availability, and possibility of real-time and dynamic evaluation, US is the first level exam for the peripheric nerves study, but its use is still limited by a lack of knowledge and expertise. One of the most common indications is suspected nerve entrapment (e.g. carpal and cubital tunnel syndromes). Peripheral nerves should be studied with high-frequency linear array probes. Nerves are usually identified on the axial planes in defined anatomical landmarks. Normal nerves show a fascicular, honeycomb appearance in the short axis and are surrounded by hyperechoic connective tissue. In the long axis, the nerve aspect is coarse and hypoechoic.Important landmarks for median nerve identification are the brachial artery in the upper arm and elbow, the flexor digitorum profundus and flexor digitorum superficialis in the forearm and the carpal tunnel in the wrist. Cross-sectional area (CSA) at three sites of the median nerve ranges from 5.38 to 8.43 mm2. The ulnar nerve is evaluated posteriorly to the brachial artery in the upper arm, at the level of the medial epicondyle of the elbow and the pisiform bone of the wrist. CSA at various points for the ulnar nerve ranges from 2.76 to 5.21 mm2. The radial nerve is assessed at the level of the arm-spiral sulcus on the posterior aspect of the humerus and has a normal CSA of 4.72 mm2. The thickening of the nerve sheath is a very common finding in the main demyelinating neuropathies, both hereditary and acquired.

MKEE-12 Participants Strong as Your Weakest Link: The Kinetic Chain and Pitching Injuries of the Elbow

Akwasi Opoku, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The "kinetic chain" is the coordinated translation of force and motion from the lower extremity/core into the upper extremity during pitching. Any deviation-abnormal anatomy, physiology, or mechanics- places increased forces across joints, predisposing to injury, especially of the elbow. This multimodality imaging review of repetitive valgus stress injury of the elbow in pitchers emphasizes important imaging findings for surgical intervention. Intra-operative correlation is provided. After viewing this exhibit, the learner should be able to: 1) Understand the biomechanics of pitching, including the concept of the kinetic chain, and recognize potential chain disruptors. 2) Recognize patterns of valgus injury of the elbow in pitchers. 3) Discuss important preoperative imaging findings for ulnar collateral ligament and osteochondral injuries.

TABLE OF CONTENTS/OUTLINE

Introduction: (1) Biomechanics of pitching: kinetic chain (2) Deviations in the kinetic chain (anatomy, physiology, mechanics)Elbow injury of the elite pitcher: Repetitive valgus overload (1) Medial Tensile force overload: UCL and common flexor tendon origin) (a) anatomy (b) pathology (tear grade and location, ligament edema, associated osseous changes) (c) Role of MR arthrography(2) Lateral compressive force overload: radiocapitellar joint (a) anatomy (capitellar bare area mimic) (b) pathology (osteochondral injury, Panner's disease)(3) Valgus extension overload (a) pathology (asymmetric osteoarthritis, ulnohumeral impaction)(4) Management of elbow injury: important imaging findings (a) surgical vs non-surgical (b) surgical technique

MKEE-120 Pointing to the Problem: A Comprehensive Approach to Finger Disorders

Participants
Augusto Altoe, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand the anatomical basis involved in finger injuries;2. To describe the imaging patterns of the finger pathologies;3. To recognize common and uncommon finger disorders.

TABLE OF CONTENTS/OUTLINE

1- Background. 2- MRI acquisition considerations. 3- Finger ligaments; a. Review of the finger ligaments; b. Collateral ligament injuries of the finger; c. Locked metacarpophalangeal joint; d. Ulnar collateral ligament tears of the thumb; e. Volar plate injuries. 4- Flexor tendons and pulley system; a. Review of the flexor tendons anatomy and pulley system; b. Flexor tendon injuries and lacerations; c. Pulley injuries; d. Trigger finger. 5 - Extensor mechanism; a. Review of the extensor mechanism anatomy; b. Terminal extensor tendon injury (Mallet Finger); c. Central slip injury; d. Sagittal band injury. 6- Miscellaneous; a. Macrodystrophia lipomatosa; b. Acro-osteolysis; c. Palmar fibromatosis (Dupuytren's contracture); d. Tenosynovial giant cell tumor; e. Fibroma of the tendon sheath. 7 - Take home messages.

MKEE-121 Talk to the Hand - Ultrasound evaluation of Tendon, Ligament, and Support Structure Injury in the Hand with MRI Correlation

Awards
Cum Laude

Participants
Peter Hoeksema, MD, Detroit, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Normal appearance of the flexor and extensor tendons of the hand on ultrasound. Review of scanning technique to optimize imaging of desired structures. Discussion of normal anatomy and insertion of tendons. Review of the pulleys on the flexor surfaces of the hand. Discussion of the extensor hood and sagittal bands. Review of the UCL at the first MCP joint.2. Ultrasound examples of injury involving the FDP, and FDS. Ultrasound example of pulley abnormalities with trigger finger. Concurrent MRI examples of pathology demonstrated on US.3. Ultrasound examples of injury extensor tendons. Example of sagittal band injury with dynamic subluxation of the tendon. Concurrent MRI examples4. Ultrasound examples of UCL injuries (partial and full thickness tear). Example of a Stener type lesion.

TABLE OF CONTENTS/OUTLINE

- Anatomy and Imaging Reviewo Review of optimal imaging technique for the flexor and extensor tendons. Review of associated normal anatomyo Review of the normal location of the flexor pulleys and imaging appearanceo Review of optimal position and technique to visualize the UCL of the thumb- Volar Pathology with radiographic and MRI correlates as availableo Ultrasound examples of FDP/FDS tendon tears with static and dynamic images.o Ultrasound of injury to the flexor pulley apparatus. Dynamic US imaging of trigger finger- Dorsal Pathology with radiographic and MRI correlates as availableo Ultrasound example of extensor tendon tearo Ultrasound examples of sagittal band injury with dynamic examples of tendon subluxation- UCLo Example of injury to the thumb UCL on ultrasound with MRI exampleso Example of Stener lesion on ultrasound

MKEE-122 Hypermobility Syndrome - Findings on an Underestimated Diagnosis of Carpal Instability Non-dissociative by the Radiologist

Participants
André Henrique Toledo, Campinas, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Carpal instability is a complex and heterogeneous clinical condition. Management requires accurate identification of the structural lesion involved. Midcarpal instability is a form of non-dissociative carpal instability and can be caused by various combinations of extrinsic ligament injuries with abnormal kinematics between the carpal rows. Such instability is related to biomechanical alterations of multiple causes that, if not identified and treated in a timely manner, will lead to gradual joint collapse. It is important to note that unstable wrist initially does not show relevant signs on standard radiographs and studies such as Magnetic resonance imaging

(MRI) and MRI arthrography can detect initial findings of instability. In more advanced stages, carpal instability can progress to static wrist misalignment and osteoarthritis, both of which are associated with significant morbidity and disability. To prevent complications and joint sequelae, the radiologist must be aware of this challenge for the early and accurate diagnosis of carpal instability as an important entity, but often undervalued and remembered.

TABLE OF CONTENTS/OUTLINE

Role of the Radiologist - What differential diagnosis would you think? - Step by step in imaging and classic instability signs - Classification and what to look for Differential diagnosis review - is there room for hypermobility syndrome? - Carpal instability x joint hypermobility syndrome - What to expect? - Take home menssage.

MKEE-124 Spectral CT Imaging of the Bone Marrow: How To Do It”

Participants
Bernhard Petritsch, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

TEACHING POINTS

To review the indications, contraindications and limitations of spectral CT imaging in terms of photon counting detector computed tomography (PCD-CT) and conventional energy integrating detector (EID) dual-energy computed tomography (DECT) for bone marrow imaging. To learn about the basic physical principles of PCD-CT and conventional DECT imaging with emphasis on bone marrow applications. To interpret spectral bone marrow CT scans of healthy subjects, patients with acute fractures or malignant bone marrow infiltration. To highlight the potential benefits of spectral CT investigation as a comprehensive examination of osseous morphology and additional bone marrow information.

TABLE OF CONTENTS/OUTLINE

A. Basic principles of photon counting detector (PCD) and energy integrating detector dual-energy computed tomography (DECT).B. Technical differences in data acquisition: PCD CT vs. Single-Source EID vs. Dual-Source EID CT-scanners (differences between 1st-3rd generation dual-source scanners).C. Post-processing: Material-decomposition algorithm, creation of VNCa (“virtual non-calcium”) images.D. Data acquisition: Parameter settings for PCD and dual-energy CT of the extremities, spine and pelvis.E. Current applications of spectral CT for the detection of acute fractures and malignant bone marrow infiltrations (e.g. in multiple myeloma): examples in the spine, pelvis and extremities.F. Pitfalls and limitations of spectral bone marrow Imaging; alternative imaging modalities.

MKEE-125 Don't Let the Foot Drop: Review of the Anatomy, Imaging, and Pathologies of the Sciatic Nerve and its Branches

Participants
Andrew Liu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Foot drop is a common reason for consultation and deserves a quick clinical and radiological assessment. Knowledge of the anatomy, the course and the division of the sciatic nerve and its branches is required so that the radiologist can image the adequate anatomical area whether by ultrasound or by MR imaging. The advantages of ultrasound lie in the possibility to survey the entire nerve and its branches in a short period of time. However, this modality remains operator-dependent. Through this Education Presentation, a review of the anatomy of the sciatic nerve and its branches, the different modern modalities available, and pathologies that might affect the sciatic nerve and its branches nerve is propose.

TABLE OF CONTENTS/OUTLINE

Revise the anatomy of the sciatic nerve, the common peroneal nerve, the superficial and deep peroneal nerves Understand, revise and optimize cross-section imaging (MRI neurography and ultrasound). Navigate through traumatic (traumatic neuroma, post-amputation neuroma), tumoral (BNPST, MPNST, neurofibromatosis, etc.), and miscellaneous pathologies (intra-neuronal and extra-neuronal ganglion cyst) of the lower extremity nerves.

MKEE-126 Musculoskeletal Ultrasound: No Pain, No Gain - A Compilation of Techniques and Lesions

Participants
Cleiton Freitas, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

A) Musculoskeletal ultrasound should be based on systematized image acquisition techniques and on the recognition of multiple pathologies. B) Importance of documenting and visualizing the appropriate musculoskeletal anatomical structures, focusing on teaching the Radiology Resident physicians the most recommended techniques. C) For each analyzed body segment, pathologies of significant clinical importance, including common and uncommon pathologies will be analyzed. D) More than 40 pathologies and their differential diagnoses will be analyzed, because no pain no gain.

TABLE OF CONTENTS/OUTLINE

- Introduction- Anatomy review- Ultrasound imaging capture sequence- Lesions and their differential diagnosis- Take-home massages

MKEE-127 Imaging of Postoperative Pectoralis Major Tendon: What Radiologists Need to Know

Participants
Luana Maciel, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To evaluate the appearance of pectoralis major tendon after surgical correction. • To assess the MRI aspects of the pectoralis major muscle tendon after surgical repair, using different approaches, such as anchors, cortical buttons, bone holes or surgical reconstruction using autologous graft (semitendinosus, gracilis) or allograft.

TABLE OF CONTENTS/OUTLINE

• Anabolic steroids usage by weightlifting athletes gym work out men has led to a significant increase in the incidence of pectoralis major injuries. • Ecchymosis and local hematomas followed to those lesions limits clinical evaluation and make imaging crucial for injury graduation and repair planning. Magnetic resonance imaging and ultrasonography are established as methods of choice. • Surgical treatment is the best approach for pectoralis major injuries. • Humeral tendon reinsertion using either surgical wires or metallic anchors are chosen for acute lesions and orthopedic screws for chronic ones. Old injuries with tendon retraction may require reconstruction with autologous graft, commonly from the hamstrings or allograft. • Surgical treatment reported a lower degree of strength loss compared to conservative conduct. In addition, it was superior regarding aesthetic and functional gain, with a high rate of sports activity return. • Imaging plays an important role not only for diagnose and surgical planning but also to postoperative follow-up, depicting early changes not seen in clinical evaluation.

MKEE-128 Normal and Abnormal MRI Finding of Rotator Interval Correlated with Athroscopy

Participants
Ji Yoon Lee, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe normal MRI anatomy of rotator interval, with associated arthroscpy finding. 2. To present MRI finding of rotator interval pathology, correlation with arthroscopy. 3. To present associated findings at long head of biceps tendon and subscapularis tendon, correlation with arthroscopy. 4. To enhance rotator interval image interpretation and let better coordination between radiologists and orthopedic surgeons in terms of surgical planning or retrospective image review.

TABLE OF CONTENTS/OUTLINE

1. Normal MRI and arthroscpy finding of rotator interval. 2. Abnormal MRI findings of rotator interval, including biceps tendon tear and subluxation, subscapularis tendon lesion, synovitis, adhesive capsulitis are presented, with corresponding arthroscopy image.

MKEE-129 The Repaired Rotator Cuff: Normal and Abnormal Appearance with Focus on US and MRI

Awards
Cum Laude

Participants
Paola Kuenzer Goes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The repaired rotator cuff frequently appears abnormal on ultrasound (US) and magnetic resonance imaging (MRI). While the appearance of tendons and surrounding tissues typically normalize, they can demonstrate clinically insignificant abnormal imaging appearances for longer than 6 months. US and MRI are useful in the postoperative assessment of the rotator cuff, not only for evaluation of the integrity of the rotator cuff, but also for detecting hardware complications and ruling out other sources of shoulder pain. The objectives of this educational exhibit are:1. Briefly review the US and MRI findings of the normal postoperativerotator cuff2. Discuss US and MRI findings of various types of repair and fixation3. Illustrate US and MRI findings of post rotator cuff repair complications according to three potential sources (tendon, hardware and soft tissues)

TABLE OF CONTENTS/OUTLINE

Normal postoperative rotator cuff• Types of repair Which tendon(s) was repaired, method of repair (tendon suture, reinsertion, transfer of tendons or grafts), and types of fixation (transosseous, double-row, double-row bridged)• US findings• Early MRI findings• Late MRI findingsComplications• Tendon Partial re-tear Complete re-tear• Hardware complications Fracture Migration• Soft tissues Infection Bursitis Adhesive capsulitis

MKEE-13 Imaging Review of the Healing Process in Sport Muscle Injuries

Awards
Identified for RadioGraphics

Participants
Jaime Isern, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the mechanisms of muscle injury, repair and regeneration. 2. To present the imaging technique of choice for the healing process study. 3. To describe the MRI findings of reparative changes of a muscle tear. 4. To show the muscle adaptive changes by MRI during the healing process. 5. To show the imaging findings that suggest aberrant progression of the healing process.

TABLE OF CONTENTS/OUTLINE

Physiological mechanism of the healing process after muscle sport injury. MRI protocol to assess the reparative process of sports muscle injury. Review of imaging findings of the healing process and adaptative changes. Discuss the influence of MRI findings on the therapeutic decision.

MKEE-130 Postoperative Rotator Cuff (Surgical Indications, Normal and Pathological Postoperative Findings) - A Practical Guide for Radiologists

Participants
Camila Munaro I, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.To review the anatomy of the rotator cuff and discuss common tendon tears2.To review surgical procedures and indications for treatment of rotator cuff tears3. To review the challenging clinical and radiologic scenario of postoperative shoulder4.To describe normal expected postoperative appearances of the rotator cuff tendons5. To discuss the most common pathological postoperative

findings, including recurrent tears, infection, anchor migration, nerve injury and muscle degeneration.

TABLE OF CONTENTS/OUTLINE

1 - Anatomy of rotator cuff2 - MR Imaging of rotator cuff tears3 - Treatment of rotator cuff tears4 - Surgical indications5 - MR evaluation of the expected postoperative rotator cuff6 - Recurrent tears7 - Infection8 - Anchor migration9 - Nerve injury10 - Muscle atrophy and fatty degeneration

MKEE-131 Multimodality Review of Sclerotic Lesions in the Spine

Participants
William Holden, MD, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Sclerotic lesions of the spine can be challenging to characterize due to their broad differential and overlapping imaging features. A methodical approach is necessary when formulating a differential diagnosis for these lesions. This educational exhibit will review patterns of focal, multifocal, and diffuse vertebral body sclerosis on multiple modalities, including plain radiographs, CT, MRI, MDP bone scan, and FDG-PET. This review will provide a framework for evaluating different categories of osseous sclerosis, including infectious/inflammatory, neoplastic, metabolic, and developmental causes. Familiarity with specific imaging patterns and assessment of pertinent clinical information will allow the radiologist to more accurately interpret sclerotic lesions of the spine, and recommend appropriate follow-up and additional imaging evaluation.

TABLE OF CONTENTS/OUTLINE

1. Provide an overview of modalities used for the evaluation of sclerotic bone lesions, including plain radiographs, CT, MRI, MDP bone scan, and FDG-PET. 2. Review common and uncommon cases of focal, multifocal, and diffuse sclerotic vertebral lesions. a. Cases will include 3-4 examples from each category: i. Infectious/inflammatory ii. Neoplastic iii. Metabolic iv. Developmental b. For each lesion, the discussion will include: i. Multimodality imaging findings ii. Pertinent clinical history iii. Diagnostic pearls 3. Provide a diagnostic algorithm for the evaluation of sclerotic vertebral lesions.

MKEE-132 Sacral Lesion - Recognizing the Most Common Lesions

Participants
Andre Y. Aihara, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is:- Review the normal anatomy and imaging appearance of the sacrum, using CT and MR images.- Didactically discuss sacrum lesion, dividing into 4 categories: Tumors, trauma, infections, and non-infectious inflammatory arthropathies.- Elucidate the typical findings of sacral tumors, frequent locations, age and sex distribution, and characteristic imaging findings.

TABLE OF CONTENTS/OUTLINE

The sacrum is a structure located in the pelvis with an important role in spinal biomechanics. It is composed of multiple tissues: cartilage, bone marrow, nerves, meninges and notochord remnants. This diversity of components can originate different primary tumors, most of them with predicted location and imaging findings. Since the sacrum is rich in hematopoietic bone marrow, metastasis is frequent.Sacral fractures can result from high-energy trauma or be related to low-energy impact, as in insufficiency stress fractures. The typical H-shaped pattern can be seen in bilateral sacral insufficiency fractures.Most sacrum infection is by continuity spread, common with the infection of the pelvic adjacent organs.Finally, it is important to remember inflammatory arthropathy and those resulting from local mechanical overload.

MKEE-133 Atlantoaxial Injuries: Don't Lose Your Head!

Awards
Identified for RadioGraphics

Participants
Leticia Morimoto, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is:• Revisit the anatomy of the atlantoaxial joint, highliting the ligamentous structures• Review with didactic cases the main atlantoaxial fractures and its associated injury mechanisms• Present several cases of non-traumatic lesions of the atlantoaxial joint, including inflammatory, infectious and tumoral conditions

TABLE OF CONTENTS/OUTLINE

• Introduction and overview of the atlantoaxial joint, including normal anatomy with didactic illustration.• Demonstrate the ligamentous anatomy and how to recognize it on MRI.• Demonstrate didactically the radiographic, CT and MRI findings of several traumatic atlantoaxial traumatic injuries.• Overview the classifications for atlantoaxial trauma injuries.• Review the manegement treatment options for each injury, and their post-operatory exames, highlighting what the radiologist should look for.• Challenging cases of non-traumatic diseases, including rheumatoid arthritis, villonodular synovitis, infections, neurofibromatosis, Langerhans cell histiocytosis, and others.• Summary.

MKEE-134 Bone-RADS Classification - What the Radiologist Needs to Know

Participants
Verena Pires, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the Bone-RADS (bone reporting and data system) classification with a simple guide using examples.To provide radiologists with a general overview enabling them to understand and interpret Bone-RADS in different lesions.

TABLE OF CONTENTS/OUTLINE

Incidental solitary bone lesions are frequently encountered on computed tomography (CT) and magnetic resonance imaging (MRI) in routine clinical practice. Despite the prevalence of these unexpected lesions, clear and consistent guidelines for their management have not been defined in the literature. The purpose is to present algorithms for the diagnostic management of solitary bone lesions incidentally encountered on CT and MRI in adults. For risk stratification, the Bone-RADS recommends four categories, incorporating the range of benign to suspicious for malignancy or need for treatment (Bone-RADS1, leave alone; Bone-RADS2, perform different imaging modality; Bone-RADS3, perform follow-up imaging; Bone-RADS4, biopsy and/or oncologic referral). Two algorithms for CT based on lesion density (lucent or sclerotic/mixed) and two for MRI allow the user to arrive at a specific Bone-RADS management recommendation. Representative cases are provided to illustrate the usability of the algorithms.The ultimate goal is to optimize bone lesion outcomes while minimizing unnecessary surgical procedures in patients at low risk of malignancy and to provide a management recommendation for each risk category. Then, this classification can standardize lesions and decrease ambiguity reporting to enhance communication among the multidisciplinary team.

MKEE-135 The Role of Conventional Radiography in the Diagnosis of Bone Tumors

Awards
Identified for RadioGraphics

Participants
Abel Gonzalez Huete, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To provide an educational review of bone tumors and their appearance in conventional radiography. 2. To review differential diagnosis and discuss a systematic approach to the diagnosis of bone tumors and tumor-like lesions based on conventional radiography features and clinical presentation.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Age of presentation. 3. Review of imaging findings. - Opacity (lytic, sclerotic, mixed). - Margin and destruction patterns. - Periosteal Reaction. - Cortical Involvement. - Mineralization (chondroid matrix, osteoid matrix). - Location: skeleton, longitudinal (epiphyseal, metaphyseal, diaphyseal), transverse (centric, eccentric, cortical, juxtacortical). - Number (solitary, multiple, polyostotic). - Soft Tissue Component. 4. Sample cases and mimics. 5. Summary.

MKEE-136 Whole-body Imaging on Multiple Myeloma: Imaging Modalities and Applications

Participants
Henrique Lino, MD, Sau Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Multiple myeloma is the most common primary tumour of bone with an incidence of 10 per 100,000. Multiple myeloma whole-body imaging techniques (MM-WB) can help detect subclinical lesions and determine early treatment, increasing prognostic and avoiding fractures and other complications.

TABLE OF CONTENTS/OUTLINE

Introduction: The MM-WB modalities are x-ray skeletal survey, computed tomography (CT), magnetic resonance (MRI), computed tomography 18F-fluorodeoxyglucose positron emission tomography (PET-CT).Objectives:(1) to review the use of MM-WB. (2) to exemplify cases and compare the imaging modalities. Methods: We queried cases to illustrate the imaging methods. Discussion: Although skeletal survey is the reference method, it has a high false negative rate (30-70%). Axial methods have a higher sensitivity (68-100 %) for the condition. The general diagnostic criteria for axial methods, by the International Myeloma Working Group, is one or more focal lesions with 5 mm or more, with osteolytic behaviour. Among these methods, MRI has the advantage of no radiation, and it has the best diagnostic performance for the evaluation of soft tissue lesions and bone marrow compromise as well it has a high specificity from 83 to 100%, and also treatment response (as well as PET-CT).Conclusion: multiple modalities of MM-WB can detect focal and diffuse disease, quantify burden, and predict treatment response as well it is able to detect mechanical complications.

MKEE-137 Sacral Insufficiency Fractures in Cancer: Is There a Met Hiding in Plain Sight?

Participants
Kaustav Bera, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the different causes of sacral insufficiency fractures (SIFs)2. Review the various imaging modalities used to diagnose SIFs3. Discuss the role of imaging findings along with clinical and laboratory findings to determine the cause of the SIFs4. Review ways to differentiate SIFs from metastatic lesions of th sacrum5. Discuss management and outcomes of SIFs

TABLE OF CONTENTS/OUTLINE

1. Introduction and history of sacral insufficiency fractures (SIF) as an entity2. Epidemiology and demographics of SIF3. Risk factors for SIF4. Clinical History and symptoms in SIF5. Association of SIF with disease conditions (Renal osteodystrophy, Rheumatoid Arthritis, Paget disease)6. Different imaging modalities that help in diagnosing SIF 7. Different etiologies that cause SIFa) Age induced/Osteoporoticb) Inflammatory arthropathyc) Radiation inducedd) Hormone inducede) Other Drug induced (Steroids/Bisphosphonate)8. Cancers that often metastasize to the sacrum and can mimic SIF9. Imaging findings coupled with clinical and laboratory parameters that help you distinguish between different etiologies of SIF as well as contrast it from Metastatic disease10. Management of SIF11. Prognosis and clinical outcome of SIF

MKEE-138 The Role of Cinematic Rendering in the Evaluation o Complex Vascular Injury of the Lower Extremities: How We Do It

Participants
Elliot Fishman, MD, Owings Mills, MD (*Presenter*) Co-founder, HipGraphics, Inc;Stockholder, HipGraphics, Inc;Institutional Grant support, Siemens AG;Institutional Grant support, General Electric Company;Consultant, Exact Sciences Corporation;Consultant, Imaging Endpoints

TEACHING POINTS

1. CT with CTA is the state of the art for the evaluation of the patient with lower extremity trauma regardless of whether the trauma is an MVA,, gunshot wound or stabbing or simply a fall2. diagnosis of injury is but step one in patient management and the role of 3D has classically been to help with management decisions by improving understanding of the true extent of the injury.3. Cinematic rendering is an advanced form of volume rendering which is ideal in the trauma setting by visualization of muscle and soft tissue, the vascular map and underlying bony structures. When optimized it provides a clear understanding of the "personality" of the specific injury4. the use of Cinematic Rendering provides an opportunity to provide extra value in the interpretation and management of complex trauma to the lower extremities. A paradigm for use of cinematic rendering is addressed.

TABLE OF CONTENTS/OUTLINE

1. Imaging protocols for lower extremity trauma including the role of dual energy CT2. imaging protocols for using cinematic rendering for the range of lower extremity trauma3. analysis of case studies showing the added value of cinematic rendering in trauma of soft tissue/muscle, the bony anatomy and the vascular map. Specific presets for optimizing workflow and analysis are presented4. case studies showing the impact of cinematic rendering on patient management are presented, and discussed5. role of Cinematic Rendering for patient management dcisions is addressed and illustrated as well. potential pitfalls and limitations of Cinematic Rendering are also discussed and illustrated

MKEE-139 Staying Afloat With the Competitive Swimmer - Common and Uncommon Injuries

Participants
Sonja Opper, DO, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Athletic injuries have been well documented in the literature, particularly in mainstream sports such as football, soccer and baseball. A sport that is poorly represented in the literature is swimming. 2. Swimmers are susceptible to chronic types of stress on their bodies as a result of varying repetitive physical movements, as well as unique environmental and chemical exposures. The majority of swimming related injuries are a result of repetitive microtrauma in the shoulders, elbows, and knees. 3. Acute injuries often relate to the flip turn, starts/finishes and the dive where there are rapid accelerations and declarations as well as the potential for barotrauma while submerged. 4. In this presentation we will review common and uncommon injuries in avid swimmers and review the mechanism of injury in these athletes with special attention to the physiology of different strokes.

TABLE OF CONTENTS/OUTLINE

1. Review the 4 basic strokes (freestyle, backstroke, breaststroke, and butterfly) and flip turns with videos illustrating the mechanics, areas of stress, and potential for injuries. 2. Review imaging of the common injuries related to competitive swimmers. a. Shoulder injuries b. Knee injuries c. Foot injuries d. Hip injuries 3. Discuss the environmental and chemical exposures that predispose swimmers to unique injuries. 4. Interactive cases

MKEE-14 Let's be "Franc" about the Lisfranc: A Review of Anatomy, Pathology, and Disease Mimics

Participants
Sirui Jiang, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the anatomy of the Lisfranc joint complex2. Review the clinical presentation and causes of injuries to the Lisfranc joint complex3. Multimodality imaging overview of Lisfranc joint complex injuries including common measurements and hallmark findings4. Discuss common radiographic mimics of Lisfranc injuries5. Overview of orthopedic management of Lisfranc injuries

TABLE OF CONTENTS/OUTLINE

Background-Image-based anatomy review of the Lisfranc joint complex-Incidence of Lisfranc injuries and diagnostic missesEtiology of Disease -Biomechanical/Traumatic Causes-Soft tissue injuries without dislocation-Bony injury with mild displacement -Bony injury with marked displacement-Clinical Presentation-Physical Examination Imaging Studies-Radiographs-AP, lateral, and oblique views during weight-bearing-How to identify dislocation of the Lisfranc joint complex-Spectrum of findings in alternative views -Spontaneous reduction during radiographic evaluation-Other Imaging Modalities-CT-MRI-Ultrasound Common Mimics -Vascular calcifications -Os intermetatarseum Complications-Post-traumatic arthrosis-Instability-Chronic painManagement-Non-operative management-Surgical fixation-Repeat imaging-Post-operative physical therapy

MKEE-140 Traumatic Instabilities of the Cervical Spine: What the Radiologists Need to Know

Participants
Alan Strapasson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. Review the anatomy in the different imaging methods and their main variations relevant to trauma assessment.2. Review measurement techniques.3. Correlate the trauma mechanism with the main injuries related to each one of them.4. Address the most common ligament injuries with a focus on MRI.5. Discuss atlantoaxial dissociation and odontoid fracture. 6. Classification of lesion instability (Vaccaro, NEXUS).

TABLE OF CONTENTS/OUTLINE

1. Anatomy and assessment of CR, CT and MRI in adults and children and their main anatomical variations relevant to the assessment of trauma. 2. Measurement techniques: Wackenheim, Chamberlain, Mcgregor, Power Ratio, basion-axial interval, atlantodental interval. 3. Flexion injuries: wedge compression fracture, flexion teardrop fracture, anterior subluxation, bilateral facet dislocation, Clay Shoveler, anterior atlantoaxial dislocation. 4. Hyperflexion and rotation: unilateral facet displacement (locked facet). 5. Extension: hangman's fracture, teardrop fracture by extension.6. Axial compression: Jefferson fracture, burst fracture.7. Odontoid fracture.8. Atlantoaxial Dissociation.9. Ligament injuries: alar and transverse ligament.10. Vaccaro Classification (2007), Harris.11. Unstable fractures in order.12. NEXUS Criteria.

MKEE-141 Myxofibrosarcoma Imaging with Pathological and Clinical Correlation

Participants
Robert W. Morris, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Myxofibrosarcoma is one of the most common sarcomas in older patients, but has only relatively recently been defined as a distinct pathological entity. There is also limited information about myxofibrosarcoma in the radiology literature. After viewing this exhibit, the viewer should be able to: 1. Describe the pathological features of myxofibrosarcoma. 2. Describe the typical imaging appearance of both low-grade and high-grade myxofibrosarcoma. 3. Discuss ancillary imaging and post-treatment imaging. 4. Recognize important features for staging, treatment and prognosis.

TABLE OF CONTENTS/OUTLINE

Table of Contents: 1. Myxofibrosarcoma overview 2. Pathology 3. Imaging characteristics 4. Low-grade myxofibrosarcoma 5. High-grade myxofibrosarcoma 6. Ancillary imaging and staging 7. Treatment 8. Post-treatment imaging 9. Prognosis 10. Conclusion

MKEE-142 Checkmate to Chest Wall Tumors: A Strategical Approach to Diagnosis

Participants
Rebeca Francelino, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review the most common tumors and their characteristic imaging findings. 2. To discuss the diagnosis and management of benign and malignant tumors.3. To correlate the imaging findings and clinical clues on a systematic approach to help narrowing the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1- Institutional Protocol to evaluate the chest wall; 2- Epidemiological assessment of the main lesions and best imaging modality; 3- Bening bone and cartilaginous tumors: Osteochondroma; Fibrous dysplasia; Aneurysmal bone cyst (ABC); Giant cell tumor (GCT); Ossifying fibromyxoid tumor; Chondromyxoid fibroma4- Malignant bone and cartilaginous tumors:Chondrosarcoma; Multiple Myeloma; Metastasis; Osteosarcoma5- Benign soft tissue lesions:Hemangioma; Elastofibroma dorsi; Fibrous Hamartoma of Infancy; Lipoma; Schwannoma; Desmoid Tumor; Neurofibroma; Ganglioneuroma; Paraganglioma; Hemangiopericytoma 6- Malignant soft tissue lesions:Ewing sarcoma; Rhabdomyosarcoma; Synovial sarcoma; Pleomorphic sarcoma; Ganglioneuroblastoma; Neuroblastoma; Angiosarcoma; Leiomyosarcoma; Malignant fibrous histiocytoma (MFH); Malignant peripheral nerve sheath tumor; Dermatofibrosarcoma protuberans7- Miscelaneous Brown Tumor

MKEE-143 3D-MERGE MRI Sequence in the Assessment of Foot and Ankle Bone Abnormalities

Participants
Tatiane Rodrigues, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Discuss the use of MERGE MRI sequence in the assessment of bone abnormalities in the foot and ankle.2) Discuss clinical applications of synthetic-CT based images on MERGE sequence in the foot and ankle through a case-based approach.

TABLE OF CONTENTS/OUTLINE

Different techniques have been used to generate MRI-based synthetic-CT and have demonstrated equivalence toconventional CT. While MRI has superior soft tissue contrast when compared to CT, abnormalities that usually manifest as areas of low-signal intensity on conventional MRI scans, such as fracture lines, are better depicted on CT.Both modalities may complement each other in the characterization of several musculoskeletal disorders. Performing CT in association with MRI not only increases costs but also exposes the patient to ionizing radiation.MERGE (Multiple Echo Recombined Gradient Echo, GE Healthcare) is a spoiled T2*-weighted 3D sequence for spinal and musculoskeletal imaging, which has the acquisition and combination of multiple echoes with a high receiver bandwidth instead of using a single low bandwidth echo, that provides high resolution and isotropic images of the extremities with optimized contrast between the ligaments and soft tissue.The purpose of this work is to show the 3D-MERGE MRI sequence in the assessment of bone abnormalities of the foot and ankle in a case-based discussion. Radiologists need to be familiarized with MRI-based synthetic-CT techniques, such as MERGE, and their imaging findings to obtain an optimal evaluation of musculoskeletal conditions with the combination of conventional and innovative sequences.

MKEE-144 Shipwrecked: Spontaneous Osteonecrosis of the Navicular Bone

Participants
Juliana Sitta, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the anatomy, joints, ligaments, function, and vascularization of the navicular bone. Discuss the clinical features and mechanism of pediatric and adult avascular necrosis of the navicular bone. Illustrate the imaging characteristics of navicular osteonecrosis and complications in multimodality imaging at different stages of the disease

TABLE OF CONTENTS/OUTLINE

Navicular bone osteonecrosis, also known as Kohler disease, is a relatively uncommon, self-limited abnormality with typically good prognosis. It differs in imaging presentation and prognosis from its adult counterpart, known as Mueller Weiss disease, which often results in progressive navicular bone deformity and midfoot biomechanical impairment. This educational exhibit aims to explore the anatomic predispositions of the navicular to osteonecrosis as well as the imaging features of these two pathologically similar entities that affect patients at opposite ends of the age spectrum. This educational exhibit provide an overview of the navicular bone anatomy, including common anatomic variants and mimickers, relationship with neighboring bones, function, and vascularization. We discuss imaging features, imaging anatomy, and potential complications in the pediatric and adult types of avascular osteonecrosis of the navicular bone. Multimodality imaging and didactic illustrations will explore the injury mechanism and presentation spectrum. The authors raise attention to the role of imaging in assessing potential secondary biomechanical

complications and pitfalls.

MKEE-145 Working "Smarter" : A Review of Artificial Intelligence in Musculoskeletal Radiology

Participants
Vidya Sankar Viswanathan, MBBS, Shaker Heights, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Define Artificial Intelligence (AI) and other commonly associated terminology2. Review current applications of FDA approved AI tools in Musculoskeletal (MSK) Radiology (diagnostics, image processing)3. Describe ways that integration of AI can improve clinical workflow4. Discuss future technologies in AI, including Radiomics and Autonomous AI5. Review limitations of AI, including challenges that need to be addressed for clinical translation of these tools.

TABLE OF CONTENTS/OUTLINE

1. Introduction -Define Artificial Intelligence (AI), Machine learning, Deep learning, Convolutional Neural Networks(CNN), Generative Adversarial Networks (GAN)2. Current applications of FDA approved AI tools in Musculoskeletal Radiology A. Image Processing/Quantification -Improved visualization -Surgical planning B. Computer-aided diagnosis3. Improved Clinical Workflow with AI A. Image Acquisition Time B. Study Triaging C. Image Interpretation Time D. Scheduling4. Future of AI A. Interpretive tools -Device placement assessment -Augment Radiology Assistants B.Non-interpretive tools -Reduce noise and artifacts -Enhance contrast -Improved visualization of pathology -Worklist Prioritization -Improving Radiology Resident Education C. Radiomics D. Autonomous AI5. Challenges A. Clinical - Reluctance toward implementation -Information/knowledge gap -Reimbursement strategies B. Medico-legal -Liability: Physician vs. software developer vs healthcare institution -Advocacy for guidelines and legislation

MKEE-146 The Role of MRI in Evaluation of Soft Tissue Lesions of the Hand and Fingers: An Imaging Review of the Common Differential Diagnoses, Artifacts and Normal Findings Which Can Simulate Disease

Participants
Cormac O Brien, MRCPI, MRCP, Dublin 4, Ireland (*Presenter*) Nothing to Disclose

TEACHING POINTS

Soft tissue lesions of the hand and fingers are frequently encountered in everyday clinical practice. The can be detected incidentally or present as painfully or painless lumps. Lesions may be idiopathic or arise secondary to trauma, foreign body, infection or systemic illness. These lesions provide a unique diagnostic challenge due to the small size of the lesions, the wide differential and the intricate anatomy. Our teaching aim is to present a practical illustration of hand and finger soft tissue lesions along with relevant clinical findings, illustrate the normal MRI appearance’s which can simulate disease and help the radiologist to provide a more accurate diagnosis, allowing improved recommendations to the referring clinicians and minimize unnecessary investigations or biopsy.

TABLE OF CONTENTS/OUTLINE

First we describe the MRI protocols used to work up soft tissue lesions of hand and fingers.Secondly we evaluate the most common artifacts in hand and finger MRI such as pulsation, aliasing and phase-encoded motion artifacts and the review practical tips to optimize image quality.Third we provide an outline of the normal findings which simulate disease including Pacinian corpuscles and submatrical hyperintense area.Finally we Illustrate the key MRI imaging features of common soft tissue lesions of the hand and fingers including cystic lesions (glomus tumors, inclusion cyst), tumor like lesions (fibroma, keratoacanthoma, peripheral nerve sheath tumor), vascular lesions such as haemangioma and malignant lesions which include squamous cell carcinoma, malignant melanoma and metastasis, with plain film, CT and Ultrasound correlation.

MKEE-147 MRI of The Midhand: The Lesser Known Anatomy

Participants
Michel De Maeseneer, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-The anatomy of the midhand is complex and not well known. We illustrate this anatomy by MR-anatomical correlation. -It includes the distal tendon insertions, the muscles of thenar and hypothenar, the midpalmar compartment, the palmar bursa and synovial sheaths, the sesamoid apparatus of the thumb base, the palmar aponeurosis. -For each structure we illustrate and refer to the most important pathological conditions -A good knowledge of anatomy is essential to adequately assess normal and abnormal MR imaging of this region.

TABLE OF CONTENTS/OUTLINE

Outline1.Distal tendon insertions: AP, EPB, ECRB and ECRL, EPL, ED, EDM, ECU2.Muscles of the hypothenar: opponens, abductor, interosseous3. Muscles of the thenar: opponens, abductor, flexor brevis, flexor pollicis longus, adductor, interosseous.4.Midpalmar compartment: interosseous, lumbricals, neurovascular bundle, transverse metacarpal ligament5. Bursae and synovial sheaths: palmar bursa, synovial sheath of finger 1 and 5, synovial sheath of finger 2-4. 6. Thumb base; sesamoid bones, intersesamoid ligament, accessory collateral ligament, collateral ligament, dorsal aponeurotic expansion (hood) from abductor and adductor tendons7. Palmar aponeurosis: palmaris longus, apex of aponeurosis, pretendinous bands, transverse ligament of Skoog, natatory ligament

MKEE-149 Meniscus Repair: What Radiologists Need to Know

Participants
Camila De Paula Silva, MD, Botucatu, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is 1. To review and illustrate the surgical techniques of meniscal repair. 2. To show MRI images appearance of the repaired meniscus. 3. To show the postoperative normal and abnormal findings.

TABLE OF CONTENTS/OUTLINE

1. Imaging appearance of meniscus injuries before and after repair. 2. Types of surgical techniques of meniscal repair, including:

1- Imaging appearance of meniscus injuries before and after repair. 2- Types of surgical techniques of meniscal repair, including: Inside-out suture repairs, outside-in suture repairs and all-inside repairs. 3- Normal post surgery findings and how to differentiate it from abnormalities. 4- Main postoperative complications of meniscal repairs in MRI images, including: avulsion of the repair, progressive meniscal extrusion and progressive articular cartilage damage.

MKEE-15 Soft Tissue Calcifications on Ultrasound - Differentials and Radiographic Correlate

Participants
Alex Ward, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Ultrasound is not the modality of choice for evaluation of calcifications, however practitioners frequently encounter calcifications during diagnostic and procedural musculoskeletal ultrasound. These calcifications may be challenging to diagnose, especially if discovered incidentally. 2) Knowledge of the sonographic appearance of calcifications and their respective radiographic correlate can help clinicians comfortably diagnose soft tissue calcifications. 3) Review of commonly encountered calcifications focusing on their typical location, distribution, imaging appearance and mechanism of formation. 4) Focus on companion cases, potential pitfalls, and unique sonographic/radiographic features to distinguish and accurately identify calcifications (ex. HADD vs enthesopathy, ultrasound appearance of Gout vs CPPD, benign vs malignant causes of calcifications)

TABLE OF CONTENTS/OUTLINE

1) Terminology and categorization of calcification vs ossification. 2) Review of commonly encountered calcifications, including typical location/distribution, mechanism of formation, sonographic appearance with radiographic correlate, potential pitfalls of the following: A. Calcium hydroxyapatite deposition disease (HADD) B. Calcium pyrophosphate deposition C. Gout D. Enthesophytes E. Normal variant ossicles F. Myositis ossificans and other forms of heterotopic ossification G. Scleroderma H. Tumoral calcinosis in End Stage Renal Disease I. Phleboliths seen in vascular malformation J. Malignancy, including chondrosarcoma and calcification in synovial sarcoma

MKEE-150 MSK Word Salad: Making Sense of the Most Frequently Encountered Metabolic Bone Disorders

Participants
Andrew Liu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Metabolic bone disorders encompass those diseases which affect bone structure and/or mass and are caused by metabolic derangements. They are important to recognize as they are common and affect patients of all age groups. Metabolic bone disorders lead to considerable morbidity and mortality, as they weaken bones, regardless of the underlying morphologic changes, increasing the risk of fractures in elderly patients and stunting skeletal growth in children. Due to the lack of acute symptoms of many of these disorders, the radiologist is likely to make the initial diagnosis and facilitate subsequent workup.

TABLE OF CONTENTS/OUTLINE

This presentation covers the more commonly encountered metabolic bone disorders. For each disease, a brief summary of the pathophysiology precedes a discussion of characteristic imaging features to provide a basis for understanding WHY those findings occur. Each slide is centered on radiographic features, with cross-sectional imaging findings shown as correlates. This is because metabolic bone diseases are most often initially detected on radiographs. Disorders discussed will be categorized as osteopenic, osteosclerotic, or mixed pattern lesions.

MKEE-151 Skeletal Dysplasias: The Role of Radiologist's Report

Participants
Mateus Andreoni, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS: The purpose of this pictorial essay is to review the main characteristics of the most prevalent bone dysplasias and highlight the key points of the radiological report: Most prevalent types of skeletal dysplasias and the latest classification Review of bone dysplasias radiological appearance The role of radiologist’s report for early diagnosis and family counseling

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE: Most prevalent types of skeletal dysplasias Skeletal dysplasias are a group of more than 450 heritable disorders with specific type of inheritance. The latest discoveries have added embryological and genetic data which provided a detailed classification in 42 groups. Review of bone displasias radiological appearance: Despite being a large group of pathologies, radiological appearance may be diagnostic or narrow to a small amount of differentials in most cases. The role of radiologist’s report: It is important to do determine a precise diagnosis to aid in menagement, familial recurrence and to report those disorders highly associated with mortality. Even tenuous radiologic findings should be correctly interpreted and reported because, added to clinical context, can be decisive in the correct diagnosis.

MKEE-152 Ultrasound (US) Imaging of The Peripheral Nerves: Normality and Abnormalities

Participants
Michaela Cellina, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the technique of the lower limb US nerve study and the appearance of the nerves to help the radiologist become confident with this US application.To show the anatomical landmarks to identify the nerves.

TABLE OF CONTENTS/OUTLINE

Thanks to its wide availability, low costs, fast execution, high soft-tissue resolution, real-time dynamic evaluation, and direct correlation with signs and symptoms, high-frequency US is considered the first-line imaging tool for the study of the peripheral nerve. Moreover, US does not suffer the limitations of MRI, such as metal implants, claustrophobia, and pacemakers. The exam is

performed with high-frequency linear array probes.The nerves are identifiable on the axial plane at defined anatomical landmarks, then the nerve is followed with the probe in the axial plane proximally and distally. If abnormalities are recognizable, the nerve should be also studied on the long axis.Common indications for US nerves study include tarsal tunnel syndrome, entrapments, traumas, suspected neuromas, and polyneuropathies.Non-pathological nerves have a characteristic honeycomb appearance in the short axis, as they are formed by hypoechoic nerve fascicles surrounded by hyperechoic connective tissue and collagen. They can be detected in the adipose tissue or in fascial planes among or superficial to the muscles and each nerve is surrounded by a portion of fat. Pathological nerves show increased diameter with a hypoechoic appearance proximal to the site of the entrapment. Post-traumatic damages can be visible as nervous focal discontinuation with swollen retracted portions.

MKEE-153 Radiographic Signs of Musculotendinous and Ligament Injuries

Participants
Diego dos Santos, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review some general information about radiographic signs of musculotendinous and ligament injuries- Describe the radiographic findings of musculotendinous and ligament injuries in the different joints of the body and in both adult and pediatric population through cases illustrated in our service- Highlight some anatomical considerations, the mechanism and some quick tips and pitfalls involving the musculotendinous and ligament injuries- Correlate the radiographic findings of musculotendinous and ligament injuries with other imaging methods

TABLE OF CONTENTS/OUTLINE

Introduction- General information about radiographic signs of musculotendinous and ligament injuriesRadiographic findings of musculotendinous and ligament injuries in the different joints- Quadriceps tendon tear with patella baja- Patellar tendon tear with patella alta- Fiburlaris longus tear with posterior deviation of the accessory peroneal ossicle- Elbow dislocation associated with fracture of the radial head and coronoid process and ligament injuries- Turf toe with posterior deviation of the hallux sesamoids- Rotator cuff tear with coracohumeral interval shortening / superior subluxation of the humeral head- Bone avulsions in different body sites associated to ligaments and tendon tears- Periarticular soft tissue densification associated to ligaments and tendon tears- Other casesAnatomical considerationsInjury mechanismQuick tips and pitfallsCorrelation with other imaging methods- Ultrasound- Magnetic Resonance Imaging

MKEE-154 Preoperative Planification and Postoperative CT-Scan Imaging Assessment of Latarjet Procedure for Anterior Shoulder Instability: What's On The Menu?

Participants
Ulrike Novo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the most important findings in preoperative CT scan planning before Latarjet.- To describe the key points to be considered in the postoperative CT scan evaluation. - To illustrate a wide spectrum of normal and pathological findings in postsurgical CT scans in a case-based scenario.

TABLE OF CONTENTS/OUTLINE

The Latarjet procedure is an operation for recurrent anterior shoulder instability consists of transferring the coracoid process to the anterior glenoid rim.Appetizer PREOPERATIVE CT SCAN PLANNINGPreoperative planning of the arthroscopic Latarjet procedure based on the CT scan is necessary to achieve satisfactory clinical and radiographic results:• Coracoid dimensions • Measurement of bone defects, Hill-Sachs lesion, bony Bankart and glenoid track Main course HOW TO PERFORM ARTHROSCOPIC LATARJET SURGERY AND POSTOPERATIVE CT SCAN EVALUATIONAdequate coracoid graft positioning:Coronal view: Coracoid graft should be flush with the articular surface along its lateral aspect.Axial view is the most useful view to judge the mediolateral position and the “angulation” of the graft. Coracoid graft should be flush with the articular suface. The angulation of the gaft (open, closed or neutral) is evaluated with the circle method.Axial plane to analyze the angle of the screw(alpha angle) with the articular surface.Sagital view allows assessment of craneocaudal position respect to glenoid equatorDessert COMPLICATIONS• Short term: Graf fracture/ avulsion and graft non-union• Long term: OsteoarthritisIn conclusion, the radiologist plays a key role in Latarjet, to know what pre-surgical CT findings are important to help with preoperative planning and to diagnose potential complications that may occur.

MKEE-155 Main Sacral Lesions and Their Radiological Findings

Participants
Bárbara Moreira Machado, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Review and understand the most common sacral tumors. 2- Debate over imaging patterns and their prevalence

TABLE OF CONTENTS/OUTLINE

1- Introduction and anatomy of the sacrum. 2- Epidemiology of sacral tumors.3- Limitations of diagnostic imaging methods. 4- Differential diagnosis of sacral lesions and main imaging features a) primary bone tumors: Sacral chordoma; chondrosarcoma; osteosarcoma; multiple myeloma/plasmacytoma; giant cell tumor; aneurysmal bone cyst; osteoid osteoma; osteoblastoma. b) secondary bone tumors: metastases. c) neural tumors: Ependymoma; schwannoma; neurofibroma; Ganglioneuroma / neuroblastoma / ganglioneuroblastoma.d) germ cell tumors: teratoma; yolk sac tumor

MKEE-156 Whole body MRI in The Analysis of Multiple Myeloma: A Overview of Evolution, Imaging Methods and Future Perspectives

Participants
Eduardo Zukovski, MD, Umuarama, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Recognize the updated diagnostic criteria for MM, indications and limitations of each imaging option, and recommendations for

follow-up. - Know MR imaging protocol for MM evaluation, indications and general technical parameters. - Comprehend MM imaging features in the different whole body MRI sequences. - Recognize the imaging response criteria in MM treatment. - Understand future perspectives of monoclonal gammopathies imaging analysis and flowcharts.

TABLE OF CONTENTS/OUTLINE

Introduction: • - Epidemiology of MM and indications of each imaging option • - Definition of MM updated diagnosis criteria • - Different indications of whole body MRI for bone diseases • - Whole body MRI sequences, technical parameters and MM imaging findings Diagnosis and imaging findings: • - Flowcharts of monoclonal gammopathies imaging methods • - Whole body MRI useful in MM treatment response assessment • - MRI patterns of bone marrow infiltration in MM • - Definition of unequivocal focal active lesion of MM in whole body MRI • - MRI findings correlated with poor patient survival • - Imaging follow-up for MM and identification of possible complications

MKEE-157 A Whole-body MRI Experience in The ProstateCcancer

Participants
Augusto Altoe, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe whole-body MRI protocol and its general considerations;2. To understand the anatomical and functional techniques and their applications;3. To illustrate the image findings of whole-body MRI in prostate cancer;4. To identify potential imaging pitfalls, differential diagnoses, and post-therapeutic assessment.

TABLE OF CONTENTS/OUTLINE

1- Introduction. 2- MRI acquisition a. Anatomical techniques; b. Functional techniques; c. Recommended protocol. 3- Clinical indications of whole-body MRI in prostate cancer; a. Newly diagnosed prostate cancer; b. Biochemical recurrence; c. Advanced disease and response assessment. 4 - Image findings of whole-body MRI in prostate cancer; a. Locoregional disease; b. Metastatic lymph node disease; c. Metastatic bone disease; d. Post-therapeutic findings. 5 - Imaging pitfalls and differential diagnoses. 6 - Take home messages and teaching points.

MKEE-158 Pitch Perfect: Biomechanics and Patterns of Injury In the Throwing Arm

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

The exceptional velocity required by sporting activities relying on overhead throwing predisposes the shoulder to extreme forces, leading to both adaptive changes and pathologic cascade of findings that can be detected on imaging. The objectives of this educational exhibit are: • 1. To review the phases of pitching and associated biomechanics that predispose the overhead-throwing shoulder and elbow to injury • 2. To highlight unique sites of injury in the overhead-throwing athlete • 3. To discuss imaging findings of common shoulder and elbow injuries in the overhead-throwing athlete

TABLE OF CONTENTS/OUTLINE

Throwing biomechanics and arc of motion Shoulder • Glenohumeral internal rotation deficit (GIRD) • Internal impingement • Superior labral anteroposterior (SLAP) tear • Partial thickness rotator cuff tear • Anterior capsule injury • Subscapularis tendon injury • Bennett lesion • Posterior muscle injury Elbow • Flexor tendinitis • UCL injury • Valgus extension overload • Olecranon stress fracture • Ulnar neuritis Pediatric • Little leaguer's shoulder and elbow

MKEE-159 Spectrum of Musculoskeletal Involvement in COVID-19 Infection Diseases: Pictorial Essay

Participants
Pedro Martins, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Covd-19 has a broad spectrum of musculoskeletal involvement that can mimic other diseases and trigger the development of rheumatic disease. After almost two years of the coronavirus pandemic, some countries are starting to treat COVID-19 infection as an endemic disease and we will probably continue to live with the virus . Although musculoskeletal involvement is uncommon, It's important to recognize its most common neuromuscular and rheumatologist complications associated with the infection, and also the musculoskeletal changes related to the long term hospitalization and the vaccine side effects.

TABLE OF CONTENTS/OUTLINE

- To explain how COVID-19 infection can involve the musculoskeletal system. - To illustrate with ultrasound, computed tomography, and magnetic resonance images the most common musculoskeletal changes of covid infection, including myositis, neuropathy, synovitis, arthritis and soft tissue abnormalities.- To demonstrate the differential diagnosis of others musculoskeletal infections and inflammatory conditions The global COVID-19 pandemic is not over yet, and may become an endemic disease within the next few years. Musculoskeletal changes can be related to the infection itself, and also be found in patients with prolonged hospitalizations and due vaccine side effects. It is important to recognize the most common musculoskeletal changes to avoid unnecessary procedures and to prevent misdiagnosis of other inflammatory and infectious conditions.

MKEE-16 The Navicular: Keystone of the Foot

Participants
Scott Wuertzer, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the anatomy of the tarsal navicular with an emphasis on the three arches of the foot. 2. Review the biomechanics of the

navicular, including the osseous keystone and the peri-navicular soft tissue stabilizers. 3. Describe various pathologies of the navicular with an emphasis on the associated pathomechanics. 4. Through case examples, highlight the expected imaging characteristics of navicular pathology.

TABLE OF CONTENTS/OUTLINE

1. Anatomy and Biomechanics. A. Osseous and vascular anatomy of the navicular. B. The arches of the foot - medial, lateral, and transverse. C. Peri-navicular soft tissue stabilizers - dorsal and plantar cuneonavicular ligaments, bifurcate ligament, spring ligament, dorsal talonavicular ligaments, cuboideonavicular ligaments, and the posterior tibial tendon. D. Joints - naviculocuneiform, cuboideonavicular, and talocalcaneonavicular. 2. Pathology, Pathomechanics, and Imaging Characteristics. A. Accessory ossicles - os navicularis, os supranaviculare. B. Tarsal coalitions -calcaneonavicular, talonavicular. C. Acute fractures - avulsion, body, and tuberosity. D. Stress fractures and osteochondral lesions. D. Kohler's disease. E. Osteonecrosis - Mueller-Weiss, secondary osteonecrosis. F. Arthropathies - osteoarthritis, rheumatoid arthritis, and neuropathic arthropathy. G. Adult acquired flatfoot deformity.

MKEE-160 A Stepwise Approach to Finally Understanding Arthritis

Participants
Bryan Wessel, BS, MD, Cincinnati, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the differences between inflammatory and degenerative arthritis. 2. Understand the progression of various forms of arthritis. 3. Identify the different radiographic findings that help distinguish between the different causes of arthritis.

TABLE OF CONTENTS/OUTLINE

• Characteristics of inflammatory and degenerative arthritis. o Symmetric vs Asymmetric joint space narrowing o Erosions vs subchondral cysto What are osteophytes?• Stepwise algorithm for determining the specific type of arthritis.• Explanation of subtypes of inflammatory arthritis with examples. o Septic Arthritis o Rheumatoid Arthritis o Seronegative Arthropathies• Explanation of subtypes of degenerative arthritis with examples. o Typical Osteoarthritis o Atypical Osteoarthritis• Application of knowledge to unknown cases.

MKEE-161 Not All Erosions are Created Equal - Approach to Hand and Wrist Arthropathy: What a Radiologist Needs to Know?

Awards
Certificate of Merit

Participants
Neha Antil, MD, Mountain View, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Outline the various arthritides that have a predilection for the hand and wrist.2. Classify arthritides based on the clinical presentation, site of involvement in the hand and wrist and further differentiate them based on characteristic imaging appearances.3. Discuss advanced imaging techniques that can be used as a problem-solving tool in rheumatology.4. Summarize and develop a practical imaging approach to making an accurate diagnosis.

TABLE OF CONTENTS/OUTLINE

• Review the causes of arthritis in hand and wrist joints.o Classify arthritides based on clinical presentation and site of involvement in the hand and wrist.o Describe imaging appearances for each arthropathy.o Differentiate the arthritides based on characteristic imaging findings.• Illustrate advanced imaging techniques that can help differentiate arthropathies affecting the wrist and hand.

MKEE-162 Ultrasound for Ultra-Insight into Diagnosing and Treating the Painful Joint Arthroplasty

Participants
Brendan Franz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Overview of utilizing ultrasound for the evaluation of periprosthetic joint infections, as well as for US-guided aspiration of infectious material in a periprosthetic joint infection. Review of the expected sonographic appearance of reactions to metallic debris at the joint arthroplasty site, including conditions such as metallosis, trunnionosis, and metal-on-metal pseudotumors. Using ultrasound for the evaluation of tendon pathology with arthroplasties, including dynamic maneuvers to evaluate for tendon impingement or snapping. Indications for joint arthroplasty injections and precautions to be taken.

TABLE OF CONTENTS/OUTLINE

Introduction Brief review of current trends in arthroplasty placement Ultrasound evaluation in periprosthetic joint infections Expected appearance of a periprosthetic joint infection on ultrasound imaging. US-guided aspiration and important biomarkers. Saline Lavage. Major pathogen causing periprosthetic joint infections at the shoulder; Cutibacterium acnes. Adverse Reactions to Metallic Debris Metallosis Trunnionosis Metal-on-metal pseudotumors Tendon pathology in joint arthroplasty Subscapularis tendon tears Gluteal tendon tears Quadriceps and patellar tendon tears Iliopsoas tendinopathy, bursitis, and impingement/snapping Joint arthroplasty injections Indications Risks Precautions Summary

MKEE-163HC 3D Printed Kyphoplasty Simulator Build Guide

Participants
Caleb Heiberger, MD, Sioux Falls, SD (*Presenter*) Nothing to Disclose

TEACHING POINTS

We demonstrate the creation of a functional kyphoplasty simulator using computed tomography (CT) images, a "desktop grade printer" and open-source software. To do so, we obtained three CT Digital Imaging and Communications in Medicine (DICOM) files

including spinal compression fractures with 1) Standard Anatomy, 2) Scoliosis and 3) Severe Arthrosis. Segmentation was performed using 3D Slicer with post-processing in Mesh-Mixer and Fusion 360 to repair segmentation defects. Printing was performed on a Prussa i3 MK3S fused deposition modeling printer using Polylactic acid (PLA) for the vertebrae and Thermoplastic Polyurethane (TPU) for the intervertebral disks. Soft tissue was simulated using a 1:1 mixture of Knox Gelatin and water, activated by a freeze/boil cycle. The mixture was poured into a custom printed container with the printed spine and allowed to solidify. Simulations were performed under fluoroscopic guidance. Early usage reviews indicated high satisfaction with device fidelity compared to other models, including cadavers. The production of this kyphoplasty model demonstrates the effective use of 3D printing in image guided interventional training.

TABLE OF CONTENTS/OUTLINE

Segmenting a DICOM in 3D SlicerEditing segmented DICOM in Mesh Mixer and Fusion 360Preparing a print in 3D CAD SoftwareSelecting filaments for specific anatomyPrinting the modelCreating soft-tissue mold and embedding spineDemonstration fluoroscopic fidelity of the modelUsage reviews and future directionsPlease visit the Learning Center to also view this presentation in hardcopy format.

MKEE-164 A Pictorial Review of the Different Radiological Presentations and Differential Diagnosis of Gout in Atypical Sites

Participants
Lin Liu, MD, Guangzhou, China (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Monosodium urate crystals commonly deposit at the joints or tendons of the foot or ankle, especially at the first metatarsophalangeal joint, but rarely deposit at the joints of upper limbs and other extra-articular sites.2. Intraspinal gout is difficult to diagnose before surgery and its clinical presentations and imaging findings mimic tumors and degenerative spinal diseases. Early diagnosis of intraspinal gout is extremely significant because timely urate-lowing therapy may avoid surgical intervention.3. The confirmation of MSU crystals in synovial fluid or tophaceous material is considered the gold standard for gout diagnosis. Gout in the atypical sites may misdiagnose because of the nonspecific clinical and imaging findings. Therefore, DECT as an auxiliary tool should be performed as soon as possible for suspected gout lesions, which may avoid unnecessary invasive operations.

TABLE OF CONTENTS/OUTLINE

1. A case-based review of sixteen different radiological presentations of gout in the atypical sites including upper limbs, spine, ligaments, and other rare joints.2. Recognize different findings of gout in atypical sites in radiography, CT, MRI, and dual-energy CT.3. Identify the differential diagnosis of gout in atypical sites.

MKEE-165 Tips and Tricks for Ablating an Osteoid osteoma: Plan It Right!

Participants
Roshni Anand, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Approach the lesion perpendicular to the cortical surface and avoid the sclerotic part of bone. This may require a prone, oblique, or lateral decubitus position.The shortest path to the lesion enables minimum injury to surrounding tissues Avoiding neurovascular bundle (NVB): Lesions may be targeted through the longer route and farther cortex to avoid injury to the NVB. Dextrose may be injected to keep at least 1 cm distance.Tandem needle technique or use of protractor in case of the angulated route.Drill bid is a superior option compared to hammering, especially in the case of a longer osseous path and sclerosis.Two or more electrodes may be required for lesions measuring >1.5cm. A single electrode is sufficient for smaller lesions.Dextrose may be injected to prevent soft tissue injury in superficial bones like in digitsIntra-articular lesions: Trans-articular approach is avoided. Iatrogenic joint effusion by instilling dextrose may protect from artciular cartilage injury.Spinal lesions: Entering the facet joint or neural foramen should be strictly avoided. A bipolar RF probe can avoid damage to the surrounding structures.Reducing Post-procedure pain and swelling: Injecting lignocaine-bupivacaine mixture along the tract up to the periosteum and local site compression for 5 minutes after ablation

TABLE OF CONTENTS/OUTLINE

Learning objectives: To demonstrate the practical tips and tricks for ablating an osteoid osteoma by correct planningCases demonstrating the teaching pointsConclusion

MKEE-166HC Quantitative Analysis of Water Material Density Values by Dual Energy CT for Osteoblastic Vertebral Metastases

Participants
Hirotaka Nakashima, MSc, RT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Virtual non-calcium (VNCa) images were created by two-material decomposition processing.2. Clinically diagnosed 81 osteoblastic metastatic vertebrae and 301 normal vertebrae were compared by water material density values quantitatively.3. The area under the curve value obtained from receiver operating characteristic (ROC) analysis was 0.93, and the water material density value was a highly discriminative index for osteoblastic metastases.4. The cutoff value between lesion and normal was 1047.8 mg/cm3 based on ROC analysis with a sensitivity of 85.7% and a specificity of 98.1%.5. New image display method was developed that reflects the cut-off value calculated from water material density values.

TABLE OF CONTENTS/OUTLINE

Vertebral metastases are the most common bone metastases. CT can detect bone calcification with high sensitivity and is therefore excellent for the diagnosis of osteolytic bone metastases with bone cortex destruction. However, osteoblastic bone metastases without destruction are difficult to diagnose and are easily overlooked. VNCa image is one of the material discrimination images produced by dual-energy CT and is a material density image obtained by highlighting the water component and removing the calcium component. By measuring the VNCa image, water material density values can be obtained. Quantitative evaluation using water material density values was a gap of knowledge. In this exhibition, water material density values of osteoblastic vertebral

metastases and normal vertebrae were compared. And cutoff values were calculated by ROC analysis. The results showed that water material density values have a high discriminatory ability against osteoblastic metastases.Please visit the Learning Center to also view this presentation in hardcopy format.

MKEE-167 Don't Stress About Stress Injuries: A Review of Stress Related Injuries of Bone

Participants
Samantha Jayasinghe, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss clinical presentation and pathophysiology of stress related fractures including fatigue, atypical, and insufficiency fractures.2. Role of imaging for stress related injuries of bone.3. Discuss common stress fracture patterns and locations.4. Discuss uncommon stress fracture patterns and locations related to competitive athletes or surgical changes.5. Review treatment algorithms.

TABLE OF CONTENTS/OUTLINE

Background1. Clinical presentation of Stress injuries2. Anatomy, Biomechanical tensile/compressive forces3. Pathophysiology4. Optimal imaging modalities for evaluationStress Fracture SubtypesFatigueCommon1. Metatarsal 2. Compression side femoral neck3. Calcaneal 4. Tibial Fredericson classificationUncommon1. Patellar2. Tensile side femoral neck3. Pubic ramus fractures status post periacetabular osteotomy4. Rib stress in competitive swimmersAtypicalBisphosphonate or monoclonal antibody associated lateral femoral fractures1. Imaging/treatment recommendations Insufficiency1. Femoral Condylar2. Femoral Head3. SacralUnilateral, H-shaped4. AcetabularPediatric1. Little Leaguer Shoulder2. Acromial Apophysiolysis3. Elbow-Olecranon4. Elbow-Panners5. Gymnast wrist6. Distal Femoral Stress Injury7. Sinding-Larsen-Johannson8. Osgood-SchlatterTreatment of Stress Fractures1. Stratifying fracture risk2. Low RiskConservative ManagementContinued Weight Bearing3. High RiskRehabilitationProtected Weight BearingSurgical Intervention

MKEE-168 Imaging Findings That Should Never Be Forgotten In Non-accidental Trauma in Children

Participants
Giovana Mesquita, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Revise the most important muscle-skeletal image findings related to non-accidental trauma in children, by using original schematic drawings and images from suspect cases of child physical abuse. Most of the cases presented were confirmed by assistant physicians. Therefore, this paper has also the aim of highlighting the fundamental role of the muscle-skeletal radiologist in identifying and documenting the skeletal injuries so as to protect the children involved and help bring victims away from their offenders as fast as possible, to stop further abuse.

TABLE OF CONTENTS/OUTLINE

1. Classical metaphyseal fracture 1.1 Traumatic mechanism 1.2 Image findings 2. Non-accidental trauma in long bones 2.1 Traumatic mechanism 2.2 Image findings 3.Non-accidental trauma in ribs 3.1 Traumatic mechanism 3.2 Image findings 4.Non-accidental trauma in pelvis 4.1 Traumatic mechanism 4.2 Image findings

MKEE-169 Whole-Body Diffusion-Weighted Magnetic ResonanceImaging in Non-tumoral Bone Marrow Diseasesand Their Mimics

Participants
Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS1) Identify correct MR protocol that should be used to analyses bone marrow in whole-body MR imaging(WBMRI) owing to detect tumoral involvement and their differential diagnosis.2) Know basic principals of DWI WBMRI and typical lesion appearances and awareness of potential pitfalls.3) Make a pictorial essay of lesions that mimick bone marrow tumoral lesions including conventional MRI sequences , DIXON and DWI and understand the characteristic features which allow discrimination between them and true neoplasms in order to avoid unnecessary additional workup.4) The usefullness of DWI whole-body MR in diagnostic algorithms of non oncological disorders including differentiate diagnosis as inflammatory, infectious and pseudotumoral conditions.

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS AND OUTLINE1) Case discussion regarding imaging that mimick bone marrow tumoral lesions as: 2) SAPHO syndrome 3) CRMO 4) Tuberculosis 5) Syphilis 6) Sarcoidosis 7) Bone Marrow hiperplasia 8) Differential diagnosis 9) Report structuring step by step

MKEE-17 Congenital Talipes Equinovarus Made Easy: What Radiologists Need to Know and How to Evaluate the Idiopathic Congenital Clubfoot

Awards
Identified for RadioGraphics

Participants
Julia Peixoto, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points: Emphasize a minimum of two major teaching points of this exhibit. What should the viewer accomplish by viewing this exhibit? The purpose of this exhibit is:1. Review the main aspects related to idiopathic congenital clubfoot (congenital talipes equinovarus), including anatomy, etiology, pathophysiology, epidemiology, clinical classification and treatment.2. To illustrate the main imaging findings and how to assess this condition in a multimodality approach, focusing on US and MRI studies.

TABLE OF CONTENTS/OUTLINE

Describe major headings (e.g., anatomy, physiology, imaging techniques, tumor disease states, etc.) 1. Review the main aspects related to idiopathic congenital clubfoot (congenital talipes equinovarus), including anatomy, etiology, pathophysiology, epidemiology, clinical classification and treatment.2. Clinical and imaging findings in a multimodality approach.3. US assessment protocol.4. MRI assessment protocol.5. Clubfoot major differential diagnoses, including: (simple metatarsus adductus, skewfoot, and oblique and vertical talus).

MKEE-18 Ultrasonography of Thumb Metacarpophalangeal Joint: Normal Anatomy and Mechanism-based Injury Approach

Participants
Kyu-Chong Lee, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The difference between metacarpal joint of thumb and other fingers 2. Anatomy and ultrasonographic normal images of thumb MCP joint 3. Mechanism based thumb MCP injury

TABLE OF CONTENTS/OUTLINE

1. Introduction 1) What is the difference between MCP joint of thumb and other fingers? 2) Biomechanism: Condyloid joint: freedom of flexion/extension, valgus/varus + opposition 3) Imaging technique for MCP joint evaluation2. Normal anatomy (1) Osseous anatomy: 1st proximal phalanx metacarpal bone + two sesamoid bones (2) Soft tissue 1) Palmar side: a. Muscle tendon: Adductor pollicis (ADP), Abductor pollicis brevis (APB), Flexor pollicis brevis (FPB), Flexor pollicis longus (FPL) b. Volar plate c. Pulley system (A1, Av, Ao + A2) 2) Dorsal side: a. Tendon: Extensor pollicis brevis (EPB) + Extensor pollicis longus (EPL) b. Dorsal plate c. Extensor hood or apparatus (sagittal band + triangular extension) 3) Collateral system (capsule-ligamentous system) a. Ulnar collateral ligament (UCL = proper/principle + accessory) + adductor aponeurosis b. Radial collateral ligament (RCL = proper/principle + accessory) + APB, FPB aponeurosis3. Mechanism based injury approach 1) Valgus or abduction injury (most common) a. Skier thumb (UCL injury) b. Stener lesion 2) Varus or adduction injury a. RCL injury b. Stener like lesion c. Varus deformity 3) Hyperextension injury a. Volar plate injury b. Tendon pulley injury c. Muscle injury 4) Hyperflexion injury a. Dorsal plate injury b. Extensor tendon tear 5) Combination damage4. Summary

MKEE-2 Imaging Dancers' Injuries

Participants
María Carvajo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To present the most common dancers' injuries and their underlying mechanisms. 2. To show the different imaging techniques. 3. To describe the semiology in imaging.

TABLE OF CONTENTS/OUTLINE

1. Most frequent types, mechanisms and structures injured in ballet dancers. 2. Injuries classification according to their mechanism. 2.1. Extreme ankle inversion and plantar flexion. 2.1.1. Lateral ankle sprains. 2.1.2. Acute fifth metatarsal fractures. 2.2. Ankle dorsiflexion, knee flexion and plantar stress. 2.2.1. Patellar tendinopathy. 2.2.2. Tibial stress injuries. 2.2.3. Acute Achilles tendon injury. 2.2.4. Tarsal stress injuries and fractures. 2.2.5. Plantar fasciitis. 2.3. Extreme ankle plantar flexion. 2.3.1. Posterior ankle impingement. 2.3.2. Peroneal tendinopathy. 2.3.3. Achilles tendinopathy. 2.3.4. Tarsal, metatarsal and phalanx stress injuries and fractures. 2.4. Knee flexo-extension. 2.4.1. Patellar tendinopathy. 2.4.2. Medial plica syndrome. 2.4.3. Patellofemoral maltracking. 2.5. Hip external rotation. 2.6. Hip external rotation, abduction and flexion. 2.6.1. Snapping hip syndrome. 2.7. Extreme hip adduction. Hip flexion/knee extension. 2.7.1. Adductor muscles injuries. 2.7.2. Stress pelvis injuries. 2.8. Lumbar spine hyperextension. 2.8.1. Spondylolisis/spondylolisthesis.

MKEE-20 Ultrasound-guided Injection of Botulinum Toxin in Neurogenic Thoracic Outlet Syndrome: Technical Aspects and Experience Over 15 Years

Participants
Ronald Mercer, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Thoracic outlet syndrome (TOS) includes a group of upper extremity disorders believed to occur due to isolated or combined neurovascular compression. -Neurogenic TOS (NTOS) constitutes 95% of all TOS patients, but presents diagnostic difficulty due to nonspecific findings during electro-diagnostic and imaging evaluation. -Botulinum toxin A (BTX) injections are useful to evaluate the diagnosis of NTOS, with symptom relief correlating with good response to subsequent treatments. -Our group pioneered ultrasound guided BTX injections since 2007, having performed over 5,000 procedures in patients being investigated for NTOS. -Injection of BTX into the anterior (ASM) and middle (MSM) scalene muscles as well as the pectoralis minor muscle (PMM) has been effective in reducing the symptoms of NTOS and may contribute to patient selection criteria for surgical management. -Ultrasound guided injection has been demonstrated to be safe and well tolerated.

TABLE OF CONTENTS/OUTLINE

-Discuss NTOS and the use of imaging-guided BTX injection in diagnosis and management. -Present relevant anatomy and safe approach to ultrasound-guided BTX injection into the ASM, MSM, and PMM. -Described complications and documented rate of symptom relief of these injections.

MKEE-21 Use of Soft Modeling Compound to Teach Musculoskeletal Anatomy and Pathology

Participants
Osvaldo Velez-Martinez, MMedSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Medical imaging is a 2D representation of 3D structures. It can be challenging for trainees to conceptualize 3D structures from 2D slices.2. Soft modeling compound is an interactive and cost effective medium to teach musculoskeletal pathology.3. 3D models

allow trainees to view anatomical structures in space and therefore conceptualize normal anatomy and pathology.4. Soft modeling can be integrated into any teaching program and is impact can be quantified.

TABLE OF CONTENTS/OUTLINE

Introduction to soft modeling compound as a teaching medium -Types-Pros-ConsSet-up-3D Model generation-Modeling tools-Documenting examplesTeaching Algorithm-Attending mediated "Show and Tell"-Trainee modeling and gradingResident Survey-Design-ResultsShoulder -Anatomy-Pathology-Labral Tears-Cartilage Injury-Rotator Cuff Tears-Long Head Biceps-CapsuloligamentousElbow AnatomyPathologyTendon TearsLigament Cartilage InjuryWrist -Anatomy-Pathology-Triangular Fibrocartilage-Scapholunate and Lunotriquetral Ligaments Hip -Anatomy-Pathology-Labral Tears-Cartilage Injury-Femoroacetabular ImpingementKnee -Anatomy-Pathology-Meniscus Tears-Cartilage Injury-Ligament Tendon Foot-Anatomy-Pathology-Ligament -Cartilage InjuryFuture Developments-Resident Grading-Quantitation of Competency Improvement-Other Applications

MKEE-22 Low-dose CT Approach to Tendon Delineation Using Deep Learning Technology

Participants
Takato Yanagisawa, Ueda, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The three-dimensional tendons image has a highly usefulness as surgical support. However, the difference in CT values between tendons and muscles is small. Therefore, it is necessary to reduce image noise in order to distinguish them. As a result, increased patient dose becomes a problem. We have tried to use Deep Learning Reconstruction (DLR) to solve this problem. This report introduces scanning techniques and patient dose reduction for creating 3D images of tendons. The 3D tendons imaging requires increased contrast and reduced patient dose reconstruction. The DLR for the brain LCD met this goal. This is because the diagnosis of the brain and the diagnosis of tendons are performed with the same low contrast. Compared to the conventional reconstruction method, DLR produced low-noise images at 75% lower dose and improved contrast, significantly enhancing the ability to visualize the finger flexor tendons.

TABLE OF CONTENTS/OUTLINE

1. Problems with imaging techniques in tendon morphology diagnosis 2. Improvement of image contrast using DLR 3. Reducing patient dose using DLR 4. Ingenuity when scanning tendons 5. Ingenuity for creating 3D tendons images 6. Verification of Clinical Effectiveness

MKEE-23 Brachial Plexus: Don't Be Afraid Anymore - A Guide for Brachial Plexus Anatomy and Injuries

Participants
LEON PERIN, Araras, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is to:1. Review with didactic illustrations the brachial plex anatomy, including how to recognize it on MRI.2. Demonstrate how several brachial plex injuries manifest clinically and on imaging exams.3. Present didactic cases of brachial plex injuries highlighting the main findings the radiologist should expect, untangling brachial plexus exams.

TABLE OF CONTENTS/OUTLINE

Introduction and review of the brachial plexus anatomy, with didactic illustration.Review the normal anatomy no MRI, highlighting the anatomic landmarks on coronal and sagittal exams.Overview the main injuries of the brachial plexus, including pre and post-ganglionar injuries, their clinical manifestations and epidemiology, and their imaging findings.Demonstrate with challenging clinical cases non-traumatic pathologies involving inflammatory and compressive causes, including Parsonage-Turner, thoracic outlet syndrome, post-Covid plexopathy.Present a serie of cases of brachial plex injuries, and what you should actively look for depending on clinical history.Propose a diagnostic checklist when evaluating brachial plexus injuries, simplifying the reading of these challenging exams.Summary.

MKEE-24 Axial Spondyloarthritis: What the Radiologist Needs to Know

Awards
Certificate of Merit

Participants
Taiki Nozaki, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are 1) To demonstrate the classification of spondyloarthritis and anatomy of sacroiliac joint. 2) To know basic imaging findings of axial spondyloarthritis. 3) To review the imaging findings of mimickers of axial spondyloarthritis that radiologists should be familiar with.

TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Classification of spondyloarthritis 3) Anatomy of sacroiliac joint for the proper evaluation on MRI 4) MR findings of axial spondyloarthritis i) Signs of activity -bone marrow edema, capsulitis, joint space fluid- ii) Signs of structural change -erosion, fat metaplasia, backfill, sclerosis, ankylosis- 5) Mimickers of axial spondyloarthritis -early post-partum, osteitis condensans ilii, pyogenic sacroiliitis, Paget disease, fibrous dysplasia, tuberculosis, spondyloepiphyseal dysplasia, bone metastases, SAPHO syndrome, DISH-

MKEE-25 The Sword in the Bone: A Review of the Sternum and Parasternal Region

Awards
Certificate of Merit

Participants
Sean Rodich, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review anatomy of sternal bone landmarks, sternal and parasternal joints, and surrounding muscle attachments for a comprehensive understanding of the anterior chest wall.2. Identify developmental variants and anomalies of the sternum to avoid confusion with other sternal pathologies.3. Illustrate various pathologies of the sternum and parasternal region, which are often overlooked in the broad differential diagnosis for chest pain.

TABLE OF CONTENTS/OUTLINE

1. Anatomy of the sternum- Bone landmarks- Sternal and parasternal joints (manubriosternal, xiphisternal, sternoclavicular, sternocostal, costochondral, and interchondral joints)- Muscle attachments2. Developmental variants and anomalies of the sternum- Sclerotic bars and clefts- Sternal foramen- Episternal ossicles- Xiphoid process variants- Pectus excavatum/carinatum- Ectopia cordis- Miscellaneous syndromes (PHACES, Pentalogy of Cantrell)3. Pathology of the sternum and parasternal region- Trauma (sternal and costal cartilage fractures, sternoclavicular joint dislocation)- Arthropathy (osteoarthritis, calcium pyrophosphate deposition disease, rheumatoid arthritis, seronegative spondyloarthropathy)- SAPHO (Synovitis, Acne, Palmoplantar pustulosis, Hyperostosis, Osteitis)- Condensing osteitis of the clavicle- Costochondritis versus Tietze syndrome- Sternotomy complications (sternal dehiscence, infection)- Neoplasm

MKEE-26 Calcaneal Fracture Guide: Don't Miss a Thing - Beware of the Ugly Stuff

Awards
Certificate of Merit

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review calcaneal anatomy, fracture classifications, possible complications and the management for each kind of fracture.2. Highlight the main information that radiologists should include in the report when analyzing a calcaneal fracture and their post-operatorive imaging, including normal and abnormal findings.3. Illustrate several cases of calcaneal fractures, including postoperative evaluation with normal findings and complications, as well as differential diagnosis cases.

TABLE OF CONTENTS/OUTLINE

Introduction: general review of calcaneal fractures, including classifications and what the report should include.Provide didactic and challenging cases of calcaneal fractures, including several complications, highlighting what is important for the report and for the orthopedic surgeon.Overview operative indications and modalities of surgical treatment.Present didactic cases of the different surgical modalities, discussing the normal and abnormal postoperative findings.Bibliographical references.

MKEE-27 Stain the Eyes-Utility of high Resolution CT Dacryocystography in Imaging Lacrimal Duct Pathology Following Facial Trauma

Participants
Sudha Pyla, MBBS, Vijayawada, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate the common complications encountered in lacrimal drainage as a complication of facial injuries.

TABLE OF CONTENTS/OUTLINE

Nasolacrimal duct injury may be due to blunt or penetrating trauma involving naso orbitoethmoidal complex, maxillofacial fractures especially Le fort type-II, Le fort type-III, also secondary to postoperative cases due to inadequate surgical repair.In early post injury period ,nasolacrimal duct obstruction can occur as a result of post traumatic compression by bone fragments or due to soft tissue edema. Inflammatory reaction followed by cicatrization resulting in delayed lacrimal duct blockade can present as late complication. Patients usually present with epiphora with or without purulent discharge. Long term complication include dacryocystocele formation.CT dacryocystography gives detailed information about the cause of obstruction, level of blockade, associated fractures and bony displacements. 1.5ml of diluted nonionic contrast (Ultravist 300mg iodine/ml) is administered into the inferior canaliculi and high resolution CT is performed. Depending on the level of blockage dacryocystorhinostomy is performed. In complete cut off of duct or chronic dacryocystitis dacryocystectomy is done.This exhibit will demonstrate various spectrum of post traumatic nasolacrimal drainage abnormality on CT dacryocystography.

MKEE-28 Lumpy-Bumpy Ride Made Easy ! - A Sonographic Guide Through Soft Tissue Lesions

Participants
Saakshi Aggarwal, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review imaging features of various soft tissue lesions to be able to differentiate pseudo masses and pseudo tumors like dermoid, sebaceous cyst, abscess, hematoma from true tumors 2. To make a schematic approach towards suspected soft tissue lesions in order to assess nature of them based on internal characteristics of the lesion 3. To prime young budding radiologists towards diagnosis of benign "leave alone" lesions such as lipomas so as to reduce patient anxiety and limit further investigations unless indicated 4.To pick up suspicious morphology on ultrasonography and suggest the next appropriate step for further assessment

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Importance of ultrasonography in assessing soft tissue lesions 3. Ultrasonographic Technique to assess soft tissue lesions 4. Imaging features to differentiate pseudo masses and pseudo tumors from true tumors 5. Simplified schematic approach towards suspected true tumors 6. Review of imaging features of various soft tissue tumors with histopathological diagnosis 7. Practical pearls for successful and complete diagnosis

MKEE-29HC Baseline, Posttreatment and Surveillance Advanced Magnetic Resonance Imaging of Soft-Tissue Sarcomas

Participants
Mathew Canjirathinkal, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Soft-Tissue Sarcoma is a rare malignant tumor of mesenchymal and primitive neuroectodermal origin, more common than primary malignant bone tumors. 2.Traditional response criteria such as RECIST inadequate rely on physical measurements, as tumor diameter does not reflect all response types.3.Diffusion-weighted imaging analysis could rely upon Whole tumor ADC histograms, focusing on mean ADC, Kurtosis, and Skewness.4.Whole tumor Perfusion Weighted Imaging (PWI) with Dynamic Contrast-enhanced imaging (DCE) could rely on morphologic patterns (nodular vs. linear) and time-intensity curves (TIC) analysis, where the presence of early arterial enhancement (TIC III, IV, and V) correlates with untreated or unsuccessfully treated sarcomas, while TIC II with successfully treated sarcomas.5.DCE MR imaging reliably distinguishes recurrent sarcoma from postsurgical scarring. TICs III, IV, and V highly raise suspicion of local tumor recurrence, while TIC type II usually represents granulation.

TABLE OF CONTENTS/OUTLINE

1.Introduction2.Learning objectives3.Soft tissue sarcoma4.The Armementarium: MR sequences: DWI/ADC, PWI/DCE and SWI5.ABASTI (Advanced bone and soft tissue tumor imaging)6.Worth knowing:Hemorrhage and ADC, Fat and ADC.7.Responding tumor ABASTI patterns8.Non-responding tumor ABASTI patterns9.Tumor recurrence and DCE10.ReferencesPlease visit the Learning Center to also view this presentation in hardcopy format.

MKEE-3 Radial Tunnel Anatomy in Supination and Pronation: Guidance for Imaging Interpretation and Interventional Procedures

Awards
Magna Cum Laude

Participants
Aurea Mohana-Borges, MD, MSc, San Diego, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

To provide a guide for radial tunnel anatomy that emphasizes the relationship of soft tissue (nerve, vessel, muscle) and osseous structures in supination and pronation with High Resolution Ultrasound (HRUS) and magnetic resonance imaging (MRI). This guide will highlight anatomic landmarks implicated in entrapment syndromes of the radial nerve. It will emphasize the dynamic nature of radial tunnel and its spatial relationships through range of motion. It will compare and contrast normal anatomy with examples of commonly encountered pathology about the radial tunnel.

TABLE OF CONTENTS/OUTLINE

Explanation of the concept, constituents, and anatomic boundaries of the radial tunnel. Demonstration of normal anatomy of the radial tunnel with HRUS and MRI with emphasis on the relationship of deep branch of radial nerve (DBRN), leash of Henry, and superior arcade of supinator muscle (arcade of Frohse). Examples of dynamic ultrasound of the DBRN, DBRN hydrodissection, and commonly encountered pathology about the radial tunnel.

MKEE-30HC Susceptibility-Weighted Imaging (SWI) Emerging Role in Musculoskeletal (MSK) Oncology

Awards
Certificate of Merit

Participants
Mathew Canjirathinkal, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Susceptibility-weighted imaging (SWI) is a 3D high-spatial-resolution, velocity-corrected gradient-echo MRI sequence that uses magnitude and filtered-phase information to create images.2. Distinguishing between calcification and blood products is possible through the filtered phase images, helping to recognize osteoblastic and osteolytic bone metastases or demonstrating calcifications and osteoid production in liposarcoma and osteosarcoma.3. Contrast-enhanced SWI (CE-SWI) can simultaneously detect the T2* susceptibility effect and spontaneous t1 shortening.4. Various Bone and soft tissue masses SWI features are described.5. CE SWI demonstrates the viable, enhancing portions of a soft tissue sarcoma separately from hemorrhagic/necrotic components, suggesting its utility as a biomarker of tumor grade and treatment response. CE-SWI shows superior differentiation between mature fibrotic T2* dark components and active enhancing T1 shortening components in Desmoid Fibromatosis6. Ring-like hemosiderin SWI pattern is observed in successfully treated sarcomas.7. CE-SWI also separates healthy T2* blooming iron-loaded bone marrow from T1-shortening enhancing bone marrow replacing tumor.

TABLE OF CONTENTS/OUTLINE

1. Introduction to SWI and SWI with contrast CE-SWI2. CE-SWI in Benign and malignant soft tissue masses3. CE-SWI of primary bone tumors and metastasis4. CE-SWI features of soft tissue sarcoma tumor response5. ReferencesPlease visit the Learning Center to also view this presentation in hardcopy format.

MKEE-31 Stand and Deliver: Weight-Bearing Extremity CT in Clinical Practice

Awards
Identified for RadioGraphics

Participants
Matthew Doan, BS, Phoenix, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

The structures of the foot and ankle are ideally assessed during weight-bearing.Cross-sectional imaging of the foot and ankle using CT and MRI can overcome the limitations of radiographs but is typically performed with patients in the supine position.Recently standing cone-beam CT (CBCT) scanners have been introduced to combine the value of cross-sectional CT imaging with the

anatomic assessment of structures during weight-bearing.

TABLE OF CONTENTS/OUTLINE

Purpose/Aim: This educational exhibit will spotlight the implementation and utilization of a standing CBCT scanner in a tertiary care medical center. The exhibit will cover the scanner and room setup, basic scanner physics, patient preparation and positioning, and image acquisition. Illustrative example cases will be included. Content Organization: Describe the room requirements for installing a standing CBCT scanner. Review the CT physics involved in obtaining a standing CBCT image. Provide a workflow model for standing CBCT scanner use in musculoskeletal radiology practice. Showcase patient positioning during standing CBCT acquisition. Highlight additional uses of a standing CBCT scanner for hand and wrist imaging. Provide illustrative clinical cases spotlighting the value of standing CBCT imaging. Summary: Radiographs of the foot and ankle obtained with weight-bearing are fundamental in initial imaging assessment. In cases requiring cross-sectional imaging, standing CBCT provides weight-bearing advanced imaging at lower dosing than traditional CT. This educational exhibit highlights the role a standing CBCT scanner can play in clinical practice.

MKEE-32 Sonography of the Wrist and Hand in Clinical Practice: Diagnosis and Intervention

Awards
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnostic and interventional sonography of the wrist and hand may be daunting in clinical practice due to the plethora of structures and abnormalities that need to be evaluated. In this education exhibit, we describe a compartment approach in detecting common wrist and hand disorders and performing the corresponding interventional procedures. The objectives of this educational exhibit are: • To review normal sonographic anatomy of the wrist and hand • To illustrate and highlight a compartment approach in diagnostic and interventional sonography of the hand and wrist • To discuss common abnormalities encountered in clinical practice and the corresponding interventions in each compartment

TABLE OF CONTENTS/OUTLINE

Extensor compartment• Extensor compartments 2 and 3 (EPL rupture, distal intersection syndrome)• Intrinsic ligaments of the wrist• Extensor hoodUlnar compartment• DRUJ• TFCC• Extensor compartment 6Volar compartment• Median nerve at carpal tunnel• Ulnar nerve in Guyon's canal• Flexor tendons and retinaculum• Finger pulleysRadial compartment• 1st CMC and STT• Extensor compartment 1 (De Quervain's tenosynovitis, proximal intersection syndrome) • UCL of thumb

MKEE-33 MRI of the Metabolic Knee

Participants
Bruno C. Vande Berg, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

* Metabolic disorders of the MSK system are frequent disorders that are usually clinically silent for a long period of time. All components of the musculo-skeletal system can be involved including bones, marrow, cartilage, tendons, ligaments, capsule, synovium and muscles. * Despite the fact that knee MRI is one of the most frequently performed examination, radiologists rarely suggest the presence of an underlying metabolic disorder at knee MRI. The vast majority of the metabolic disorders of the MSK system remains occult at knee MRI until complications occur. * Knee MRI can depict a spectrum of complications associated with metabolic disorders including typical and atypical fractures, bone necrosis, acute and chronic arthritis, periarthritis, tendinopathies and tendon rupture, synovial and capsule deposits, red marrow reconversion and serous transformation. * The radiologists should recognize these complications at knee MRI and suggest a possible link with an underlying metabolic disorder. * The current exhibit aims at presenting a series of clinical cases in which knee MRI was performed and led to the diagnosis of a systemic metabolic disorder.

TABLE OF CONTENTS/OUTLINE

* Insufficiency and avulsion fractures in osteoporosis/osteomalacia/renal osteodystrophy.* Crystal-associated acute arthritis and periarthritis. * Chronic tophaceous arthritis. * Drug-associated tendinopathies and tendon rupture. * Unusual osteoarthritis associated with calcium pyrophosphate crystals.* Marrow reconversion and marrow necrosis associated with anemias.* fat and serous atrophy of the bone marrow associated with cachexia.* Synovial and cartilage deposits of iron and copper. * Synovial and capsule amyloidosis.

MKEE-34 The Many Faces of Ramp Lesions of the Medial Meniscus

Participants
Alfonso Iglesias, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Meniscal ramp injury is a meniscus-capsular vertical longitudinal tear of the posterior horn of the internal meniscus, often associated, with an anterior cruciate ligament injury. In MRI, an injury of the internal meniscal ramp must be suspected when a rupture of the ACL and/or bone edema in the posteromedial slope of the tibial plateau is observed. It is important to detect meniscal ramp injuries in MRI and alert the traumatologist, since they are hidden meniscal lesions with the usual arthroscopic portals, and require accessory portals for a diagnostic confirmation. The decision of either a conservative or a surgical treatment will depend primary on the stability and the extent of the injury.

TABLE OF CONTENTS/OUTLINE

Recognize and identify a ramp lesion of the medial meniscus on MR images Describe and classify ramp lesion of the medial meniscus on MR images with arthroscopic correlation Review of surgical technique for the detection and repair of these types of lesions

MKEE-35 Shoulder Microinstability:Demystifying the Interplay of Static and Dynamic Stabilizers of the Glenohumeral Joint

Participants
Juliana Sitta, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Microinstability is a relatively new concept defined by rotational or directional pathologic movement of the glenohumeral joint without true (macro) instability on physical examination.The pathophysiology may include abnormalities involving static and dynamic stabilizers of the glenohumeral joint, the anterosuperior labrum, rotator interval, or middle glenohumeral ligament.Causes of microinstability may include acute or chronic recurrent traumatic etiology (including overuse), iatrogenic, and congenital osseous and soft tissue abnormalities.Clinical and imaging findings including those of internal impingement syndromes are often subtle and radiologists play an important role in identifying these patients to guide appropriate treatment and avoid delay in diagnosis which can lead to osteoarthritis.

TABLE OF CONTENTS/OUTLINE

Glenohumeral anatomy and congenital variants. Pathophysiology of shoulder microinstability, glenoid dysplasia, anterior and posterior internal impingement syndromes. Multimodality imaging findings and differential diagnosis. Clinical and surgical management. Complications and post treatment imaging findings.

MKEE-36 Imaging Features of Glenohumeral Osteoarthritis: The Power of Simplicity

Participants
Paulo de Tarso Perez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:To briefly review the concepts of glenohumeral osteoarthritis.To review the most used classifications, image findings and measures of glenoid. Highlight the Walch classification, glenoid morphology changes and what we should report that can change the management and treatment. To make the differential diagnosis with entities that may cause osteoarthritis.

TABLE OF CONTENTS/OUTLINE

Introduction: to review the concepts of glenohumeral osteoarthritis.Show didactic and illustrative cases reviewing the classifications and the main imaging findings according to the different etiologies, highlighting what we should report in order to assist in the correct and early diagnosis and treatment.Present a schematic table and imaging of the most used classifications and showing measures of glenoid and its morphology changes.Conclusions.Bibliographical references.

MKEE-37 Is This DISH?": Radiological Findings with Special Attention to Extraspinal Involvement

Participants
Dario Herran de la Gala, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will: 1) Describe the most frequent radiological findings of DISH in the spine. 2) Establish the diagnostic criteria and their usefulness in DISH differential diagnosis. 3) Show the most frequent extraspinal findings. 4) Illustrate the most frequent DISH complications.

TABLE OF CONTENTS/OUTLINE

Diffuse idiopathic skeletal hyperostosis (DISH) is an underdiagnosed disease whose prevalence increases with age. This disease consist in an ossification of both spinal and extraspinal tendons, ligaments, periosteum and joint capsules. It can cause pain, stiffness, compressive syndromes or spinal fractures after minor traumas. Radiological findings in the spine and DISH diagnostic criteria are widely known. On the other hand, extraspinal involvement, especially in isolation, may go unnoticed. Moreover, extraspinal involvement precedes spinal radiological findings and can be found in younger patients.

MKEE-38 Haemophilic Artropathy: An Imaging Overview

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review and illustrate classifications and spectrum of imaging findings of haemophilic arthropathies in a multimodality approach including radiographs, ultrasound, computed tomography and magnetic resonance in different joints.2. Highlight and discuss other musculoskeletal complications of haemophilia that the radiologist must be aware in these patients, such as hematomas, pseudotumors, heterotopic calcification, and others. 3. Provide a guidebook for all the typical and atypical musculoskeletal findings in hemophilic arthropathy.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation, epidemiology, pathology and clinical manifestation of haemophilic arthropathies.Present a schematic illustration with the distribution of the most common joints affected by haemophilic arthropathy while discussing the main findings on didactic cases.Overview some of main haemophilic arthropathy classification including a schematic illustration of Arnold-Hilgartner classification. Provide didactic cases of the all image modality of different joints with typical and atypical findings. Provide other musculoskeletal manifestations and complication with challenging cases of hematomas, pseudotumors and heterotopic calcification. Present differential diagnosis cases with some similar intra-articular findings that should not be mistaken with hemophilic disease, including inflammatory arthropathies, amyloidosis, gout, among others. Bibliographical references.

MKEE-39 A Radiological Overview of Ankle Arthroplasty - Practical Keys in the Assessment of Ankle Replacement

Participants
Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To know the different types of total ankle replacement. -To review imaging techniques for preoperative imaging and in the evaluation of prostheses (plain radiograph, CT, MR, US, scintigraphy). -To understand the usefulness and limitations of plain radiographs in the evaluation of ankle replacements, emphasizing useful parameters and illustrating image analysis and interpretation. -To become familiar with normal and abnormal postoperative imaging findings and signs of complications.

TABLE OF CONTENTS/OUTLINE

We review imaging of total ankle replacement, highlighting key concepts perceived as important variables by the surgeon and correlating images with clinical considerations and functional outcomes. We present: 1. A review of types of ankle replacement 2. Surgery. Aims. 3. Imaging. Role of CT, MR, US, and scintigraphy. 4. Plain radiographs: -Technique and views. Standard image acquisition: beam and anatomical landmarks -Parameters that should be evaluated: alignment of tibial and talar components, position, rotation, radiolucent lines and subtle abnormalities such as subsidence, early osteolysis, and angular deformities that may indicate aseptic loosening or possible infection -Imaging of complications: aseptic loosening, expansile osteolysis, subsidence and component migration, infection, periprosthetic fracture, heterotopic ossification, and PE spacer displacement or fracture

MKEE-4 Apophyseal Athletic Injuries Around the Hip: Why You Shouldn't Be Afraid

Awards
Certificate of Merit

Participants
Vitor Sato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: Illustrate and discuss hip anatomy in individuals with immature bone skeleton, focusing on the apophysis; Describe and illustrate the maturation process of apophysis; Discuss and illustrate with classical and challenging cases the imaging findings of different apophysitis and apophyseal lesion around the hip; Show common and uncommon pitfalls that mimic apophyseal lesion in the hip; Show imaging findings of sequelae of apophysitis in the hip.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of anatomy with MRI of hip apophysis in the immature bone skeleton, including the complex anatomy of tendinous and aponeurosis insertion in the pubic apophysis; Present schematic cases and illustration to show maturation process of apophysis, with emphasis in the pubic apophysis; Describe schematically the algorithm and imaging protocol for assessing apophyseal injury in skeletal immature athletes; Show imaging findings of classical and challenging cases of apophyseal injury around the hip in athletes and also pitfalls that could mimic this pathologic condition; Show imaging findings of sequelae of apophysitis in the hip; Bibliographical references with recent articles highlighting what's new in the topic.

MKEE-40 Chip on the Shoulder: Multimodality Review of Reverse Shoulder Arthroplasties

Participants
Akwasi Opoku, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The reverse shoulder arthroplasty (RSA) is a significant advance in shoulder reconstruction, reversing the normal ball and socket anatomy, stabilizing the glenohumeral center of rotation, and allowing the deltoid to function as the main muscular force. RSA has been shown to provide pain relief and functional improvement. Radiologists must be aware of the importance of certain preoperative imaging findings in patients under consideration for RSA, such as deltoid integrity, as well as potential postoperative complications unique to RSA, such as acromial and scapular fractures, and scapular notching.After viewing this exhibit, the learner should understand:1. Shoulder anatomy and biomechanics2. Indications for RSA 3. Role of preoperative imaging and measurements4. Advantages, disadvantages, and specific complications of RSA 5. Normal imaging findings and imaging findings of complications

TABLE OF CONTENTS/OUTLINE

Introduction Shoulder anatomy and biomechanics1. Bones, joints, muscles, other soft tissues (cartilage, labrum, capsule) 2. Unconstrained ball and socket, static and dynamic stabilizers Design, function, and success of RSA Indications 1. Arthropathy, trauma, cuff disease, osteonecrosis, prior infection, failed arthroplasty Role of preoperative imaging (multimodality)1. Evaluation of cuff, bone stock, cartilage 2. Glenoid morphology and version Complications 1.Acromial and scapular fractures 2. Scapular notching 3. Hardware fracture and disengagement 4. Periprosthetic fracture 5. Loosening 6. Infection 7. Instability 8. Nerve injury Imaging appearances 1. Normal and complications

MKEE-41 Hip Dysplasia: Evaluation Beyond Diagnosis - What the Radiologist Should Know About Its Management Treatment

Participants
Mariana Batista Rosa Pinto, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is to:Briefly approach the pathophysiology and epidemiology of hip dysplasia.Discuss the imaging modalities used to evaluate hip dysplasia and list the imaging findings and measurable parameters that most accurately reflect the disorder.Review and didactically illustrate the most frequent treatments, complications and differential diagnoses of the disease. Provide a guide with several examples of post-treatment imaging, highlighting what the radiologist should know about the management of hip dysplasia.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of the epidemiology, pathophysiology and clinical findings of hip dysplasia.Present schematic illustrations of findings and measurable parameters that most accurately help the diagnosis of the disorder. Provide didactic cases of the manifestation related to each type of imaging method.Discuss treatments and what radiologists should know when evaluating the postoperative exams, while providing pre and postoperative imaging examples.Point complications and show differential diagnoses.Provide an imaging guide of the several hip dysplasia treatment options.Conclusions.Bibliographical references with recent articles on what is new in the topic.

MKEE-42 Musculoskeletal Complications of Cosmetic Procedures: When Things Get Ugly

Participants
Ligia Couceiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

According to the American Society of Plastic Surgery (ASPS), aesthetic procedures have increased exponentially in recent years. A wide variety of cosmetic techniques are performed in healthy patients to improve body image or for reconstructive reasons. Those procedures can be either incidental findings or the cause of symptoms on imaging exams. It is indispensable for radiologists to learn identification of the common aesthetic procedures on different imaging techniques and be capable of evaluating their normal appearance and complications.The purpose of this study is: • To recognize the most common aesthetic procedures and their normal appearance, focusing on musculoskeletal system imaging.• To discuss the cosmetic procedures complications and their imaging findings.• Illustrate imaging findings through sample cases • Propose a systematic approach to image interpretation.

TABLE OF CONTENTS/OUTLINE

• INTRODUCTION• Review aesthetic procedures and their complications.• COSMETIC PROCEDURES INVOLVING THE MUSCULOSKELETAL SYSTEM AND THEIR COMPLICATIONS:• Gluteal augmentation (gluteal implants, autologous fat grafting, filler injections): implants displacement/ rupture, capsular contraction; infection; compressive syndromes, etc • Abdominoplasty: wound dehiscence, infection, etc• Body countering with silicone implants (arms, legs): infection, implants rupture, etc• Pectoral augmentation (implants, filler injections): infection, implants displacement or rupture, etc• IMAGING INTERPRETATION• Cosmetic procedures normal and pathological findings • Systematic approach to evaluate image exams • INTERACTIVE CASE-BASED DIDACTICS• Sample cases to illustrate and solidify the concepts

MKEE-43 Fungal Musculoskeletal Infections: Who, When, Where and How? A Comprehensive Approach to Proper Diagnosis

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Julia Peixoto, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points:The purpose of this exhibit is to:1. Provide a comprehensive overview, yet a didactic practical guide to assess fungal musculoskeletal infections imaging;2. Integrate imaging, clinical and epidemiological aspects, reviewing and illustrating the most frequent and some rare presentations of fungal musculoskeletal infections;

TABLE OF CONTENTS/OUTLINE

Outlines:Introduction: epidemiology, etiology, pathophysiology and clinical findings.Section-structured overview emphasizing the main imaging findings and relevant clinical and epidemiological features of each group of fungus.Illustrative cases, exemplifying classic imaging signs, and challenging cases addressing differential diagnoses with practical tips.Bibliography: broad-researched references highlighting what's useful to the radiologist.

MKEE-44 A Guide to Tibiofibular Syndesmosis: Anatomy, Imaging and Surgical Techniques

Participants
Cristyano Leite, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Comprehend clinic indications for imaging evaluation.Recognize the most useful image methods.Learn the anatomic features and relationships of the tibiofibular syndesmosis.Understand role and limitations of each method.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION.Epidemiology of the tibiofibular syndesmosis injury.Different Imaging methods to evaluate the syndesmosis.ANATOMICAL CONCEPTS.Anatomic description of the syndesmosis ligaments.Normal syndesmosis in the different methods.CASE-BASED DIDACTICS.Ligaments and syndesmotic injuries in the different methods.SURGICAL TECHNIQUES.Most used surgical techniques: indication and examples.

MKEE-45 Ultrasound of Medial Elbow Pain: Beyond the Epicondylitis

Participants
Jee Won Chai, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although it is less common than lateral elbow pain, medial elbow pain is a musculoskeletal problem more commonly encountered in the population participating repetitive activities. Ultrasonography has advantages in focused and dynamic evaluation of medial elbow structures, and subsequently enables to establish the differential diagnosis. The various anatomic structures more than common flexor tendon, such as ulnar collateral ligament, ulnar nerve, medial antebrachial cutaneous nerve and elbow joint can cause medial elbow pain, and some characteristic clinical features and physical examinations would be helpful for more focused evaluation on the clinically suspicious structures. Even with positive finding on one structure, other structures also should be evaluated for screening of coexisting pathology or other possible diagnosis; for instance, medial epicondylitis can accompany ulnar

neuropathy or ulnar collateral ligament injury as well, and proper treatment would be differed in such cases.

TABLE OF CONTENTS/OUTLINE

1. Differential diagnosis of medial elbow pain 2. Scanning technique and normal medial elbow on ultrasonography 3. Medial elbow pathologyA. Medial epicondylitisB. Ulnar collateral ligament injuryC. Ulnar neuropathy i. Cubital tunnel syndrome ii. Ulnar nerve instability D. Snapping triceps syndrome E. Medial antecubital cutaneous neuropathy F. Arthritis i. Ulnohumeral osteoarthritis ii. Gouty arthritis G. Others i. Cervical radiculopathy ii. Basilic vein thrombophlebitis

MKEE-46 Comparing US and MRI for Hand and Wrist Diseases: Which Weapon to Choose?

Participants
Young Ju Song, MD, Jeonju, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound imaging uses sound waves to produce pictures of muscles, tendons, ligaments, nerves and joints throughout the body. It is used to help diagnose sprains, strains, tears, trapped nerves, arthritis and other conditions. However, there are some diseases that US cannot fully detect, whereas MRI can easily and quickly find.Magnetic resonance imaging (MRI) uses a powerful magnetic field, radio waves and a computer to produce detailed pictures of joints, soft tissues and especially intraosseous lesions. It is usually the best choice for evaluating the body for injuries, tumors, and degenerative disorders. But in some cases, US is superior to MRI for detecting certain pathologies.The ability of a radiologist to understand the fundamental physics of US and MRI, recognize US and MRI competencies, and provide recommendations for using the most suitable imaging modality is essential for proper image interpretation, troubleshooting, and utilization of the full potential of each modality.

TABLE OF CONTENTS/OUTLINE

1. Basic Physics of Ultrasound 2. Basic Physics of MRI 3. Hand and Wrist Lesions : Comparison of Ultrasound vs. MRI1) Cases that show how Ultrasound is superior to MRI: Gout, Calcific Tendinosis, Extensor Carpi Ulnaris Dislocation (in dynamic study), Digital Nerve Adhesion, Pulley Thickening (Trigger finger) 2) Cases that show how MRI is superior to Ultrasound: Triangular Fibrocartilage Complex Tear, Osteomyelitis, Bone Tumor, Complex Regional Pain Syndrome, Infectious Arthritis 3) Cases that show how both Ultrasound and MRI are equally useful: Tenosynovitis, Sagittal Band Rupture, Volar Plate Injury, Collateral Ligament Injury, Rheumatoid Arthritis, Ganglion Cyst, Tenosynovial Giant Cell Tumor

MKEE-47 "Go With the Flow" - Vascular Pathology Encountered on Knee MRI

Participants
Kathryn Stevens, MBBS, FRCR, Stanford, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Review common and uncommon pathology of the popliteal artery and veins that can be encountered on knee MRI 2. Describe the signal characteristics of vascular masses occurring within and around the knee, as well as some of the potential pitfalls The major teaching points of this exhibit are: 1. Vascular pathology can often be seen on knee MRI, and is important to recognize 2. Knowledge of normal variants in vascular and muscle anatomy occurring around the knee has important implications for surgical planning 3. Detecting a DVT on routine MRI may significantly affect subsequent patient management 4. Intra- and extra-articular vascular malformations are not infrequently encountered around the knee, and it is important to identify characteristic imaging findings together with some of the potential pitfalls in diagnosis

TABLE OF CONTENTS/OUTLINE

1. Discuss classification and imaging findings of popliteal entrapment syndrome 2. Illustrate pathologies affecting the popliteal artery, including popliteal artery dissection, transection, aneurysm/pseudoaneurysm, cystic adventitial disease of the popliteal artery, and arterial calcification due to deficiency of CD73 (ACDC) 3. Review the aberrant anterior tibial artery, a commonly encountered normal variant, and emphasize the importance of including a description of this common variant in an MR report, particularly if the patient is to undergo subsequent knee surgery 4. Highlight the importance of evaluating for deep venous thrombosis on routine MRI 5. Outline imaging characteristics of vascular malformations occurring around the knee 6. Illustrate potential pitfalls mimicking vascular pathology around the knee

MKEE-48 Don't Be Afraid About T2 Mapping of the Knee Articular Cartilage: A Simple Way to Decrease Reports Ambiguity and Improve the Communication with Arthroscopists

Awards
Certificate of Merit

Participants
Estefania Gallego Diaz, MD, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- T2 mapping sequence improves the sensibility of detecting cartilage lesions within the knee joint, especially in the early stages.- To explain the importance of adding a T2 mapping sequence to a routine MRI protocol. - To instruct the radiologist on who applies the T2 mapping and how to do it. - To Review the main classifications of chondral (cartilage) lesions. - To implement the use of validated evaluation scales. - To present an algorithm approach and protocol that facilitates a uniform lexicon between radiologists and arthroscopists.- To simplify the technique and reports used in these patients to improve communication with the arthroscopy specialists.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Definitions 3. Understanding the chondral(cartilage) lesion 4. Classifications of chondral lesions and correlation with arthroscopy 5. Validated evaluation scales 6. T2 mapping sequence · Indications · Physics · Technique and protocol recommendations 7. How to report it: · Pictorial review · Algorithm approach and templates tips. · Case-based learning 8. Conclusions

MKEE-49 The Patellofemoral Joint: From Joint Stability to Articular Pathologies

Participants
Andre Rosenfeld, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this educational exhibit is:- Review the normal anatomy and imaging evaluation of the stabilizers of the patellofemoral joint and their pathologies, exemplifying the pathologies with didactic cases- Illustrate and discuss knee extensor mechanism injuries, patellar fat pat and bursae pathologies- Review patellofemoral joint pathologies, including degenerative osteoarthritis, inflammatory and crystal arthropathy

TABLE OF CONTENTS/OUTLINE

Patellofemoral congruency depends on dynamic stabilizers (extensor muscles and medial patellofemoral retinaculum/ligament) and static (bone) stabilizers. Imaging evaluation includes patellar and trochlear measurements, patellar translation distance (TT-TG) and torsional measurements. The knee extensor mechanism is composed of the quadriceps muscle and tendon, medial and lateral patellar retinaculum, patella, patellar tendon and tibial tuberosity. Its pathologies can be divided by location and chronology (acute vs chronic). Associated extensor mechanism pathologies include patellar fat pad and bursa abnormalities.The patellofemoral joint is a synovial joint that can be affected by degenerative, inflammatory and crystal arthropathies and synovial processes, with typical imaging findings. The radiologist needs to be familiar with the complete imaging evaluation of the patellofemoral joint, from joint stability to articular pathologies.

MKEE-5 Musculoskeletal Manifestations of Dermatomyositis: An Imaging Overview

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review and illustrate musculoskeletal manifestation of dermatomyositis with imaging findings on radiographs, ultrasound, computed tomography scan and magnetic resonance imaging.2. Review and discuss diagnoses related to dermatomyositis as paraneoplastic manifestation. 3. Review and discuss differential diagnoses.

TABLE OF CONTENTS/OUTLINE

Introduction: overview of clinical manifestation of the disease, including epidemiology, physiopathology, also presenting musculoskeletal clinical features of dermatomyositis.Present an illustrated scheme with the most common manifestations of dermatomyositis.Exemplify the manifestations of dermatomyositis such as skin involvement, subcutaneous tissue involvement, musculoskeletal involvement, and correlate with different imaging modalities.Present clinical case with differential diagnosis.References.

MKEE-50 Posterior Meniscal Roots Injury: What Radiologists Need to Know

Participants
Camila De Paula Silva, MD, Botucatu, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review and illustrate the anatomy of the posterior meniscal roots in schematic figures and MRI.To review and illustrate the lesions and classification of posterior root meniscal tears in schematic figures and MRI.To review and illustrate the surgical techniques to repair meniscal posterior root tears in schematic figures, intra-operative imaging, and post-operative imaging in a multimodality approach.

TABLE OF CONTENTS/OUTLINE

1- Anatomy of the posterior meniscus root. 2- MRI of posterior meniscus root tears and their classifications: - type 1 (partial radial root tears without any tear in the adjacent posterior horn or body); - type 2 (complete radial root tears); - type 3 (longitudinal bucket-handle tears with a complete tear of the root attachment); - type 4 (complex oblique tears with a complete tear of the root attachment); - type 5 (avulsion fractures of the tibial plateau). 3- Types of surgical techniques to repair meniscal root tears, include - Surgical indications.- Intra-operative imaging.- Partial meniscectomy.- Meniscal repair (transtibial pullout repair, suture anchor repair, and side-to-side repair).

MKEE-51 Update on Orthopedic Procedures in the Knee

Participants
Eduarda Bernal, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review new methods to repair cartilage of the knee like allograft and autologous transplantation associated with collagen membrane.Demonstrate that extra-articular anterolateral procedures improve clinical outcome when performed as an augmentation of the anterior cruciate ligament reconstruction in specific groups of patients.Review normal and abnormal postoperative MRI findings of arthroscopic transtibial pullout repair (ATPR) for medial meniscus posterior root tear (MMPRT).Talk about future prospects of minimally invasive knee surgery.

TABLE OF CONTENTS/OUTLINE

Cartilage defects of the knee are often debilitating and predispose to osteoarthritis. seeking methods that combined can effectively repair cartilage and prevent progression to osteoarthritis is the goal of orthopedists. For larger lesions with a substantial amount of cartilage loss, autologous chondrocyte implantation using a bilayer collagen membrane has been demonstrated excellent results.Currently, the most commonly used technique for root repair is ATPR. The role of postoperative MRI is confirm the reduction of the posterior meniscus root to the original footprint of the tibial surface, identify the integrity of this structure, note the decrease in intra-meniscal signal intensity.The anterolateral ligament and capsule of the knee are anatomical structures involved in rotational stability and pivot-shift control. As such, it has been demonstrated that the extra-articular anterolateral procedures improve clinical outcome when performed as an augmentation of the anterior cruciate ligament reconstruction in specific groups of

patients.

MKEE-52 Osteosarcopenia: A New Geriatric Syndrome with Great Impact on Our Life

Participants
Jimi Huh, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is 1. To explain the concept and updated knowledge about osteosarcopenia 2. To systematically review the current researches about clinical importance of osteosarcopenia 3. To understand the concept and future directions of body composition imaging for evaluation of osteosarcopeniaMajor teaching points are: 1. Osteosarcopenia, a combination of osteoporosis and sarcopenia is a distinct disease entity with unique pathophysiology.2. Osteosarcopenia is highly associated with frailty and mortality in elderly people and cancer patients. 3. Advances in imaging have enabled detailed analysis of osteosarcopenia.

TABLE OF CONTENTS/OUTLINE

1. Concept and updated knowledge about osteosarcopenia - Changing concepts: From sarcopenia to osteosarcopenia and myosteatosis - Osteosarcopenia: combination of sarcopenia and osteoporosis - Distinct pathophysiology focusing on interaction between muscle and bone2. Systematic review for clinical importance of osteosarcopenia - Prognostic markers for overall survival in cancer patients - Independent risk factors for osteoporotic fractures and frailty - Increase in mortality/morbidity after major surgery3. Body composition imaging for evaluation of osteosarcopenia - Current leading diagnostic modalities of osteosarcopenia : CT, MRI and DXA - Imaging methods to measure the skeletal muscle area (SMA) and bone mineral density (BMD) - Evolution of AI techniques: AI segmentation and pattern analysis for BMD4. Future directions of body composition imaging - Standardization of diagnostic modality, measuring level, and diagnostic cut-off and criteria - Accurate methods to assess muscle and bone tissue composition in opportunistic CT

MKEE-53 Sonography of Anatomical Variations in the Hand Innervation

Participants
Afarine Madani, PhD, Bruxelles, Belgium (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Less than 10% of individuals show the classical hand innervation pattern as described in anatomical books • More than 90% of individuals display at least one or up to five anastomoses between ulnar nerve and median nerve • 50% of the anastomoses are localized within the forearm • Knowledge of anatomical variations in the hand innervation is essential because they induce variations in symptomatology, clinical findings, imaging results, and "routine" electrodiagnostic tests, but also because they may lead to wrong diagnosis, inadequate treatment and/or iatrogenic lesions • In case of anastomosis between motor branches, diagnosis is based on the distribution of atrophic pattern and fatty degeneration of intrinsic muscles of the hand • In case of anastomosis between sensitive branches, diagnosis is mainly focused on patient's complaints

TABLE OF CONTENTS/OUTLINE

• The 4 most frequent anastomoses in the upper extremity are between motor branches, -Martin-Gruber, Marinacci, Riché-Cannieu, and between sensitive branches, -Berrettini- • Description of US technique that helps their identification • Discussion of the clinical implications

MKEE-54 Using Dynamic Maneuvers in the Computer Tomography/Magnetic Resonance Assessment of Musculoskeletal Pathologies

Participants
Thais de Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologic assessment of certain musculoskeletal lesions may still pose difficulties. Certain maneuvers have been described to overcome these difficulties. Although dynamic ultrasound is a well established diagnostic technique, TC and MR dynamic imaging have particular indications and are also valuable tools in certain musculoskeletal pathologies. This study aims to review the use of dynamic maneuvers in MR and CT for evaluation of some specific musculoskeletal pathologies including: Hirayama disease, ankle syndesmosis injury, radioulnar instability, chronic compartmental syndrome and others. We intend to illustrate and highlight the utility and benefits of dynamic maneuvers for the diagnosis of different musculoskeletal pathologies.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION: Dynamic Acquisitions. Diseases caused by dynamic abnormalities and dynamic instability SAMPLE CASES Hirayama disease: flexion maneuvers allow to demonstrate anterior displacement of the dura mater. Ankle syndesmosis injury: flexion knee maneuvers. Radioulnar instability: supine maneuvers allow sensibilization for ulnar subluxation. Chronic compartimental syndrome: effort maneuvers. Thoracic outlet syndrome (TOC): arm abduction maneuvers allow sensibilization for TOC. Extrinsic median nerve compression: flexion/extension of fingers allow better visualization of dynamic compression. CONCLUSIONDynamic musculoskeletal imaging in CT and MR are important tools that allow detection of different musculoskeletal pathologies. Being able to recognize its indications, to guide targeted protocols and to know how to interpret the imaging findings both in neutral and dynamic positions is imperative for radiologists.

MKEE-55 Don't Forget the Atlantoaxial Joint: From Anatomy to Pathological Findings

Participants
Alan Strapasson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. Review developmental embryology, anatomy, biomechanics, measurement of the atlantodental interval in the adult and pediatric population and its main anatomical variations that can simulate solutions.2. Review imaging protocols for their evaluation according to clinical suspicion (X-ray, CT and MRI). 3. Discuss the main traumatic and non-traumatic injuries that can affect the joint, correlating their findings with imaging methods.

TABLE OF CONTENTS/OUTLINE

1. Developmental embryology (ossification nuclei). 2. Atlanto-axial joint anatomy: CT, X-ray, ligaments (MRI), craniometry (basion-dens interval, power ratio, basion-axial interval, atlantodental interval, spinolamine distance C1-C2) 3. Normal variants that mimic lesions: fusion anomalies, posterior/anterior rachischisis, persistence of the terminal ossicle (Bergman), "os odontoideum", calcification of the alar ligament. 4. Biomechanics: extension, flexion, lateral flexion, axial rotation. 5. Imaging assessment: RX, CT and MRI protocols (ligaments and spinal cord injury). 6. Differentiation of normal/positional findings from pathological alignment changes. 7. Atlas fracture (Jefferson). 8. Odontoid fracture (Anderson and D'Alonzo classification). 9. Traumatic spondylolisthesis of C2 (hangman's fracture). 10. Atlanto-axial subluxation (anteroposterior, rotational, vertical and lateral). 11. Alar ligament deformity-rupture. 12. Rupture of the transverse ligaments. 13. Rheumatoid arthritis. 14. CPPD

MKEE-56 Update on Cartilaginous Tumors

Awards
Certificate of Merit

Participants
Sara Gomez Pena, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

•To review the new concepts of the 2020 WHO classification of tumors of bone •To describe the radiological spectrum of cartilaginous tumors •To recognize the radiologic manifestations that may allow differentiation of the various types of chondrosarcoma •To discuss the role of different imaging modalities in the diagnosis and follow-up of chondrosarcomas •To deepen the role of imaging biomarkers and artificial intelligence in the diagnosis and follow-up of cartilaginous tumors

TABLE OF CONTENTS/OUTLINE

1.Introduction: generalities and the 2020 WHO classification of tumors of bone 2.Enchondroma vs. chondrosarcoma 3.Imaging features in the diagnosis, follow-up and local recurrence in chondrosarcomas 4.Imaging biomarkers and IA in chondrosarcomas 5.Conclusions

MKEE-57 Bone Tumors in the Spine: A Simplified Approach

Participants
Tatiane Moriwaki, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: Review and illustrate features of spinal bone tumors with imaging findings on radiography, computed tomography and magnetic resonance; Illustrate and discuss differential diagnosis with didactic and challenging cases; Provide a basic guide to characterizing bone tumors of the spine.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of the epidemiology of bone tumors in the spine. Distribution of bone tumors: schematic flowchart showing the rationale for bone lesions based on age, distribution, and location of the main spinal tumors to help narrow differential diagnoses and identify "don't touch" lesions. • In patients younger than 30 years, spinal tumors are uncommon and usually benign, except for Ewing's sarcoma and osteosarcoma, while in patients older than 30 years, metastases should be included in the differential diagnoses. Infections should also be considered when there are signs of aggression. Evaluation of spinal tumors: •Characteristics of the main bone tumors in terms of epidemiology, matrix type, typical, and atypical imaging findings; • Summary of management and prognosis; •Didactic and challenging cases: benign and malignant spinal tumors. Bibliographical references with recent articles highlighting what is new in the topic.

MKEE-58 Spondylarthritis (SpA): A Practical Imaging Diagnostic Approach and Current Definitions

Awards
Cum Laude

Participants
Damaris Goncalves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

SpA is a heterogeneous group of diseases that share common genetic, clinical, and imaging features. The diagnosis is complex and multifactorial, there is no gold standard exam or diagnostic criterion, and the classification criterion is often misused in clinical practice, which can lead to diagnostic errors, mostly false positives. In its last update of the definition of sacroiliitis in 2021, the ASAS highlighted the high rates of false positives when using previous definitions of sacroiliitis, expressed concern about the misuse of the classification criteria in clinical practice and reformulated the definition, now more specific, including both inflammatory and structural lesions, although still for research purposes. Imaging diagnosis of SpA in clinical practice can be made with any combination of inflammatory and/or structural lesions in the sacroiliac joints, spine, peripheral joints and/or entheses, as long as these findings are "highly suggestive of SpA", although this definition is subjective and there is considerable interobserver variability, even among experienced readers. The distribution of the lesions must also be considered either in the sacroiliac joint, spine or peripheral joints. The differential diagnoses must be excluded, especially mechanical pathologies, which are much more prevalent and a common cause of false positive results. In addition, knowledge of habitual skeletal maturation in children is essential, as it can mimic sacroiliitis or enthesitis.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Sacroiliac joint 3. Spine 4. Peripheral Findings 5. WBMRI 6. Conclusion

MKEE-59 2022: A Spacer Odyssey: Imaging of Antibiotic Spacers for Periprosthetic Joint Infection-

Participants
Jason Matakas, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Educate the reader regarding two-stage revision surgery with antibiotic spacers and why it has become the gold standard for periprosthetic joint infection (PJI) management. • Highlight advances in antibiotic spacer design.• Depict radiographic appearance of various types of spacers and how they can be differentiated.• Discuss common complications of antibiotic spacers the radiologist should be aware of.

TABLE OF CONTENTS/OUTLINE

• Background/Indication for two-staged revision with antibiotic spacer.• Benefits: Maintains tissue tension, provides high local concentration of antibiotics, preserves cavity for subsequent revision; articulating spacers additionally allow preserved range of motion, prevent immobilization, and allow weightbearing.• Spacer types and radiographic appearance: o Knee: static, intraoperative mold, prefabricated cement, metal/polyethylene.o Hip: non-articulating, intraoperative mold, prefabricated cement, metal/polyethylene.o Shoulder: non-articulating, intraoperative mold, prefabricated cement, cement-coated hemiarthroplasty.• Case-based discussion of complications: prosthetic and periprosthetic fracture, bone loss, dislocation/subluxation, persistent infection.• Outcomes: High efficacy of infection eradication; some patients decline further revision.

MKEE-6 Pain in the Calf! - Musculoskeletal Ultrasound in the Diagnosis of Calf Pain

Awards
Certificate of Merit

Participants
Kristin Shute, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the normal anatomy of the calf. Demonstrate the optimal patient positioning and ultrasound technique for the evaluation of various causes of calf pain. Illustrate the ultrasound appearance of various pathologic conditions about the calf.Highlight pitfalls of calf ultrasound to avoid misinterpretation of pathology.

TABLE OF CONTENTS/OUTLINE

Anatomy overview with correlate of normal ultrasound appearance. Clinical imaging and findings of disease Muscle Injuries/Pathologies Tennis leg Muscle strain, tear, hematoma Muscle hernia Accessory soleus Bursae Baker's cyst (simple and complex) Ruptured Baker's cyst PseudoBaker's cyst/mimics Pes Anserine bursa Achilles rupture Nerves Neuroma PNST Nerve entrapments Fracture Conclusion and discussion References

MKEE-60 Don't Be Very Nervous": Neurovascular Structures to Avoid During Ultrasound-guided Interventions in the Extremities

Participants
Jenifer Pitman, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Ultrasound is extremely useful for guiding injections and other procedures in the extremities, but a firm grasp of the regional anatomy is important for the procedures to be performed safely.2. Neurovascular structures need to be avoided, and awareness of their characteristic locations relative to the structure of interest will allow safe needle advancement.3. This education exhibit will review the typical needle orientation for many ultrasound-guided procedures in the extremities, focusing on important neurovascular structures to avoid for each.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Shoulder:a. Paralabral cyst aspiration (Avoiding the suprascapular nerve (N))3. Elbow:a. Elbow joint injection (Avoiding the deep branch of the radial N)b. Medial epicondylitis injection (Avoiding the ulnar N)c. Biceps tendon injection (Avoiding the lateral antebrachial cutaneous N)4. Wrist/Hand:a. Dorsal and volar ganglion cyst aspirations of the wrist (Avoiding the posterior interosseous N and radial artery (A), respectively)b. 1st carpometacarpal and triscaphe joint injections (Avoiding the radial A)c. 1st dorsal extensor compartment injections (Avoiding the sensory branch of the radial N)d. Finger flexor tendon retinacular cyst aspiration/tendon sheath injection (Avoiding the proper digital N)5. Hip:a. Iliopsoas bursal injection (Avoiding the femoral neurovascular bundle)b. Hamstring injection/aspiration (Avoiding the sciatic N)6. Knee:a. Baker's cyst aspiration (Avoiding the saphenous N)7. Ankle:a. Tibiotalar joint injection (Avoiding the dorsalis pedis and deep peroneal N)b. Flexor hallucis longus sheath / os trigonum injection (Avoiding the tibial N and medial and lateral plantar N)

MKEE-61 Opportunistic Evaluation of Sarcopenia and Osteoporosis - Focus on Musculoskeletal Imaging

Participants
Jennifer Padwal, MD, MS, Palo Alto, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Sarcopenia and osteoporosis are independent risk factors for poor clinical outcomes 2) Abdominal CTs have been most thoroughly studied for the evaluation of sarcopenia and osteoporosis, although other anatomic regions on CT, MRI, and ultrasound may offer valuable information on muscle and bone quality 3) Reporting of sarcopenia and osteoporosis on imaging may influence patient management

TABLE OF CONTENTS/OUTLINE

I. Epidemiology and clinical significance of sarcopenia and osteoporosis II. Definitions of sarcopenia and osteoporosis: From DXA to opportunistic CT, MRI, and ultrasound III. CT and MRI screening of sarcopenia and osteoporosis on musculoskeletal imaging examinations (spine and extremities), including CT attenuation (e.g., Hounsfield unit thresholds) and MRI-derived biomarkers (e.g., T2 relaxation time, functional anisotropy) IV. Translating clinical research into clinical practice: Terminology and templates for reporting sarcopenia and osteoporosis on CT, MRI, and ultrasound

MKEE-62 Congenital Femoral Deficiency and Its Imaging and Surgical Evolution Over Time

Participants
Denny Marcela Achicanoy I, MEd, Ciudad De Mexico, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Congenital femoral deficiency is hypoplasia of the proximal portion of the femur without a known specific etiology.Its prevalence is 0.1 to 0.2 cases per 10,000 newborns it is mainly associated with fibular hemimelia, patellar absence, acetabular dysplasia. Paley's imaging classification depends on the degree of development of the integrity of the femur without depending on age or degree of ossification.

TABLE OF CONTENTS/OUTLINE

1. Definition. 2. Embryological origin. 3. Etiology associated factors. 4. Imaging findings. 5. Treatment.Congenital femoral deficiency is the specific partial absence (hypoplasia) of the proximal portion of the femur with shortening of the entire lower limb without an etiology. Its prevalence is 0.1 to 0.2 cases per 10,000 newborns it is mainly associated with fibular hemimelia, patellar absence and acetabular dysplasia mainly due to the association with its postaxial embryonic origin. Initially it was classified by Guillespie Torode into two groups: I or congenital hypoplastic femur, where the hip knee are functional after surgical treatment symmetry of the limbs can be achieved; II or proximal focal femoral deficiency where the hip is abnormal the knee is considered non-functional, in these cases prosthetic management is suggested. However, Paley created an imaging classification with the intention of offering a guide for surgical treatment depending on the degree of development of the integrity of the femur. The Paley Classification is aimed at facilitating decisions treatment protocols to follow. In this poster we will present cases of femoral hypoplasia with different classification according to Paley.

MKEE-63 Uncomplicating Spinal Cord Disorders - A Practical Guide for the Musculoskeletal Radiologist

Participants
Alexandre Goncalves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review anatomy of the spinal cord. 2. Narrow the differential of spinal cord diseases according to location. 3. Differentiate between inflammatory, infection, demyelinating, metabolic, neoplastic lesions and vascular disorders.

TABLE OF CONTENTS/OUTLINE

1 - Topographic and cross section detailed anatomy of the spinal cord. 2 - Correlate spinal cord diseases that manifest with high signal within the spinal cord on T2WI with their locations to narrow the differential diagnosis. 3 - Illustrate the most common causes and imaging findings in MRI, including - Inflammatory; - Vasculitis; - Infection; - HIV; - Bacteria; - Fungus; - Cysticercosis; - Demyelinating disorders; - Multiple sclerosis; - Transverse myelitis; - Neuromyelitis optica; - Acute disseminated encephalomyelitis; - Metabolic; - B12 hypovitaminosis; - Neoplastic; - Ependymoma; - Astrocytoma - Hemangioblastoma; - Lymphoma; - Metastases; - Vascular disorders; - Ischemia due to spinal arteriovenous malformation. 4 - Summary and practical guide to narrow the differential diagnosis of MRI findings according to location and how to relate the findings to the patients' relevant clinical and laboratory data.

MKEE-64 Spectrum of Imaging Findings of Iatrogenic Vascular Injuries After Orthopedic Surgery

Participants
Emanuele Barabino, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Despite the establishment of safety zones to place screws and metallic devices, the rate of vascular injuries during orthopedic surgery has keeping increasing in the last decades due to the increasing employment and revision of prosthetic devices.• Severe injuries (i.e., tearing of major vessels) cause severe bleeding and hypotension and are usually prompted recognized intraoperatively; despite not life-threatening, minor injuries are typically more insidious, and they could determine significant functional losses and postpone the healing process.• The spectrum of imaging findings of the iatrogenic vascular injuries after orthopedic surgery is wide and heterogenous and the radiologic evaluation of surgical field is often impaired by artifacts generated by metallic devices.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Anatomical Considerations3. Mechanisms of Injury3.1 Vascular injuries after elective surgery3.2 Vascular injuries after trauma surgery4. Risk Factors4.1 Anticoagulation and Antiplatelet therapy4.2 Atherosclerosis4.3 Infection5. Imaging Techniques and Technical Consideration5.1 CT Protocol5.2 Metal Artifact reduction Protocol6. Radiologic Features6.1 Hematoma6.2 Pseudoaneurysm6.3 Vessel Transection6.4 Occlusion7. Conclusion

MKEE-65 I Want to Ride My Bicycle! A Pictorial Essay on Cycling-related Musculoskeletal Injuries

Participants
Damaris Goncalves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Overview on epidemiology of cycling-related musculoskeletal injuries; ? To demonstrate the most common mechanisms that lead to the development of musculoskeletal lesions during cycling (lesions of contact, overuse and traumatic); ? To summarize the main musculoskeletal lesions related to cycling according to the affected musculoskeletal structures; ? To demonstrate the typical findings related to such lesions in a variety of imaging methods.

TABLE OF CONTENTS/OUTLINE

? Introduction: concept of bicycling-related injuries, epidemiology; ? Mechanisms of musculoskeletal injuries that occur during cycling; ? Overview of the main musculoskeletal injuries among cyclists in different parts of the musculoskeletal system; ? Pictorial essay on the typical imaging findings related to those lesions, including brief discussion on clinical presentation.

MKEE-66 First Metatarsophalangeal Trauma: The Complete Spectrum of Osseous and Soft Tissue Injuries

Participants
Collin Edwards, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Injuries to the first metatarsophalangeal (MTP) joint, including but not limited to "turf toe", have long been associated with athletic trauma and overuse. Imaging plays an important role in the determination of severity and extent of damaged structures within this complex. Multiple classification systems frequently combine both the imaging characteristics and clinical presentation in an effort to guide management and predict return to play.This session reviews injuries to the first MTP joint to increase participants' understanding of the following: 1. Mechanisms of injury and epidemiological risk factors 2. MRI findings of 1st MTP injury and classification systems 3. Management pathways.We use multiple case examples to demonstrate the relationship between MRI findings and management decisions/outcomes. Increased understanding of these clinical, radiologic and surgical factors will further inform the radiologist's interpretation of MRI for first MTP trauma.

TABLE OF CONTENTS/OUTLINE

Review of normal 1st MTP osseous and ligamentous anatomy; Mechanisms and epidemiology of 1st MTP injury; Classifications of 1st MTP injuries; Case examples of osseous and ligamentous pathology, including: - Hallux sesamoid fracture and stress injuries - Osteochondral lesions - Capsuloligamentous injuries (Sesamoidophalangeal, intersesamoid, metatarsosesamoid, collateral ligament injuries) - Musculotendinous injuries; Non-surgical and surgical management

MKEE-68 MRI evaluation of Post-operative Peripheral Nerve Injury

Awards
Certificate of Merit

Participants
Hye Yang, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review common types of procedures that are prone to causing peripheral nerve injury. 2. To recognize the MRI appearance of peripheral nerve injury including the changes to the related muscles. 3. To review the patterns of peripheral nerve injury. 4. To review the common appearances and presentations of peripheral nerve injury on MRI

TABLE OF CONTENTS/OUTLINE

1. Normal Anatomy: a. Normal appearance of peripheral nerve. b. Normal appearance of muscle. 2. Procedures that predispose to peripheral nerve injury: a. Types of procedures. b. Areas that are prone to injury. 3. Classification of peripheral nerve injury: a. Seddon Classification. b. Sunderland Classification. 4. MRI appearance of injury: a. Grades/Types of nerve injury. b. Neuroma. c. Peripheral muscle changes. 5. Treatment

MKEE-69 Complications of Reverse Total Shoulder Arthroplasty: What a Radiologist Should Know

Awards
Certificate of Merit

Participants
Timothy T. Klostermeier, MD, Lebanon, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Reverse Total Shoulder Arthroplasty (RTSA) restores glenohumeral mobility and function to patients with rotator cuff arthropathy and other severe glenohumeral conditions. Radiologists should understand the biomechanical advantages, expected appearance, and anatomy of this arthroplasty (and its design variations).2. Basic examples of types of RTSA will be presented.3. Complications related to RTSA need to be promptly recognized and communicated. Radiologists should be familiar with the appearance of these complications.4. Mechanical failures will be highlighted with pictorial examples.5. Recognition of signs of infection and role in component failure.

TABLE OF CONTENTS/OUTLINE

1. Epidemiology of RTSAIncidence, prevalence, and rising complications 2. Role of radiologist:-Normal biomechanics-Identifying types of RTSA, medialized and lateralized and expected appearance-Recognizing and addressing complications 3. Components of RTSA4. Complications(a) Scapular notching (b) Acromial stress fractures(c) Periprosthetic fractures (d) Infections and treatment(e) Implant failures• Implant loosening• glenoid/ humeral stem• Intra implant unscrewing: humerus• Disengaged glenosphere• Broken screws• Canal filling of stem and stress shielding of greater tuberosity5. Dislocation-Assessment of implant orientation

MKEE-7 A Pain in the Neck: Magnetic Resonance Neurography of Neurogenic and Disputed Subtypes of Thoracic Outlet Syndrome

Participants
Emily Davidson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Thoracic outlet syndrome (TOS) is thought to result from compression of the upper limb neurovascular structures traversing the thoracic outlet. TOS remains poorly understood, despite extensive available literature describing clinical features, imaging findings and approaches to the syndrome. 2. TOS due to compression on the brachial plexus causes upper limb neurological symptoms, varying from mild sensory disturbance to motor function loss. 3. Subtypes of neurological TOS have been divided into Neurogenic TOS (nTOS) and Disputed TOS (dTOS), based on clinical features and electrodiagnostic results. nTOS have positive motor nerve involvement, whilst dTOS have preserved motor nerve function with a predominant sensory disturbance. 4. Magnetic resonance neurography (MRN) is increasingly being used to investigate nTOS and dTOS and identify focal areas of compression on the brachial plexus. MRN has become an important test within the diagnostic algorithm for TOS investigation and management (non-operative vs operative).

TABLE OF CONTENTS/OUTLINE

1. Update on brachial plexus MRN imaging techniques including coil selection, imaging acquisition protocols, and imaging reconstruction protocols that employ deep learning algorithms. 2. Overview of TOS brachial plexus anatomy. 3. Review clinical features/electrodiagnostics of nTOS and dTOS. 4. Review MRN case examples of nTOS and dTOS subtypes, including: overhead throwing athlete, postoperative complications resulting in perineural scar and muscle denervation, and osseous abnormalities (cervical and first rib).

MKEE-71 Exploiting the Technical Possibilities and Advancements of Photon-Counting CT for Musculoskeletal Imaging: The Way Forward

Participants
Jeffrey De Groen, BSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate the possibilities regarding acquisition and reconstruction techniques of PCCT for musculoskeletal imaging To provide insights and knowledge needed for optimal utilization of PCCT in musculoskeletal imaging To give an outlook on the future prospects of PCCT in MSK imaging

TABLE OF CONTENTS/OUTLINE

With the recent introduction of a clinical photon-counting computed tomography (PCCT) scanner, it has become possible to combine ultra-high image resolution with spectral information. Image data obtained with PCCT may provide clinicians and radiologists with improved diagnostic confidence. For example, a better visualization of metastatic bone might offer valuable information about how to best stabilize the bone with metal plate placement. However, there is still limited knowledge about what the best choices are for PCCT acquisitions (e.g. x-ray spectra) and reconstructions (e.g. kernels, mono-energetic and metal artifact reduction techniques) for the various areas of interest. This exhibit will provide you with examples of clinical PCCT scans obtained in two different institutions, compared to previously acquired energy-integrating detector (EID) CT scans and other modalities in e.g., the diagnosis and follow-up of fractures, the evaluation of osteolysis, osseointegration of orthopedic joint replacement implants, and the assessment of bone tumor and metastasis. Finally, an outlook on the future utilization of PCCT to extract quantitative bone biomarkers and the assessment of bone quality and structure is provided.

MKEE-72 Osteotomies - Indications, Imaging Appearance, and Surgical Techniques

Participants
Majid Chalian, MD, Seattle, WA (*Presenter*) Grant, The Boeing Company

TEACHING POINTS

1. Review of the common osteotomy procedures and techniques2. Review of different techniques for each osteotomy procedureReview of the common osteotomies' clinical indications and complicationsReview of the common osteotomies normal postoperative imaging findings.

TABLE OF CONTENTS/OUTLINE

• Craniotomy• Lateral nasal osteotomy• Bilateral sagittal split osteotomy• Reduction malarplasty• Thoracolumbar vertebral osteotomy• Rib osteotomy• External rotation humeral osteotomy• Ulnar shortening Osteotomy• Distal radius corrective osteotomy• Scaphoid corrective osteotomy• Periacetabular osteotomy• High tibial osteotomy• Talar neck osteotomy• Calcaneal osteotomy• Hallux valgus osteotomy

MKEE-73 Normal and Abnormal MRI of the CapsuloLabral Complex of the Hip

Awards
Magna Cum Laude
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

Contrary to its counterpart in the glenohumeral joint, the anatomy, biomechanics and patterns of injury involving the femoroacetabular capsulo-labral complex may be less familiar to radiologists. The labrum and articular capsule of the femoroacetabular (hip) joint work in conjunction to stabilize the articulation. At lesser degrees of distraction, the labrum is the most important hip stabilizer, whereas in greater distraction states, the contribution of the capsule to hip stability increases. The objectives of this educational exhibit are as follows: • Review normal anatomy and biomechanics of the femoroacetabular or hip labrum and capsular ligaments • Discuss patterns of failure and injury involving the capsulo-labral complex of the hip • Define MR imaging pearls and pitfalls in diagnosing these capsulo-labral injuries

TABLE OF CONTENTS/OUTLINE

NORMAL MRI • Hip labrum and anatomic variants• Capsular ligaments of the hip • Ligamentum teresIMAGING CONSIDERATIONS• Radial sequences• MR arthrographyABNORMAL MRI• Labral tears• Posterior hip dislocation • Isolated injuries of the capsular ligaments

MKEE-74 Imaging Review of Beach Tennis Injuries: A New Sport Trend and Related Musculoskeletal Lesions

Participants
Andre Mannato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The exponential growth of Beach Tennis (BT) has been observed in Brazil, mainly in coastal cities. The origin of this sport dates back to Italy in the 80s. Only in 1996 the official rules of the sport were determined. Worldwide it is estimated that more than 1 million people are practicing which is played using Beach Tennis paddles and a low compression tennis ball. BT is mainly played

overhead, including serving, defensive moves and attacking, this may have contributed to rotator cuff tendinopathy. Explosive sprinting in the serve with sudden plantarflexion of the foot with knee extended, contributed to more injuries in the leg and ankle muscles and tendon. Moving on sand requires more energy due to the mechanical work related to the sand's compliance and the lower efficacy of positive muscular work. For this reason, is important for the radiologist to correlate the clinical scenarios for the correct radiologic diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Overview on epidemiology of beach tennis related musculoskeletal injuries 2. To demonstrate the most common mechanisms that lead to the development of musculoskeletal lesions during the match (serving, attacking, defense) 3. To summarize the main musculoskeletal lesion related to beach tennis according to the affected musculoskeletal structures To demonstrate the typical findings related to such lesions in a variety of imaging methods

MKEE-75 Midfoot Strains Illustrated with Global Illumination Rendering

Participants
Fatma Boubaker, Nancy, France (*Presenter*) Nothing to Disclose

TEACHING POINTS

Midfoot strains are clinically and radiologically underdiagnosed. They require a more aggressive treatment than classical lateral ankle sprains, with which they are often associated, because of higher sequalae risk. The Chopart joint is sustained by the spring ligament complex, the talonavicular, bifurcate, and calcaneocuboid (lateral and plantar) ligaments. Inversion lesions are the most frequent and lead to talonavicular impaction and calcaneocuboid distraction injuries. The Lisfranc joint is composed of 3 columns, inter-connected by dorsal, plantar, and intermetatarsal ligaments, and especially by an inter-osseous (Lisfranc) ligament, linking the medial and intermediate columns, which attempt leads to joint instability. Radiographs allow sub-optimal evaluation in a post-traumatic context. CT must be performed if a fracture is suspected and permits a good depiction of small bony avulsions, as MRI, considered the gold standard for ligamentous study, is usually not available in the acute phase. Moreover, Global Illumination rendering provides information beyond the reach of 2D images. Even though midfoot anatomy is considered complex, a clear knowledge of its anatomy improves the early detection of traumatic lesions requiring more aggressive treatment to avoid degenerative changes, especially using CT in the very early setting.

TABLE OF CONTENTS/OUTLINE

1. Chopart injuries. 1.1 - Introduction, 1.2 - Anatomy, 1.3 - Imaging findings2. Lisfranc Injuries. 2.1 - Introduction, 2.2 - Anatomy, 2.3 - Imaging findings

MKEE-76 Non-traumatic Mid and Forefoot Pain: Must-know Findings to Radiologists in Training

Participants
Marcos Assuncao, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The mid and forefoot pain is a common complaint among patients in a non- traumatic scenario, especially the forefoot. Many pathologies with different etiopathogenesis and difficult differentiation based only on clinical aspects can cause pain in these regions, from biomechanical disarrangements to infections or neoplasms.An important aspect in the initial evaluation is differentiation between mechanical and non-mechanical causes. The first is related to structural changes that lead to overload of the joints, primary the metatarsophalangeals, and may present with varied findings. The non-mechanical causes comprises the degenerative and inflammatory arthropathies, infections, tendinosis, metabolic or vascular disorders, tumors and alterations associated with foreign bodies.Imaging of the mid and forefoot allows the complete evaluation of these primary causes and their relationship with anatomy and biomechanics, granting correct and fast therapeutic alignment with better outcomes. Radiologists should be familiar with the method of choice in each clinical presumption and prompt recognize the typical findings of each pathology.

TABLE OF CONTENTS/OUTLINE

Introduction to primary causes of non-traumatic pain of the mid and forefoot.Pictory essay with the typical imaging findings.Discussion about the methods of choice and what to evaluate in each disorder.

MKEE-77 No Strings Attached - Tendon and Tendon Sheath Pathologies of the Hand

Participants
Jan Grunz, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

TEACHING POINTS

The tendons of the hand run in close proximity to each other and within reticular tunnels adjacent to articular joints, while forming intersections in characteristic locations. This particular anatomy can lead to stenosis in the fibrous outer layers of the extensor retinaculum and A1 annular pulleys, resulting in tendinosis and functional disability. In contrast, proliferative tenosynovitis is a disease of the synovial inner layer of the tendon sheath with tendon infiltration and ensuing tendinitis, most frequently seen in rheumatoid arthritis. Phlegmonous or purulent tenosynovitis is more common in the flexor compartments, potentially resulting in tenosynovial necrosis and tendon dislocation. Diseases of the tendons and tendon sheaths may have mechanical, degenerative, metabolic or inflammatory etiology. Fibrous tunnels and bony prominences in close proximity to crossing tendons predispose to mechanical tendon irritation at typical sites of the hand. Requiring high-resolution techniques due to the small size of the compartments involved, the tendons and tendon sheaths of the hand can be precisely assessed in ultrasound and MRI.

TABLE OF CONTENTS/OUTLINE

1. Anatomy of the tendon and tenosynovium 1.1. The extensor mechanism 1.2. The flexor mechanism 2. Imaging principles 2.1 Ultrasound 2.2 MRI 3. Common pathologies 3.1. Tendinosis 3.2. Tendinitis 3.3. Paratendinitis 3.4. Reactive tenosynovialosis 3.5. Stenosing tenovaginosis 3.6. Proliferative tenosynovitis 3.7. Traumatic ruptures 3.8. Tumors of the tendon sheath 4. Discussion

MKEE-78 Stay Flexible! Diagnosis and Treatment of Flexor Tendon Injuries

Awards

Certificate of Merit

Participants
Steven Daniels, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review anatomy of the flexor tendon and flexor tendon sheath 2. To review imaging findings in flexor tendon tears highlighting those important to the treating surgeon 3. To discuss the different treatment options in flexor tendon tears and demonstrate how imaging helps guide patient management 4. To discuss complications of primary flexor tendon repair and flexor tendon reconstruction

TABLE OF CONTENTS/OUTLINE

1. Anatomy of the flexor tendon and flexor tendon sheath a. Flexor tendon anatomy b. Flexor tendon sheath and pulley system c. Flexor zones of injury 2. Zone 1 injuries - Leddy and Packer classification 3. Zone 2 injuries - Injury types 4. Zone 3,4,5 injuries - Injuries by location 5. Treatment options a. Primary tendon repair b. One-stage reconstruction c. Two-stage reconstruction 6. Imaging of potential tendon grafts 7. Post-operative clinical care 8. Post-operative imaging and complications a. Normal findings b. Adhesions c. Re-tear

MKEE-79 Finger It to Know It: A Detailed Walk Through from Anatomy, Imaging and Pathology to Post-treatment Follow-up of Finger

Participants
Amit Sahu, MBBS, MD, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the normal anatomy of finger and the appearance on ultrasound, radiograph, CT and MRI. 2. Discuss common bony injures affecting the finger. 3. Discuss soft tissue injures affecting the finger. 4. Review common bone tumours of finger and their imaging appearance. 5. Review common soft tissue tumours of finger and their imaging appearance.

TABLE OF CONTENTS/OUTLINE

1. Normal anatomy of finger on radiograph, ultrasound, CT and MRI including the bony and soft tissue structures (tendons, ligaments, volar plates and pulleys). 2. Advantages and pitfalls of ultrasound and MRI in imaging of finger. 3. Various types of fracture of metacarpal and phalanges, their imaging approach and what the orthopedic surgeon wants to know. 4. Types of soft tissue injuries like avulsion injuries of flexor and extensor tendons, volar plate injuries, collateral ligament injuries, their imaging appearance, what a radiologist should describe and post surgical follow-up. 5. Various common and uncommon bony and soft tissue tumors of finger, their imaging appearance and common differentials. Need of time for radiologist is not just lesion detection but also guiding the treating doctor for further management.

MKEE-8 Glenoid Track Assessment on Imaging in Anterior Shoulder Instability: Its Rationale and A Step-By-Step Guide

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Ustun Aydingoz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To explain the concept of glenoid track and how it relates to the management of glenohumeral instability associated with bipolar (humeral and glenoid) fractures. 2. To describe how to make the glenoid track assessment on CT or with the help of CT-like images generated with zero echo-time (ZTE) MR imaging in bipolar (humeral and glenoid) fractures associated with anterior shoulder instability. 3. To explain how on-track/off-track status influences strategizing treatment and selecting the type of surgery.

TABLE OF CONTENTS/OUTLINE

1. Pathophysiologic background of glenoid track assessment and why this evaluation is important. 2. Step-by-step guide to assessment of the glenoid track on CT or MRI with the CT-like ZTE sequence: (a) establishing the bipolarity of the shoulder fracture dislocation; (b) estimating the glenoid bone stock; (c) calculating the glenoid track; (d) determining the Hill-Sachs interval; (e) ascertaining the on-track/off-track status of the Hill-Sachs lesion. 3. Case examples with pearls, pitfalls, and sample radiology reports (e.g., how to decide on erosive/compressive versus fragmented osseous Bankart lesions; how correlation of the Hill-Sachs interval on ZTE and conventional MRI sequences overcomes a shortcoming of CT in ascertaining this interval; what to put into the imaging report). 4. How the on-track/off-track status influences the treatment strategy or type of surgery.

MKEE-80 Doctor, I Can't Bend My Finger": Diagnostic Strategies for the Radiologists

Participants
Jiwoon Seo, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Patients with impaired finger flexion are often encountered in our daily clinical practice. There are many etiologies, such as tendon injuries or neuropathy, that cause difficulty in finger flexion. Radiologist must understand the basic anatomy of the finger flexor system and corresponding structural failure to made diagnostic decision.The major teaching points of this exhibit are:1. To review the basic anatomy of the finger flexor system and mechanism.2. To review the etiologies of impaired finger flexion and correlate with imaging (US, MRI) findings.

TABLE OF CONTENTS/OUTLINE

1. Anatomy and Mechanism of the Finger Flexor System.a. Tendons and extrinsic muscles.b. Flexor pulley system.c. Intrinsic muscles.d. Nerve innervation.2. Etiologies of the Impaired Finger Flexion.a. Flexor tendon injuries.b. Trigger finger.c. Flexor

tenosynovitis.d. Neuropathy.e. Intrinsic muscle injuries.f. Miscellaneous.3. Summary and Take-home Messages.

MKEE-81 Scratching the Surface: MSK Pathology Involving the Skin Subcutaneous Tissues

Participants
Mark Manganaro, DO, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Familiarize radiologists with musculoskeletal diseases that have associated manifestations of the skin and subcutaneous tissues including causes from: infectious, inflammatory, tumor, congenital and connective tissue disorders.2. Be able to identify and diagnosis these various entities using radiography, CT, and MRI.3. Clinically correlate the radiographic findings with the dermatologic appearances.4. An emphasis will be placed on uncommon musculoskeletal disorders which have known dermatological manifestations.

TABLE OF CONTENTS/OUTLINE

The following diseases/syndromes will be shown using radiographs, CT, and MRI as well as having dermatologic correlate images when applicable. Cases that will be in the exhibit include:1. Infectious: Disseminated Mycobacterium chelonae.2. Inflammatory/Connective tissue disorders: Psoriasis/Acrodermatitis of Hallopeau, CREST syndrome/Scleroderma, SAPHO syndrome, dermatomyositis, granuloma annulare, eosinophilic fasciitis.3. Tumor: Rothmund-Thomson Syndrome, Maffucci Syndrome, Neurofibromatosis 1, etc, basal cell and squamous cell carcinoma (Marjolin's ulcer), Dermatofibrosarcoma protuberans.4. Congenital: McCune-Albright Syndrome, Nail-Patella Syndrome, Osteopoikilosis / Osteopathia Striata, Tuberous Sclerosis.

MKEE-82 Peripheral Nerve Assessment of Typical and Atypical Lesions - An Ultrasound Review

Participants
Ligia Couceiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Peripheral nerve injuries are important causes of loss of functionality what makes early diagnosis and treatment indispensable. High resolution ultrasound stands out as a cost-effective, accessible method with high diagnostic potential. The purpose of this study is:• To review peripheral nerve anatomy and correlation with the ultrasound imaging. • To discuss the method's advantages and disadvantages.• To identify normal nerve appearance and also pathological findings.• To recognize the multiple causes of neuropathies, including the most prevalent ones and some atypical or rare presentations.• Illustrate imaging findings through sample cases - atypical and typical cases.

TABLE OF CONTENTS/OUTLINE

• INTRODUCTION- Review peripheral nerve anatomy and correlate to the ultrasound imaging.- To compare high frequency ultrasound advantages and disadvantages to evaluate peripheral neuropathies compared to other methods.- Evaluation of peripheral nerve's normal appearance and pathological findings. • PERIPHERAL NEUROPATHIES - DIFFERENTIAL DIAGNOSIS- Trauma - Compressive syndromes- Inflammatory processes- Infection- Neoplastic • IMAGING INTERPRETATION• Systematic approach to evaluate image exams• Template reporting system • INTERACTIVE CASE-BASED DIDACTICS• Sample typical and atypical cases to illustrate and solidify the concepts.

MKEE-83 Sports Injuries in the Rectus Femoris - What, How, Why and Where

Awards
Certificate of Merit

Participants
Leandro Mazza, MD, La Plata, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Know the anatomy and biodynamic characteristics of the rectus femoris.Recognize the spectrum of muscle injuries that compromise the rectus femoris in various sports, analyzing its production mechanism.Analyze the different diagnostic methods of the different injuries in order to establish the precise location and particular characteristics of each injury.Establish an estimated prognostic criterion for recovery and sports return.

TABLE OF CONTENTS/OUTLINE

The anterior rectus has a complex anatomy that allows it to fulfill very characteristic functions, being essential in many current sports practices. Its "muscle within a muscle" morphology and its insertions, added to the type of contractile fibers it presents, mean that its lesions can be grouped and classified, with characteristic compromise sites that are repeated in the different sports practices, presenting a mechanism of similar injury. Indirect type injuries (muscle tears) can be divided into central or peripheral according to the myoconnective junction, being in the case of central injuries of capital importance to assess the status of the adjacent tendon. According to its extension and location, we can roughly predict the potential evolution of the lesions and the approximate return to play time. In turn, there are also direct type injuries (muscle contusions) that will have another treatment and evolution. Finally, we must include epiphysitis in children - adolescents, and tendon disinsertions, which are more frequent in adults.

MKEE-84 Give It Another Shot": A Radiologist's Guide to Shoulder Injury Related to Vaccine Administration (SIRVA) Imaging Features

Participants
Hadas Benhabib, MD, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review procedural considerations for the administration of intramuscular injections, including anatomical landmarking and injection technique; 2) Discuss the variety of anatomical structures that can be injured, depending on the different locations of a non-target deltoid intramuscular injection; 3) Describe the imaging features of patients with recent vaccinations and the spectrum of imaging findings in patients with SIRVA, including subacromial/subdeltoid bursitis, glenohumeral synovitis, adhesive capsulitis, septic

arthritis, osteitis/periostitis, and rotator cuff tears.

TABLE OF CONTENTS/OUTLINE

Shoulder injury related to vaccine administration (SIRVA) is a preventable outcome that can occur when an intramuscular deltoid injection is inadvertently administered into the shoulder capsule or surrounding musculoskeletal structures. Imaging studies are frequently requested in the diagnostic evaluation of SIRVA, with the reported utilization of MRI in SIRVA patients being as high as 81%. This exhibit provides a case-based review of the variety of SIRVA-related events, including rotator cuff injuries, bursitis, adhesive capsulitis, and osteomyelitis. Given the importance and growing prevalence of recent COVID-19 inoculations, with 660 million vaccinations having been administered in Canada and the United States to date, prompt recognition of symptomatic non-target vaccinations is essential in providing quality care for our patients and preventing long-term impairments.

MKEE-85 Scoliosis: A Review of Surgical Treatment Options

Participants
Lucas Miyahara, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review the modalities of scoliosis surgical treatment and their indications, including the main findings in scoliosis exams that needs to be highlighted when choosing surgical management.2. Illustrate several cases of scoliosis with emphasis on postoperative findings, what to expect and their complications.3. Discuss and provide a guide for what the radiologist must actively look for and report in these cases, supporting surgeons in decision making.

TABLE OF CONTENTS/OUTLINE

Introduction: review general presentation of scoliosis, including their complete evaluation and what the report should include.Provide several challenging scoliosis cases due to defects of formation, segmentation and mixed ones, in the context of various syndromic conditions.Overview and discuss the several operative indications and modalities of surgical treatment.Present didactic illustrations and cases of the different surgical modalities, with their pre and post-operatory imaging exams.Propose a guidebook for post-operatory scoliosis imaging, including several complications that the radiologist needs to be aware and how they should report.Relevant bibliographical references.

MKEE-86 Soft Tissue Imaging Findings of Critically Ill Patients

Participants
Ana Carolina Augusto, MD, MSc, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this pictorial essay is to: • Review the imaging appearance of soft tissue findings commonly seen critically ill patients, mainly in MRI. • Differentiate infectious from non-infectious soft tissue diseases in the intensive care unit patient setting.

TABLE OF CONTENTS/OUTLINE

Patients in intensive care units commonly spend long periods of time restrict to the hospital bed, vulnerable to infections and going through multiple venipunctures. Not rarely, imaging is required to further examinate possible complications related to the primal disease or long-term hospitalization. Early diagnosis of possible soft tissues changes can prevent further complications and poor outcomes, specially in elder population. In addition, it is possible to help the surgeon clarify the extent of the damage and preparate the best approach. Muscle edema is a common MRI finding in critically ill patients and the differential diagnosis includes critical illness myopathy (a common acquired condition in an ICU setting), rhabdomyolysis, infections, among others. Correct distinction of infectious from noninfectious soft tissue diseases can be an important factor in determining patient survival.

MKEE-87 Declawed: A Review of Claw Toe Pathology and Treatment

Awards
Certificate of Merit

Participants
Tristan Cooper-Roth, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this educational exhibit is to provide the learner with the following information: 1. Define anatomically what a claw toe deformity is, what this looks like on a radiograph, and what the most common causes are 2. What are the key distinguishing features of other lesser toe deformities and their corresponding radiographic appearances 3. Identify claw toe abnormalities seen on MRI 4. Summarize the types of therapeutic non-surgical and surgical approaches of a claw toe deformity 5. Characterize the post-surgical changes of a Weil lesser metatarsal osteotomy on diagnostic imaging

TABLE OF CONTENTS/OUTLINE

1. Define anatomically what a claw toe deformity is, providing a radiographic example, and what are the most common causes 2. Examples of other lesser toe deformities and their appearance on radiographs 3. Characteristics of claw toe abnormalities on MRI 4. Assess atrophy of intrinsic foot musculature on diagnostic imaging 5. Types of therapeutic non-surgical and surgical approaches to a claw toe deformity 6. Post-surgical changes on diagnostic imaging

MKEE-88HC Qualitative and Quantitative Anatomic Investigation of the Lateral Ankle Ligaments for Surgical Reconstruction Procedures Using 3D High-Resolution MRI in Chronic Ankle Instability

Participants
Meng Dai, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To quantitatively investigate the anatomy of the ATFL and CFL for surgical reconstruction procedures in chronic ankle instability.

TABLE OF CONTENTS/OUTLINE

Purpose: To quantitatively investigate the anatomy of the anterior talofibular ligament (ATFL) and calcaneofibular ligament (CFL) for surgical reconstruction procedures in chronic ankle instability. Materials and Methods: 3D MRI were performed on five fresh-frozen cadaveric ankles with six different spatial resolutions. Resolution of 0.45x045x0.45mm3 was performed on 24 healthy adult volunteers on bilateral ankles. A four-point subjective score system was used to evaluate the imaging quality. Morphologic parameters including the classification of ATFL,the length of ATFL and CFL, and the four distances of surgically relevant bony landmarkers were measured and analyzed.Results: In subjective evaluation, the interobserver ICC was 0.95 [95% confidence interval (CI): 0.94-0.97] between two readers. The spatial resolution of 0.3x0.3x0.3mm3 and 0.45x0.45x0.45mm3 received highest subjective score on average and demonstrated highest consistency with autopsy measurements in objective evaluation. Regarding the measurements on the 48 volunteer ankles, distance 1 in type I and II were 12.65±2.08mm, 13.43±2.06mm(superior-banded in Type II) and 7.69±2.56mm(inferior-banded in Type II) (means ± SD), respectively. Distance 2 in type I and II were 10.90±2.24mm, 11.07±2.66mm(superior-banded in Type II), and 18.44±3.28mm(inferior-banded in Type II), respectively. Distance 3 and 4 were 4.71±1.04mm and 14.35±2.22mm, respectively.Conclusion: The feasibility to quantify the distances of surgically relevant bony landmarkers.Please visit the Learning Center to also view this presentation in hardcopy format.

MKEE-89 Multimodality Review of Important Musculoskeletal Measurements in the Upper Extremity

Participants
Jennifer S. Weaver, MD, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

Many image-based measurements are used by orthopedic surgeons to plan treatment. This educational exhibit will discuss the indications and measurement techniques for several commonly used upper extremity measurements, and will detail the technical requirements of imaging needed to obtain precise and accurate measurements.After viewing this exhibit, the learner should be able to:(1) Understand important technical considerations and limitations in measurement techniques of various modalities, including radiographs, CT, MRI, and ultrasound(2) Discuss commonly encountered measurements in the upper extremity, including clinical indication, specific technique, and potential pitfalls

TABLE OF CONTENTS/OUTLINE

Introduction General Measurement TechniquesShoulder1. Acromioclavicular Interval2. Acromiohumeral Distance3. Coracoclavicular Interval4. Acromial Angle, Tilt, and Slope5. Humeral Neck Shaft Angle6. Lateral Glenohumeral Offset Angle7. Glenoid Version Angle8. On track/off track Hill SachsElbow1. Humero-condylar Angle2. Ulnar Collateral Ligament Thickness3. Ulnar Collateral Ligament Medial Joint Gap with Valgus Stress4. Nerve Cross Sectional AreaWrist-hand1. Capitolunate, Lunotriquetral, and Scapholunate Angles2. Scapholunate Interval3. Radial Inclination4. Dorsal Radial Tilt5. Radial Height6. Radioulnar Angle7. Radioscaphoid Angle8. Ulnar Variance and Inclination9. Carpal Tunnel Bowing and Area10. Median Nerve Cross Sectional Area11. Carpal Height, Height Ratio, and Height IndexShear wave elastography Conclusion

MKEE-9 Musculoskeletal Manifestations of Systemic Lupus Erythematosus: An Imaging Overview

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review the most frequent and also atypical presentations of musculoskeletal involvement of systemic lupus erythematosus (SLE). 2. Illustrate with didactic cases while discussing the imaging findings and main complications of these disease

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of the epidemiology and clinical findings of musculoskeletal involvement of systemic lupus erythematosus.Review the multi-modality imaging findings of musculoskeletal SLE with didactic illustrations. Present challenging cases with musculoskeletal manifestations related to systemic lupus erythematosus as insufficiency fracture, tenosynovitis, arthropathy, avascular necrosis, bone infarction, vasculitis and infection.Differential diagnosis including other inflammatory conditions and arthropathy helping the radiologist how to differentiate them. Relevant bibliographical references.

MKEE-90 Shouldering the Burden: A Pictorial Review of Shoulder Arthroplasties

Participants
Akwasi Opoku, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Advancements in shoulder arthroplasty has increased its use, particularly over the past two decades. The shoulder is the third most common replaced joint after hip and knee, with its overall incidence increasing at a greater rate than those of total knee and hip replacements. After viewing this exhibit, the learner should understand:1. Shoulder anatomy and biomechanics2. Indications for shoulder arthroplasty3. Role of preoperative imaging and measurements4. Advantages, disadvantages, and specific complications of various shoulder arthroplasties5. Normal imaging findings and imaging findings of complications

TABLE OF CONTENTS/OUTLINE

Introduction - history and evolution Shoulder anatomy and biomechanics1. Bones, joints, muscles, other soft tissues (cartilage, labrum, capsule)2. Unconstrained ball and socket, static and dynamic stabilizers Indications 1. Arthropathy, trauma, cuff pathology, osteonecrosis, prior infectionRole of preoperative imaging (multimodality)1. Evaluation of cuff, bone stock, cartilage2. Glenoid morphology and versionTypes of shoulder arthroplasties, indications, advantages, disadvantages 1. Humeral head resurfacing arthroplasty2. Hemiarthroplasty3. Anatomic total shoulder arthroplasty4. Reverse total should arthroplastyImaging appearances1. Normal and complications

MKEE-91 What's Your Carbon Footprint? Carbon-Fiber Implants in Orthopedic Oncology

Awards
Certificate of Merit

Participants
Erik Verhey, Reno, NV (*Presenter*) Nothing to Disclose

TEACHING POINTS

*Carbon fiber reinforced polyetheretherketone (CFR-PEEK) is a composite material which can be used to create orthopedic implants for use in the appendicular skeleton and spine*CFR-PEEK implants are nearly radiolucent and produce relatively little artifact when imaged with CT and MRI*Owing to their favorable imaging profile, CFR-PEEK implants facilitate post-operative imaging follow up of tumor patients*Post-operative radiation therapy in oncologic patients with CFR-PEEK implants is also improved due to lower artifact on planning CT scans and enabling the use of photon therapy

TABLE OF CONTENTS/OUTLINE

*Background of CRF-PEEK as a composite material and its use in implants*Surgical perspective: CRF-PEEK implant use in the spine*Surgical perspective: CFR-PEEK implant use in the appendicular skeleton*Radiographic and fluoroscopic appearance of CFR-PEEK implants with example cases*CT appearance of CFR-PEEK implants with example cases*MRI appearance of CFR-PEEK implants with example cases*Value of CFR-PEEK implants in radiation oncology *Conclusions

MKEE-92 Exchange Arthroplasty for Periprosthetic Joint Infection: What the Radiologist Needs to Know

Participants
Nicholas G. Rhodes, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Management of periprosthetic joint infection (PJI) is a complex task.2. The radiologist should be familiar with the varied constructs employed following resection arthroplasty for infection.3. The presence of polymethylmethacrylate bone cement is often the radiologist's initial clue to the presence of joint infection undergoing treatment.4. Serial radiographs play an important role in the management of periprosthetic joint infection.

TABLE OF CONTENTS/OUTLINE

1. Review imaging of PJI a. Role of radiographs b. Role of advanced imaging c. Role of joint aspiration 2. Review clinical features of PJI 3. Review treatment options for PJI 4. Discuss imaging related to various treatment options a. Review of imaging appearance during and after treatment of PJI at various joints i. Resected arthroplasty ii. Spacers iii. Articulating spacers iv. Destination spacers b. Review how the radiologist puts it all together i. Discuss clinical findings and thought behind and directing this process ii. Define the role of the radiologist iii. Define appropriate terminology concerning joint resection/prosthesis explantation and employed spacers iv. Highlight role of serial radiographs v. Highlight expected and unexpected imaging findings during this process

MKEE-93 Intercondylar Notch Beyond the Cruciate Ligaments: Light at the End of the Tunnel

Participants
Sergio Atala, MD, Las Condes, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The intercondylar notch is a commonly neglected area in the knee anatomy and in the assessment of radiologic studies. 2. Knowledge of the consistent normal anatomy of this notch is easily and swiftly assessed with several imaging modalities, particularly with MR Imaging. 3. Some anatomic variations should be well recognized, not be confused with pathologic conditions. 4. Meniscal root pathology is critical and dedicated examination in the MR Imaging studies is recommended. In the case of meniscal root tears LaPrade classification can be utilized preoperatively, with prognostic relevance. Surgical techniques for meniscal root tears are presented to be assessed in the postoperative MR Imaging studies. 5. Solid and cystic masses can be primarily originated in the intercondylar notch, and a brief pictorial review is presented. 6. The medial synovial fold of the posterior cruciate ligament is a well-recognized structure, and pathologic conditions are presented, with therapeutic implications.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Anatomy. 3. Interchondilar morphology and insertion (tibial / femoral) of intercondylar structures. 4. Tibial spine tubercules. 5. Changes in the anatomy of the intercondylar notch during lifetime. 6. Meniscal roots variants, tears and postoperative changes. 7. Ganglion cyst in meniscal roots. 8. Oblique meniscal ligaments. Meniscofemoral ligaments. 9. Ligamentum mucosum. 10. Synovial fringe. 11. Intercondylar mensical fragments. 12. Ganglion cysts. 13. Solid Masses. 14. Medial synovial fold PCL. 15. Conclusion.

MKEE-94 Adipose Tissue Around the Knee - A Review of Normal Anatomy and MRI Findings of Common Pathologies

Participants
Majid Chalian, MD, Seattle, WA (*Presenter*) Grant, The Boeing Company

TEACHING POINTS

1. Anatomy of intraarticular fat pads and subcutaneous adipose tissue2. Review the role of intraarticular fat pads and subcutaneous adipose tissue3. Review the clinical presentation of intraarticular fat pads and subcutaneous adipose tissue pathologies and provide case examples 4. Review the MRI presentation of the pathologies involving intraarticular fat pads and Subcutaneous adipose tissue

TABLE OF CONTENTS/OUTLINE

Review of anatomy:• Infrapatellar fat pad and related structures• Suprapatellar fat pad• Prefemoral fat pad• Pericruciate fat pad• Subcutaneous fat Review of the role:• Non-mechanical roleo Inflammatory roleo Endocrine roleo Peroprioseptive role• Mechanical roleo The dynamic role of anterior intraarticular fat pads during knee flexion and extensiono Shock absorbing roleo The route for surgical probingReview of the clinical presentation in pathological changes:• Infrapatellar fat pad and related structures• Suprapatellar fat pad• Prefemoral fat pad• Pericruciate fat pad• Subcutaneous fat Review of the MRI presentation:• Pathologies involving the synovial lining• Pathologies presenting with edema like changes • Space occupying pathologies

MKEE-95 The Multiple Applications of Dixon Sequences in Musculoskeletal MRI

Awards
Certificate of Merit

Participants
Massimo Donalisio, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The Dixon method has gained much interest in musculoskeletal MRI, and many applications have been validated by the literature. The four sets of images generated by the Dixon technique can each provide specific qualitative or quantitative information, and they may serve to optimise acquisition protocols in various applications including bone marrow, whole body, oncological and rheumatological imaging. Water only images provide robust fat suppression that can be useful in large field of view applications or MRI of the extremities. Fat only images are particularly useful for the assessment of bone marrow lesions and may replace the information provided by T1-weighted sequences in certain indications. There are some pitfalls and disadvantages that radiologists must be familiar with.

TABLE OF CONTENTS/OUTLINE

1. Brief review of the physics of Dixon sequences: from one sequence to four sets of images; 2. Illustrated review of common applications of Dixon sequences in musculoskeletal practice: a) Fat suppression technique in extremities, large field of view applications (comparison to CHESS and STIR techniques), b) Spine and bone marrow imaging: advantages of the use of fat only images in replacement of T1 weighted sequences, c) Whole body MRI: the use of Dixon technique to optimise whole-body protocols with a focus on neuromuscular disorders, d) MRI in rheumatology: the use of Dixon sequences to scan more regions with less sequences, e) MRI of sarcomas: the benefits of including Dixon sequences in the acquisition protocol, f) The Dixon technique as a quantitative MRI tool to assess the fat fraction; 3. Pitfalls and disadvantages of Dixon sequences.

MKEE-96 Mismatch Findings of WB DWI MRI and PET-CT in Oncology

Participants
Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTSTo evaluate the performance of WB-DWI MRI in the diagnosis and follow-up of cancer patients in situations of false positive or negative results in the PET-CT study (18F-FDG and PSMA). PET/CT is used in the evaluation of oncology patients to identify malignancy, but could be non-specific. Identify what sequences should be used to analyse bone marrow and soft tissue in whole-body MR imaging protocols to detect neoplasic lesions and pseudotumoral in oncological patients.To be aware of the conditions and the mechanisms by which false positive and negative results occur on 18F-FDG-PET-CTscans and to compare with WBMRI-DWI study.Make a pictorial essay of the main false false negative PET-CT PSMA cases comparing with WBMRI study. An understanding of the limitations of this nuclear medicine technology is necessary to avoid making inaccurate diagnosis and potentially limiting the right treatment for our patients.

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS AND OUTLINE1) The value of WB-DWI MRI IN in the diagnosis and follow-up of cancer patients.2) Case discussion to demonstrate 18F-FDG PET/CT false positive and false negative examples:Small lesions (less than 1,0 cm)Osteoblastic sclerotic metastasesPatient anxiety can result in increased uptakeBone marrow infiltrationLow grade lymphoma3) To demonstrate PET/CT-PSMA false positive and false negative examples:small tumorsneuroendocrine prostate tumorSmall tumors near bladder4) Common pittfalls5) Differential diagnosis6) Structured reporting step by step

MKEE-97 Review of the Effects of Diabetes Mellitus on the Musculoskeletal System

Participants
Jimmy Saade, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Epidemiology and financial burden of diabetes mellitus (DM).• DM affects nearly every organ system.• Beyond the well-known manifestations of diabetes, such as neuropathy and nephropathy, DM can also have damaging effects on the musculoskeletal (MSK) system.• As the prevalence of DM continues to increase, the lesser-known musculoskeletal complications are to increase as well.• We demonstrate some of these MSK manifestations. Early recognition and diagnosis of the many DM-related complications will lead to earlier intervention, and ultimately, less morbidity for patients and financial burden on the healthcare system.• DM-related disease entities discussed include osteoporosis, diffuse idiopathic skeletal hyperostosis (DISH), Dupuytren's contractures, trigger finger, rotator cuff tendinopathy, adhesive capsulitis, and calcaneal insufficiency fractures.• We demonstrate a multimodality approach to the diagnosis of these pathologies including MSK ultrasound.

TABLE OF CONTENTS/OUTLINE

• Diabetes Mellitus: Epidemiology and pathology.• DM-related osteoporosis and diagnosis with DEXA, radiographs, and CT.• DISH with imaging findings across multiple imaging modalities.• Dupuytren's contractures utilizing ultrasound for diagnosis.• Trigger finger with confirmatory findings on MRI.• Adhesive capsulitis and rotator cuff tendinopathy findings on MRI.• Calcaneal insufficiency fracture and confirmatory findings on CT and x-ray.• Conclusion.

MKEE-98 Imaging of Calf Pain

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Allison Khoo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the muscular anatomy of the calf including the gastrocnemius, soleus, plantaris, and Achilles tendon. 2. Recognize

subtle radiographic findings of calf and posterior ankle pathology such as obliteration of Kager's fat pad. 3. Develop a differential for calf pain spanning traumatic, metabolic, infectious/inflammatory, neoplastic, congenital, and vascular etiologies.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Relevant anatomy: a. Kager's fat pad on ankle radiograph: obliterated by pathology from adjacent structures including Achilles tendon, calcaneus, and tibiotalar joint. b. Review of gastrocnemius, soleus, and plantaris anatomy. 3. Case-based review of calf and posterior ankle pathology organized by etiology. a) trauma/overuse- Achilles tendinopathy and tear, Haglund deformity, Tennis leg/plantaris rupture. b) metabolic-xanthoma. c) infectious/inflammatory: myositis, rhabdomyolysis. d) neoplastic: sarcoma, lymphoma. e) congenital: accessory soleus, cortical desmoid. f) vascular: popliteal artery (aneurysm, entrapment, stenosis), deep venous thrombosis

MKEE-99 Triceps Surae Muscle Injuries: What the Radiologist Should Know?

Participants
Jaime Isern, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the pathophysiological mechanism of Triceps surae muscle injuries. 2. To Assess the imaging technique of choice for the study of acute and chronic injuries. 3. To show the US and MRI findings in Triceps surae muscle injuries. 4. To describe the reparative process in the favorable or unfavorable evolution of these injuries and the residual findings.

TABLE OF CONTENTS/OUTLINE

Pathophysiological mechanism of Triceps surae muscle injuries. US and MRI protocols for an adequate diagnosis of Triceps surae muscle injuries. Current severity classification systems. Review of imaging findings of the acute injury according to the type of damage. Range of imaging healing process in lesions and residual changes.

Achilles-calcaneus-plantar fascia system: Anatomy, Biomechanics and Patterns of Injury

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

The Achilles tendon, calcaneus and plantar fascia comprise an interconnected complex or system of structures that play a vital role in the load distribution of the foot, including absorbing mechanical shock, stabilizing and preventing the collapse of the longitudinal arch during propulsion. Failure, overload or repetitive stress to any or a combination of these structures leads to a multitude of disorders and imaging findings. The objectives of this educational exhibit are: • Review normal anatomy and biomechanics of the Achilles tendon, calcaneus and plantar fascia • Discuss patterns of failure and injury involving the Achilles tendon, calcaneus and plantar fascia • Identify imaging findings that may aid in differentiating these disorders when clinical findings are equivocal

TABLE OF CONTENTS/OUTLINE

Pertinent anatomy and biomechanics • Calcaneal crescent • Windlass mechanism Imaging techniques Disorders Achilles Complete and partial tear Insertional tendinopathy and tendinitis Peritendinitis Peri-Achilles bursal fluid Calcaneus Stress fracture Haglund syndrome Posterior ankle impingement Plantar fascia Fasciitis Rupture Fibromatosis Plantar fat pad abnormalities

Current Trends in Total Ankle Arthroplasty

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Identified for RadioGraphics

Participants
Jason Ha, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe indications for total ankle arthroplasty (TAA) vs. arthrodesis.Recognize different types of TAA, including semi-constrained and minimally constrained designs.Understand normal tibiotalar and distal anterior tibia angles.Define normal and abnormal imaging appearance of TAA.

TABLE OF CONTENTS/OUTLINE

1. Indications for TAA vs. arthrodesis. 2. Types of TAA: Differences between 1st generation, 2nd generation, 3rd generation. Comparison of Agility, Salto-Talaris, Inbone, STAR, Hintegra, Mobility, and Zimmer Trabecular Metal. 3. Normal imaging appearance: Radiolucency, Tibiotalar Angle, Distal Anterior Tibia Angle. 4. Complications: Radiolucency, Hardware Subsidence, Perihardware fracture, Syndesmotic screw loosening, Heterotopic ossification, Increased varus or valgus angulation of the ankle, Ankle gutter narrowing, Infection, Syndesmotic or fibula osteotomy nonunion, Aseptic loosening, Expansile osteolysis (also known as ballooning osteolysis, periprosthetic cysts)

Pain in the Rear-Exploration of MRI Findings Useful in Distinguishing Septic Arthritis from Inflammatory Spondyloarthritis of the Sacroiliac (SI) joints

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Matin Goldooz, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the sacroiliac joint anatomy. Illustrate MRI findings specific for inflammatory sacroiliitis and review updated Assessment of SpondyloArthritis international Society (ASAS) criteria. Illustrate common MR findings in infectious sacroiliitis. Review manifestations of degenerative sacroiliitis. Discuss common procedures for SI joint aspiration and therapeutic injection.

TABLE OF CONTENTS/OUTLINE

Infectious sacroiliitis is a destructive, monoarticular arthropathy typically caused by hematogenous seeding of bacterial pathogen. Clinical symptoms of SI joint disease are often nonspecific and may be attributed to pathology in hips or spine. Early recognition and prompt treatment of the condition is important to prevent permanent joint damage or abscess formation. Spondyloarthritides such as ankylosing spondylitis commonly involve the SI joints. The most recently updated classification criteria of axial spondyloarthropathies are based on specific MRI findings, which facilitates prompt diagnosis.Differentiation between infectious and spondyloarthropathy associated sacroiliitis is incredibly important given the different prognosis and treatment regimens. MRI is the most relevant modality in evaluation of sacroiliitis, that can assist in differentiation of infectious and inflammatory etiology. Radiologists should be familiar with the MRI features that are more indicative of infectious sacroiliitis given the urgency required in making this diagnosis.In this educational exhibit we illustrate MRI findings of infectious and inflammatory sacroiliitis with emphasis on findings useful in differentiation of the two and in distinguishing both from degenerative sacroiliitis.

Cervical Spine Infections and their Mimics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Samantha Salmon, MD, Columbia, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss shared key clinical and imaging characteristics of inflammatory and infectious diseases of the cervical spine2. To detail, in a case-based format, typical imaging features of infection of the cervical spine, organized by the site of origin3. To detail, in a case-based format, disease states that mimic infection and highlight key imaging and clinical factors that assist in the differentiation

TABLE OF CONTENTS/OUTLINE

This presentation will be a case-based discussion reviewing cervical infections, differentiated by their site of origin. Cases will be presented alongside cases that mimic infection.· Overview of shared presentation of infection and inflammatory diseases· Features of perivertebral infections· Prevertebral infection compared to longus coli tendinitis· Spondylodiscitis compared to renal osteodystrophy· Epidural infection, highlighting progression from phlegmon to abscess, compared to epidural tumor and hematoma· Intramedullary abscess compared to demyelination and infarction· Facet septic arthritis compared to CPPD arthropathy and neoplasm· Posterior soft tissue infections compared to post-operative seroma

3T Magnetic Resonance Neurography - From Head to Toe!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Cum Laude

Participants
Flavia M. Costa, MD, PhD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) 3T MR neurography is a technique involving regional MRI that allows evaluation of the peripheral nerves and is more effective than electrodiagnostic studies in the evaluation of deep structures. 2) Create a didactic script of what should be evaluated in neurography exams and how to recognize a normal or altered nerve. 3) Make a pictorial essay of the main peripheral nerves and their differential diagnoses.

TABLE OF CONTENTS/OUTLINE

1) Overview of what is magnetic resonance neurography and the examination technique. 2) 3T magnetic resonance of a traumatic lesion. 3) Tumoral lesion. 4) Inflammatory neuronal lesion. 5) Step by step for the evaluation of lesions and table with a summary of findings expected.

A Nocturnal Nuisance: Diagnosis and Treatment of Osteoid Osteoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Meghan Jardon, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Osteoid osteoma is a benign tumor of bone that presents with nocturnal pain in children and young adults, classically relieved by non-steroidal anti-inflammatory drugs (NSAIDs). Common locations include the femur, tibia, and posterior elements of the spine. 2. The classic imaging appearance of a calcified nidus with surrounding sclerosis that is described on CT can be difficult to appreciate on MRI. Thus, the radiologist must maintain a high level of suspicion when interpreting MRI, as misinterpretation may delay appropriate patient management. 3. Radiofrequency ablation provides a safe and effective means of treating osteoid osteomas, but additional consideration should be given in difficult locations (i.e. adjacent to neural elements, articular cartilage, etc.)

TABLE OF CONTENTS/OUTLINE

1. Background/Introduction2. Clinical and Imaging Manifestations of Osteoid Osteomas3. Case Examples from a variety of different anatomic locations A. Long bones: femur, tibia B. Spine: T12 posterior elements C. Others: talus, calcaneus D. Intra-articular examples: hip, elbow4. Differential Diagnostic considerations for osteoid osteoma5. Management of Osteoid OsteomaA. Medical managementB. Radiofrequency ablation: Equipment, technique, special considerations in difficult locationsC. Surgical resection

Many Faces of Bone Metastasis: How to Detect and Not be Surprised

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Eduarda Bernal, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points? Be prepared to do early detection of skeletal metastases.? Understand the biological mechanisms by which tumors metastasize to bone.? Recognize the appearance of skeletal metastases.? Review typical and atypical forms of secondary musculoskeletal involvement in different imaging methods

TABLE OF CONTENTS/OUTLINE

Introduction and objectivesMetastases are the most common malignant tumors of the skeleton, and bone is the third most frequent site of metastasis, behind only the lung and liver.Early detection of skeletal metastases is essential for accurate staging and optimal treatment, in addition to improving the patient's quality of life. Bone metastases are a major cause of morbidity in cancer patients, characterized by severe pain, impaired mobility, pathological fractures and spinal cord compression. Understanding of the biological mechanisms by which tumors metastasize to bone and the diverse image appearance of skeletal metastases are important to detect disseminated disease. MethodsWe will review typical and atypical forms of secondary musculoskeletal involvement in different imaging methods through several cases and discuss the ideal method for diagnosis and monitoring of response to treatment of skeletal metastases. ConclusionsBone metastases have an important impact on the quality of life of cancer patients, and therefore, new strategies are needed to detect skeletal disease and attenuate established skeletal events. Radiologists are essential for this diagnosis since most bone metastases are asymptomatic at the beginning and knowing typical and atypical forms of skeletal metastatic involvement helps in early diagnosis and monitoring of response to treatment.

Recognizing Pediatric Bone Tumors: Growing Your Knowledge

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Vitor Cardoso Linhares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is a vast variety of bone tumors proposed by WHO 2020 classification, divided, among other aspects, into its tissue matrix type and biological behavior (benign, intermediate and malign). Considering the bone tumors of the pediatric population, the most common malign tumours are osteosarcoma and ewing sarcoma, and the most common benign tumours includes simple bone cyst and aneurysmal bone cyst.To identify the main characteristic of this tumours, especially in the pediatric age, can help patients to receive the adequate treatment and avoid unnecessary procedures.The purpose of this exhibit is to:• Briefly review the most recent World Health Organization (WHO) bone tumours classification.• Demonstrate cases of the most prevalent pediatric bone tumours. • Review the image findings of radiographic, CT and MRI studies of the most prevalent bone neoplasms in children.

TABLE OF CONTENTS/OUTLINE

(1) Briefly review the World Health Organization (WHO) bone tumours classification, and correlacionate with the most prevalent tumours in the pediatric population. (2) Approach the characteristics and image findings to help distinguish non aggressive and aggressive bone neoplasms. (3) Classify the most prevalent groups of benign, intermediate and malignant bone tumours in the pediatric population. (4) Describe radiographic, CT and MRI findings of each of the most prevalent groups of bone neoplasm in children. (5) Systematic approach to help the radiologist in the correct diagnosis of the bone tumours in the pediatric population.

Fractures of the Appendicular Skeleton and Criteria for Their Surgical Management: What the Orthopedic Surgeon Wants to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Lucas Miyahara, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review and illustrate some of the main appendicular skeleton fractures with surgical management, with emphasis on radiography and computed tomography, methods most commonly used in the emergency.2. Didactically summarize the imaging findings that indicate the surgical treatment of appendicular skeleton fractures.

TABLE OF CONTENTS/OUTLINE

Introduction: general illustration of the fractures to be addressed.Demonstrate didactic and illustrative cases contemplating the following fractures: proximal humerus fracture, terrible triad of the elbow, Monteggia fracture-dislocation, Galeazzi fracture-dislocation, Barton fracture, scaphoid fracture, pelvic ring fracture, intertrochanteric fracture, femoral neck fracture, tibial plateau fracture, ankle fracture and Lisfranc fracture-dislocation.Provide schematic illustrations reviewing fracture classifications and discussing important concepts to understand the imaging findings.Present two tables that summarizes the trauma mechanisms and imaging findings that indicate the surgical treatment of appendicular skeleton fractures in each affected segment.Bibliographical references.

Uncommon Manifestations of Bone Trauma: Focus on Medullary Fat

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Pablo Rengifo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Following a high energy bone injury, a macroscopic fracture or a bone contusion (trabecular microfactures) is produced. In either case, medullary fat is compromised and typically shows high signal on fluid-sensitive MRI sequences. However, medullary fat might have other manifestations secondary to bone injuries.2. Uncommon manifestations of medullary fat related to bone trauma can be classified in intramedullary and extramedullary (extraosseus) fat acumulation. The last one could be categorized in intra-articular, intra-tendon sheath, intra-bursal, subperiosteal and systemic (fat embolism).3. Familiarity with imaging characteristics of intramedullary and extramedullary fat accumulation related to a high energy bone injury is essential in order to prompt further studies to demonstrate a possible occult fracture.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Anatomy of the Medullary Cavity.3. Types of uncommon manifestations of medullary fat after bone trauma: Overview.4. Intramedullary fat acumulation after bone trauma.5. Extramedullary (extraosseus) fat acumulation after bone trauma.5.1. Intra-articular.5.2. Intra-tendon sheath. 5.3. Intra-bursal. 5.4. Subperiosteal. 5.5. Systemic (fat embolism).5. Summary.6. References.

Gluteal Tendon Injuries: Anatomy, Pathological Conditions and Postoperative Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Carlos H. Longo, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: • Review and illustrate the anatomy of the gluteal tendons and their relationship to adjacent structures; • Illustrate and discuss the patterns of injuries involving these structures with didactic cases and their clinical relevance; • Illustrate and discuss types of surgical treatment and postoperative imaging findings of gluteal tendon injuries, and discuss its relation to hip arthroplasty.

TABLE OF CONTENTS/OUTLINE

The gluteus medius and minimus muscles are hip abductors, with a crucial hole in maintaining pelvic stability and normal gait. Although gluteal lesions are common, there is a relative paucity of detailed descriptions of features and patterns of tendon pathology in the literature compared to upper limb rotator cuff tendinopathy. Anatomy: • Imaging of gluteal bundles, subgluteus bursa and insertional anatomy exemplified by cases and didactic illustrations. Pathological conditions: • Function considerations and clinical relevance: Tendinopathy of the gluteus tendons are a cause of lateral hip pain and gait instability, particularly in older adults. Asymptomatic gluteal tendinopathies have been shown to have a negative effect on the outcomes of total hip arthroplasty. Surgical treatment and postoperative imaging: • Surgical indications and types of surgeries, modalities and complications.

World Cup is Coming - Recall the Typical Soccer Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Gillis Lago, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibition is:1. Review the main orthopedic injuries that occur in soccer.2. Correlate the trauma mechanism with the type of injury found3. Discuss the most common injuries, including muscle strains and injuries that occur in the knee, ankle and foot, as well as less common injuries that can occur in the upper limbs, through imaging methods in a multimodality approach.

TABLE OF CONTENTS/OUTLINE

1 - Most common orthopedic injuries that occur after playing soccer, correlated with the main imaging findings in a multimodality approach (CR, US, CT and MRI).2 - Correlate the trauma mechanism with the main injuries found.3 - Most common orthopedic injuries and imaging findings in a multimodal approach, including:- Muscle injuries: - Acute; - Chronic;- Hip and pelvis: - Symphysis pubic disfunction.- Knee injuries: - Ligament injuries, especially rupture of the anterior cruciate, medial collateral and posterior cruciate ligaments (less common). - Meniscal injuries; - Posterolateral corner injuries;- Ankle/foot injuries: - Ligament injuries, especially the lateral complex, which is the most affected; - Less common injuries, such as foot plate and ligament injuries;- Upper limb injuries: - Acute injuries to the shoulder, wrist and finger.- Miscellaneous and pediatric skeletal injuries, as osteochondrosis.

The Great Pretender: Benign Soft Tissue Tumors Mimicking Malignancy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Tina Shiang, MD, Worcester, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this educational exhibit is to present a case-based multimodality review of benign soft tissue tumors mimicking malignancy and provide a systematic approach to challenging cases of "lumps and bumps."1. Review the systematic approach to evaluating "lumps and bumps" and general principles for distinguishing benign vs malignant soft tissue masses.2. Present a series of challenging soft tissue tumor/pseudotumor cases that provided a diagnostic dilemma for the radiologist using a multimodality approach.3. Highlight the importance of a multidisciplinary approach in improving patient experience, including clinical, radiologic, and histopathologic correlation.

TABLE OF CONTENTS/OUTLINE

1. Systematic approach to evaluating "lumps and bumps" in MSK practice.2. Presentation of benign soft tissue masses with imaging features suggestive of malignancy (XR, US, CT and MRI). a. Trauma: Myositis ossificans b. Neurologic: granular cell tumor, schwannoma c. Vascular: glomus tumor, vascular malformation d. Inflammatory: rheumatoid nodule e. Other: desmoplastic fibroelastoma, nodular fasciitis, pigmented villonodular synovitis3. Discussion of challenging aspects of clinical decision-making, management, and patient outcome.

I Feel Something in My Hand - What Could it Be?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Cecilia Ruiz de Castaneda, Toledo, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review the spectrum of soft tissue tumors of the hand and illustrate the typical and atypical imaging features. 2. To describe the main tumor-like lesions of the hand and wrist. 3. To analyze the differential diagnosis and provide diagnostic keys to identify pitfalls.

TABLE OF CONTENTS/OUTLINE

Soft tissue masses of the hand and wrist are very prevalent in clinical practice. For this reason, the radiologist should be familiar with the most common benign and malignant tumors to develop and narrow the differential diagnosis. Multimodality imaging approach is mandatory for therapeutic planning. Although magnetic resonance imaging is an important imaging modality to diagnose soft tissue tumors, other initially ordered imaging modalities such as radiographs and ultrasound can also add valuable information about the lesions. We provide a comprehensive approach to tumors and tumor-like lesions of the hand, including demographics, clinical presentation, and imaging findings required to make an appropriate differential diagnosis

Vascular Changes that Every Musculoskeletal Radiologist Should be Aware of

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Eduarda Bernal, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points- MRI of joints is often performed for presumed musculoskeletal conditions. There is a wide variety of variant vascular anatomy and vascular pathology that can occur around the joint, including an aberrant artery, vascular trauma that occurs with joint dislocation, artery aneurysm, vein thrombosis, cystic adventitial disease, and vascular anomalies like arteriovenous malformation.- Peripheral artery disease (PAD) is currently the leading cause of morbidity and mortality in the western world. The identification of PAD incidentally in a musculoskeletal examination can make the diagnosis and improve the survival of this patient.- Venous thrombosis is an important and frequent diagnosis with clinical signs and symptoms that can mimic musculoskeletal pathologies.- Cystic adventitial disease is an uncommon vascular pathology that have a predilection in the popliteal region, manifesting rapidly progressive calf claudication and lower extremity pain.

TABLE OF CONTENTS/OUTLINE

IntroductionVascular abnormalities are an important and frequent diagnosis with clinical signs and symptoms that can mimic musculoskeletal pathologies. Due to this clinical similarity, MR examinations are frequently requested for patients with vascular abnormalities, under an equivocate suspicion of a musculotendineous or articular injury.ObjectivesThe purpose of this study is review unexpected and expected vascular findings, that can mimic musculoskeletal pathologies with the same clinical signs and symptoms.ConclusionsReviewing cases with vascular abnormalities on musculoskeletal examinations can help the radiologist to detect some patterns and extend the differential diagnosis.

Ultrasound-guided Intervention of Small Joints

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound-guided intervention of small joints can be technically challenging because of irregular bony contour, size of joints disproportionately small compared to utilized tools and superficial location of intended targets. The objectives of this educational exhibit are: • 1. To identify clinical manifestations and indications of US-guided small joint interventions • 2. To describe the various indications for, contraindications to and expected outcomes associated with US-guided small joint interventions • 3. To demonstrate techniques, tips and tricks in performing these procedures by correlating with cross sectional images and graphic illustrations

TABLE OF CONTENTS/OUTLINE

Axial skeleton • Temporomandibular joint • Sternoclavicular • Symphysis Upper extremity • Tenotomies at the elbow • Ulnar nerve at cubital tunnel • De Quervain’s tenosynovitis • Trigger finger • Median nerve at carpal tunnel • DRUJ Lower extremity • PeriAchilles region • Plantar fascia • Morton's neuroma

Anything is Possible if You've Got Enough Nerve! Ultrasound (US) Approach to the Upper Limb Nerves

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Michaela Cellina, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To show the US approach to the nerves of the upper limb, involving the technique, patient's positioning, and anatomical landmarks. To describe dimensional and echo-structural characteristics of non-pathological nerves.

TABLE OF CONTENTS/OUTLINE

Thanks to its spatial resolution, wide availability, and possibility of real-time and dynamic evaluation, US is the first level exam for the peripheric nerves study, but its use is still limited by a lack of knowledge and expertise. One of the most common indications is suspected nerve entrapment (e.g. carpal and cubital tunnel syndromes). Peripheral nerves should be studied with high-frequency linear array probes. Nerves are usually identified on the axial planes in defined anatomical landmarks. Normal nerves show a fascicular, honeycomb appearance in the short axis and are surrounded by hyperechoic connective tissue. In the long axis, the nerve aspect is coarse and hypoechoic.Important landmarks for median nerve identification are the brachial artery in the upper arm and elbow, the flexor digitorum profundus and flexor digitorum superficialis in the forearm and the carpal tunnel in the wrist. Cross-sectional area (CSA) at three sites of the median nerve ranges from 5.38 to 8.43 mm2. The ulnar nerve is evaluated posteriorly to the brachial artery in the upper arm, at the level of the medial epicondyle of the elbow and the pisiform bone of the wrist. CSA at various points for the ulnar nerve ranges from 2.76 to 5.21 mm2. The radial nerve is assessed at the level of the arm-spiral sulcus on the posterior aspect of the humerus and has a normal CSA of 4.72 mm2. The thickening of the nerve sheath is a very common finding in the main demyelinating neuropathies, both hereditary and acquired.

Strong as Your Weakest Link: The Kinetic Chain and Pitching Injuries of the Elbow

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Akwasi Opoku, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The "kinetic chain" is the coordinated translation of force and motion from the lower extremity/core into the upper extremity during pitching. Any deviation-abnormal anatomy, physiology, or mechanics- places increased forces across joints, predisposing to injury, especially of the elbow. This multimodality imaging review of repetitive valgus stress injury of the elbow in pitchers emphasizes important imaging findings for surgical intervention. Intra-operative correlation is provided. After viewing this exhibit, the learner should be able to: 1) Understand the biomechanics of pitching, including the concept of the kinetic chain, and recognize potential chain disruptors. 2) Recognize patterns of valgus injury of the elbow in pitchers. 3) Discuss important preoperative imaging findings for ulnar collateral ligament and osteochondral injuries.

TABLE OF CONTENTS/OUTLINE

Introduction: (1) Biomechanics of pitching: kinetic chain (2) Deviations in the kinetic chain (anatomy, physiology, mechanics)Elbow injury of the elite pitcher: Repetitive valgus overload (1) Medial Tensile force overload: UCL and common flexor tendon origin) (a) anatomy (b) pathology (tear grade and location, ligament edema, associated osseous changes) (c) Role of MR arthrography(2) Lateral compressive force overload: radiocapitellar joint (a) anatomy (capitellar bare area mimic) (b) pathology (osteochondral injury, Panner's disease)(3) Valgus extension overload (a) pathology (asymmetric osteoarthritis, ulnohumeral impaction)(4) Management of elbow injury: important imaging findings (a) surgical vs non-surgical (b) surgical technique

Pointing to the Problem: A Comprehensive Approach to Finger Disorders

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Augusto Altoe, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand the anatomical basis involved in finger injuries;2. To describe the imaging patterns of the finger pathologies;3. To recognize common and uncommon finger disorders.

TABLE OF CONTENTS/OUTLINE

1- Background. 2- MRI acquisition considerations. 3- Finger ligaments; a. Review of the finger ligaments; b. Collateral ligament injuries of the finger; c. Locked metacarpophalangeal joint; d. Ulnar collateral ligament tears of the thumb; e. Volar plate injuries. 4- Flexor tendons and pulley system; a. Review of the flexor tendons anatomy and pulley system; b. Flexor tendon injuries and lacerations; c. Pulley injuries; d. Trigger finger. 5 - Extensor mechanism; a. Review of the extensor mechanism anatomy; b. Terminal extensor tendon injury (Mallet Finger); c. Central slip injury; d. Sagittal band injury. 6- Miscellaneous; a. Macrodystrophia lipomatosa; b. Acro-osteolysis; c. Palmar fibromatosis (Dupuytren's contracture); d. Tenosynovial giant cell tumor; e. Fibroma of the tendon sheath. 7 - Take home messages.

Talk to the Hand - Ultrasound evaluation of Tendon, Ligament, and Support Structure Injury in the Hand with MRI Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Cum Laude

Participants
Peter Hoeksema, MD, Detroit, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Normal appearance of the flexor and extensor tendons of the hand on ultrasound. Review of scanning technique to optimize imaging of desired structures. Discussion of normal anatomy and insertion of tendons. Review of the pulleys on the flexor surfaces of the hand. Discussion of the extensor hood and sagittal bands. Review of the UCL at the first MCP joint.2. Ultrasound examples of injury involving the FDP, and FDS. Ultrasound example of pulley abnormalities with trigger finger. Concurrent MRI examples of pathology demonstrated on US.3. Ultrasound examples of injury extensor tendons. Example of sagittal band injury with dynamic subluxation of the tendon. Concurrent MRI examples4. Ultrasound examples of UCL injuries (partial and full thickness tear). Example of a Stener type lesion.

TABLE OF CONTENTS/OUTLINE

- Anatomy and Imaging Reviewo Review of optimal imaging technique for the flexor and extensor tendons. Review of associated normal anatomyo Review of the normal location of the flexor pulleys and imaging appearanceo Review of optimal position and technique to visualize the UCL of the thumb- Volar Pathology with radiographic and MRI correlates as availableo Ultrasound examples of FDP/FDS tendon tears with static and dynamic images.o Ultrasound of injury to the flexor pulley apparatus. Dynamic US imaging of trigger finger- Dorsal Pathology with radiographic and MRI correlates as availableo Ultrasound example of extensor tendon tearo Ultrasound examples of sagittal band injury with dynamic examples of tendon subluxation- UCLo Example of injury to the thumb UCL on ultrasound with MRI exampleso Example of Stener lesion on ultrasound

Hypermobility Syndrome - Findings on an Underestimated Diagnosis of Carpal Instability Non-dissociative by the Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
André Henrique Toledo, Campinas, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Carpal instability is a complex and heterogeneous clinical condition. Management requires accurate identification of the structural lesion involved. Midcarpal instability is a form of non-dissociative carpal instability and can be caused by various combinations of extrinsic ligament injuries with abnormal kinematics between the carpal rows. Such instability is related to biomechanical alterations of multiple causes that, if not identified and treated in a timely manner, will lead to gradual joint collapse. It is important to note that unstable wrist initially does not show relevant signs on standard radiographs and studies such as Magnetic resonance imaging (MRI) and MRI arthrography can detect initial findings of instability. In more advanced stages, carpal instability can progress to static wrist misalignment and osteoarthritis, both of which are associated with significant morbidity and disability. To prevent complications and joint sequelae, the radiologist must be aware of this challenge for the early and accurate diagnosis of carpal instability as an important entity, but often undervalued and remembered.

TABLE OF CONTENTS/OUTLINE

Role of the Radiologist - What differential diagnosis would you think? - Step by step in imaging and classic instability signs - Classification and what to look for Differential diagnosis review - is there room for hypermobility syndrome? - Carpal instability x joint hypermobility syndrome - What to expect? - Take home menssage.

Spectral CT Imaging of the Bone Marrow: How To Do It”

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Bernhard Petritsch, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

TEACHING POINTS

To review the indications, contraindications and limitations of spectral CT imaging in terms of photon counting detector computed tomography (PCD-CT) and conventional energy integrating detector (EID) dual-energy computed tomography (DECT) for bone marrow imaging. To learn about the basic physical principles of PCD-CT and conventional DECT imaging with emphasis on bone marrow applications. To interpret spectral bone marrow CT scans of healthy subjects, patients with acute fractures or malignant bone marrow infiltration. To highlight the potential benefits of spectral CT investigation as a comprehensive examination of osseous morphology and additional bone marrow information.

TABLE OF CONTENTS/OUTLINE

A. Basic principles of photon counting detector (PCD) and energy integrating detector dual-energy computed tomography (DECT).B. Technical differences in data acquisition: PCD CT vs. Single-Source EID vs. Dual-Source EID CT-scanners (differences between 1st-3rd generation dual-source scanners).C. Post-processing: Material-decomposition algorithm, creation of VNCa (“virtual non-calcium”) images.D. Data acquisition: Parameter settings for PCD and dual-energy CT of the extremities, spine and pelvis.E. Current applications of spectral CT for the detection of acute fractures and malignant bone marrow infiltrations (e.g. in multiple myeloma): examples in the spine, pelvis and extremities.F. Pitfalls and limitations of spectral bone marrow Imaging; alternative imaging modalities.

Don't Let the Foot Drop: Review of the Anatomy, Imaging, and Pathologies of the Sciatic Nerve and its Branches

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Andrew Liu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Foot drop is a common reason for consultation and deserves a quick clinical and radiological assessment. Knowledge of the anatomy, the course and the division of the sciatic nerve and its branches is required so that the radiologist can image the adequate anatomical area whether by ultrasound or by MR imaging. The advantages of ultrasound lie in the possibility to survey the entire nerve and its branches in a short period of time. However, this modality remains operator-dependent. Through this Education Presentation, a review of the anatomy of the sciatic nerve and its branches, the different modern modalities available, and pathologies that might affect the sciatic nerve and its branches nerve is propose.

TABLE OF CONTENTS/OUTLINE

Revise the anatomy of the sciatic nerve, the common peroneal nerve, the superficial and deep peroneal nerves Understand, revise and optimize cross-section imaging (MRI neurography and ultrasound). Navigate through traumatic (traumatic neuroma, post-amputation neuroma), tumoral (BNPST, MPNST, neurofibromatosis, etc.), and miscellaneous pathologies (intra-neuronal and extra-neuronal ganglion cyst) of the lower extremity nerves.

Musculoskeletal Ultrasound: No Pain, No Gain - A Compilation of Techniques and Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Cleiton Freitas, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

A) Musculoskeletal ultrasound should be based on systematized image acquisition techniques and on the recognition of multiple pathologies. B) Importance of documenting and visualizing the appropriate musculoskeletal anatomical structures, focusing on teaching the Radiology Resident physicians the most recommended techniques. C) For each analyzed body segment, pathologies of significant clinical importance, including common and uncommon pathologies will be analyzed. D) More than 40 pathologies and their differential diagnoses will be analyzed, because no pain no gain.

TABLE OF CONTENTS/OUTLINE

- Introduction- Anatomy review- Ultrasound imaging capture sequence- Lesions and their differential diagnosis- Take-home massages

Imaging of Postoperative Pectoralis Major Tendon: What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Luana Maciel, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To evaluate the appearance of pectoralis major tendon after surgical correction. • To assess the MRI aspects of the pectoralis major muscle tendon after surgical repair, using different approaches, such as anchors, cortical buttons, bone holes or surgical reconstruction using autologous graft (semitendinosus, gracilis) or allograft.

TABLE OF CONTENTS/OUTLINE

• Anabolic steroids usage by weightlifting athletes gym work out men has led to a significant increase in the incidence of pectoralis major injuries. • Ecchymosis and local hematomas followed to those lesions limits clinical evaluation and make imaging crucial for injury graduation and repair planning. Magnetic resonance imaging and ultrasonography are established as methods of choice. • Surgical treatment is the best approach for pectoralis major injuries. • Humeral tendon reinsertion using either surgical wires or metallic anchors are chosen for acute lesions and orthopedic screws for chronic ones. Old injuries with tendon retraction may require reconstruction with autologous graft, commonly from the hamstrings or allograft. • Surgical treatment reported a lower degree of strength loss compared to conservative conduct. In addition, it was superior regarding aesthetic and functional gain, with a high rate of sports activity return. • Imaging plays an important role not only for diagnose and surgical planning but also to postoperative follow-up, depicting early changes not seen in clinical evaluation.

Normal and Abnormal MRI Finding of Rotator Interval Correlated with Athroscopy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Ji Yoon Lee, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe normal MRI anatomy of rotator interval, with associated arthroscpy finding. 2. To present MRI finding of rotator interval pathology, correlation with arthroscopy. 3. To present associated findings at long head of biceps tendon and subscapularis tendon, correlation with arthroscopy. 4. To enhance rotator interval image interpretation and let better coordination between radiologists and orthopedic surgeons in terms of surgical planning or retrospective image review.

TABLE OF CONTENTS/OUTLINE

1. Normal MRI and arthroscpy finding of rotator interval. 2. Abnormal MRI findings of rotator interval, including biceps tendon tear and subluxation, subscapularis tendon lesion, synovitis, adhesive capsulitis are presented, with corresponding arthroscopy image.

The Repaired Rotator Cuff: Normal and Abnormal Appearance with Focus on US and MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Cum Laude

Participants
Paola Kuenzer Goes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The repaired rotator cuff frequently appears abnormal on ultrasound (US) and magnetic resonance imaging (MRI). While the appearance of tendons and surrounding tissues typically normalize, they can demonstrate clinically insignificant abnormal imaging appearances for longer than 6 months. US and MRI are useful in the postoperative assessment of the rotator cuff, not only for evaluation of the integrity of the rotator cuff, but also for detecting hardware complications and ruling out other sources of shoulder pain. The objectives of this educational exhibit are:1. Briefly review the US and MRI findings of the normal postoperativerotator cuff2. Discuss US and MRI findings of various types of repair and fixation3. Illustrate US and MRI findings of post rotator cuff repair complications according to three potential sources (tendon, hardware and soft tissues)

TABLE OF CONTENTS/OUTLINE

Normal postoperative rotator cuff• Types of repair Which tendon(s) was repaired, method of repair (tendon suture, reinsertion, transfer of tendons or grafts), and types of fixation (transosseous, double-row, double-row bridged)• US findings• Early MRI findings• Late MRI findingsComplications• Tendon Partial re-tear Complete re-tear• Hardware complications Fracture Migration• Soft tissues Infection Bursitis Adhesive capsulitis

Multimodality Review of Sclerotic Lesions in the Spine

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
William Holden, MD, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Sclerotic lesions of the spine can be challenging to characterize due to their broad differential and overlapping imaging features. A methodical approach is necessary when formulating a differential diagnosis for these lesions. This educational exhibit will review patterns of focal, multifocal, and diffuse vertebral body sclerosis on multiple modalities, including plain radiographs, CT, MRI, MDP bone scan, and FDG-PET. This review will provide a framework for evaluating different categories of osseous sclerosis, including infectious/inflammatory, neoplastic, metabolic, and developmental causes. Familiarity with specific imaging patterns and assessment of pertinent clinical information will allow the radiologist to more accurately interpret sclerotic lesions of the spine, and recommend appropriate follow-up and additional imaging evaluation.

TABLE OF CONTENTS/OUTLINE

1. Provide an overview of modalities used for the evaluation of sclerotic bone lesions, including plain radiographs, CT, MRI, MDP bone scan, and FDG-PET. 2. Review common and uncommon cases of focal, multifocal, and diffuse sclerotic vertebral lesions. a. Cases will include 3-4 examples from each category: i. Infectious/inflammatory ii. Neoplastic iii. Metabolic iv. Developmental b. For each lesion, the discussion will include: i. Multimodality imaging findings ii. Pertinent clinical history iii. Diagnostic pearls 3. Provide a diagnostic algorithm for the evaluation of sclerotic vertebral lesions.

Sacral Lesion - Recognizing the Most Common Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Andre Y. Aihara, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is:- Review the normal anatomy and imaging appearance of the sacrum, using CT and MR images.- Didactically discuss sacrum lesion, dividing into 4 categories: Tumors, trauma, infections, and non-infectious inflammatory arthropathies.- Elucidate the typical findings of sacral tumors, frequent locations, age and sex distribution, and characteristic imaging findings.

TABLE OF CONTENTS/OUTLINE

The sacrum is a structure located in the pelvis with an important role in spinal biomechanics. It is composed of multiple tissues: cartilage, bone marrow, nerves, meninges and notochord remnants. This diversity of components can originate different primary tumors, most of them with predicted location and imaging findings. Since the sacrum is rich in hematopoietic bone marrow, metastasis is frequent.Sacral fractures can result from high-energy trauma or be related to low-energy impact, as in insufficiency stress fractures. The typical H-shaped pattern can be seen in bilateral sacral insufficiency fractures.Most sacrum infection is by continuity spread, common with the infection of the pelvic adjacent organs.Finally, it is important to remember inflammatory arthropathy and those resulting from local mechanical overload.

Bone-RADS Classification - What the Radiologist Needs to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Verena Pires, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the Bone-RADS (bone reporting and data system) classification with a simple guide using examples.To provide radiologists with a general overview enabling them to understand and interpret Bone-RADS in different lesions.

TABLE OF CONTENTS/OUTLINE

Incidental solitary bone lesions are frequently encountered on computed tomography (CT) and magnetic resonance imaging (MRI) in routine clinical practice. Despite the prevalence of these unexpected lesions, clear and consistent guidelines for their management have not been defined in the literature. The purpose is to present algorithms for the diagnostic management of solitary bone lesions incidentally encountered on CT and MRI in adults. For risk stratification, the Bone-RADS recommends four categories, incorporating the range of benign to suspicious for malignancy or need for treatment (Bone-RADS1, leave alone; Bone-RADS2, perform different imaging modality; Bone-RADS3, perform follow-up imaging; Bone-RADS4, biopsy and/or oncologic referral). Two algorithms for CT based on lesion density (lucent or sclerotic/mixed) and two for MRI allow the user to arrive at a specific Bone-RADS management recommendation. Representative cases are provided to illustrate the usability of the algorithms.The ultimate goal is to optimize bone lesion outcomes while minimizing unnecessary surgical procedures in patients at low risk of malignancy and to provide a management recommendation for each risk category. Then, this classification can standardize lesions and decrease ambiguity reporting to enhance communication among the multidisciplinary team.

Whole-body Imaging on Multiple Myeloma: Imaging Modalities and Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Henrique Lino, MD, Sau Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Multiple myeloma is the most common primary tumour of bone with an incidence of 10 per 100,000. Multiple myeloma whole-body imaging techniques (MM-WB) can help detect subclinical lesions and determine early treatment, increasing prognostic and avoiding fractures and other complications.

TABLE OF CONTENTS/OUTLINE

Introduction: The MM-WB modalities are x-ray skeletal survey, computed tomography (CT), magnetic resonance (MRI), computed tomography 18F-fluorodeoxyglucose positron emission tomography (PET-CT).Objectives:(1) to review the use of MM-WB. (2) to exemplify cases and compare the imaging modalities. Methods: We queried cases to illustrate the imaging methods. Discussion: Although skeletal survey is the reference method, it has a high false negative rate (30-70%). Axial methods have a higher sensitivity (68-100 %) for the condition. The general diagnostic criteria for axial methods, by the International Myeloma Working Group, is one or more focal lesions with 5 mm or more, with osteolytic behaviour. Among these methods, MRI has the advantage of no radiation, and it has the best diagnostic performance for the evaluation of soft tissue lesions and bone marrow compromise as well it has a high specificity from 83 to 100%, and also treatment response (as well as PET-CT).Conclusion: multiple modalities of MM-WB can detect focal and diffuse disease, quantify burden, and predict treatment response as well it is able to detect mechanical complications.

The Role of Cinematic Rendering in the Evaluation o Complex Vascular Injury of the Lower Extremities: How We Do It

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Elliot Fishman, MD, Owings Mills, MD (*Presenter*) Co-founder, HipGraphics, Inc;Stockholder, HipGraphics, Inc;Institutional Grant support, Siemens AG;Institutional Grant support, General Electric Company;Consultant, Exact Sciences Corporation;Consultant, Imaging Endpoints

TEACHING POINTS

1. CT with CTA is the state of the art for the evaluation of the patient with lower extremity trauma regardless of whether the trauma is an MVA,, gunshot wound or stabbing or simply a fall2. diagnosis of injury is but step one in patient management and the role of 3D has classically been to help with management decisions by improving understanding of the true extent of the injury.3. Cinematic rendering is an advanced form of volume rendering which is ideal in the trauma setting by visualization of muscle and soft tissue, the vascular map and underlying bony structures. When optimized it provides a clear understanding of the "personality" of the specific injury4. the use of Cinematic Rendering provides an opportunity to provide extra value in the interpretation and management of complex trauma to the lower extremities. A paradigm for use of cinematic rendering is addressed.

TABLE OF CONTENTS/OUTLINE

1. Imaging protocols for lower extremity trauma including the role of dual energy CT2. imaging protocols for using cinematic rendering for the range of lower extremity trauma3. analysis of case studies showing the added value of cinematic rendering in trauma of soft tissue/muscle, the bony anatomy and the vascular map. Specific presets for optimizing workflow and analysis are presented4. case studies showing the impact of cinematic rendering on patient management are presented, and discussed5. role of Cinematic Rendering for patient management dcisions is addressed and illustrated as well. potential pitfalls and limitations of Cinematic Rendering are also discussed and illustrated

Staying Afloat With the Competitive Swimmer - Common and Uncommon Injuries

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Sonja Opper, DO, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Athletic injuries have been well documented in the literature, particularly in mainstream sports such as football, soccer and baseball. A sport that is poorly represented in the literature is swimming. 2. Swimmers are susceptible to chronic types of stress on their bodies as a result of varying repetitive physical movements, as well as unique environmental and chemical exposures. The majority of swimming related injuries are a result of repetitive microtrauma in the shoulders, elbows, and knees. 3. Acute injuries often relate to the flip turn, starts/finishes and the dive where there are rapid accelerations and declarations as well as the potential for barotrauma while submerged. 4. In this presentation we will review common and uncommon injuries in avid swimmers and review the mechanism of injury in these athletes with special attention to the physiology of different strokes.

TABLE OF CONTENTS/OUTLINE

1. Review the 4 basic strokes (freestyle, backstroke, breaststroke, and butterfly) and flip turns with videos illustrating the mechanics, areas of stress, and potential for injuries. 2. Review imaging of the common injuries related to competitive swimmers. a. Shoulder injuries b. Knee injuries c. Foot injuries d. Hip injuries 3. Discuss the environmental and chemical exposures that predispose swimmers to unique injuries. 4. Interactive cases

Let's be "Franc" about the Lisfranc: A Review of Anatomy, Pathology, and Disease Mimics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Sirui Jiang, MD, PhD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the anatomy of the Lisfranc joint complex2. Review the clinical presentation and causes of injuries to the Lisfranc joint complex3. Multimodality imaging overview of Lisfranc joint complex injuries including common measurements and hallmark findings4. Discuss common radiographic mimics of Lisfranc injuries5. Overview of orthopedic management of Lisfranc injuries

TABLE OF CONTENTS/OUTLINE

Background-Image-based anatomy review of the Lisfranc joint complex-Incidence of Lisfranc injuries and diagnostic missesEtiology of Disease -Biomechanical/Traumatic Causes-Soft tissue injuries without dislocation-Bony injury with mild displacement -Bony injury with marked displacement-Clinical Presentation-Physical Examination Imaging Studies-Radiographs-AP, lateral, and oblique views during weight-bearing-How to identify dislocation of the Lisfranc joint complex-Spectrum of findings in alternative views -Spontaneous reduction during radiographic evaluation-Other Imaging Modalities-CT-MRI-Ultrasound Common Mimics -Vascular calcifications -Os intermetatarseum Complications-Post-traumatic arthrosis-Instability-Chronic painManagement-Non-operative management-Surgical fixation-Repeat imaging-Post-operative physical therapy

Traumatic Instabilities of the Cervical Spine: What the Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Alan Strapasson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. Review the anatomy in the different imaging methods and their main variations relevant to trauma assessment.2. Review measurement techniques.3. Correlate the trauma mechanism with the main injuries related to each one of them.4. Address the most common ligament injuries with a focus on MRI.5. Discuss atlantoaxial dissociation and odontoid fracture. 6. Classification of lesion instability (Vaccaro, NEXUS).

TABLE OF CONTENTS/OUTLINE

1. Anatomy and assessment of CR, CT and MRI in adults and children and their main anatomical variations relevant to the assessment of trauma. 2. Measurement techniques: Wackenheim, Chamberlain, Mcgregor, Power Ratio, basion-axial interval, atlantodental interval. 3. Flexion injuries: wedge compression fracture, flexion teardrop fracture, anterior subluxation, bilateral facet dislocation, Clay Shoveler, anterior atlantoaxial dislocation. 4. Hyperflexion and rotation: unilateral facet displacement (locked facet). 5. Extension: hangman's fracture, teardrop fracture by extension.6. Axial compression: Jefferson fracture, burst fracture.7. Odontoid fracture.8. Atlantoaxial Dissociation.9. Ligament injuries: alar and transverse ligament.10. Vaccaro Classification (2007), Harris.11. Unstable fractures in order.12. NEXUS Criteria.

Myxofibrosarcoma Imaging with Pathological and Clinical Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Robert W. Morris, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Myxofibrosarcoma is one of the most common sarcomas in older patients, but has only relatively recently been defined as a distinct pathological entity. There is also limited information about myxofibrosarcoma in the radiology literature. After viewing this exhibit, the viewer should be able to: 1. Describe the pathological features of myxofibrosarcoma. 2. Describe the typical imaging appearance of both low-grade and high-grade myxofibrosarcoma. 3. Discuss ancillary imaging and post-treatment imaging. 4. Recognize important features for staging, treatment and prognosis.

TABLE OF CONTENTS/OUTLINE

Table of Contents: 1. Myxofibrosarcoma overview 2. Pathology 3. Imaging characteristics 4. Low-grade myxofibrosarcoma 5. High-grade myxofibrosarcoma 6. Ancillary imaging and staging 7. Treatment 8. Post-treatment imaging 9. Prognosis 10. Conclusion

Checkmate to Chest Wall Tumors: A Strategical Approach to Diagnosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Rebeca Francelino, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review the most common tumors and their characteristic imaging findings. 2. To discuss the diagnosis and management of benign and malignant tumors.3. To correlate the imaging findings and clinical clues on a systematic approach to help narrowing the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1- Institutional Protocol to evaluate the chest wall; 2- Epidemiological assessment of the main lesions and best imaging modality; 3- Bening bone and cartilaginous tumors: Osteochondroma; Fibrous dysplasia; Aneurysmal bone cyst (ABC); Giant cell tumor (GCT); Ossifying fibromyxoid tumor; Chondromyxoid fibroma4- Malignant bone and cartilaginous tumors:Chondrosarcoma; Multiple Myeloma; Metastasis; Osteosarcoma5- Benign soft tissue lesions:Hemangioma; Elastofibroma dorsi; Fibrous Hamartoma of Infancy; Lipoma; Schwannoma; Desmoid Tumor; Neurofibroma; Ganglioneuroma; Paraganglioma; Hemangiopericytoma 6- Malignant soft tissue lesions:Ewing sarcoma; Rhabdomyosarcoma; Synovial sarcoma; Pleomorphic sarcoma; Ganglioneuroblastoma; Neuroblastoma; Angiosarcoma; Leiomyosarcoma; Malignant fibrous histiocytoma (MFH); Malignant peripheral nerve sheath tumor; Dermatofibrosarcoma protuberans7- Miscelaneous Brown Tumor

3D-MERGE MRI Sequence in the Assessment of Foot and Ankle Bone Abnormalities

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Tatiane Rodrigues, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Discuss the use of MERGE MRI sequence in the assessment of bone abnormalities in the foot and ankle.2) Discuss clinical applications of synthetic-CT based images on MERGE sequence in the foot and ankle through a case-based approach.

TABLE OF CONTENTS/OUTLINE

Different techniques have been used to generate MRI-based synthetic-CT and have demonstrated equivalence toconventional CT. While MRI has superior soft tissue contrast when compared to CT, abnormalities that usually manifest as areas of low-signal intensity on conventional MRI scans, such as fracture lines, are better depicted on CT.Both modalities may complement each other in the characterization of several musculoskeletal disorders. Performing CT in association with MRI not only increases costs but also exposes the patient to ionizing radiation.MERGE (Multiple Echo Recombined Gradient Echo, GE Healthcare) is a spoiled T2*-weighted 3D sequence for spinal and musculoskeletal imaging, which has the acquisition and combination of multiple echoes with a high receiver bandwidth instead of using a single low bandwidth echo, that provides high resolution and isotropic images of the extremities with optimized contrast between the ligaments and soft tissue.The purpose of this work is to show the 3D-MERGE MRI sequence in the assessment of bone abnormalities of the foot and ankle in a case-based discussion. Radiologists need to be familiarized with MRI-based synthetic-CT techniques, such as MERGE, and their imaging findings to obtain an optimal evaluation of musculoskeletal conditions with the combination of conventional and innovative sequences.

MKEE-144

Shipwrecked: Spontaneous Osteonecrosis of the Navicular Bone

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Juliana Sitta, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the anatomy, joints, ligaments, function, and vascularization of the navicular bone. Discuss the clinical features and mechanism of pediatric and adult avascular necrosis of the navicular bone. Illustrate the imaging characteristics of navicular osteonecrosis and complications in multimodality imaging at different stages of the disease

TABLE OF CONTENTS/OUTLINE

Navicular bone osteonecrosis, also known as Kohler disease, is a relatively uncommon, self-limited abnormality with typically good prognosis. It differs in imaging presentation and prognosis from its adult counterpart, known as Mueller Weiss disease, which often results in progressive navicular bone deformity and midfoot biomechanical impairment. This educational exhibit aims to explore the anatomic predispositions of the navicular to osteonecrosis as well as the imaging features of these two pathologically similar entities that affect patients at opposite ends of the age spectrum. This educational exhibit provide an overview of the navicular bone anatomy, including common anatomic variants and mimickers, relationship with neighboring bones, function, and vascularization. We discuss imaging features, imaging anatomy, and potential complications in the pediatric and adult types of avascular osteonecrosis of the navicular bone. Multimodality imaging and didactic illustrations will explore the injury mechanism and presentation spectrum. The authors raise attention to the role of imaging in assessing potential secondary biomechanical complications and pitfalls.

Working "Smarter" : A Review of Artificial Intelligence in Musculoskeletal Radiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Vidya Sankar Viswanathan, MBBS, Shaker Heights, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Define Artificial Intelligence (AI) and other commonly associated terminology2. Review current applications of FDA approved AI tools in Musculoskeletal (MSK) Radiology (diagnostics, image processing)3. Describe ways that integration of AI can improve clinical workflow4. Discuss future technologies in AI, including Radiomics and Autonomous AI5. Review limitations of AI, including challenges that need to be addressed for clinical translation of these tools.

TABLE OF CONTENTS/OUTLINE

1. Introduction -Define Artificial Intelligence (AI), Machine learning, Deep learning, Convolutional Neural Networks(CNN), Generative Adversarial Networks (GAN)2. Current applications of FDA approved AI tools in Musculoskeletal Radiology A. Image Processing/Quantification -Improved visualization -Surgical planning B. Computer-aided diagnosis3. Improved Clinical Workflow with AI A. Image Acquisition Time B. Study Triaging C. Image Interpretation Time D. Scheduling4. Future of AI A. Interpretive tools -Device placement assessment -Augment Radiology Assistants B.Non-interpretive tools -Reduce noise and artifacts -Enhance contrast -Improved visualization of pathology -Worklist Prioritization -Improving Radiology Resident Education C. Radiomics D. Autonomous AI5. Challenges A. Clinical - Reluctance toward implementation -Information/knowledge gap -Reimbursement strategies B. Medico-legal -Liability: Physician vs. software developer vs healthcare institution -Advocacy for guidelines and legislation

The Role of MRI in Evaluation of Soft Tissue Lesions of the Hand and Fingers: An Imaging Review of the Common Differential Diagnoses, Artifacts and Normal Findings Which Can Simulate Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Cormac O Brien, MRCPI, MRCP, Dublin 4, Ireland (*Presenter*) Nothing to Disclose

TEACHING POINTS

Soft tissue lesions of the hand and fingers are frequently encountered in everyday clinical practice. The can be detected incidentally or present as painfully or painless lumps. Lesions may be idiopathic or arise secondary to trauma, foreign body, infection or systemic illness. These lesions provide a unique diagnostic challenge due to the small size of the lesions, the wide differential and the intricate anatomy. Our teaching aim is to present a practical illustration of hand and finger soft tissue lesions along with relevant clinical findings, illustrate the normal MRI appearance's which can simulate disease and help the radiologist to provide a more accurate diagnosis, allowing improved recommendations to the referring clinicians and minimize unnecessary investigations or biopsy.

TABLE OF CONTENTS/OUTLINE

First we describe the MRI protocols used to work up soft tissue lesions of hand and fingers.Secondly we evaluate the most common artifacts in hand and finger MRI such as pulsation, aliasing and phase-encoded motion artifacts and the review practical tips to optimize image quality.Third we provide an outline of the normal findings which simulate disease including Pacinian corpuscles and submatrical hyperintense area.Finally we Illustrate the key MRI imaging features of common soft tissue lesions of the hand and fingers including cystic lesions (glomus tumors, inclusion cyst), tumor like lesions (fibroma, keratoacanthoma, peripheral nerve sheath tumor), vascular lesions such as haemangioma and malignant lesions which include squamous cell carcinoma, malignant melanoma and metastasis, with plain film, CT and Ultrasound correlation.

MRI of The Midhand: The Lesser Known Anatomy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Michel De Maeseneer, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-The anatomy of the midhand is complex and not well known. We illustrate this anatomy by MR-anatomical correlation. -It includes the distal tendon insertions, the muscles of thenar and hypothenar, the midpalmar compartment, the palmar bursa and synovial sheaths, the sesamoid apparatus of the thumb base, the palmar aponeurosis. -For each structure we illustrate and refer to the most important pathological conditions -A good knowledge of anatomy is essential to adequately assess normal and abnormal MR imaging of this region.

TABLE OF CONTENTS/OUTLINE

Outline1.Distal tendon insertions: AP, EPB, ECRB and ECRL, EPL, ED, EDM, ECU2.Muscles of the hypothenar: opponens, abductor, interosseous3. Muscles of the thenar: opponens, abductor, flexor brevis, flexor pollicis longus, adductor, interosseous.4.Midpalmar compartment: interosseous, lumbricals, neurovascular bundle, transverse metacarpal ligament5. Bursae and synovial sheaths: palmar bursa, synovial sheath of finger 1 and 5, synovial sheath of finger 2-4. 6. Thumb base; sesamoid bones, intersesamoid ligament, accessory collateral ligament, collateral ligament, dorsal aponeurotic expansion (hood) from abductor and adductor tendons7. Palmar aponeurosis: palmaris longus, apex of aponeurosis, pretendinous bands, transverse ligament of Skoog, natatory ligament

Meniscus Repair: What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Camila De Paula Silva, MD, Botucatu, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is 1. To review and illustrate the surgical techniques of meniscal repair. 2. To show MRI images appearance of the repaired meniscus. 3. To show the postoperative normal and abnormal findings.

TABLE OF CONTENTS/OUTLINE

1- Imaging appearance of meniscus injuries before and after repair. 2- Types of surgical techniques of meniscal repair, including: Inside-out suture repairs, outside-in suture repairs and all-inside repairs. 3- Normal post surgery findings and how to differentiate it from abnormalities. 4- Main postoperative complications of meniscal repairs in MRI images, including: avulsion of the repair, progressive meniscal extrusion and progressive articular cartilage damage.

Soft Tissue Calcifications on Ultrasound - Differentials and Radiographic Correlate

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Alex Ward, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Ultrasound is not the modality of choice for evaluation of calcifications, however practitioners frequently encounter calcifications during diagnostic and procedural musculoskeletal ultrasound. These calcifications may be challenging to diagnose, especially if discovered incidentally. 2) Knowledge of the sonographic appearance of calcifications and their respective radiographic correlate can help clinicians comfortably diagnose soft tissue calcifications. 3) Review of commonly encountered calcifications focusing on their typical location, distribution, imaging appearance and mechanism of formation. 4) Focus on companion cases, potential pitfalls, and unique sonographic/radiographic features to distinguish and accurately identify calcifications (ex. HADD vs enthesopathy, ultrasound appearance of Gout vs CPPD, benign vs malignant causes of calcifications)

TABLE OF CONTENTS/OUTLINE

1) Terminology and categorization of calcification vs ossification. 2) Review of commonly encountered calcifications, including typical location/distribution, mechanism of formation, sonographic appearance with radiographic correlate, potential pitfalls of the following: A. Calcium hydroxyapatite deposition disease (HADD) B. Calcium pyrophosphate deposition C. Gout D. Enthesophytes E. Normal variant ossicles F. Myositis ossificans and other forms of heterotopic ossification G. Scleroderma H. Tumoral calcinosis in End Stage Renal Disease I. Phleboliths seen in vascular malformation J. Malignancy, including chondrosarcoma and calcification in synovial sarcoma

MSK Word Salad: Making Sense of the Most Frequently Encountered Metabolic Bone Disorders

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Andrew Liu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Metabolic bone disorders encompass those diseases which affect bone structure and/or mass and are caused by metabolic derangements. They are important to recognize as they are common and affect patients of all age groups. Metabolic bone disorders lead to considerable morbidity and mortality, as they weaken bones, regardless of the underlying morphologic changes, increasing the risk of fractures in elderly patients and stunting skeletal growth in children. Due to the lack of acute symptoms of many of these disorders, the radiologist is likely to make the initial diagnosis and facilitate subsequent workup.

TABLE OF CONTENTS/OUTLINE

This presentation covers the more commonly encountered metabolic bone disorders. For each disease, a brief summary of the pathophysiology precedes a discussion of characteristic imaging features to provide a basis for understanding WHY those findings occur. Each slide is centered on radiographic features, with cross-sectional imaging findings shown as correlates. This is because metabolic bone diseases are most often initially detected on radiographs. Disorders discussed will be categorized as osteopenic, osteosclerotic, or mixed pattern lesions.

Skeletal Dysplasias: The Role of Radiologist's Report

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Mateus Andreoni, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS: The purpose of this pictorial essay is to review the main characteristics of the most prevalent bone dysplasias and highlight the key points of the radiological report: Most prevalent types of skeletal dysplasias and the latest classification Review of bone dysplasias radiological appearance The role of radiologist’s report for early diagnosis and family counseling

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE: Most prevalent types of skeletal dysplasias Skeletal dysplasias are a group of more than 450 heritable disorders with specific type of inheritance. The latest discoveries have added embryological and genetic data which provided a detailed classification in 42 groups. Review of bone displasias radiological appearance: Despite being a large group of pathologies, radiological appearance may be diagnostic or narrow to a small amount of differentials in most cases. The role of radiologist’s report: It is important to do determine a precise diagnosis to aid in menagement, familial recurrence and to report those disorders highly associated with mortality. Even tenuous radiologic findings should be correctly interpreted and reported because, added to clinical context, can be decisive in the correct diagnosis.

MKEE-152

Ultrasound (US) Imaging of The Peripheral Nerves: Normality and Abnormalities

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Michaela Cellina, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe the technique of the lower limb US nerve study and the appearance of the nerves to help the radiologist become confident with this US application.To show the anatomical landmarks to identify the nerves.

TABLE OF CONTENTS/OUTLINE

Thanks to its wide availability, low costs, fast execution, high soft-tissue resolution, real-time dynamic evaluation, and direct correlation with signs and symptoms, high-frequency US is considered the first-line imaging tool for the study of the peripheral nerve. Moreover, US does not suffer the limitations of MRI, such as metal implants, claustrophobia, and pacemakers. The exam is performed with high-frequency linear array probes.The nerves are identifiable on the axial plane at defined anatomical landmarks, then the nerve is followed with the probe in the axial plane proximally and distally. If abnormalities are recognizable, the nerve should be also studied on the long axis.Common indications for US nerves study include tarsal tunnel syndrome, entrapments, traumas, suspected neuromas, and polyneuropathies.Non-pathological nerves have a characteristic honeycomb appearance in the short axis, as they are formed by hypoechoic nerve fascicles surrounded by hyperechoic connective tissue and collagen. They can be detected in the adipose tissue or in fascial planes among or superficial to the muscles and each nerve is surrounded by a portion of fat. Pathological nerves show increased diameter with a hypoechoic appearance proximal to the site of the entrapment. Post-traumatic damages can be visible as nervous focal discontinuation with swollen retracted portions.

Preoperative Planification and Postoperative CT-Scan Imaging Assessment of Latarjet Procedure for Anterior Shoulder Instability: What's On The Menu?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Ulrike Novo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the most important findings in preoperative CT scan planning before Latarjet.- To describe the key points to be considered in the postoperative CT scan evaluation. - To illustrate a wide spectrum of normal and pathological findings in postsurgical CT scans in a case-based scenario.

TABLE OF CONTENTS/OUTLINE

The Latarjet procedure is an operation for recurrent anterior shoulder instability consists of transferring the coracoid process to the anterior glenoid rim.Appetizer PREOPERATIVE CT SCAN PLANNINGPreoperative planning of the arthroscopic Latarjet procedure based on the CT scan is necessary to achieve satisfactory clinical and radiographic results:• Coracoid dimensions • Measurement of bone defects, Hill-Sachs lesion, bony Bankart and glenoid track Main course HOW TO PERFORM ARTHROSCOPIC LATARJET SURGERY AND POSTOPERATIVE CT SCAN EVALUATIONAdequate coracoid graft positioning:Coronal view: Coracoid graft should be flush with the articular surface along its lateral aspect.Axial view is the most useful view to judge the mediolateral position and the "angulation" of the graft. Coracoid graft should be flush with the articular suface. The angulation of the gaft (open, closed or neutral) is evaluated with the circle method.Axial plane to analyze the angle of the screw(alpha angle) with the articular surface.Sagital view allows assessment of craneocaudal position respect to glenoid equatorDessert COMPLICATIONS• Short term: Graf fracture/ avulsion and graft non-union• Long term: OsteoarthritisIn conclusion, the radiologist plays a key role in Latarjet, to know what pre-surgical CT findings are important to help with preoperative planning and to diagnose potential complications that may occur.

Whole body MRI in The Analysis of Multiple Myeloma: A Overview of Evolution, Imaging Methods and Future Perspectives

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Eduardo Zukovski, MD, Umuarama, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Recognize the updated diagnostic criteria for MM, indications and limitations of each imaging option, and recommendations for follow-up. - Know MR imaging protocol for MM evaluation, indications and general technical parameters. - Comprehend MM imaging features in the different whole body MRI sequences. - Recognize the imaging response criteria in MM treatment. - Understand future perspectives of monoclonal gammopathies imaging analysis and flowcharts.

TABLE OF CONTENTS/OUTLINE

Introduction: • - Epidemiology of MM and indications of each imaging option • - Definition of MM updated diagnosis criteria • - Different indications of whole body MRI for bone diseases • - Whole body MRI sequences, technical parameters and MM imaging findings Diagnosis and imaging findings: • - Flowcharts of monoclonal gammopathies imaging methods • - Whole body MRI useful in MM treatment response assessment • - MRI patterns of bone marrow infiltration in MM • - Definition of unequivocal focal active lesion of MM in whole body MRI • - MRI findings correlated with poor patient survival • - Imaging follow-up for MM and identification of possible complications

Pitch Perfect: Biomechanics and Patterns of Injury In the Throwing Arm

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

The exceptional velocity required by sporting activities relying on overhead throwing predisposes the shoulder to extreme forces, leading to both adaptive changes and pathologic cascade of findings that can be detected on imaging. The objectives of this educational exhibit are: • 1. To review the phases of pitching and associated biomechanics that predispose the overhead-throwing shoulder and elbow to injury • 2. To highlight unique sites of injury in the overhead-throwing athlete • 3. To discuss imaging findings of common shoulder and elbow injuries in the overhead-throwing athlete

TABLE OF CONTENTS/OUTLINE

Throwing biomechanics and arc of motion Shoulder • Glenohumeral internal rotation deficit (GIRD) • Internal impingement • Superior labral anteroposterior (SLAP) tear • Partial thickness rotator cuff tear • Anterior capsule injury • Subscapularis tendon injury • Bennett lesion • Posterior muscle injury Elbow • Flexor tendinitis • UCL injury • Valgus extension overload • Olecranon stress fracture • Ulnar neuritis Pediatric • Little leaguer's shoulder and elbow

Spectrum of Musculoskeletal Involvement in COVID-19 Infection Diseases: Pictorial Essay

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Pedro Martins, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Covd-19 has a broad spectrum of musculoskeletal involvement that can mimic other diseases and trigger the development of rheumatic disease. After almost two years of the coronavirus pandemic, some countries are starting to treat COVID-19 infection as an endemic disease and we will probably continue to live with the virus . Although musculoskeletal involvement is uncommon, It's important to recognize its most common neuromuscular and rheumatologist complications associated with the infection, and also the musculoskeletal changes related to the long term hospitalization and the vaccine side effects.

TABLE OF CONTENTS/OUTLINE

- To explain how COVID-19 infection can involve the musculoskeletal system. - To illustrate with ultrasound, computed tomography, and magnetic resonance images the most common musculoskeletal changes of covid infection, including myositis, neuropathy, synovitis, arthritis and soft tissue abnormalities.- To demonstrate the differential diagnosis of others musculoskeletal infections and inflammatory conditions The global COVID-19 pandemic is not over yet, and may become an endemic disease within the next few years. Musculoskeletal changes can be related to the infection itself, and also be found in patients with prolonged hospitalizations and due vaccine side effects. It is important to recognize the most common musculoskeletal changes to avoid unnecessary procedures and to prevent misdiagnosis of other inflammatory and infectious conditions.

The Navicular: Keystone of the Foot

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Scott Wuertzer, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the anatomy of the tarsal navicular with an emphasis on the three arches of the foot. 2. Review the biomechanics of the navicular, including the osseous keystone and the peri-navicular soft tissue stabilizers. 3. Describe various pathologies of the navicular with an emphasis on the associated pathomechanics. 4. Through case examples, highlight the expected imaging characteristics of navicular pathology.

TABLE OF CONTENTS/OUTLINE

1. Anatomy and Biomechanics. A. Osseous and vascular anatomy of the navicular. B. The arches of the foot - medial, lateral, and transverse. C. Peri-navicular soft tissue stabilizers - dorsal and plantar cuneonavicular ligaments, bifurcate ligament, spring ligament, dorsal talonavicular ligaments, cuboideonavicular ligaments, and the posterior tibial tendon. D. Joints - naviculocuneiform, cuboideonavicular, and talocalcaneonavicular. 2. Pathology, Pathomechanics, and Imaging Characteristics. A. Accessory ossicles - os navicularis, os supranaviculare. B. Tarsal coalitions -calcaneonavicular, talonavicular. C. Acute fractures - avulsion, body, and tuberosity. D. Stress fractures and osteochondral lesions. D. Kohler's disease. E. Osteonecrosis - Mueller-Weiss, secondary osteonecrosis. F. Arthropathies - osteoarthritis, rheumatoid arthritis, and neuropathic arthropathy. G. Adult acquired flatfoot deformity.

A Stepwise Approach to Finally Understanding Arthritis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Bryan Wessel, BS, MD, Cincinnati, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the differences between inflammatory and degenerative arthritis. 2. Understand the progression of various forms of arthritis. 3. Identify the different radiographic findings that help distinguish between the different causes of arthritis.

TABLE OF CONTENTS/OUTLINE

• Characteristics of inflammatory and degenerative arthritis. o Symmetric vs Asymmetric joint space narrowing o Erosions vs subchondral cysto What are osteophytes?• Stepwise algorithm for determining the specific type of arthritis.• Explanation of subtypes of inflammatory arthritis with examples. o Septic Arthritis o Rheumatoid Arthritis o Seronegative Arthropathies• Explanation of subtypes of degenerative arthritis with examples. o Typical Osteoarthritis o Atypical Osteoarthritis• Application of knowledge to unknown cases.

Not All Erosions are Created Equal - Approach to Hand and Wrist Arthropathy: What a Radiologist Needs to Know?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Neha Antil, MD, Mountain View, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Outline the various arthritides that have a predilection for the hand and wrist.2. Classify arthritides based on the clinical presentation, site of involvement in the hand and wrist and further differentiate them based on characteristic imaging appearances.3. Discuss advanced imaging techniques that can be used as a problem-solving tool in rheumatology.4. Summarize and develop a practical imaging approach to making an accurate diagnosis.

TABLE OF CONTENTS/OUTLINE

• Review the causes of arthritis in hand and wrist joints.o Classify arthritides based on clinical presentation and site of involvement in the hand and wrist.o Describe imaging appearances for each arthropathy.o Differentiate the arthritides based on characteristic imaging findings.• Illustrate advanced imaging techniques that can help differentiate arthropathies affecting the wrist and hand.

Ultrasound for Ultra-Insight into Diagnosing and Treating the Painful Joint Arthroplasty

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Brendan Franz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Overview of utilizing ultrasound for the evaluation of periprosthetic joint infections, as well as for US-guided aspiration of infectious material in a periprosthetic joint infection. Review of the expected sonographic appearance of reactions to metallic debris at the joint arthroplasty site, including conditions such as metallosis, trunnionosis, and metal-on-metal pseudotumors. Using ultrasound for the evaluation of tendon pathology with arthroplasties, including dynamic maneuvers to evaluate for tendon impingement or snapping. Indications for joint arthroplasty injections and precautions to be taken.

TABLE OF CONTENTS/OUTLINE

Introduction Brief review of current trends in arthroplasty placement Ultrasound evaluation in periprosthetic joint infections Expected appearance of a periprosthetic joint infection on ultrasound imaging. US-guided aspiration and important biomarkers. Saline Lavage. Major pathogen causing periprosthetic joint infections at the shoulder; Cutibacterium acnes. Adverse Reactions to Metallic Debris Metallosis Trunnionosis Metal-on-metal pseudotumors Tendon pathology in joint arthroplasty Subscapularis tendon tears Gluteal tendon tears Quadriceps and patellar tendon tears Iliopsoas tendinopathy, bursitis, and impingement/snapping Joint arthroplasty injections Indications Risks Precautions Summary

3D Printed Kyphoplasty Simulator Build Guide

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Caleb Heiberger, MD, Sioux Falls, SD (*Presenter*) Nothing to Disclose

TEACHING POINTS

We demonstrate the creation of a functional kyphoplasty simulator using computed tomography (CT) images, a "desktop grade printer" and open-source software. To do so, we obtained three CT Digital Imaging and Communications in Medicine (DICOM) files including spinal compression fractures with 1) Standard Anatomy, 2) Scoliosis and 3) Severe Arthrosis. Segmentation was performed using 3D Slicer with post-processing in Mesh-Mixer and Fusion 360 to repair segmentation defects. Printing was performed on a Prussa i3 MK3S fused deposition modeling printer using Polylactic acid (PLA) for the vertebrae and Thermoplastic Polyurethane (TPU) for the intervertebral disks. Soft tissue was simulated using a 1:1 mixture of Knox Gelatin and water, activated by a freeze/boil cycle. The mixture was poured into a custom printed container with the printed spine and allowed to solidify. Simulations were performed under fluoroscopic guidance. Early usage reviews indicated high satisfaction with device fidelity compared to other models, including cadavers. The production of this kyphoplasty model demonstrates the effective use of 3D printing in image guided interventional training.

TABLE OF CONTENTS/OUTLINE

Segmenting a DICOM in 3D SlicerEditing segmented DICOM in Mesh Mixer and Fusion 360Preparing a print in 3D CAD SoftwareSelecting filaments for specific anatomyPrinting the modelCreating soft-tissue mold and embedding spineDemonstration fluoroscopic fidelity of the modelUsage reviews and future directionsPlease visit the Learning Center to also view this presentation in hardcopy format.

A Pictorial Review of the Different Radiological Presentations and Differential Diagnosis of Gout in Atypical Sites

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Lin Liu, MD, Guangzhou, China (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Monosodium urate crystals commonly deposit at the joints or tendons of the foot or ankle, especially at the first metatarsophalangeal joint, but rarely deposit at the joints of upper limbs and other extra-articular sites.2. Intraspinal gout is difficult to diagnose before surgery and its clinical presentations and imaging findings mimic tumors and degenerative spinal diseases. Early diagnosis of intraspinal gout is extremely significant because timely urate-lowing therapy may avoid surgical intervention.3. The confirmation of MSU crystals in synovial fluid or tophaceous material is considered the gold standard for gout diagnosis. Gout in the atypical sites may misdiagnose because of the nonspecific clinical and imaging findings. Therefore, DECT as an auxiliary tool should be performed as soon as possible for suspected gout lesions, which may avoid unnecessary invasive operations.

TABLE OF CONTENTS/OUTLINE

1. A case-based review of sixteen different radiological presentations of gout in the atypical sites including upper limbs, spine, ligaments, and other rare joints.2. Recognize different findings of gout in atypical sites in radiography, CT, MRI, and dual-energy CT.3. Identify the differential diagnosis of gout in atypical sites.

Tips and Tricks for Ablating an Osteoid osteoma: Plan It Right!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Roshni Anand, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Approach the lesion perpendicular to the cortical surface and avoid the sclerotic part of bone. This may require a prone, oblique, or lateral decubitus position.The shortest path to the lesion enables minimum injury to surrounding tissues Avoiding neurovascular bundle (NVB): Lesions may be targeted through the longer route and farther cortex to avoid injury to the NVB. Dextrose may be injected to keep at least 1 cm distance.Tandem needle technique or use of protractor in case of the angulated route.Drill bid is a superior option compared to hammering, especially in the case of a longer osseous path and sclerosis.Two or more electrodes may be required for lesions measuring >1.5cm. A single electrode is sufficient for smaller lesions.Dextrose may be injected to prevent soft tissue injury in superficial bones like in digitsIntra-articular lesions: Trans-articular approach is avoided. Iatrogenic joint effusion by instilling dextrose may protect from artciular cartilage injury.Spinal lesions: Entering the facet joint or neural foramen should be strictly avoided. A bipolar RF probe can avoid damage to the surrounding structures.Reducing Post-procedure pain and swelling: Injecting lignocaine-bupivacaine mixture along the tract up to the periosteum and local site compression for 5 minutes after ablation

TABLE OF CONTENTS/OUTLINE

Learning objectives: To demonstrate the practical tips and tricks for ablating an osteoid osteoma by correct planningCases demonstrating the teaching pointsConclusion

Quantitative Analysis of Water Material Density Values by Dual Energy CT for Osteoblastic Vertebral Metastases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Hirotaka Nakashima, MSc, RT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Virtual non-calcium (VNCa) images were created by two-material decomposition processing.2. Clinically diagnosed 81 osteoblastic metastatic vertebrae and 301 normal vertebrae were compared by water material density values quantitatively.3. The area under the curve value obtained from receiver operating characteristic (ROC) analysis was 0.93, and the water material density value was a highly discriminative index for osteoblastic metastases.4. The cutoff value between lesion and normal was 1047.8 mg/cm3 based on ROC analysis with a sensitivity of 85.7% and a specificity of 98.1%.5. New image display method was developed that reflects the cut-off value calculated from water material density values.

TABLE OF CONTENTS/OUTLINE

Vertebral metastases are the most common bone metastases. CT can detect bone calcification with high sensitivity and is therefore excellent for the diagnosis of osteolytic bone metastases with bone cortex destruction. However, osteoblastic bone metastases without destruction are difficult to diagnose and are easily overlooked. VNCa image is one of the material discrimination images produced by dual-energy CT and is a material density image obtained by highlighting the water component and removing the calcium component. By measuring the VNCa image, water material density values can be obtained. Quantitative evaluation using water material density values was a gap of knowledge. In this exhibition, water material density values of osteoblastic vertebral metastases and normal vertebrae were compared. And cutoff values were calculated by ROC analysis. The results showed that water material density values have a high discriminatory ability against osteoblastic metastases.Please visit the Learning Center to also view this presentation in hardcopy format.

Imaging Findings That Should Never Be Forgotten In Non-accidental Trauma in Children

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Giovana Mesquita, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Revise the most important muscle-skeletal image findings related to non-accidental trauma in children, by using original schematic drawings and images from suspect cases of child physical abuse. Most of the cases presented were confirmed by assistant physicians. Therefore, this paper has also the aim of highlighting the fundamental role of the muscle-skeletal radiologist in identifying and documenting the skeletal injuries so as to protect the children involved and help bring victims away from their offenders as fast as possible, to stop further abuse.

TABLE OF CONTENTS/OUTLINE

1. Classical metaphyseal fracture 1.1 Traumatic mechanism 1.2 Image findings 2. Non-accidental trauma in long bones 2.1 Traumatic mechanism 2.2 Image findings 3.Non-accidental trauma in ribs 3.1 Traumatic mechanism 3.2 Image findings 4.Non-accidental trauma in pelvis 4.1 Traumatic mechanism 4.2 Image findings

Whole-Body Diffusion-Weighted Magnetic ResonanceImaging in Non-tumoral Bone Marrow Diseasesand Their Mimics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS1) Identify correct MR protocol that should be used to analyses bone marrow in whole-body MR imaging(WBMRI) owing to detect tumoral involvement and their differential diagnosis.2) Know basic principals of DWI WBMRI and typical lesion appearances and awareness of potential pitfalls.3) Make a pictorial essay of lesions that mimick bone marrow tumoral lesions including conventional MRI sequences , DIXON and DWI and understand the characteristic features which allow discrimination between them and true neoplasms in order to avoid unnecessary additional workup.4) The usefullness of DWI whole-body MR in diagnostic algorithms of non oncological disorders including differentiate diagnosis as inflammatory, infectious and pseudotumoral conditions.

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS AND OUTLINE1) Case discussion regarding imaging that mimick bone marrow tumoral lesions as: 2) SAPHO syndrome 3) CRMO 4) Tuberculosis 5) Syphilis 6) Sarcoidosis 7) Bone Marrow hiperplasia 8) Differential diagnosis 9) Report structuring step by step

Congenital Talipes Equinovarus Made Easy: What Radiologists Need to Know and How to Evaluate the Idiopathic Congenital Clubfoot

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Identified for RadioGraphics

Participants
Julia Peixoto, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points: Emphasize a minimum of two major teaching points of this exhibit. What should the viewer accomplish by viewing this exhibit? The purpose of this exhibit is:1. Review the main aspects related to idiopathic congenital clubfoot (congenital talipes equinovarus), including anatomy, etiology, pathophysiology, epidemiology, clinical classification and treatment.2. To illustrate the main imaging findings and how to assess this condition in a multimodality approach, focusing on US and MRI studies.

TABLE OF CONTENTS/OUTLINE

Describe major headings (e.g., anatomy, physiology, imaging techniques, tumor disease states, etc.) 1. Review the main aspects related to idiopathic congenital clubfoot (congenital talipes equinovarus), including anatomy, etiology, pathophysiology, epidemiology, clinical classification and treatment.2. Clinical and imaging findings in a multimodality approach.3. US assessment protocol.4. MRI assessment protocol.5. Clubfoot major differential diagnoses, including: (simple metatarsus adductus, skewfoot, and oblique and vertical talus).

Ultrasonography of Thumb Metacarpophalangeal Joint: Normal Anatomy and Mechanism-based Injury Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Kyu-Chong Lee, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The difference between metacarpal joint of thumb and other fingers 2. Anatomy and ultrasonographic normal images of thumb MCP joint 3. Mechanism based thumb MCP injury

TABLE OF CONTENTS/OUTLINE

1. Introduction 1) What is the difference between MCP joint of thumb and other fingers? 2) Biomechanism: Condyloid joint: freedom of flexion/extension, valgus/varus + opposition 3) Imaging technique for MCP joint evaluation2. Normal anatomy (1) Osseous anatomy: 1st proximal phalanx metacarpal bone + two sesamoid bones (2) Soft tissue 1) Palmar side: a. Muscle tendon: Adductor pollicis (ADP), Abductor pollicis brevis (APB), Flexor pollicis brevis (FPB), Flexor pollicis longus (FPL) b. Volar plate c. Pulley system (A1, Av, Ao + A2) 2) Dorsal side: a. Tendon: Extensor pollicis brevis (EPB) + Extensor pollicis longus (EPL) b. Dorsal plate c. Extensor hood or apparatus (sagittal band + triangular extension) 3) Collateral system (capsule-ligamentous system) a. Ulnar collateral ligament (UCL = proper/principle + accessory) + adductor aponeurosis b. Radial collateral ligament (RCL = proper/principle + accessory) + APB, FPB aponeurosis3. Mechanism based injury approach 1) Valgus or abduction injury (most common) a. Skier thumb (UCL injury) b. Stener lesion 2) Varus or adduction injury a. RCL injury b. Stener like lesion c. Varus deformity 3) Hyperextension injury a. Volar plate injury b. Tendon pulley injury c. Muscle injury 4) Hyperflexion injury a. Dorsal plate injury b. Extensor tendon tear 5) Combination damage4. Ultrasound-guided Injection of Botulinum Toxin in Neurogenic Thoracic Outlet Syndrome: Technical Aspects and Experience Over 15 Years

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Ronald Mercer, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Thoracic outlet syndrome (TOS) includes a group of upper extremity disorders believed to occur due to isolated or combined neurovascular compression. -Neurogenic TOS (NTOS) constitutes 95% of all TOS patients, but presents diagnostic difficulty due to nonspecific findings during electro-diagnostic and imaging evaluation. -Botulinum toxin A (BTX) injections are useful to evaluate the diagnosis of NTOS, with symptom relief correlating with good response to subsequent treatments. -Our group pioneered ultrasound guided BTX injections since 2007, having performed over 5,000 procedures in patients being investigated for NTOS. -Injection of BTX into the anterior (ASM) and middle (MSM) scalene muscles as well as the pectoralis minor muscle (PMM) has been effective in reducing the symptoms of NTOS and may contribute to patient selection criteria for surgical management. -Ultrasound guided injection has been demonstrated to be safe and well tolerated.

TABLE OF CONTENTS/OUTLINE

-Discuss NTOS and the use of imaging-guided BTX injection in diagnosis and management. -Present relevant anatomy and safe approach to ultrasound-guided BTX injection into the ASM, MSM, and PMM. -Described complications and documented rate of symptom relief of these injections.

Use of Soft Modeling Compound to Teach Musculoskeletal Anatomy and Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Osvaldo Velez-Martinez, MMedSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Medical imaging is a 2D representation of 3D structures. It can be challenging for trainees to conceptualize 3D structures from 2D slices.2. Soft modeling compound is an interactive and cost effective medium to teach musculoskeletal pathology.3. 3D models allow trainees to view anatomical structures in space and therefore conceptualize normal anatomy and pathology.4. Soft modeling can be integrated into any teaching program and is impact can be quantified.

TABLE OF CONTENTS/OUTLINE

Low-dose CT Approach to Tendon Delineation Using Deep Learning Technology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Takato Yanagisawa, Ueda, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The three-dimensional tendons image has a highly usefulness as surgical support. However, the difference in CT values between tendons and muscles is small. Therefore, it is necessary to reduce image noise in order to distinguish them. As a result, increased patient dose becomes a problem. We have tried to use Deep Learning Reconstruction (DLR) to solve this problem. This report introduces scanning techniques and patient dose reduction for creating 3D images of tendons. The 3D tendons imaging requires increased contrast and reduced patient dose reconstruction. The DLR for the brain LCD met this goal. This is because the diagnosis of the brain and the diagnosis of tendons are performed with the same low contrast. Compared to the conventional reconstruction method, DLR produced low-noise images at 75% lower dose and improved contrast, significantly enhancing the ability to visualize the finger flexor tendons.

TABLE OF CONTENTS/OUTLINE

1. Problems with imaging techniques in tendon morphology diagnosis 2. Improvement of image contrast using DLR 3. Reducing patient dose using DLR 4. Ingenuity when scanning tendons 5. Ingenuity for creating 3D tendons images 6. Verification of Clinical Effectiveness

Brachial Plexus: Don't Be Afraid Anymore - A Guide for Brachial Plexus Anatomy and Injuries

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
LEON PERIN, Araras, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is to:1. Review with didactic illustrations the brachial plex anatomy, including how to recognize it on MRI.2. Demonstrate how several brachial plex injuries manifest clinically and on imaging exams.3. Present didactic cases of brachial plex injuries highlighting the main findings the radiologist should expect, untangling brachial plexus exams.

TABLE OF CONTENTS/OUTLINE

Introduction and review of the brachial plexus anatomy, with didactic illustration.Review the normal anatomy no MRI, highlighting the anatomic landmarks on coronal and sagittal exams.Overview the main injuries of the brachial plexus, including pre and post-ganglionar injuries, their clinical manifestations and epidemiology, and their imaging findings.Demonstrate with challenging clinical cases non-traumatic pathologies involving inflammatory and compressive causes, including Parsonage-Turner, thoracic outlet syndrome, post-Covid plexopathy.Present a serie of cases of brachial plex injuries, and what you should actively look for depending on clinical history.Propose a diagnostic checklist when evaluating brachial plexus injuries, simplifying the reading of these challenging exams.Summary.

Taiki Nozaki, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are 1) To demonstrate the classification of spondyloarthritis and anatomy of sacroiliac joint. 2) To know basic imaging findings of axial spondyloarthritis. 3) To review the imaging findings of mimickers of axial spondyloarthritis that radiologists should be familiar with.

TABLE OF CONTENTS/OUTLINE

1) Introduction 2) Classification of spondyloarthritis 3) Anatomy of sacroiliac joint for the proper evaluation on MRI 4) MR findings of axial spondyloarthritis i) Signs of activity -bone marrow edema, capsulitis, joint space fluid- ii) Signs of structural change -erosion, fat metaplasia, backfill, sclerosis, ankylosis- 5) Mimickers of axial spondyloarthritis -early post-partum, osteitis condensans ilii, pyogenic sacroiliitis, Paget disease, fibrous dysplasia, tuberculosis, spondyloepiphyseal dysplasia, bone metastases, SAPHO syndrome, DISH-

The Sword in the Bone: A Review of the Sternum and Parasternal Region

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Sean Rodich, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review anatomy of sternal bone landmarks, sternal and parasternal joints, and surrounding muscle attachments for a comprehensive understanding of the anterior chest wall.2. Identify developmental variants and anomalies of the sternum to avoid confusion with other sternal pathologies.3. Illustrate various pathologies of the sternum and parasternal region, which are often overlooked in the broad differential diagnosis for chest pain.

TABLE OF CONTENTS/OUTLINE

1. Anatomy of the sternum- Bone landmarks- Sternal and parasternal joints (manubriosternal, xiphisternal, sternoclavicular, sternocostal, costochondral, and interchondral joints)- Muscle attachments2. Developmental variants and anomalies of the sternum- Sclerotic bars and clefts- Sternal foramen- Episternal ossicles- Xiphoid process variants- Pectus excavatum/carinatum- Ectopia cordis- Miscellaneous syndromes (PHACES, Pentalogy of Cantrell)3. Pathology of the sternum and parasternal region- Trauma (sternal and costal cartilage fractures, sternoclavicular joint dislocation)- Arthropathy (osteoarthritis, calcium pyrophosphate deposition disease, rheumatoid arthritis, seronegative spondyloarthropathy)- SAPHO (Synovitis, Acne, Palmoplantar pustulosis, Hyperostosis, Osteitis)- Condensing osteitis of the clavicle- Costochondritis versus Tietze syndrome- Sternotomy complications (sternal dehiscence, infection)- Neoplasm

Calcaneal Fracture Guide: Don't Miss a Thing - Beware of the Ugly Stuff

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review calcaneal anatomy, fracture classifications, possible complications and the management for each kind of fracture.2. Highlight the main information that radiologists should include in the report when analyzing a calcaneal fracture and their post-operatorive imaging, including normal and abnormal findings.3. Illustrate several cases of calcaneal fractures, including postoperative evaluation with normal findings and complications, as well as differential diagnosis cases.

TABLE OF CONTENTS/OUTLINE

Introduction: general review of calcaneal fractures, including classifications and what the report should include.Provide didactic and challenging cases of calcaneal fractures, including several complications, highlighting what is important for the report and for the orthopedic surgeon.Overview operative indications and modalities of surgical treatment.Present didactic cases of the different surgical modalities, discussing the normal and abnormal postoperative findings.Bibliographical references.

Stain the Eyes-Utility of high Resolution CT Dacryocystography in Imaging Lacrimal Duct Pathology Following Facial Trauma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Sudha Pyla, MBBS, Vijayawada, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate the common complications encountered in lacrimal drainage as a complication of facial injuries.

TABLE OF CONTENTS/OUTLINE

Nasolacrimal duct injury may be due to blunt or penetrating trauma involving naso orbitoethmoidal complex, maxillofacial fractures especially Le fort type-II, Le fort type-III, also secondary to postoperative cases due to inadequate surgical repair.In early post injury period ,nasolacrimal duct obstruction can occur as a result of post traumatic compression by bone fragments or due to soft tissue edema. Inflammatory reaction followed by cicatrization resulting in delayed lacrimal duct blockade can present as late complication. Patients usually present with epiphora with or without purulent discharge. Long term complication include dacryocystocele formation.CT dacryocystography gives detailed information about the cause of obstruction, level of blockade, associated fractures and bony displacements. 1.5ml of diluted nonionic contrast (Ultravist 300mg iodine/ml) is administered into the inferior canaliculi and high resolution CT is performed. Depending on the level of blockage dacryocystorhinostomy is performed. In complete cut off of duct or chronic dacryocystitis dacryocystectomy is done.This exhibit will demonstrate various spectrum of post traumatic nasolacrimal drainage abnormality on CT dacryocystography.

Lumpy-Bumpy Ride Made Easy ! - A Sonographic Guide Through Soft Tissue Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Saakshi Aggarwal, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review imaging features of various soft tissue lesions to be able to differentiate pseudo masses and pseudo tumors like dermoid, sebaceous cyst, abscess, hematoma from true tumors 2. To make a schematic approach towards suspected soft tissue lesions in order to assess nature of them based on internal characteristics of the lesion 3. To prime young budding radiologists towards diagnosis of benign "leave alone" lesions such as lipomas so as to reduce patient anxiety and limit further investigations unless indicated 4.To pick up suspicious morphology on ultrasonography and suggest the next appropriate step for further assessment

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Importance of ultrasonography in assessing soft tissue lesions 3. Ultrasonographic Technique to assess soft tissue lesions 4. Imaging features to differentiate pseudo masses and pseudo tumors from true tumors 5. Simplified schematic approach towards suspected true tumors 6. Review of imaging features of various soft tissue tumors with histopathological diagnosis 7. Practical pearls for successful and complete diagnosis

Baseline, Posttreatment and Surveillance Advanced Magnetic Resonance Imaging of Soft-Tissue Sarcomas

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Mathew Canjirathinkal, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Soft-Tissue Sarcoma is a rare malignant tumor of mesenchymal and primitive neuroectodermal origin, more common than primary malignant bone tumors. 2.Traditional response criteria such as RECIST inadequate rely on physical measurements, as tumor diameter does not reflect all response types.3.Diffusion-weighted imaging analysis could rely upon Whole tumor ADC histograms, focusing on mean ADC, Kurtosis, and Skewness.4.Whole tumor Perfusion Weighted Imaging (PWI) with Dynamic Contrast-enhanced imaging (DCE) could rely on morphologic patterns (nodular vs. linear) and time-intensity curves (TIC) analysis, where the presence of early arterial enhancement (TIC III, IV, and V) correlates with untreated or unsuccessfully treated sarcomas, while TIC II with successfully treated sarcomas.5.DCE MR imaging reliably distinguishes recurrent sarcoma from postsurgical scarring. TICs III, IV, and V highly raise suspicion of local tumor recurrence, while TIC type II usually represents granulation.

TABLE OF CONTENTS/OUTLINE

1.Introduction2.Learning objectives3.Soft tissue sarcoma4.The Armementarium: MR sequences: DWI/ADC, PWI/DCE and SWI5.ABASTI (Advanced bone and soft tissue tumor imaging)6.Worth knowing:Hemorrhage and ADC, Fat and ADC.7.Responding tumor ABASTI patterns8.Non-responding tumor ABASTI patterns9.Tumor recurrence and DCE10.ReferencesPlease visit the Learning Center to also view this presentation in hardcopy format.

Radial Tunnel Anatomy in Supination and Pronation: Guidance for Imaging Interpretation and Interventional Procedures

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Magna Cum Laude

Participants
Aurea Mohana-Borges, MD, MSc, San Diego, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

To provide a guide for radial tunnel anatomy that emphasizes the relationship of soft tissue (nerve, vessel, muscle) and osseous structures in supination and pronation with High Resolution Ultrasound (HRUS) and magnetic resonance imaging (MRI). This guide will highlight anatomic landmarks implicated in entrapment syndromes of the radial nerve. It will emphasize the dynamic nature of radial tunnel and its spatial relationships through range of motion. It will compare and contrast normal anatomy with examples of commonly encountered pathology about the radial tunnel.

TABLE OF CONTENTS/OUTLINE

Explanation of the concept, constituents, and anatomic boundaries of the radial tunnel. Demonstration of normal anatomy of the radial tunnel with HRUS and MRI with emphasis on the relationship of deep branch of radial nerve (DBRN), leash of Henry, and superior arcade of supinator muscle (arcade of Frohse). Examples of dynamic ultrasound of the DBRN, DBRN hydrodissection, and commonly encountered pathology about the radial tunnel.

Susceptibility-Weighted Imaging (SWI) Emerging Role in Musculoskeletal (MSK) Oncology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Mathew Canjirathinkal, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Susceptibility-weighted imaging (SWI) is a 3D high-spatial-resolution, velocity-corrected gradient-echo MRI sequence that uses magnitude and filtered-phase information to create images.2. Distinguishing between calcification and blood products is possible through the filtered phase images, helping to recognize osteoblastic and osteolytic bone metastases or demonstrating calcifications and osteoid production in liposarcoma and osteosarcoma.3. Contrast-enhanced SWI (CE-SWI) can simultaneously detect the T2* susceptibility effect and spontaneous t1 shortening.4. Various Bone and soft tissue masses SWI features are described.5. CE SWI demonstrates the viable, enhancing portions of a soft tissue sarcoma separately from hemorrhagic/necrotic components, suggesting its utility as a biomarker of tumor grade and treatment response. CE-SWI shows superior differentiation between mature fibrotic T2* dark components and active enhancing T1 shortening components in Desmoid Fibromatosis6. Ring-like hemosiderin SWI pattern is observed in successfully treated sarcomas.7. CE-SWI also separates healthy T2* blooming iron-loaded bone marrow from T1-shortening enhancing bone marrow replacing tumor.

TABLE OF CONTENTS/OUTLINE

1. Introduction to SWI and SWI with contrast CE-SWI2. CE-SWI in Benign and malignant soft tissue masses3. CE-SWI of primary bone tumors and metastasis4. CE-SWI features of soft tissue sarcoma tumor response5. ReferencesPlease visit the Learning Center to also view this presentation in hardcopy format.

Stand and Deliver: Weight-Bearing Extremity CT in Clinical Practice

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Identified for RadioGraphics

Participants
Matthew Doan, BS, Phoenix, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

The structures of the foot and ankle are ideally assessed during weight-bearing.Cross-sectional imaging of the foot and ankle using CT and MRI can overcome the limitations of radiographs but is typically performed with patients in the supine position.Recently standing cone-beam CT (CBCT) scanners have been introduced to combine the value of cross-sectional CT imaging with the anatomic assessment of structures during weight-bearing.

TABLE OF CONTENTS/OUTLINE

Purpose/Aim: This educational exhibit will spotlight the implementation and utilization of a standing CBCT scanner in a tertiary care medical center. The exhibit will cover the scanner and room setup, basic scanner physics, patient preparation and positioning, and image acquisition. Illustrative example cases will be included. Content Organization: Describe the room requirements for installing a standing CBCT scanner. Review the CT physics involved in obtaining a standing CBCT image. Provide a workflow model for standing CBCT scanner use in musculoskeletal radiology practice. Showcase patient positioning during standing CBCT acquisition. Highlight additional uses of a standing CBCT scanner for hand and wrist imaging. Provide illustrative clinical cases spotlighting the value of standing CBCT imaging. Summary: Radiographs of the foot and ankle obtained with weight-bearing are fundamental in initial imaging assessment. In cases requiring cross-sectional imaging, standing CBCT provides weight-bearing advanced imaging at lower dosing than traditional CT. This educational exhibit highlights the role a standing CBCT scanner can play in clinical practice.

Sonography of the Wrist and Hand in Clinical Practice: Diagnosis and Intervention

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnostic and interventional sonography of the wrist and hand may be daunting in clinical practice due to the plethora of structures and abnormalities that need to be evaluated. In this education exhibit, we describe a compartment approach in detecting common wrist and hand disorders and performing the corresponding interventional procedures. The objectives of this educational exhibit are: • To review normal sonographic anatomy of the wrist and hand • To illustrate and highlight a compartment approach in diagnostic and interventional sonography of the hand and wrist • To discuss common abnormalities encountered in clinical practice and the corresponding interventions in each compartment

TABLE OF CONTENTS/OUTLINE

Extensor compartment• Extensor compartments 2 and 3 (EPL rupture, distal intersection syndrome)• Intrinsic ligaments of the wrist• Extensor hoodUlnar compartment• DRUJ• TFCC• Extensor compartment 6Volar compartment• Median nerve at carpal tunnel• Ulnar nerve in Guyon's canal• Flexor tendons and retinaculum• Finger pulleysRadial compartment• 1st CMC and STT• Extensor compartment 1 (De Quervain's tenosynovitis, proximal intersection syndrome) • UCL of thumb

MRI of the Metabolic Knee

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Bruno C. Vande Berg, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

* Metabolic disorders of the MSK system are frequent disorders that are usually clinically silent for a long period of time. All components of the musculo-skeletal system can be involved including bones, marrow, cartilage, tendons, ligaments, capsule, synovium and muscles. * Despite the fact that knee MRI is one of the most frequently performed examination, radiologists rarely suggest the presence of an underlying metabolic disorder at knee MRI. The vast majority of the metabolic disorders of the MSK system remains occult at knee MRI until complications occur. * Knee MRI can depict a spectrum of complications associated with metabolic disorders including typical and atypical fractures, bone necrosis, acute and chronic arthritis, periarthritis, tendinopathies and tendon rupture, synovial and capsule deposits, red marrow reconversion and serous transformation. * The radiologists should recognize these complications at knee MRI and suggest a possible link with an underlying metabolic disorder. * The current exhibit aims at presenting a series of clinical cases in which knee MRI was performed and led to the diagnosis of a systemic metabolic disorder.

TABLE OF CONTENTS/OUTLINE

* Insufficiency and avulsion fractures in osteoporosis/osteomalacia/renal osteodystrophy.* Crystal-associated acute arthritis and periarthritis. * Chronic tophaceous arthritis. * Drug-associated tendinopathies and tendon rupture. * Unusual osteoarthritis associated with calcium pyrophosphate crystals.* Marrow reconversion and marrow necrosis associated with anemias.* fat and serous atrophy of the bone marrow associated with cachexia.* Synovial and cartilage deposits of iron and copper. * Synovial and capsule amyloidosis.

The Many Faces of Ramp Lesions of the Medial Meniscus

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Alfonso Iglesias, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Meniscal ramp injury is a meniscus-capsular vertical longitudinal tear of the posterior horn of the internal meniscus, often associated, with an anterior cruciate ligament injury. In MRI, an injury of the internal meniscal ramp must be suspected when a rupture of the ACL and/or bone edema in the posteromedial slope of the tibial plateau is observed. It is important to detect meniscal ramp injuries in MRI and alert the traumatologist, since they are hidden meniscal lesions with the usual arthroscopic portals, and require accessory portals for a diagnostic confirmation. The decision of either a conservative or a surgical treatment will depend primary on the stability and the extent of the injury.

TABLE OF CONTENTS/OUTLINE

Recognize and identify a ramp lesion of the medial meniscus on MR images Describe and classify ramp lesion of the medial meniscus on MR images with arthroscopic correlation Review of surgical technique for the detection and repair of these types of lesions

Shoulder Microinstability:Demystifying the Interplay of Static and Dynamic Stabilizers of the Glenohumeral Joint

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Juliana Sitta, MD, Jackson, MS (*Presenter*) Nothing to Disclose

TEACHING POINTS

Microinstability is a relatively new concept defined by rotational or directional pathologic movement of the glenohumeral joint without true (macro) instability on physical examination.The pathophysiology may include abnormalities involving static and dynamic stabilizers of the glenohumeral joint, the anterosuperior labrum, rotator interval, or middle glenohumeral ligament.Causes of microinstability may include acute or chronic recurrent traumatic etiology (including overuse), iatrogenic, and congenital osseous and soft tissue abnormalities.Clinical and imaging findings including those of internal impingement syndromes are often subtle and radiologists play an important role in identifying these patients to guide appropriate treatment and avoid delay in diagnosis which can lead to osteoarthritis.

TABLE OF CONTENTS/OUTLINE

Glenohumeral anatomy and congenital variants. Pathophysiology of shoulder microinstability, glenoid dysplasia, anterior and posterior internal impingement syndromes. Multimodality imaging findings and differential diagnosis. Clinical and surgical management. Complications and post treatment imaging findings.

Imaging Features of Glenohumeral Osteoarthritis: The Power of Simplicity

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Paulo de Tarso Perez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:To briefly review the concepts of glenohumeral osteoarthritis.To review the most used classifications, image findings and measures of glenoid. Highlight the Walch classification, glenoid morphology changes and what we should report that can change the management and treatment. To make the differential diagnosis with entities that may cause osteoarthritis.

TABLE OF CONTENTS/OUTLINE

Introduction: to review the concepts of glenohumeral osteoarthritis.Show didactic and illustrative cases reviewing the classifications and the main imaging findings according to the different etiologies, highlighting what we should report in order to assist in the correct and early diagnosis and treatment.Present a schematic table and imaging of the most used classifications and showing measures of glenoid and its morphology changes.Conclusions.Bibliographical references.

Is This DISH?": Radiological Findings with Special Attention to Extraspinal Involvement

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Dario Herran de la Gala, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will: 1) Describe the most frequent radiological findings of DISH in the spine. 2) Establish the diagnostic criteria and their usefulness in DISH differential diagnosis. 3) Show the most frequent extraspinal findings. 4) Illustrate the most frequent DISH complications.

TABLE OF CONTENTS/OUTLINE

Diffuse idiopathic skeletal hyperostosis (DISH) is an underdiagnosed disease whose prevalence increases with age. This disease consist in an ossification of both spinal and extraspinal tendons, ligaments, periosteum and joint capsules. It can cause pain, stiffness, compressive syndromes or spinal fractures after minor traumas. Radiological findings in the spine and DISH diagnostic criteria are widely known. On the other hand, extraspinal involvement, especially in isolation, may go unnoticed. Moreover, extraspinal involvement precedes spinal radiological findings and can be found in younger patients.

Haemophilic Artropathy: An Imaging Overview

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review and illustrate classifications and spectrum of imaging findings of haemophilic arthropathies in a multimodality approach including radiographs, ultrasound, computed tomography and magnetic resonance in different joints.2. Highlight and discuss other musculoskeletal complications of haemophilia that the radiologist must be aware in these patients, such as hematomas, pseudotumors, heterotopic calcification, and others. 3. Provide a guidebook for all the typical and atypical musculoskeletal findings in hemophilic arthropathy.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation, epidemiology, pathology and clinical manifestation of haemophilic arthropathies.Present a schematic illustration with the distribution of the most common joints affected by haemophilic arthropathy while discussing the main findings on didactic cases.Overview some of main haemophilic arthropathy classification including a schematic illustration of Arnold-Hilgartner classification. Provide didactic cases of the all image modality of different joints with typical and atypical findings. Provide other musculoskeletal manifestations and complication with challenging cases of hematomas, pseudotumors and heterotopic calcification. Present differential diagnosis cases with some similar intra-articular findings that should not be mistaken with hemophilic disease, including inflammatory arthropathies, amyloidosis, gout, among others. Bibliographical references.

A Radiological Overview of Ankle Arthroplasty - Practical Keys in the Assessment of Ankle Replacement

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Javier Azpeitia Arman, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To know the different types of total ankle replacement. -To review imaging techniques for preoperative imaging and in the evaluation of prostheses (plain radiograph, CT, MR, US, scintigraphy). -To understand the usefulness and limitations of plain radiographs in the evaluation of ankle replacements, emphasizing useful parameters and illustrating image analysis and interpretation. -To become familiar with normal and abnormal postoperative imaging findings and signs of complications.

TABLE OF CONTENTS/OUTLINE

We review imaging of total ankle replacement, highlighting key concepts perceived as important variables by the surgeon and correlating images with clinical considerations and functional outcomes. We present: 1. A review of types of ankle replacement 2. Surgery. Aims. 3. Imaging. Role of CT, MR, US, and scintigraphy. 4. Plain radiographs: -Technique and views. Standard image acquisition: beam and anatomical landmarks -Parameters that should be evaluated: alignment of tibial and talar components, position, rotation, radiolucent lines and subtle abnormalities such as subsidence, early osteolysis, and angular deformities that may indicate aseptic loosening or possible infection -Imaging of complications: aseptic loosening, expansile osteolysis, subsidence and component migration, infection, periprosthetic fracture, heterotopic ossification, and PE spacer displacement or fracture

Apophyseal Athletic Injuries Around the Hip: Why You Shouldn't Be Afraid

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Vitor Sato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: Illustrate and discuss hip anatomy in individuals with immature bone skeleton, focusing on the apophysis; Describe and illustrate the maturation process of apophysis; Discuss and illustrate with classical and challenging cases the imaging findings of different apophysitis and apophyseal lesion around the hip; Show common and uncommon pitfalls that mimic apophyseal lesion in the hip; Show imaging findings of sequelae of apophysitis in the hip.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of anatomy with MRI of hip apophysis in the immature bone skeleton, including the complex anatomy of tendinous and aponeurosis insertion in the pubic apophysis; Present schematic cases and illustration to show maturation process of apophysis, with emphasis in the pubic apophysis; Describe schematically the algorithm and imaging protocol for assessing apophyseal injury in skeletal immature athletes; Show imaging findings of classical and challenging cases of apophyseal injury around the hip in athletes and also pitfalls that could mimic this pathologic condition; Show imaging findings of sequelae of apophysitis in the hip; Bibliographical references with recent articles highlighting what’s new in the topic.

Chip on the Shoulder: Multimodality Review of Reverse Shoulder Arthroplasties

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Akwasi Opoku, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The reverse shoulder arthroplasty (RSA) is a significant advance in shoulder reconstruction, reversing the normal ball and socket anatomy, stabilizing the glenohumeral center of rotation, and allowing the deltoid to function as the main muscular force. RSA has been shown to provide pain relief and functional improvement. Radiologists must be aware of the importance of certain preoperative imaging findings in patients under consideration for RSA, such as deltoid integrity, as well as potential postoperative complications unique to RSA, such as acromial and scapular fractures, and scapular notching.After viewing this exhibit, the learner should understand:1. Shoulder anatomy and biomechanics2. Indications for RSA 3. Role of preoperative imaging and measurements4. Advantages, disadvantages, and specific complications of RSA 5. Normal imaging findings and imaging findings of complications

TABLE OF CONTENTS/OUTLINE

Introduction Shoulder anatomy and biomechanics1. Bones, joints, muscles, other soft tissues (cartilage, labrum, capsule) 2. Unconstrained ball and socket, static and dynamic stabilizers Design, function, and success of RSA Indications 1. Arthropathy, trauma, cuff disease, osteonecrosis, prior infection, failed arthroplasty Role of preoperative imaging (multimodality)1. Evaluation of cuff, bone stock, cartilage 2. Glenoid morphology and version Complications 1.Acromial and scapular fractures 2. Scapular notching 3. Hardware fracture and disengagement 4. Periprosthetic fracture 5. Loosening 6. Infection 7. Instability 8. Nerve injury Imaging appearances 1. Normal and complications

Hip Dysplasia: Evaluation Beyond Diagnosis - What the Radiologist Should Know About Its Management Treatment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Mariana Batista Rosa Pinto, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this study is to:Briefly approach the pathophysiology and epidemiology of hip dysplasia.Discuss the imaging modalities used to evaluate hip dysplasia and list the imaging findings and measurable parameters that most accurately reflect the disorder.Review and didactically illustrate the most frequent treatments, complications and differential diagnoses of the disease. Provide a guide with several examples of post-treatment imaging, highlighting what the radiologist should know about the management of hip dysplasia.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of the epidemiology, pathophysiology and clinical findings of hip dysplasia.Present schematic illustrations of findings and measurable parameters that most accurately help the diagnosis of the disorder. Provide didactic cases of the manifestation related to each type of imaging method.Discuss treatments and what radiologists should know when evaluating the postoperative exams, while providing pre and postoperative imaging examples.Point complications and show differential diagnoses.Provide an imaging guide of the several hip dysplasia treatment options.Conclusions.Bibliographical references with recent articles on what is new in the topic.

Musculoskeletal Complications of Cosmetic Procedures: When Things Get Ugly

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Ligia Couceiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

According to the American Society of Plastic Surgery (ASPS), aesthetic procedures have increased exponentially in recent years. A wide variety of cosmetic techniques are performed in healthy patients to improve body image or for reconstructive reasons. Those procedures can be either incidental findings or the cause of symptoms on imaging exams. It is indispensable for radiologists to learn identification of the common aesthetic procedures on different imaging techniques and be capable of evaluating their normal appearance and complications.The purpose of this study is: • To recognize the most common aesthetic procedures and their normal appearance, focusing on musculoskeletal system imaging.• To discuss the cosmetic procedures complications and their imaging findings.• Illustrate imaging findings through sample cases • Propose a systematic approach to image interpretation.

TABLE OF CONTENTS/OUTLINE

• INTRODUCTION• Review aesthetic procedures and their complications.• COSMETIC PROCEDURES INVOLVING THE MUSCULOSKELETAL SYSTEM AND THEIR COMPLICATIONS:• Gluteal augmentation (gluteal implants, autologous fat grafting, filler injections): implants displacement/ rupture, capsular contraction; infection; compressive syndromes, etc • Abdominoplasty: wound dehiscence, infection, etc• Body countering with silicone implants (arms, legs): infection, implants rupture, etc• Pectoral augmentation (implants, filler injections): infection, implants displacement or rupture, etc• IMAGING INTERPRETATION• Cosmetic procedures normal and pathological findings • Systematic approach to evaluate image exams • INTERACTIVE CASE-BASED DIDACTICS• Sample cases to illustrate and solidify the concepts

Identified for RadioGraphics

Participants
Julia Peixoto, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points:The purpose of this exhibit is to:1. Provide a comprehensive overview, yet a didactic practical guide to assess fungal musculoskeletal infections imaging;2. Integrate imaging, clinical and epidemiological aspects, reviewing and illustrating the most frequent and some rare presentations of fungal musculoskeletal infections;

TABLE OF CONTENTS/OUTLINE

Outlines:Introduction: epidemiology, etiology, pathophysiology and clinical findings.Section-structured overview emphasizing the main imaging findings and relevant clinical and epidemiological features of each group of fungus.Illustrative cases, exemplifying classic imaging signs, and challenging cases addressing differential diagnoses with practical tips.Bibliography: broad-researched references highlighting what’s useful to the radiologist.

A Guide to Tibiofibular Syndesmosis: Anatomy, Imaging and Surgical Techniques

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Cristyano Leite, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Comprehend clinic indications for imaging evaluation.Recognize the most useful image methods.Learn the anatomic features and relationships of the tibiofibular syndesmosis.Understand role and limitations of each method.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION.Epidemiology of the tibiofibular syndesmosis injury.Different Imaging methods to evaluate the syndesmosis.ANATOMICAL CONCEPTS.Anatomic description of the syndesmosis ligaments.Normal syndesmosis in the different methods.CASE-BASED DIDACTICS.Ligaments and syndesmotic injuries in the different methods.SURGICAL TECHNIQUES.Most used surgical techniques: indication and examples.

Ultrasound of Medial Elbow Pain: Beyond the Epicondylitis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jee Won Chai, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although it is less common than lateral elbow pain, medial elbow pain is a musculoskeletal problem more commonly encountered in the population participating repetitive activities. Ultrasonography has advantages in focused and dynamic evaluation of medial elbow structures, and subsequently enables to establish the differential diagnosis. The various anatomic structures more than common flexor tendon, such as ulnar collateral ligament, ulnar nerve, medial antebrachial cutaneous nerve and elbow joint can cause medial elbow pain, and some characteristic clinical features and physical examinations would be helpful for more focused evaluation on the clinically suspicious structures. Even with positive finding on one structure, other structures also should be evaluated for screening of coexisting pathology or other possible diagnosis; for instance, medial epicondylitis can accompany ulnar neuropathy or ulnar collateral ligament injury as well, and proper treatment would be differed in such cases.

TABLE OF CONTENTS/OUTLINE

1. Differential diagnosis of medial elbow pain 2. Scanning technique and normal medial elbow on ultrasonography 3. Medial elbow pathologyA. Medial epicondylitisB. Ulnar collateral ligament injuryC. Ulnar neuropathy i. Cubital tunnel syndrome ii. Ulnar nerve instability D. Snapping triceps syndrome E. Medial antecubital cutaneous neuropathy F. Arthritis i. Ulnohumeral osteoarthritis ii. Gouty arthritis G. Others i. Cervical radiculopathy ii. Basilic vein thrombophlebitis

Comparing US and MRI for Hand and Wrist Diseases: Which Weapon to Choose?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Young Ju Song, MD, Jeonju, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound imaging uses sound waves to produce pictures of muscles, tendons, ligaments, nerves and joints throughout the body. It is used to help diagnose sprains, strains, tears, trapped nerves, arthritis and other conditions. However, there are some diseases that US cannot fully detect, whereas MRI can easily and quickly find.Magnetic resonance imaging (MRI) uses a powerful magnetic field, radio waves and a computer to produce detailed pictures of joints, soft tissues and especially intraosseous lesions. It is usually the best choice for evaluating the body for injuries, tumors, and degenerative disorders. But in some cases, US is superior to MRI for detecting certain pathologies.The ability of a radiologist to understand the fundamental physics of US and MRI, recognize US and MRI competencies, and provide recommendations for using the most suitable imaging modality is essential for proper image interpretation, troubleshooting, and utilization of the full potential of each modality.

TABLE OF CONTENTS/OUTLINE

1. Basic Physics of Ultrasound 2. Basic Physics of MRI 3. Hand and Wrist Lesions : Comparison of Ultrasound vs. MRI1) Cases that show how Ultrasound is superior to MRI: Gout, Calcific Tendinosis, Extensor Carpi Ulnaris Dislocation (in dynamic study), Digital Nerve Adhesion, Pulley Thickening (Trigger finger) 2) Cases that show how MRI is superior to Ultrasound: Triangular Fibrocartilage Complex Tear, Osteomyelitis, Bone Tumor, Complex Regional Pain Syndrome, Infectious Arthritis 3) Cases that show how both Ultrasound and MRI are equally useful: Tenosynovitis, Sagittal Band Rupture, Volar Plate Injury, Collateral Ligament Injury, Rheumatoid Arthritis, Ganglion Cyst, Tenosynovial Giant Cell Tumor

"Go With the Flow" - Vascular Pathology Encountered on Knee MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Kathryn Stevens, MBBS, FRCR, Stanford, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: 1. Review common and uncommon pathology of the popliteal artery and veins that can be encountered on knee MRI 2. Describe the signal characteristics of vascular masses occurring within and around the knee, as well as some of the potential pitfalls The major teaching points of this exhibit are: 1. Vascular pathology can often be seen on knee MRI, and is important to recognize 2. Knowledge of normal variants in vascular and muscle anatomy occurring around the knee has important implications for surgical planning 3. Detecting a DVT on routine MRI may significantly affect subsequent patient management 4. Intra- and extra-articular vascular malformations are not infrequently encountered around the knee, and it is important to identify characteristic imaging findings together with some of the potential pitfalls in diagnosis

TABLE OF CONTENTS/OUTLINE

1. Discuss classification and imaging findings of popliteal entrapment syndrome 2. Illustrate pathologies affecting the popliteal artery, including popliteal artery dissection, transection, aneurysm/pseudoaneurysm, cystic adventitial disease of the popliteal artery, and arterial calcification due to deficiency of CD73 (ACDC) 3. Review the aberrant anterior tibial artery, a commonly encountered normal variant, and emphasize the importance of including a description of this common variant in an MR report, particularly if the patient is to undergo subsequent knee surgery 4. Highlight the importance of evaluating for deep venous thrombosis on routine MRI 5. Outline imaging characteristics of vascular malformations occurring around the knee 6. Illustrate potential pitfalls mimicking vascular pathology around the knee

Don't Be Afraid About T2 Mapping of the Knee Articular Cartilage: A Simple Way to Decrease Reports Ambiguity and Improve the Communication with Arthroscopists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Estefania Gallego Diaz, MD, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

- T2 mapping sequence improves the sensibility of detecting cartilage lesions within the knee joint, especially in the early stages.- To explain the importance of adding a T2 mapping sequence to a routine MRI protocol. - To instruct the radiologist on who applies the T2 mapping and how to do it. - To Review the main classifications of chondral (cartilage) lesions. - To implement the use of validated evaluation scales. - To present an algorithm approach and protocol that facilitates a uniform lexicon between radiologists and arthroscopists.- To simplify the technique and reports used in these patients to improve communication with the arthroscopy specialists.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Definitions 3. Understanding the chondral(cartilage) lesion 4. Classifications of chondral lesions and correlation with arthroscopy 5. Validated evaluation scales 6. T2 mapping sequence · Indications · Physics · Technique and protocol recommendations 7. How to report it: · Pictorial review · Algorithm approach and templates tips. · Case-based learning 8. Conclusions

The Patellofemoral Joint: From Joint Stability to Articular Pathologies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Andre Rosenfeld, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this educational exhibit is:- Review the normal anatomy and imaging evaluation of the stabilizers of the patellofemoral joint and their pathologies, exemplifying the pathologies with didactic cases- Illustrate and discuss knee extensor mechanism injuries, patellar fat pat and bursae pathologies- Review patellofemoral joint pathologies, including degenerative osteoarthritis, inflammatory and crystal arthropathy

TABLE OF CONTENTS/OUTLINE

Patellofemoral congruency depends on dynamic stabilizers (extensor muscles and medial patellofemoral retinaculum/ligament) and static (bone) stabilizers. Imaging evaluation includes patellar and trochlear measurements, patellar translation distance (TT-TG) and torsional measurements. The knee extensor mechanism is composed of the quadriceps muscle and tendon, medial and lateral patellar retinaculum, patella, patellar tendon and tibial tuberosity. Its pathologies can be divided by location and chronology (acute vs chronic). Associated extensor mechanism pathologies include patellar fat pad and bursa abnormalities.The patellofemoral joint is a synovial joint that can be affected by degenerative, inflammatory and crystal arthropathies and synovial processes, with typical imaging findings. The radiologist needs to be familiar with the complete imaging evaluation of the patellofemoral joint, from joint stability to articular pathologies.

Musculoskeletal Manifestations of Dermatomyositis: An Imaging Overview

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review and illustrate musculoskeletal manifestation of dermatomyositis with imaging findings on radiographs, ultrasound, computed tomography scan and magnetic resonance imaging.2. Review and discuss diagnoses related to dermatomyositis as paraneoplastic manifestation. 3. Review and discuss differential diagnoses.

TABLE OF CONTENTS/OUTLINE

Introduction: overview of clinical manifestation of the disease, including epidemiology, physiopathology, also presenting musculoskeletal clinical features of dermatomyositis.Present an illustrated scheme with the most common manifestations of dermatomyositis.Exemplify the manifestations of dermatomyositis such as skin involvement, subcutaneous tissue involvement, musculoskeletal involvement, and correlate with different imaging modalities.Present clinical case with differential diagnosis.References.

Posterior Meniscal Roots Injury: What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Camila De Paula Silva, MD, Botucatu, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review and illustrate the anatomy of the posterior meniscal roots in schematic figures and MRI.To review and illustrate the lesions and classification of posterior root meniscal tears in schematic figures and MRI.To review and illustrate the surgical techniques to repair meniscal posterior root tears in schematic figures, intra-operative imaging, and post-operative imaging in a multimodality approach.

TABLE OF CONTENTS/OUTLINE

1- Anatomy of the posterior meniscus root. 2- MRI of posterior meniscus root tears and their classifications: - type 1 (partial radial root tears without any tear in the adjacent posterior horn or body); - type 2 (complete radial root tears); - type 3 (longitudinal bucket-handle tears with a complete tear of the root attachment); - type 4 (complex oblique tears with a complete tear of the root attachment); - type 5 (avulsion fractures of the tibial plateau). 3- Types of surgical techniques to repair meniscal root tears, include - Surgical indications.- Intra-operative imaging.- Partial meniscectomy.- Meniscal repair (transtibial pullout repair, suture anchor repair, and side-to-side repair).

Update on Orthopedic Procedures in the Knee

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Eduarda Bernal, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review new methods to repair cartilage of the knee like allograft and autologous transplantation associated with collagen membrane.Demonstrate that extra-articular anterolateral procedures improve clinical outcome when performed as an augmentation of the anterior cruciate ligament reconstruction in specific groups of patients.Review normal and abnormal postoperative MRI findings of arthroscopic transtibial pullout repair (ATPR) for medial meniscus posterior root tear (MMPRT).Talk about future prospects of minimally invasive knee surgery.

TABLE OF CONTENTS/OUTLINE

Cartilage defects of the knee are often debilitating and predispose to osteoarthritis. seeking methods that combined can effectively repair cartilage and prevent progression to osteoarthritis is the goal of orthopedists. For larger lesions with a substantial amount of cartilage loss, autologous chondrocyte implantation using a bilayer collagen membrane has been demonstrated excellent results.Currently, the most commonly used technique for root repair is ATPR. The role of postoperative MRI is confirm the reduction of the posterior meniscus root to the original footprint of the tibial surface, identify the integrity of this structure, note the decrease in intra-meniscal signal intensity.The anterolateral ligament and capsule of the knee are anatomical structures involved in rotational stability and pivot-shift control. As such, it has been demonstrated that the extra-articular anterolateral procedures improve clinical outcome when performed as an augmentation of the anterior cruciate ligament reconstruction in specific groups of patients.

Osteosarcopenia: A New Geriatric Syndrome with Great Impact on Our Life

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jimi Huh, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is 1. To explain the concept and updated knowledge about osteosarcopenia 2. To systematically review the current researches about clinical importance of osteosarcopenia 3. To understand the concept and future directions of body composition imaging for evaluation of osteosarcopeniaMajor teaching points are: 1. Osteosarcopenia, a combination of osteoporosis and sarcopenia is a distinct disease entity with unique pathophysiology.2. Osteosarcopenia is highly associated with frailty and mortality in elderly people and cancer patients. 3. Advances in imaging have enabled detailed analysis of osteosarcopenia.

TABLE OF CONTENTS/OUTLINE

1. Concept and updated knowledge about osteosarcopenia - Changing concepts: From sarcopenia to osteosarcopenia and myosteatosis - Osteosarcopenia: combination of sarcopenia and osteoporosis - Distinct pathophysiology focusing on interaction between muscle and bone2. Systematic review for clinical importance of osteosarcopenia - Prognostic markers for overall survival in cancer patients - Independent risk factors for osteoporotic fractures and frailty - Increase in mortality/morbidity after major surgery3. Body composition imaging for evaluation of osteosarcopenia - Current leading diagnostic modalities of osteosarcopenia : CT, MRI and DXA - Imaging methods to measure the skeletal muscle area (SMA) and bone mineral density (BMD) - Evolution of AI techniques: AI segmentation and pattern analysis for BMD4. Future directions of body composition imaging - Standardization of diagnostic modality, measuring level, and diagnostic cut-off and criteria - Accurate methods to assess muscle and bone tissue composition in opportunistic CT

Sonography of Anatomical Variations in the Hand Innervation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Afarine Madani, PhD, Bruxelles, Belgium (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Less than 10% of individuals show the classical hand innervation pattern as described in anatomical books • More than 90% of individuals display at least one or up to five anastomoses between ulnar nerve and median nerve • 50% of the anastomoses are localized within the forearm • Knowledge of anatomical variations in the hand innervation is essential because they induce variations in symptomatology, clinical findings, imaging results, and "routine" electrodiagnostic tests, but also because they may lead to wrong diagnosis, inadequate treatment and/or iatrogenic lesions • In case of anastomosis between motor branches, diagnosis is based on the distribution of atrophic pattern and fatty degeneration of intrinsic muscles of the hand • In case of anastomosis between sensitive branches, diagnosis is mainly focused on patient's complaints

TABLE OF CONTENTS/OUTLINE

• The 4 most frequent anastomoses in the upper extremity are between motor branches, -Martin-Gruber, Marinacci, Riché-Cannieu, and between sensitive branches, -Berrettini- • Description of US technique that helps their identification • Discussion of the clinical implications

Using Dynamic Maneuvers in the Computer Tomography/Magnetic Resonance Assessment of Musculoskeletal Pathologies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Thais de Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologic assessment of certain musculoskeletal lesions may still pose difficulties. Certain maneuvers have been described to overcome these difficulties. Although dynamic ultrasound is a well established diagnostic technique, TC and MR dynamic imaging have particular indications and are also valuable tools in certain musculoskeletal pathologies. This study aims to review the use of dynamic maneuvers in MR and CT for evaluation of some specific musculoskeletal pathologies including: Hirayama disease, ankle syndesmosis injury, radioulnar instability, chronic compartmental syndrome and others. We intend to illustrate and highlight the utility and benefits of dynamic maneuvers for the diagnosis of different musculoskeletal pathologies.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION: Dynamic Acquisitions. Diseases caused by dynamic abnormalities and dynamic instability SAMPLE CASES Hirayama disease: flexion maneuvers allow to demonstrate anterior displacement of the dura mater. Ankle syndesmosis injury: flexion knee maneuvers. Radioulnar instability: supine maneuvers allow sensibilization for ulnar subluxation. Chronic compartimental syndrome: effort maneuvers. Thoracic outlet syndrome (TOC): arm abduction maneuvers allow sensibilization for TOC. Extrinsic median nerve compression: flexion/extension of fingers allow better visualization of dynamic compression. CONCLUSIONDynamic musculoskeletal imaging in CT and MR are important tools that allow detection of different musculoskeletal pathologies. Being able to recognize its indications, to guide targeted protocols and to know how to interpret the imaging findings both in neutral and dynamic positions is imperative for radiologists.

Don't Forget the Atlantoaxial Joint: From Anatomy to Pathological Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Alan Strapasson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. Review developmental embryology, anatomy, biomechanics, measurement of the atlantodental interval in the adult and pediatric population and its main anatomical variations that can simulate solutions.2. Review imaging protocols for their evaluation according to clinical suspicion (X-ray, CT and MRI). 3. Discuss the main traumatic and non-traumatic injuries that can affect the joint, correlating their findings with imaging methods.

TABLE OF CONTENTS/OUTLINE

1. Developmental embryology (ossification nuclei). 2. Atlanto-axial joint anatomy: CT, X-ray, ligaments (MRI), craniometry (basion-dens interval, power ratio, basion-axial interval, atlantodental interval, spinolamine distance C1-C2) 3. Normal variants that mimic lesions: fusion anomalies, posterior/anterior rachischisis, persistence of the terminal ossicle (Bergman), "os odontoideum", calcification of the alar ligament. 4. Biomechanics: extension, flexion, lateral flexion, axial rotation. 5. Imaging assessment: RX, CT and MRI protocols (ligaments and spinal cord injury). 6. Differentiation of normal/positional findings from pathological alignment changes. 7. Atlas fracture (Jefferson). 8. Odontoid fracture (Anderson and D'Alonzo classification). 9. Traumatic spondylolisthesis of C2 (hangman's fracture). 10. Atlanto-axial subluxation (anteroposterior, rotational, vertical and lateral). 11. Alar ligament deformity-rupture. 12. Rupture of the transverse ligaments. 13. Rheumatoid arthritis. 14. CPPD

Bone Tumors in the Spine: A Simplified Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Tatiane Moriwaki, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to: Review and illustrate features of spinal bone tumors with imaging findings on radiography, computed tomography and magnetic resonance; Illustrate and discuss differential diagnosis with didactic and challenging cases; Provide a basic guide to characterizing bone tumors of the spine.

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of the epidemiology of bone tumors in the spine. Distribution of bone tumors: schematic flowchart showing the rationale for bone lesions based on age, distribution, and location of the main spinal tumors to help narrow differential diagnoses and identify "don't touch" lesions. • In patients younger than 30 years, spinal tumors are uncommon and usually benign, except for Ewing's sarcoma and osteosarcoma, while in patients older than 30 years, metastases should be included in the differential diagnoses. Infections should also be considered when there are signs of aggression. Evaluation of spinal tumors: •Characteristics of the main bone tumors in terms of epidemiology, matrix type, typical, and atypical imaging findings; • Summary of management and prognosis; •Didactic and challenging cases: benign and malignant spinal tumors. Bibliographical references with recent articles highlighting what is new in the topic.

Spondylarthritis (SpA): A Practical Imaging Diagnostic Approach and Current Definitions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Cum Laude

Participants
Damaris Goncalves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

SpA is a heterogeneous group of diseases that share common genetic, clinical, and imaging features. The diagnosis is complex and multifactorial, there is no gold standard exam or diagnostic criterion, and the classification criterion is often misused in clinical practice, which can lead to diagnostic errors, mostly false positives. In its last update of the definition of sacroiliitis in 2021, the ASAS highlighted the high rates of false positives when using previous definitions of sacroiliitis, expressed concern about the misuse of the classification criteria in clinical practice and reformulated the definition, now more specific, including both inflammatory and structural lesions, although still for research purposes. Imaging diagnosis of SpA in clinical practice can be made with any combination of inflammatory and/or structural lesions in the sacroiliac joints, spine, peripheral joints and/or entheses, as long as these findings are "highly suggestive of SpA", although this definition is subjective and there is considerable interobserver variability, even among experienced readers. The distribution of the lesions must also be considered either in the sacroiliac joint, spine or peripheral joints. The differential diagnoses must be excluded, especially mechanical pathologies, which are much more prevalent and a common cause of false positive results. In addition, knowledge of habitual skeletal maturation in children is essential, as it can mimic sacroiliitis or enthesitis.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Sacroiliac joint 3. Spine 4. Peripheral Findings 5. WBMRI 6. Conclusion

2022: A Spacer Odyssey: Imaging of Antibiotic Spacers for Periprosthetic Joint Infection-

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jason Matakas, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Educate the reader regarding two-stage revision surgery with antibiotic spacers and why it has become the gold standard for periprosthetic joint infection (PJI) management. • Highlight advances in antibiotic spacer design.• Depict radiographic appearance of various types of spacers and how they can be differentiated.• Discuss common complications of antibiotic spacers the radiologist should be aware of.

TABLE OF CONTENTS/OUTLINE

• Background/Indication for two-staged revision with antibiotic spacer.• Benefits: Maintains tissue tension, provides high local concentration of antibiotics, preserves cavity for subsequent revision; articulating spacers additionally allow preserved range of motion, prevent immobilization, and allow weightbearing.• Spacer types and radiographic appearance: o Knee: static, intraoperative mold, prefabricated cement, metal/polyethylene.o Hip: non-articulating, intraoperative mold, prefabricated cement, metal/polyethylene.o Shoulder: non-articulating, intraoperative mold, prefabricated cement, cement-coated hemiarthroplasty.• Case-based discussion of complications: prosthetic and periprosthetic fracture, bone loss, dislocation/subluxation, persistent infection.• Outcomes: High efficacy of infection eradication; some patients decline further revision.

Don't Be Very Nervous": Neurovascular Structures to Avoid During Ultrasound-guided Interventions in the Extremities

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jenifer Pitman, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Ultrasound is extremely useful for guiding injections and other procedures in the extremities, but a firm grasp of the regional anatomy is important for the procedures to be performed safely.2. Neurovascular structures need to be avoided, and awareness of their characteristic locations relative to the structure of interest will allow safe needle advancement.3. This education exhibit will review the typical needle orientation for many ultrasound-guided procedures in the extremities, focusing on important neurovascular structures to avoid for each.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Shoulder:a. Paralabral cyst aspiration (Avoiding the suprascapular nerve (N))3. Elbow:a. Elbow joint injection (Avoiding the deep branch of the radial N)b. Medial epicondylitis injection (Avoiding the ulnar N)c. Biceps tendon injection (Avoiding the lateral antebrachial cutaneous N)4. Wrist/Hand:a. Dorsal and volar ganglion cyst aspirations of the wrist (Avoiding the posterior interosseous N and radial artery (A), respectively)b. 1st carpometacarpal and triscaphe joint injections (Avoiding the radial A)c. 1st dorsal extensor compartment injections (Avoiding the sensory branch of the radial N)d. Finger flexor tendon retinacular cyst aspiration/tendon sheath injection (Avoiding the proper digital N)5. Hip:a. Iliopsoas bursal injection (Avoiding the femoral neurovascular bundle)b. Hamstring injection/aspiration (Avoiding the sciatic N)6. Knee:a. Baker's cyst aspiration (Avoiding the saphenous N)7. Ankle:a. Tibiotalar joint injection (Avoiding the dorsalis pedis and deep peroneal N)b. Flexor hallucis longus sheath / os trigonum injection (Avoiding the tibial N and medial and lateral plantar N)

Opportunistic Evaluation of Sarcopenia and Osteoporosis - Focus on Musculoskeletal Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jennifer Padwal, MD, MS, Palo Alto, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Sarcopenia and osteoporosis are independent risk factors for poor clinical outcomes 2) Abdominal CTs have been most thoroughly studied for the evaluation of sarcopenia and osteoporosis, although other anatomic regions on CT, MRI, and ultrasound may offer valuable information on muscle and bone quality 3) Reporting of sarcopenia and osteoporosis on imaging may influence patient management

TABLE OF CONTENTS/OUTLINE

I. Epidemiology and clinical significance of sarcopenia and osteoporosis II. Definitions of sarcopenia and osteoporosis: From DXA to opportunistic CT, MRI, and ultrasound III. CT and MRI screening of sarcopenia and osteoporosis on musculoskeletal imaging examinations (spine and extremities), including CT attenuation (e.g., Hounsfield unit thresholds) and MRI-derived biomarkers (e.g., T2 relaxation time, functional anisotropy) IV. Translating clinical research into clinical practice: Terminology and templates for reporting sarcopenia and osteoporosis on CT, MRI, and ultrasound

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Denny Marcela Achicanoy I, MEd, Ciudad De Mexico, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

Congenital femoral deficiency is hypoplasia of the proximal portion of the femur without a known specific etiology.Its prevalence is 0.1 to 0.2 cases per 10,000 newborns it is mainly associated with fibular hemimelia, patellar absence, acetabular dysplasia. Paley's imaging classification depends on the degree of development of the integrity of the femur without depending on age or degree of ossification.

TABLE OF CONTENTS/OUTLINE

1. Definition. 2. Embryological origin. 3. Etiology associated factors. 4. Imaging findings. 5. Treatment.Congenital femoral deficiency is the specific partial absence (hypoplasia) of the proximal portion of the femur with shortening of the entire lower limb without an etiology. Its prevalence is 0.1 to 0.2 cases per 10,000 newborns it is mainly associated with fibular hemimelia, patellar absence and acetabular dysplasia mainly due to the association with its postaxial embryonic origin. Initially it was classified by Guillespie Torode into two groups: I or congenital hypoplastic femur, where the hip knee are functional after surgical treatment symmetry of the limbs can be achieved; II or proximal focal femoral deficiency where the hip is abnormal the knee is considered non-functional, in these cases prosthetic management is suggested. However, Paley created an imaging classification with the intention of offering a guide for surgical treatment depending on the degree of development of the integrity of the femur. The Paley Classification is aimed at facilitating decisions treatment protocols to follow. In this poster we will present cases of femoral hypoplasia with different classification according to Paley.

Uncomplicating Spinal Cord Disorders - A Practical Guide for the Musculoskeletal Radiologist

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Alexandre Goncalves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To review anatomy of the spinal cord. 2. Narrow the differential of spinal cord diseases according to location. 3. Differentiate between inflammatory, infection, demyelinating, metabolic, neoplastic lesions and vascular disorders.

TABLE OF CONTENTS/OUTLINE

1 - Topographic and cross section detailed anatomy of the spinal cord. 2 - Correlate spinal cord diseases that manifest with high signal within the spinal cord on T2WI with their locations to narrow the differential diagnosis. 3 - Illustrate the most common causes and imaging findings in MRI, including - Inflammatory; - Vasculitis; - Infection; - HIV; - Bacteria; - Fungus; - Cysticercosis; - Demyelinating disorders; - Multiple sclerosis; - Transverse myelitis; - Neuromyelitis optica; - Acute disseminated encephalomyelitis; - Metabolic; - B12 hypovitaminosis; - Neoplastic; - Ependymoma; - Astrocytoma - Hemangioblastoma; - Lymphoma; - Metastases; - Vascular disorders; - Ischemia due to spinal arteriovenous malformation. 4 - Summary and practical guide to narrow the differential diagnosis of MRI findings according to location and how to relate the findings to the patients' relevant clinical and laboratory data.

Spectrum of Imaging Findings of Iatrogenic Vascular Injuries After Orthopedic Surgery

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Emanuele Barabino, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Despite the establishment of safety zones to place screws and metallic devices, the rate of vascular injuries during orthopedic surgery has keeping increasing in the last decades due to the increasing employment and revision of prosthetic devices.• Severe injuries (i.e., tearing of major vessels) cause severe bleeding and hypotension and are usually prompted recognized intraoperatively; despite not life-threatening, minor injuries are typically more insidious, and they could determine significant functional losses and postpone the healing process.• The spectrum of imaging findings of the iatrogenic vascular injuries after orthopedic surgery is wide and heterogenous and the radiologic evaluation of surgical field is often impaired by artifacts generated by metallic devices.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Anatomical Considerations3. Mechanisms of Injury3.1 Vascular injuries after elective surgery3.2 Vascular injuries after trauma surgery4. Risk Factors4.1 Anticoagulation and Antiplatelet therapy4.2 Atherosclerosis4.3 Infection5. Imaging Techniques and Technical Consideration5.1 CT Protocol5.2 Metal Artifact reduction Protocol6. Radiologic Features6.1 Hematoma6.2 Pseudoaneurysm6.3 Vessel Transection6.4 Occlusion7. Conclusion

I Want to Ride My Bicycle! A Pictorial Essay on Cycling-related Musculoskeletal Injuries

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Damaris Goncalves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Overview on epidemiology of cycling-related musculoskeletal injuries; ? To demonstrate the most common mechanisms that lead to the development of musculoskeletal lesions during cycling (lesions of contact, overuse and traumatic); ? To summarize the main musculoskeletal lesions related to cycling according to the affected musculoskeletal structures; ? To demonstrate the typical findings related to such lesions in a variety of imaging methods.

TABLE OF CONTENTS/OUTLINE

? Introduction: concept of bicycling-related injuries, epidemiology; ? Mechanisms of musculoskeletal injuries that occur during cycling; ? Overview of the main musculoskeletal injuries among cyclists in different parts of the musculoskeletal system; ? Pictorial essay on the typical imaging findings related to those lesions, including brief discussion on clinical presentation.

First Metatarsophalangeal Trauma: The Complete Spectrum of Osseous and Soft Tissue Injuries

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Collin Edwards, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Injuries to the first metatarsophalangeal (MTP) joint, including but not limited to "turf toe", have long been associated with athletic trauma and overuse. Imaging plays an important role in the determination of severity and extent of damaged structures within this complex. Multiple classification systems frequently combine both the imaging characteristics and clinical presentation in an effort to guide management and predict return to play.This session reviews injuries to the first MTP joint to increase participants' understanding of the following: 1. Mechanisms of injury and epidemiological risk factors 2. MRI findings of 1st MTP injury and classification systems 3. Management pathways.We use multiple case examples to demonstrate the relationship between MRI findings and management decisions/outcomes. Increased understanding of these clinical, radiologic and surgical factors will further inform the radiologist's interpretation of MRI for first MTP trauma.

TABLE OF CONTENTS/OUTLINE

Review of normal 1st MTP osseous and ligamentous anatomy; Mechanisms and epidemiology of 1st MTP injury; Classifications of 1st MTP injuries; Case examples of osseous and ligamentous pathology, including: - Hallux sesamoid fracture and stress injuries - Osteochondral lesions - Capsuloligamentous injuries (Sesamoidophalangeal, intersesamoid, metatarsosesamoid, collateral ligament injuries) - Musculotendinous injuries; Non-surgical and surgical management

MRI evaluation of Post-operative Peripheral Nerve Injury

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Hye Yang, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review common types of procedures that are prone to causing peripheral nerve injury. 2. To recognize the MRI appearance of peripheral nerve injury including the changes to the related muscles. 3. To review the patterns of peripheral nerve injury. 4. To review the common appearances and presentations of peripheral nerve injury on MRI

TABLE OF CONTENTS/OUTLINE

1. Normal Anatomy: a. Normal appearance of peripheral nerve. b. Normal appearance of muscle. 2. Procedures that predispose to peripheral nerve injury: a. Types of procedures. b. Areas that are prone to injury. 3. Classification of peripheral nerve injury: a. Seddon Classification. b. Sunderland Classification. 4. MRI appearance of injury: a. Grades/Types of nerve injury. b. Neuroma. c. Peripheral muscle changes. 5. Treatment

Complications of Reverse Total Shoulder Arthroplasty: What a Radiologist Should Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Timothy T. Klostermeier, MD, Lebanon, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Reverse Total Shoulder Arthroplasty (RTSA) restores glenohumeral mobility and function to patients with rotator cuff arthropathy and other severe glenohumeral conditions. Radiologists should understand the biomechanical advantages, expected appearance, and anatomy of this arthroplasty (and its design variations).2. Basic examples of types of RTSA will be presented.3. Complications related to RTSA need to be promptly recognized and communicated. Radiologists should be familiar with the appearance of these complications.4. Mechanical failures will be highlighted with pictorial examples.5. Recognition of signs of infection and role in component failure.

TABLE OF CONTENTS/OUTLINE

1. Epidemiology of RTSAIncidence, prevalence, and rising complications 2. Role of radiologist:-Normal biomechanics-Identifying types of RTSA, medialized and lateralized and expected appearance-Recognizing and addressing complications 3. Components of RTSA4. Complications(a) Scapular notching (b) Acromial stress fractures(c) Periprosthetic fractures (d) Infections and treatment(e) Implant failures• Implant loosening• glenoid/ humeral stem• Intra implant unscrewing: humerus• Disengaged glenosphere• Broken screws• Canal filling of stem and stress shielding of greater tuberosity5. Dislocation-Assessment of implant orientation

A Pain in the Neck: Magnetic Resonance Neurography of Neurogenic and Disputed Subtypes of Thoracic Outlet Syndrome

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Emily Davidson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Thoracic outlet syndrome (TOS) is thought to result from compression of the upper limb neurovascular structures traversing the thoracic outlet. TOS remains poorly understood, despite extensive available literature describing clinical features, imaging findings and approaches to the syndrome. 2. TOS due to compression on the brachial plexus causes upper limb neurological symptoms, varying from mild sensory disturbance to motor function loss. 3. Subtypes of neurological TOS have been divided into Neurogenic TOS (nTOS) and Disputed TOS (dTOS), based on clinical features and electrodiagnostic results. nTOS have positive motor nerve involvement, whilst dTOS have preserved motor nerve function with a predominant sensory disturbance. 4. Magnetic resonance neurography (MRN) is increasingly being used to investigate nTOS and dTOS and identify focal areas of compression on the brachial plexus. MRN has become an important test within the diagnostic algorithm for TOS investigation and management (non-operative vs operative).

TABLE OF CONTENTS/OUTLINE

1. Update on brachial plexus MRN imaging techniques including coil selection, imaging acquisition protocols, and imaging reconstruction protocols that employ deep learning algorithms. 2. Overview of TOS brachial plexus anatomy. 3. Review clinical features/electrodiagnostics of nTOS and dTOS. 4. Review MRN case examples of nTOS and dTOS subtypes, including: overhead throwing athlete, postoperative complications resulting in perineural scar and muscle denervation, and osseous abnormalities (cervical and first rib).

Exploiting the Technical Possibilities and Advancements of Photon-Counting CT for Musculoskeletal Imaging: The Way Forward

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jeffrey De Groen, BSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate the possibilities regarding acquisition and reconstruction techniques of PCCT for musculoskeletal imaging To provide insights and knowledge needed for optimal utilization of PCCT in musculoskeletal imaging To give an outlook on the future prospects of PCCT in MSK imaging

TABLE OF CONTENTS/OUTLINE

With the recent introduction of a clinical photon-counting computed tomography (PCCT) scanner, it has become possible to combine ultra-high image resolution with spectral information. Image data obtained with PCCT may provide clinicians and radiologists with improved diagnostic confidence. For example, a better visualization of metastatic bone might offer valuable information about how to best stabilize the bone with metal plate placement. However, there is still limited knowledge about what the best choices are for PCCT acquisitions (e.g. x-ray spectra) and reconstructions (e.g. kernels, mono-energetic and metal artifact reduction techniques) for the various areas of interest. This exhibit will provide you with examples of clinical PCCT scans obtained in two different institutions, compared to previously acquired energy-integrating detector (EID) CT scans and other modalities in e.g., the diagnosis and follow-up of fractures, the evaluation of osteolysis, osseointegration of orthopedic joint replacement implants, and the assessment of bone tumor and metastasis. Finally, an outlook on the future utilization of PCCT to extract quantitative bone biomarkers and the assessment of bone quality and structure is provided.

Normal and Abnormal MRI of the CapsuloLabral Complex of the Hip

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Magna Cum Laude
Identified for RadioGraphics

Participants
Dyan V. Flores, MD, Ottawa, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

Contrary to its counterpart in the glenohumeral joint, the anatomy, biomechanics and patterns of injury involving the femoroacetabular capsulo-labral complex may be less familiar to radiologists. The labrum and articular capsule of the femoroacetabular (hip) joint work in conjunction to stabilize the articulation. At lesser degrees of distraction, the labrum is the most important hip stabilizer, whereas in greater distraction states, the contribution of the capsule to hip stability increases. The objectives of this educational exhibit are as follows: • Review normal anatomy and biomechanics of the femoroacetabular or hip labrum and capsular ligaments • Discuss patterns of failure and injury involving the capsulo-labral complex of the hip • Define MR imaging pearls and pitfalls in diagnosing these capsulo-labral injuries

TABLE OF CONTENTS/OUTLINE

NORMAL MRI • Hip labrum and anatomic variants• Capsular ligaments of the hip • Ligamentum teresIMAGING CONSIDERATIONS• Radial sequences• MR arthrographyABNORMAL MRI• Labral tears• Posterior hip dislocation • Isolated injuries of the capsular ligaments

Imaging Review of Beach Tennis Injuries: A New Sport Trend and Related Musculoskeletal Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Andre Mannato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The exponential growth of Beach Tennis (BT) has been observed in Brazil, mainly in coastal cities. The origin of this sport dates back to Italy in the 80s. Only in 1996 the official rules of the sport were determined. Worldwide it is estimated that more than 1 million people are practicing which is played using Beach Tennis paddles and a low compression tennis ball. BT is mainly played overhead, including serving, defensive moves and attacking, this may have contributed to rotator cuff tendinopathy. Explosive sprinting in the serve with sudden plantarflexion of the foot with knee extended, contributed to more injuries in the leg and ankle muscles and tendon. Moving on sand requires more energy due to the mechanical work related to the sand's compliance and the lower efficacy of positive muscular work. For this reason, is important for the radiologist to correlate the clinical scenarios for the correct radiologic diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Overview on epidemiology of beach tennis related musculoskeletal injuries 2. To demonstrate the most common mechanisms that lead to the development of musculoskeletal lesions during the match (serving, attacking, defense) 3. To summarize the main musculoskeletal lesion related to beach tennis according to the affected musculoskeletal structures To demonstrate the typical findings related to such lesions in a variety of imaging methods

Midfoot Strains Illustrated with Global Illumination Rendering

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Fatma Boubaker, Nancy, France (*Presenter*) Nothing to Disclose

TEACHING POINTS

Midfoot strains are clinically and radiologically underdiagnosed. They require a more aggressive treatment than classical lateral ankle sprains, with which they are often associated, because of higher sequalae risk. The Chopart joint is sustained by the spring ligament complex, the talonavicular, bifurcate, and calcaneocuboid (lateral and plantar) ligaments. Inversion lesions are the most frequent and lead to talonavicular impaction and calcaneocuboid distraction injuries. The Lisfranc joint is composed of 3 columns, inter-connected by dorsal, plantar, and intermetatarsal ligaments, and especially by an inter-osseous (Lisfranc) ligament, linking the medial and intermediate columns, which attempt leads to joint instability. Radiographs allow sub-optimal evaluation in a post-traumatic context. CT must be performed if a fracture is suspected and permits a good depiction of small bony avulsions, as MRI, considered the gold standard for ligamentous study, is usually not available in the acute phase. Moreover, Global Illumination rendering provides information beyond the reach of 2D images. Even though midfoot anatomy is considered complex, a clear knowledge of its anatomy improves the early detection of traumatic lesions requiring more aggressive treatment to avoid degenerative changes, especially using CT in the very early setting.

TABLE OF CONTENTS/OUTLINE

1. Chopart injuries. 1.1 - Introduction, 1.2 - Anatomy, 1.3 - Imaging findings2. Lisfranc Injuries. 2.1 - Introduction, 2.2 - Anatomy, 2.3 - Imaging findings

No Strings Attached - Tendon and Tendon Sheath Pathologies of the Hand

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jan Grunz, MD, Wuerzburg, Germany (*Presenter*) Research Consultant, Siemens AG

TEACHING POINTS

The tendons of the hand run in close proximity to each other and within reticular tunnels adjacent to articular joints, while forming intersections in characteristic locations. This particular anatomy can lead to stenosis in the fibrous outer layers of the extensor retinaculum and A1 annular pulleys, resulting in tendinosis and functional disability. In contrast, proliferative tenosynovitis is a disease of the synovial inner layer of the tendon sheath with tendon infiltration and ensuing tendinitis, most frequently seen in rheumatoid arthritis. Phlegmonous or purulent tenosynovitis is more common in the flexor compartments, potentially resulting in tenosynovial necrosis and tendon dislocation. Diseases of the tendons and tendon sheaths may have mechanical, degenerative, metabolic or inflammatory etiology. Fibrous tunnels and bony prominences in close proximity to crossing tendons predispose to mechanical tendon irritation at typical sites of the hand. Requiring high-resolution techniques due to the small size of the compartments involved, the tendons and tendon sheaths of the hand can be precisely assessed in ultrasound and MRI.

TABLE OF CONTENTS/OUTLINE

1. Anatomy of the tendon and tenosynovium 1.1. The extensor mechanism 1.2. The flexor mechanism 2. Imaging principles 2.1 Ultrasound 2.2 MRI 3. Common pathologies 3.1. Tendinosis 3.2. Tendinitis 3.3. Paratendinitis 3.4. Reactive tenosynovialosis 3.5. Stenosing tenovaginosis 3.6. Proliferative tenosynovitis 3.7. Traumatic ruptures 3.8. Tumors of the tendon sheath 4. Discussion

Stay Flexible! Diagnosis and Treatment of Flexor Tendon Injuries

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Steven Daniels, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review anatomy of the flexor tendon and flexor tendon sheath 2. To review imaging findings in flexor tendon tears highlighting those important to the treating surgeon 3. To discuss the different treatment options in flexor tendon tears and demonstrate how imaging helps guide patient management 4. To discuss complications of primary flexor tendon repair and flexor tendon reconstruction

TABLE OF CONTENTS/OUTLINE

1. Anatomy of the flexor tendon and flexor tendon sheath a. Flexor tendon anatomy b. Flexor tendon sheath and pulley system c. Flexor zones of injury 2. Zone 1 injuries - Leddy and Packer classification 3. Zone 2 injuries - Injury types 4. Zone 3,4,5 injuries - Injuries by location 5. Treatment options a. Primary tendon repair b. One-stage reconstruction c. Two-stage reconstruction 6. Imaging of potential tendon grafts 7. Post-operative clinical care 8. Post-operative imaging and complications a. Normal findings b. Adhesions c. Re-tear

Finger It to Know It: A Detailed Walk Through from Anatomy, Imaging and Pathology to Post-treatment Follow-up of Finger

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Amit Sahu, MBBS, MD, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the normal anatomy of finger and the appearance on ultrasound, radiograph, CT and MRI. 2. Discuss common bony injures affecting the finger. 3. Discuss soft tissue injures affecting the finger. 4. Review common bone tumours of finger and their imaging appearance. 5. Review common soft tissue tumours of finger and their imaging appearance.

TABLE OF CONTENTS/OUTLINE

1. Normal anatomy of finger on radiograph, ultrasound, CT and MRI including the bony and soft tissue structures (tendons, ligaments, volar plates and pulleys). 2. Advantages and pitfalls of ultrasound and MRI in imaging of finger. 3. Various types of fracture of metacarpal and phalanges, their imaging approach and what the orthopedic surgeon wants to know. 4. Types of soft tissue injuries like avulsion injuries of flexor and extensor tendons, volar plate injuries, collateral ligament injuries, their imaging appearance, what a radiologist should describe and post surgical follow-up. 5. Various common and uncommon bony and soft tissue tumors of finger, their imaging appearance and common differentials. Need of time for radiologist is not just lesion detection but also guiding the treating doctor for further management.

Glenoid Track Assessment on Imaging in Anterior Shoulder Instability: Its Rationale and A Step-By-Step Guide

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Ustun Aydingoz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To explain the concept of glenoid track and how it relates to the management of glenohumeral instability associated with bipolar (humeral and glenoid) fractures. 2. To describe how to make the glenoid track assessment on CT or with the help of CT-like images generated with zero echo-time (ZTE) MR imaging in bipolar (humeral and glenoid) fractures associated with anterior shoulder instability. 3. To explain how on-track/off-track status influences strategizing treatment and selecting the type of surgery.

TABLE OF CONTENTS/OUTLINE

1. Pathophysiologic background of glenoid track assessment and why this evaluation is important. 2. Step-by-step guide to assessment of the glenoid track on CT or MRI with the CT-like ZTE sequence: (a) establishing the bipolarity of the shoulder fracture dislocation; (b) estimating the glenoid bone stock; (c) calculating the glenoid track; (d) determining the Hill-Sachs interval; (e) ascertaining the on-track/off-track status of the Hill-Sachs lesion. 3. Case examples with pearls, pitfalls, and sample radiology reports (e.g., how to decide on erosive/compressive versus fragmented osseous Bankart lesions; how correlation of the Hill-Sachs interval on ZTE and conventional MRI sequences overcomes a shortcoming of CT in ascertaining this interval; what to put into the imaging report). 4. How the on-track/off-track status influences the treatment strategy or type of surgery.

MKEE-80

Doctor, I Can't Bend My Finger": Diagnostic Strategies for the Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jiwoon Seo, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Patients with impaired finger flexion are often encountered in our daily clinical practice. There are many etiologies, such as tendon injuries or neuropathy, that cause difficulty in finger flexion. Radiologist must understand the basic anatomy of the finger flexor system and corresponding structural failure to made diagnostic decision.The major teaching points of this exhibit are:1. To review the basic anatomy of the finger flexor system and mechanism.2. To review the etiologies of impaired finger flexion and correlate with imaging (US, MRI) findings.

TABLE OF CONTENTS/OUTLINE

1. Anatomy and Mechanism of the Finger Flexor System.a. Tendons and extrinsic muscles.b. Flexor pulley system.c. Intrinsic muscles.d. Nerve innervation.2. Etiologies of the Impaired Finger Flexion.a. Flexor tendon injuries.b. Trigger finger.c. Flexor tenosynovitis.d. Neuropathy.e. Intrinsic muscle injuries.f. Miscellaneous.3. Summary and Take-home Messages.

Scratching the Surface: MSK Pathology Involving the Skin Subcutaneous Tissues

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Mark Manganaro, DO, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Familiarize radiologists with musculoskeletal diseases that have associated manifestations of the skin and subcutaneous tissues including causes from: infectious, inflammatory, tumor, congenital and connective tissue disorders.2. Be able to identify and diagnosis these various entities using radiography, CT, and MRI.3. Clinically correlate the radiographic findings with the dermatologic appearances.4. An emphasis will be placed on uncommon musculoskeletal disorders which have known dermatological manifestations.

TABLE OF CONTENTS/OUTLINE

The following diseases/syndromes will be shown using radiographs, CT, and MRI as well as having dermatologic correlate images when applicable. Cases that will be in the exhibit include:1. Infectious: Disseminated Mycobacterium chelonae.2. Inflammatory/Connective tissue disorders: Psoriasis/Acrodermatitis of Hallopeau, CREST syndrome/Scleroderma, SAPHO syndrome, dermatomyositis, granuloma annulare, eosinophilic fasciitis.3. Tumor: Rothmund-Thomson Syndrome, Maffucci Syndrome, Neurofibromatosis 1, etc, basal cell and squamous cell carcinoma (Marjolin's ulcer), Dermatofibrosarcoma protuberans.4. Congenital: McCune-Albright Syndrome, Nail-Patella Syndrome, Osteopoikilosis / Osteopathia Striata, Tuberous Sclerosis.

Peripheral Nerve Assessment of Typical and Atypical Lesions - An Ultrasound Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Ligia Couceiro, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Peripheral nerve injuries are important causes of loss of functionality what makes early diagnosis and treatment indispensable. High resolution ultrasound stands out as a cost-effective, accessible method with high diagnostic potential. The purpose of this study is:• To review peripheral nerve anatomy and correlation with the ultrasound imaging. • To discuss the method’s advantages and disadvantages.• To identify normal nerve appearance and also pathological findings.• To recognize the multiple causes of neuropathies, including the most prevalent ones and some atypical or rare presentations.• Illustrate imaging findings through sample cases - atypical and typical cases.

TABLE OF CONTENTS/OUTLINE

• INTRODUCTION- Review peripheral nerve anatomy and correlate to the ultrasound imaging.- To compare high frequency ultrasound advantages and disadvantages to evaluate peripheral neuropathies compared to other methods.- Evaluation of peripheral nerve's normal appearance and pathological findings. • PERIPHERAL NEUROPATHIES - DIFFERENTIAL DIAGNOSIS- Trauma - Compressive syndromes- Inflammatory processes- Infection- Neoplastic • IMAGING INTERPRETATION• Systematic approach to evaluate image exams• Template reporting system • INTERACTIVE CASE-BASED DIDACTICS• Sample typical and atypical cases to illustrate and solidify the concepts.

Sports Injuries in the Rectus Femoris - What, How, Why and Where

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Leandro Mazza, MD, La Plata, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

Know the anatomy and biodynamic characteristics of the rectus femoris.Recognize the spectrum of muscle injuries that compromise the rectus femoris in various sports, analyzing its production mechanism.Analyze the different diagnostic methods of the different injuries in order to establish the precise location and particular characteristics of each injury.Establish an estimated prognostic criterion for recovery and sports return.

TABLE OF CONTENTS/OUTLINE

The anterior rectus has a complex anatomy that allows it to fulfill very characteristic functions, being essential in many current sports practices. Its "muscle within a muscle" morphology and its insertions, added to the type of contractile fibers it presents, mean that its lesions can be grouped and classified, with characteristic compromise sites that are repeated in the different sports practices, presenting a mechanism of similar injury. Indirect type injuries (muscle tears) can be divided into central or peripheral according to the myoconnective junction, being in the case of central injuries of capital importance to assess the status of the adjacent tendon. According to its extension and location, we can roughly predict the potential evolution of the lesions and the approximate return to play time. In turn, there are also direct type injuries (muscle contusions) that will have another treatment and evolution. Finally, we must include epiphysitis in children - adolescents, and tendon disinsertions, which are more frequent in adults.

MKEE-84

Give It Another Shot": A Radiologist's Guide to Shoulder Injury Related to Vaccine Administration (SIRVA) Imaging Features

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Hadas Benhabib, MD, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review procedural considerations for the administration of intramuscular injections, including anatomical landmarking and injection technique; 2) Discuss the variety of anatomical structures that can be injured, depending on the different locations of a non-target deltoid intramuscular injection; 3) Describe the imaging features of patients with recent vaccinations and the spectrum of imaging findings in patients with SIRVA, including subacromial/subdeltoid bursitis, glenohumeral synovitis, adhesive capsulitis, septic arthritis, osteitis/periostitis, and rotator cuff tears.

TABLE OF CONTENTS/OUTLINE

Shoulder injury related to vaccine administration (SIRVA) is a preventable outcome that can occur when an intramuscular deltoid injection is inadvertently administered into the shoulder capsule or surrounding musculoskeletal structures. Imaging studies are frequently requested in the diagnostic evaluation of SIRVA, with the reported utilization of MRI in SIRVA patients being as high as 81%. This exhibit provides a case-based review of the variety of SIRVA-related events, including rotator cuff injuries, bursitis, adhesive capsulitis, and osteomyelitis. Given the importance and growing prevalence of recent COVID-19 inoculations, with 660 million vaccinations having been administered in Canada and the United States to date, prompt recognition of symptomatic non-target vaccinations is essential in providing quality care for our patients and preventing long-term impairments.

Scoliosis: A Review of Surgical Treatment Options

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Lucas Miyahara, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review the modalities of scoliosis surgical treatment and their indications, including the main findings in scoliosis exams that needs to be highlighted when choosing surgical management.2. Illustrate several cases of scoliosis with emphasis on postoperative findings, what to expect and their complications.3. Discuss and provide a guide for what the radiologist must actively look for and report in these cases, supporting surgeons in decision making.

TABLE OF CONTENTS/OUTLINE

Introduction: review general presentation of scoliosis, including their complete evaluation and what the report should include.Provide several challenging scoliosis cases due to defects of formation, segmentation and mixed ones, in the context of various syndromic conditions.Overview and discuss the several operative indications and modalities of surgical treatment.Present didactic illustrations and cases of the different surgical modalities, with their pre and post-operatory imaging exams.Propose a guidebook for post-operatory scoliosis imaging, including several complications that the radiologist needs to be aware and how they should report.Relevant bibliographical references.

Soft Tissue Imaging Findings of Critically Ill Patients

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Ana Carolina Augusto, MD, MSc, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this pictorial essay is to: • Review the imaging appearance of soft tissue findings commonly seen critically ill patients, mainly in MRI. • Differentiate infectious from non-infectious soft tissue diseases in the intensive care unit patient setting.

TABLE OF CONTENTS/OUTLINE

Patients in intensive care units commonly spend long periods of time restrict to the hospital bed, vulnerable to infections and going through multiple venipunctures. Not rarely, imaging is required to further examinate possible complications related to the primal disease or long-term hospitalization. Early diagnosis of possible soft tissues changes can prevent further complications and poor outcomes, specially in elder population. In addition, it is possible to help the surgeon clarify the extent of the damage and preparate the best approach. Muscle edema is a common MRI finding in critically ill patients and the differential diagnosis includes critical illness myopathy (a common acquired condition in an ICU setting), rhabdomyolysis, infections, among others. Correct distinction of infectious from noninfectious soft tissue diseases can be an important factor in determining patient survival.

Declawed: A Review of Claw Toe Pathology and Treatment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Tristan Cooper-Roth, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this educational exhibit is to provide the learner with the following information: 1. Define anatomically what a claw toe deformity is, what this looks like on a radiograph, and what the most common causes are 2. What are the key distinguishing features of other lesser toe deformities and their corresponding radiographic appearances 3. Identify claw toe abnormalities seen on MRI 4. Summarize the types of therapeutic non-surgical and surgical approaches of a claw toe deformity 5. Characterize the post-surgical changes of a Weil lesser metatarsal osteotomy on diagnostic imaging

TABLE OF CONTENTS/OUTLINE

1. Define anatomically what a claw toe deformity is, providing a radiographic example, and what are the most common causes 2. Examples of other lesser toe deformities and their appearance on radiographs 3. Characteristics of claw toe abnormalities on MRI 4. Assess atrophy of intrinsic foot musculature on diagnostic imaging 5. Types of therapeutic non-surgical and surgical approaches to a claw toe deformity 6. Post-surgical changes on diagnostic imaging

Qualitative and Quantitative Anatomic Investigation of the Lateral Ankle Ligaments for Surgical Reconstruction Procedures Using 3D High-Resolution MRI in Chronic Ankle Instability

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Meng Dai, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To quantitatively investigate the anatomy of the ATFL and CFL for surgical reconstruction procedures in chronic ankle instability.

TABLE OF CONTENTS/OUTLINE

Purpose: To quantitatively investigate the anatomy of the anterior talofibular ligament (ATFL) and calcaneofibular ligament (CFL) for surgical reconstruction procedures in chronic ankle instability. Materials and Methods: 3D MRI were performed on five fresh-frozen cadaveric ankles with six different spatial resolutions. Resolution of 0.45x045x0.45mm3 was performed on 24 healthy adult volunteers on bilateral ankles. A four-point subjective score system was used to evaluate the imaging quality. Morphologic parameters including the classification of ATFL,the length of ATFL and CFL, and the four distances of surgically relevant bony landmarkers were measured and analyzed.Results: In subjective evaluation, the interobserver ICC was 0.95 [95% confidence interval (CI): 0.94-0.97] between two readers. The spatial resolution of 0.3x0.3x0.3mm3 and 0.45x0.45x0.45mm3 received highest subjective score on average and demonstrated highest consistency with autopsy measurements in objective evaluation. Regarding the measurements on the 48 volunteer ankles, distance 1 in type I and II were 12.65±2.08mm, 13.43±2.06mm(superior-banded in Type II) and 7.69±2.56mm(inferior-banded in Type II) (means ± SD), respectively. Distance 2 in type I and II were 10.90±2.24mm, 11.07±2.66mm(superior-banded in Type II), and 18.44±3.28mm(inferior-banded in Type II), respectively. Distance 3 and 4 were 4.71±1.04mm and 14.35±2.22mm, respectively.Conclusion: The feasibility to quantify the distances of surgically relevant bony landmarkers.Please visit the Learning Center to also view this presentation in hardcopy format.

Multimodality Review of Important Musculoskeletal Measurements in the Upper Extremity

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jennifer S. Weaver, MD, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

Many image-based measurements are used by orthopedic surgeons to plan treatment. This educational exhibit will discuss the indications and measurement techniques for several commonly used upper extremity measurements, and will detail the technical requirements of imaging needed to obtain precise and accurate measurements.After viewing this exhibit, the learner should be able to:(1) Understand important technical considerations and limitations in measurement techniques of various modalities, including radiographs, CT, MRI, and ultrasound(2) Discuss commonly encountered measurements in the upper extremity, including clinical indication, specific technique, and potential pitfalls

TABLE OF CONTENTS/OUTLINE

Introduction General Measurement TechniquesShoulder1. Acromioclavicular Interval2. Acromiohumeral Distance3. Coracoclavicular Interval4. Acromial Angle, Tilt, and Slope5. Humeral Neck Shaft Angle6. Lateral Glenohumeral Offset Angle7. Glenoid Version Angle8. On track/off track Hill SachsElbow1. Humero-condylar Angle2. Ulnar Collateral Ligament Thickness3. Ulnar Collateral Ligament Medial Joint Gap with Valgus Stress4. Nerve Cross Sectional AreaWrist-hand1. Capitolunate, Lunotriquetral, and Scapholunate Angles2. Scapholunate Interval3. Radial Inclination4. Dorsal Radial Tilt5. Radial Height6. Radioulnar Angle7. Radioscaphoid Angle8. Ulnar Variance and Inclination9. Carpal Tunnel Bowing and Area10. Musculoskeletal Manifestations of Systemic Lupus Erythematosus: An Imaging Overview

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to:1. Review the most frequent and also atypical presentations of musculoskeletal involvement of systemic lupus erythematosus (SLE). 2. Illustrate with didactic cases while discussing the imaging findings and main complications of these disease

TABLE OF CONTENTS/OUTLINE

Introduction: general presentation of the epidemiology and clinical findings of musculoskeletal involvement of systemic lupus erythematosus.Review the multi-modality imaging findings of musculoskeletal SLE with didactic illustrations. Present challenging cases with musculoskeletal manifestations related to systemic lupus erythematosus as insufficiency fracture, tenosynovitis, arthropathy, avascular necrosis, bone infarction, vasculitis and infection.Differential diagnosis including other inflammatory conditions and arthropathy helping the radiologist how to differentiate them. Shouldering the Burden: A Pictorial Review of Shoulder Arthroplasties

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Akwasi Opoku, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Advancements in shoulder arthroplasty has increased its use, particularly over the past two decades. The shoulder is the third most common replaced joint after hip and knee, with its overall incidence increasing at a greater rate than those of total knee and hip replacements. After viewing this exhibit, the learner should understand:1. Shoulder anatomy and biomechanics2. Indications for shoulder arthroplasty3. Role of preoperative imaging and measurements4. Advantages, disadvantages, and specific complications of various shoulder arthroplasties5. Normal imaging findings and imaging findings of complications

TABLE OF CONTENTS/OUTLINE

Introduction - history and evolution Shoulder anatomy and biomechanics1. Bones, joints, muscles, other soft tissues (cartilage, labrum, capsule)2. Unconstrained ball and socket, static and dynamic stabilizers Indications 1. Arthropathy, trauma, cuff pathology, osteonecrosis, prior infectionRole of preoperative imaging (multimodality)1. Evaluation of cuff, bone stock, cartilage2. Glenoid morphology and versionTypes of shoulder arthroplasties, indications, advantages, disadvantages 1. Humeral head resurfacing arthroplasty2. Hemiarthroplasty3. Anatomic total shoulder arthroplasty4. Reverse total should arthroplastyImaging appearances1. Normal and complications

Exchange Arthroplasty for Periprosthetic Joint Infection: What the Radiologist Needs to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Nicholas G. Rhodes, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Management of periprosthetic joint infection (PJI) is a complex task.2. The radiologist should be familiar with the varied constructs employed following resection arthroplasty for infection.3. The presence of polymethylmethacrylate bone cement is often the radiologist's initial clue to the presence of joint infection undergoing treatment.4. Serial radiographs play an important role in the management of periprosthetic joint infection.

TABLE OF CONTENTS/OUTLINE

1. Review imaging of PJI a. Role of radiographs b. Role of advanced imaging c. Role of joint aspiration 2. Review clinical features of PJI 3. Review treatment options for PJI 4. Discuss imaging related to various treatment options a. Review of imaging appearance during and after treatment of PJI at various joints i. Resected arthroplasty ii. Spacers iii. Articulating spacers iv. Destination spacers b. Review how the radiologist puts it all together i. Discuss clinical findings and thought behind and directing this process ii. Define the role of the radiologist iii. Define appropriate terminology concerning joint resection/prosthesis explantation and employed spacers iv. Highlight role of serial radiographs v. Highlight expected and unexpected imaging findings during this process

Intercondylar Notch Beyond the Cruciate Ligaments: Light at the End of the Tunnel

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Sergio Atala, MD, Las Condes, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The intercondylar notch is a commonly neglected area in the knee anatomy and in the assessment of radiologic studies. 2. Knowledge of the consistent normal anatomy of this notch is easily and swiftly assessed with several imaging modalities, particularly with MR Imaging. 3. Some anatomic variations should be well recognized, not be confused with pathologic conditions. 4. Meniscal root pathology is critical and dedicated examination in the MR Imaging studies is recommended. In the case of meniscal root tears LaPrade classification can be utilized preoperatively, with prognostic relevance. Surgical techniques for meniscal root tears are presented to be assessed in the postoperative MR Imaging studies. 5. Solid and cystic masses can be primarily originated in the intercondylar notch, and a brief pictorial review is presented. 6. The medial synovial fold of the posterior cruciate ligament is a well-recognized structure, and pathologic conditions are presented, with therapeutic implications.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Anatomy. 3. Interchondilar morphology and insertion (tibial / femoral) of intercondylar structures. 4. Tibial spine tubercules. 5. Changes in the anatomy of the intercondylar notch during lifetime. 6. Meniscal roots variants, tears and postoperative changes. 7. Ganglion cyst in meniscal roots. 8. Oblique meniscal ligaments. Meniscofemoral ligaments. 9. Ligamentum mucosum. 10. Synovial fringe. 11. Intercondylar mensical fragments. 12. Ganglion cysts. 13. Solid Masses. 14. Medial synovial fold PCL. 15. Conclusion.

The Multiple Applications of Dixon Sequences in Musculoskeletal MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit

Participants
Massimo Donalisio, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The Dixon method has gained much interest in musculoskeletal MRI, and many applications have been validated by the literature. The four sets of images generated by the Dixon technique can each provide specific qualitative or quantitative information, and they may serve to optimise acquisition protocols in various applications including bone marrow, whole body, oncological and rheumatological imaging. Water only images provide robust fat suppression that can be useful in large field of view applications or MRI of the extremities. Fat only images are particularly useful for the assessment of bone marrow lesions and may replace the information provided by T1-weighted sequences in certain indications. There are some pitfalls and disadvantages that radiologists must be familiar with.

TABLE OF CONTENTS/OUTLINE

1. Brief review of the physics of Dixon sequences: from one sequence to four sets of images; 2. Illustrated review of common applications of Dixon sequences in musculoskeletal practice: a) Fat suppression technique in extremities, large field of view applications (comparison to CHESS and STIR techniques), b) Spine and bone marrow imaging: advantages of the use of fat only images in replacement of T1 weighted sequences, c) Whole body MRI: the use of Dixon technique to optimise whole-body protocols with a focus on neuromuscular disorders, d) MRI in rheumatology: the use of Dixon sequences to scan more regions with less sequences, e) MRI of sarcomas: the benefits of including Dixon sequences in the acquisition protocol, f) The Dixon technique as a quantitative MRI tool to assess the fat fraction; 3. Pitfalls and disadvantages of Dixon sequences.

Mismatch Findings of WB DWI MRI and PET-CT in Oncology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTSTo evaluate the performance of WB-DWI MRI in the diagnosis and follow-up of cancer patients in situations of false positive or negative results in the PET-CT study (18F-FDG and PSMA). PET/CT is used in the evaluation of oncology patients to identify malignancy, but could be non-specific. Identify what sequences should be used to analyse bone marrow and soft tissue in whole-body MR imaging protocols to detect neoplasic lesions and pseudotumoral in oncological patients.To be aware of the conditions and the mechanisms by which false positive and negative results occur on 18F-FDG-PET-CTscans and to compare with WBMRI-DWI study.Make a pictorial essay of the main false false negative PET-CT PSMA cases comparing with WBMRI study. An understanding of the limitations of this nuclear medicine technology is necessary to avoid making inaccurate diagnosis and potentially limiting the right treatment for our patients.

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS AND OUTLINE1) The value of WB-DWI MRI IN in the diagnosis and follow-up of cancer patients.2) Case discussion to demonstrate 18F-FDG PET/CT false positive and false negative examples:Small lesions (less than 1,0 cm)Osteoblastic sclerotic metastasesPatient anxiety can result in increased uptakeBone marrow infiltrationLow grade lymphoma3) To demonstrate PET/CT-PSMA false positive and false negative examples:small tumorsneuroendocrine prostate tumorSmall tumors near bladder4) Common pittfalls5) Differential diagnosis6) Structured reporting step by step

Review of the Effects of Diabetes Mellitus on the Musculoskeletal System

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Participants
Jimmy Saade, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Epidemiology and financial burden of diabetes mellitus (DM).• DM affects nearly every organ system.• Beyond the well-known manifestations of diabetes, such as neuropathy and nephropathy, DM can also have damaging effects on the musculoskeletal (MSK) system.• As the prevalence of DM continues to increase, the lesser-known musculoskeletal complications are to increase as well.• We demonstrate some of these MSK manifestations. Early recognition and diagnosis of the many DM-related complications will lead to earlier intervention, and ultimately, less morbidity for patients and financial burden on the healthcare system.• DM-related disease entities discussed include osteoporosis, diffuse idiopathic skeletal hyperostosis (DISH), Dupuytren's contractures, trigger finger, rotator cuff tendinopathy, adhesive capsulitis, and calcaneal insufficiency fractures.• We demonstrate a multimodality approach to the diagnosis of these pathologies including MSK ultrasound.

TABLE OF CONTENTS/OUTLINE

• Diabetes Mellitus: Epidemiology and pathology.• DM-related osteoporosis and diagnosis with DEXA, radiographs, and CT.• DISH with imaging findings across multiple imaging modalities.• Dupuytren's contractures utilizing ultrasound for diagnosis.• Trigger finger with confirmatory findings on MRI.• Adhesive capsulitis and rotator cuff tendinopathy findings on MRI.• Calcaneal insufficiency fracture and confirmatory findings on CT and x-ray.• Conclusion.

Imaging of Calf Pain

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MK

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Allison Khoo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the muscular anatomy of the calf including the gastrocnemius, soleus, plantaris, and Achilles tendon. 2. Recognize subtle radiographic findings of calf and posterior ankle pathology such as obliteration of Kager's fat pad. 3. Develop a differential for calf pain spanning traumatic, metabolic, infectious/inflammatory, neoplastic, congenital, and vascular etiologies.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. Relevant anatomy: a. Kager’s fat pad on ankle radiograph: obliterated by pathology from adjacent structures including Achilles tendon, calcaneus, and tibiotalar joint. b. Review of gastrocnemius, soleus, and plantaris anatomy. 3. Case-based review of calf and posterior ankle pathology organized by etiology. a) trauma/overuse- Achilles tendinopathy and tear, Haglund deformity, Tennis leg/plantaris rupture. b) metabolic-xanthoma. c) infectious/inflammatory: myositis, rhabdomyolysis. d) neoplastic: sarcoma, lymphoma. e) congenital: accessory soleus, cortical desmoid. f) vascular: popliteal artery (aneurysm, entrapment, stenosis), deep venous thrombosis

MSEE-1 Pre-and Post Procedure CT for Cardiac Implantable Electronic Devices Extraction: A Primer for Radiologists

Participants
Samuel Cesconetto, MD, SAO PAULO, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learning objectives: - To review the principles of extraction technique and the role of computed tomography for planning the extraction of cardiac implantable electronic devices - To illustrate a spectrum of different complications related to cardiac electronic devices and their extraction - To discuss how to assess by imaging the risk of major complications during the procedure - To propose a systematic approach and a structured reporting.

TABLE OF CONTENTS/OUTLINE

Table of contents: - Introduction: - Cardiac implantable electronic devices: Overview, types, components, follow up and complications. - Extraction technique. - Patient selection. - CT: Acquisition protocol, image interpretation and clinical application. - Case-based review. - Pre-and postprocedure multidisciplinary assessment and complication score. - Proposal for a structured reporting. - Future directions and take home messages.

MSEE-11 MRI Safety: Bullets, Ballistics, Shrapnel

Participants
Kyle Stumetz, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In the United States, more than 100,000 patients per year present to the emergency room for gun-related trauma or other ballistic related injuries. Many of these patients may require an MRI (during the initial visit or years later), and thus the presence of retained bullet fragments and/or metallic shrapnel impose important safety concerns. With this information in mind, the goal of this presentation is to: 1) Review an algorithmic approach to imaging patients with suspected retained bullets and/or shrapnel. 2) Identify the most common types of bullets and projectiles, including their metallic compositions. 3) Explain commonly encountered MRI metallic artifacts and common techniques employed to diminish them. 4) Identify scenarios in which MRI imaging is and is not appropriate for retained bullet fragments via a case-based review.

TABLE OF CONTENTS/OUTLINE

1. Can my patient with a bullet in their _____ get an MRI? 2. Most common questions 3. Algorithmic Approach 4. Types of Projectiles 5. Bullet/Projectile Composition 6. MR Metal Artifacts 7. MR Metal Artifact Reduction Sequences (MARS) 8. Case-based review

MSEE-12 Genetics and Its Advances: What a Pediatric Radiologist Needs to Know?

Participants
Sara Rodriguez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. New advances and understanding in genetics is driving the diagnostic workup, management and clinical practice. 2. Learning the basic concepts of genetics can help radiologists to have a better understanding of diseases and their imaging characteristics, and help decide imaging workup and screening protocols.3. In this primer, we aim to provide basic concepts and terminology in genetics, to familiarize radiologists with different types of genetic testing and to understand the impact of genetics in different groups of pediatric diseases including cancers and cancer predisposition syndromes, skeletal dysplasia, vascular anomalies, autoimmune diseases and others.

TABLE OF CONTENTS/OUTLINE

IntroductionBasic concepts and terminology in genetics: Gene expression and regulation: from DNA to mRNA to amino acids to proteinGene inheritance, transmission and genetic imprintingGenetic dominance: genotype-phenotype relationships, phenotype variability Genetic mutationsGenes and diseases: monogenetic, chromosomal, multifactorial. Genetic testing: Molecular test (target single variant, single gene, gene panel, whole genome sequence)Chromosomal microarrayGene expression testBiochemical tests. Genetics in cancer predisposition syndromes: Tumor suppressor genes Proto oncogenesRadiological screening in cancer predisposition syndromes. Genetics in skeletal dysplasia: Skeletal dysplasia panelImplications on imaging. Genetics in vascular malformations: RAS/ MEK/ERK and PI3 kinase/mTOR signaling pathway. Genetics in autoimmune diseases. Genetics in other pediatric diseases. Summary

MSEE-13 Abdominal Abbreviated MRI Protocols: From Description to Implementation

Maria Tello, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the need of having abbreviated MRI protocols and describe their role.2. Explain the clinical scenarios where they can be applied.3. Describe how to perform some of these abdominal abbreviated MRI protocols4. Illustrate the workflow of how to implement the described above protocols

TABLE OF CONTENTS/OUTLINE

1. MRI nowadays, why to perform abbreviated protocols, advantages and disadvantages. 2. Description of the MRI situation at our institution, selecting the abbreviated protocols that we can benefit the most. 3. Description of the abbreviated MRI protocols we are going to implementPancreatic cystic lesions Liver metastases, including the role in colorectal cancerAdrenal incidentalomasActive surveillance for small renal masses4. Implementation at our institution, how we are going to do it? A brief guide step by step.

MSEE-14 DECT In The Emergency Room: Play Your Best Game and Leave It All Out On The Field!

Awards
Certificate of Merit

Participants
Kirbi Sullivan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Dual Energy CT (DECT) may aid in diagnosis for Emergency Department (ED) patients but is only impactful if radiologists maximize utilization of the extra information.2. Workflow changes are needed to optimally incorporate DECT into a busy ED.

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Discuss patient selection strategies for DECT from both the radiologist and technologist perspectiveb. Review high-yield DECT reconstructions to detect pathology and problem-solve2. DECT winsa. Avoiding downstream testingi. Differentiating between gastrointestinal bleeding and ingested contents, avoiding endoscopyii. Differentiating hematoma from tumor in a hypotensive patient with peritoneal carcinomatosisb. Expediting carei. Detection of postoperative hemorrhage on a portal venous phase CT, bypassing CT angiography for rapid embolizationii. Detection of early bowel ischemia on iodine maps, leading to rapid surgery and avoiding bowel resectioniii. Subtle fracture detection with bone marrow edema mapsiv. Active extravasation detection in intracranial hemorrhage on iodine maps3. DECT losses: underutilized information negatively impacted downstream testing and carea. Unnecessary testingi. Mischaracterization of suture material as active extravasation in a postoperative patient, leading to unnecessary angiographyii. Unnecessary workup of incidentalomas not fully characterized with DECT at the time of detectionb. Delayed carei. Missed subtle pyelonephritis, leading to a second ED visit 1 month later

MSEE-15 Recent Advances in Cardiothoracic Imaging

Participants
Joshua Hunter, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review novel techniques in cardiothoracic imaging and how they improve upon existing methodologies. 2. Discuss technical parameters and protocol considerations of the new techniques. 3. Illustrate use cases of novel cardiothoracic imaging techniques.

TABLE OF CONTENTS/OUTLINE

1. Discuss existing cardiothoracic imaging modalities and briefly cover the pathologies that they diagnose2. Discuss limitations of existing techniques3. Enumerate the new techniques in cardiothoracic imaging and how they alleviate some of the existing limitations4. Discuss technical and protocol implications of the new techniques5. Compare the advantages and disadvantages afforded by the new techniques, when compared to existing imaging methodologies6. Brief overview of several novel imaging techniques7. Novel Cardiothoracic Imaginga. Radiography i.Dual energy subtraction radiography (DESR)1. Bone-selective radiograph improves detection of bony lesions2. Soft tissue-selective radiograph eliminates potential for obstruction by bones ii.AI-enabled detection1. Thoracic Pathologies (Pneumothorax, Pneumonia)2. Lines and tube malpositioning (ET tube, Enteric tube) iii.AI-enabled prognostication1. COVID-19 patients needing urgent mechanical ventilation. CT i.Dual Energy CT ii.Photon counting CT iii.CT-FFR iv.AI-enabled tools1. Automated coronary artery calcium scoring2. Automated PE detection and nodule analysis on CTc. MRI i.Parametric mapping and ECV ii.MR Strain imaging iii.4D Flow MRI iv.PET/MRId. Ultrasound i.IVUS ii.3D Echocardiography8. Disadvantages of new imaging techniques9. Other emerging techniques currently in the research sphere; and not in clinical use10. Future goals and directions

MSEE-16 Low Field Body MRI: Challenges and Opportunities at 0.55T

Awards
Identified for RadioGraphics

Participants
Anup Shetty, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Low-field MRI (0.55T) for body imaging presents challenges and opportunities for patients, radiologists, and enterprises compared to high-field (1.5T or 3T) MRI. This exhibit will:1. Discuss imaging advantages and challenges of low-field body MRI compared to high-field body MRI2. Discuss logistical and workflow challenges of low-field body MRI compared to high-field body MRI3. Illustrate use cases, strategies, and nuances in low-field body MRI through a series of case examples

TABLE OF CONTENTS/OUTLINE

- Low-field MRI advantages: lower cost; easier installation (including lighter weight, less shielding, less helium), larger bore size, MR physics benefits (longer T2* [i.e., reduced susceptibility], lower SAR, shorter T1 [i.e., faster acquisition], easier shimming for B0 homogeneity), less acoustic noise- Low-field MRI challenges: lower SNR, fewer receiver coil options, weaker gradients, longer acquisition times, longer TE for chemical-shift imaging- Comparison of sequences across field strengths, highlighting key limitations and observations of each sequence at 0.55T- comparison of lesion conspicuity with example cases acquired at both low and high field strengths- discussion of sequence modifications and strategies at 0.55T to overcome imaging limitations and maintain comparable image quality- exploration of uses cases (lung imaging, pancreatic cyst follow-up, hepatic imaging after locoregional therapy, emergency imaging, adrenal/renal imaging, pelvic imaging, etc.)

MSEE-17HC Whole Body MRI In Children: A Primer for Beginners

Participants
Daniela Carrascal-Penaranda, MD, MSc, Bogota D.C, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

To explain the usefulness of Whole body MRI in the pediatric population, its utility and indications.To review basic concepts on used sequences and different protocols, which one is the most appropriate to make a successful evaluation of the body.To discuss and exemplify through cases the possible scenarios of imaging findings in patients with cancer and the broad spectrum of cancer predisposition syndromes.To discuss the principal indications of whole body MRI in infectious - inflammatory disease as well as in general population.

TABLE OF CONTENTS/OUTLINE

Introduction - Definitions.Applications and indicationsStandard protocol -Technical requirementsCancer predisposition syndromes Indications in non-oncological pathology: MiscellaneousIncidental findings and further implications to the patientStructured report in pediatricsSummaryConclusionsPlease visit the Learning Center to also view this presentation in hardcopy format.

MSEE-18 Imaging of Oncologic Pain: A Multi System Approach

Participants
Thais Kuwazuru, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibition is to:1. Review the current concepts about oncologic pain syndromes;2. Describe the role of imaging in oncologic pain, focusing on diagnosis;3. Correlate imaging findings with clinical syndromes and therapeutic strategies;4. Illustrate the causes of oncologic pain with illustrative cases.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION:a. Definitions and classification of oncologic pain;b. Impact of pain syndromes in patient quality of life and prognosis.2. ACUTE PAIN SYNDROMES:a. Associated with tumor: Tumor bleeding, pathologic fractures, obstruction and perforation of viscera, superior vena cava syndrome, acute thrombosis;b. Associated with treatment: Chemotherapy-induced neuropathy, radiation therapy-induced bone pain and plexopathy, oral mucositis, enteritis and proctitis.3. CHRONIC PAIN SYNDROMES:a. Somatic pain: Bone and soft tissue pain;b. Visceral pain: Abdominal pain syndromes;c. Neuropathic pain: Leptomeningeal metastasis, cranial and peripheral neuropathies;d. Headaches;e. Related to treatment: Post-chemotherapy, post-surgical and post-radiation pain syndromes;4. CONCLUSION:a. Pain assessment in cancer patients very often include imaging investigation;b. When interpreting imaging exams, it is essential to understand the imaging patterns of each syndrome and the important findings for therapeutic planning.

MSEE-19HC Strategies to Identify, Treat, and Eliminate MRI Radiofrequency Burns

Participants
Anshuman Panda, PhD, Scottsdale, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Thermal burns are a potential cause of injury during MRI scans. Recognition, diagnosis, and management of these burns can be challenging and may often go unrecognized.2. We implemented a multidisciplinary team, led by a radiology physician assistant, to help in the timely identification, assessment, and management of patients with suspected MRI burns.3. As a result of this initiative, we have collected numerous cases of MRI burns. In this exhibit, we will use these cases to demonstrate causes of MRI burns, physical findings of these burns, and discuss management strategies.

TABLE OF CONTENTS/OUTLINE

A. Background of MRI burns with an emphasis on physics aspect of burns and excessive power deposition.B. Pathophysiology of radiofrequency burns.C. Clinical presentation and treatment.D. Discussion of our local burn initiative including physical assessment of patients and the review by MR technologists and physicists to address root cause of burn cases.E. Case based review and management of burn cases identified in our practicePlease visit the Learning Center to also view this presentation in hardcopy format.

MSEE-2 Solitary Fibrous Tumor in the Brain, Head and Neck, and Spine: Basic and Advanced Neuroimaging

Awards
Certificate of Merit

Participants
Ryo Kurokawa, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibit is to1. Review the etiology, histology, and epidemiology of solitary fibrous tumor (SFT) in the brain, head and neck, and spine2. Demonstrate the imaging characteristics on the conventional modalities/sequences3. Show how advanced modalities/sequences can help diagnose SFT

TABLE OF CONTENTS/OUTLINE

Content organization1. Introduction-Etiology, histology, and epidemiology of SFT in the brain, head and neck, and spine 2. Typical imaging findings 3. Advanced imaging-MRS-Diffusion-weighted imaging-Contrast-enhanced perfusion-weighted imaging-FDG-PET 4. Atypical imaging findings-Atypical localization: Cavernous sinus, Orbit-Atypical manifestation: Metastasis, Doege-Potter syndrome, Intracranial hemorrhage 5. Differential diagnosis-Various neoplasms 6. Summary

MSEE-20 The Forgotten System: Lymphatics of Abdomen and Pelvis

Participants
Rodrigo Loto, MD, Rosario, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Presentation of the organization and function of the lymphatic vascular system.-Overview of lymphatic vascular development (lymphangiogenesis).-Importantly, lymphangiogenesis occurs in adult tissues during inflammation, wound healing, and tumor metastasis.-Radiology is playing an important and growing role in the diagnosis and treatment of many lymphatic conditions.

TABLE OF CONTENTS/OUTLINE

Studies of the last decades have revealed the importance of angiogenesis for normal growth and for the pathogenesis of numerous diseases. Much less studied is lymphangiogenesis , the growth of lymphatic vessels, which drain extravasated fluid, proteins, and cells and transport them back to the venous circulation. Nonetheless, insufficient lymphangiogenesis causes incapacitating lymphedema, while lymphatic growth around tumors may facilitate metastatic spread of malignant cells that ultimately kill the patient.During inflammation, lymph flow increases to limit edema and prevents tissue antigen-presenting cell transport. Lymphatics also adjust their contractile activity to increase fluid transfer during acute inflammation. Conversely, chronic inflammation can provoke lymphostasis, which might limit pathogen spread within the circulation; however, decreased lymph flow leads to the persistence of immune cells and mediators in tissues to intensifying injury.Knowledge of lymphatic anatomy, physiology, and expected imaging appearances is crucial in understanding the pattern of cancer spread.Lymphatics have been proposed as transphrenic dissemination pathway for multiple phenomena, including neoplasms, septic processes, urinothorax, and porous diaphragm syndromes.

MSEE-21 Not Too Young to Know: Multimodality Imaging Review of Commonly Encountered Pathologies in Institution-Living Elderly

Participants
Andy Guo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Define the institutional elderly patient population and explain how they are a vulnerable population2- Learn about common pathologic conditions specifically affecting the institutional elderly3- There are special considerations in clinical and imaging approach for evaluating these patients that are different from the general population including compassionate care, imaging techniques and accounting for limitations in the institutional elderly

TABLE OF CONTENTS/OUTLINE

1- Review examples of common pathologies in the institutional elderly, including but not limited to:Musculoskeletal- falls and traumaInfectious disease- aspiration pneumoniaGastrointestinal- chronic constipationGenitourinary- incontinenceDrug Toxicity- confusion and over-sedationNeurological- dementia and strokeUnderlying Medical Condition- heart failure, hypertension and type 2 diabetes2- Describe specific imaging findings in evaluation of example pathologies, with teaching points about underlying pathophysiology3- Review special considerations that radiologists and technologists must make in evaluating this vulnerable patient population to align with compassionate care

MSEE-23 Lymphatics: Imaging and Interventions- A Comprehensive Review

Participants
Smily Sharma, MD, MBBS, Jodhpur, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To study the anatomy of the lymphatic system and its pathophysiological basis 2. To study in detail the methodology and protocols of MR and Conventional Lymphangiography 3. To discuss imaging features of various disorders of the lymphatic system including macrocytic, microcystic, mixed lymphatic malformations, renal lymphangiectasia and syndromes associated with lymphatic disorders 4. To discuss imaging features of congenital abnormalities of lymphatics like vanishing bone disease, primary lymphedema 5. To discuss imaging features of acquired lymphatic disorders like chyle leak, pulmonary lymphatic perfusion syndrome, and the role of MR and conventional lymphangiogram in these disorders using state of the art cases 6. To discuss the role of Interventional Radiology in the management of lymphatic disorders including sclerosing agents and thoracic duct embolization

TABLE OF CONTENTS/OUTLINE

1. Anatomy of Lymphatic System and Pathophysiological Basis of Lymphatic Disorders 2. Conventional Lymphangiography: Method 3. MR Lymphangiography: Method and Protocols 4. Lymphatic Malformations 5. Renal Lymphangiectasia6. Syndromes associated with Lymphatic disorders 7. Congenital Lymphatic Disorders: Generalized Lymphatic Anomaly, Gorham Stout Disease, Primary Lymphedema 8. Acquired Lymphatic disorders: chyle leak, pulmonary lymphatic perfusion syndrome, secondary lymphedema 9. Interventional Radiology in treatment of lymphatics: Sclerosing Agents, Thoracic Duct Embolization 10. Summary

MSEE-24 Free-Breathing T1-Weighted Motion Correction in Abdominal MRI: Technical Principles, Applications, and Current Limitations

Awards
Identified for RadioGraphics

Participants
Ebru Yaman Akcicek, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the technical principles of free breathing T1 weighted pulse sequences 2. Learn the difference between non-dynamic and dynamic contrast enhanced acquisitions using radial k space trajectories 3. Examine the currently established indications for motion corrected contrast techniques 4. Discuss limitations of current free breathing techniques and accelerated cartesian acquisitions 5. Learn how to identify the best patient-adapted protocol strategy 6. Review newly emerging techniques for motion reduction

TABLE OF CONTENTS/OUTLINE

1. Principals of radial imaging: description of radial k-space trajectories (stack of stars) 2. Dynamic contrast acquisitions with view sharing 3. Abdominal applications of free breathing motion correction indications in liver, pancreas and kidneys 4. Strategies for patient-adapted abdominal examination protocols using free breathing techniques 5. Limitations of motion correction techniques, and mitigation strategies 6. Novel developments of free breathing pulse sequences

MSEE-25 Focusing the Retrospectoscope: Challenging and Easily Overlooked Patterns of Recurrence and Metastases in Abdominopelvic Oncologic Imaging

Participants
Molly Roseland, MD, Northville, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Accurate recognition of recurrent and metastatic cancers by CT, MRI, and PET/CT may be challenging. 2. Post-surgical scarring and distortion is a common mimic of recurrence. Enlarging enhancing tissue should be considered suspicious. 3. Common features of missed recurrent malignancy include small size, slow or infiltrative growth pattern, obscuration by irregular surgical margins, or location in an imaging "blind-spot." Comparisons over time, surgical history, and thorough search pattern are essential. PET may improve detection.

TABLE OF CONTENTS/OUTLINE

1. General principles: use history, many comparisons 2. Individual Cancer Recurrence Patterns A. Pancreatic adenocarcinoma -Recurrence: perivascular cuffing, pancreatic mass; Mimic: Post-Whipple fibrosis -Metastases: peritoneum, liver; mimic: fat necrosis, micro-abscesses B. Cholangiocarcinoma -Recurrence: mass at surgical margin, biliary stricture; mimic: postsurgical change, cholangitis C. Colorectal cancer -Recurrence: perianasatomotic, lymph nodes; mimic: scarring (presacral) D. Renal cell carcinoma -Recurrence: surgical bed, IVC; Pitfall: post-treatment change (noncontrast) -Metastases: Adrenal, pancreas (unique), bone; Pitfall: Small; no arterial-phase; adrenal washout E. Bladder cancer -Recurrence: ureteral stricture, mass; Mimic: Reflux post-cystectomy F. Prostate cancer -Local Recurrence; PSMA PET Pitfall: obscuration by urinary excretion -Metastases: bone, lymph nodes; Pitfall: epidural extension, fracture; Pitfall: rare sites (sacral nerves, penis) 3. Summary and recommendations

MSEE-26 Lymph Nodes in Abdominal and Pelvis Neoplasms: Evaluation From Stagng to Post - Treatment: Messengers of the Force or Dark Side Sentinel?

Awards
Certificate of Merit

Participants
Thamiris De Sousa Garcia, MD, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Use of different imaging methods to assess lymph nodes for tumor dissemination, what each method can add and how to proceed for further investigation. - Evaluation of heterogeneity of staging criteria and treatment response of lymph nodes involved in abdominal and pelvic neoplasms. - Better understanding of regional lymph nodes involved in different neoplasms, with revision of the anatomy of lymph node chains and dissemination routes.

TABLE OF CONTENTS/OUTLINE

- Introduction - Lymph nodes of abdomen and pelvis: anatomy. - Evaluation of lymph nodes using different imaging methods: findings of normality and criteria for tumor involvement. - Staging of the main neoplasms of the abdomen and pelvis with characterization of regional involvement and dissemination pathways, as well as its particularities. - Comparison between different types of methods and criteria for evaluating lymph node response to surgical and non-surgical treatment. - Teaching points.

MSEE-27 Flap Anatomy After Pelvic Reconstructive Surgery: A Brief Survival Guide

Participants
Paula Otermin Barrera, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe in a practical way the resulting anatomy after various flap-based reconstructive surgery techniques, as well as potential complications, providing specific iconography selected from our tertiary referral center, with special emphasis on myocutaneous flaps and their application in pelvic reconstruction after oncological resections

TABLE OF CONTENTS/OUTLINE

1. Introduction. Definition of flap and benefits provided by flap coverage.2. Types of flap according to their vascular anatomy and tissue composition.3. Myocutaneous flaps. Imaging characteristics and applications in pelvic reconstruction of rectus abdominis muscle flaps (TRAM, VRAM and variants) and gracilis muscle flaps. 4. Omental flap.5. Deep Inferior Epigastric Perforator flap (DIEP). Preoperative CT study for selection and marking of optimal perforators. Imaging characteristics and applications in pelvic reconstruction.6. Complications (flap and donor area): post-surgical fluid collections and surgical wound infection, fat necrosis, flap ischemia, dehiscence, tumor recurrence.

MSEE-28 Ciliopathy Syndromes: Pathogenesis and Multisystem Multimodality Imaging Review

Participants

Yarik Bezkor, BS, MD, Lexington, KY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points: 1. Ciliopathies are a diverse group of disorders occurring secondary to abnormal development and/or structural or functional defects of the cilia. 2. Cilia are highly evolved, complex organelles, found ubiquitously on the surface of almost all the cell types, and have diverse mechanosensory and chemosensory signal transduction roles and there have been significant recent advances in the understanding of these key organelles.3. Ciliopathy syndromes affecting non-motile cilia are associated with multisystem developmental disorders predominantly affecting renal, skeletal, and nervous systems.4. Renal ciliopathies are the most common which include autosomal polycystic kidney disease, and nephronophthisis, Ciliopathy syndromes associated with neurodevelopmental features include Meckel-Gruber syndrome, Joubert syndrome, orofacial digital syndrome as well as Bardet-Biedl syndrome. Motile ciliopathies, grouped as "primary ciliary dyskinesia" most commonly present as Kartagener's syndrome.5. Multimodality imaging with Ultrasound, CT, and MRI is crucial for the diagnosis and management of these syndromes.

TABLE OF CONTENTS/OUTLINE

1. A. Embryology and pathogenesis of ciliopathy syndromes 2. B. Multimodality imaging of Motile and non-motile ciliopathy syndromes.

MSEE-29 New CT Technology: A Practical Approach to Convert CT Acquisition Protocols from Energy Integrating Detector (EID) CT to Photon Counting Detector (PCD) CT

Participants
Nikkole Weber, ARRT, RT, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Explain the differences between energy integrating detector (EID) and photon counting detector (PCD) technologies 2. Understand critical differences in PCD technology that need to be taken into account when designing PCD scanning acquisition protocols.

TABLE OF CONTENTS/OUTLINE

1. Explain differences between PCD and EID technologies used on commercial CT scanners a. PCD: Directly convert X-ray into electronic signals, count individual photon and record its energy b. EID: Indirect, 2 stage conversion of X-ray of light to electronic signal. No information on individual photon energy 2. Create a core team of experts a. Medical Physicists b. CT technologists c. Subspecialized radiologists 3. Explore new CT scanner technology and its benefits 4. As a practice, decide protocol conversion approach: a. Apples-to-apples: i. Acquisitions with similar appearance and diagnostic quality as current EID CT b. Apples-to-oranges: i. Acquisitions leveraging technical advantages of PCD technology (high matrix, sharper kernels, higher IR) 5. Define parameters that do not allow an apples-to-apples protocol conversion a. Scan modes (high res, multi-energy, combined-lower kV) b. Conventional tube potential selection (conventional) vs. Virtual monoenergetic selection (PCD) c. System-specific reconstruction kernels and reconstruction nomenclature 6. Protocol evaluation through image review sessions a. Define two lists of protocols i. Commonly used protocols in your practice ii. Protocols or indications that would benefit from new technology b. Change acquisition and reconstruction parameters, iteratively reevaluating images with core experts

MSEE-3 Don't Burst That Bubble!: A Guide to Skin Cysts

Participants
Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS1) Palpable skin lesions are a common complaint in dermatology offices and ultrasounds are often requested to clarify the origin.2) High-frequency ultrasound is the imaging modality chosen for skin examination due to its cost and availability.3) Cutaneous cystic lesions are very common and have specific characteristics that help in the diagnosis.4) Make a pictorial essay of the main cutaneous cysts and their differential diagnoses, such as trichilemmal cyst, dermoid cist, epidermic cyst, and hidradenoma.

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE1) Overview of cystic structures and their definition;2) High-frequency ultrasound of cystic skin lesions - epidermal cyst and hidradenoma;3) Trichilemmal cyst and dermoid cyst;4) Report structuring step by step;5) Differential diagnosis.

MSEE-30 Thinking IN and OUT of the Box: Using Chemical Shift Imaging as a Problem-Solving Tool

Participants
Anthony Larder, DO, Milford, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review basic physics concepts of chemical shift and magnetic susceptibility in MRI-Discuss tissue characteristics that can be used for diagnosis with chemical shift imaging including: macroscopic fat, microscopic fat, calcifications, gas, and iron-Review imaging findings and associated pathophysiology of multiple scenarios in which chemical shift artifact aids in diagnosis

TABLE OF CONTENTS/OUTLINE

Review of physics concepts related to chemical shift imaging including original illustrations and relevant case examples-Precession of fat and water-Signal characteristics and physical properties of Type 1 and Type 2 chemical shift artifact-Liver fat quantification-Magnetic susceptibility-T2* decay based on TE-Properties of diamagnetic, paramagnetic, and ferromagnetic substances-Liver iron quantificationReview of chemical shift as a diagnostic tool, including differential diagnoses, discussion of relevant pathophysiology, and clinical issues. Case examples including-Macroscopic fat:-Renal angiomyolipoma-Mature teratoma-Liposarcoma-Fat-containing hepatocellular carcinoma-Microscopic fat:-Hepatic steatosis-Nodular-Companion case of hepatic melanoma metastases -Hepatic adenoma-Adrenal adenoma-Metastatic marrow replacement -Fat-containing hepatocellular carcinoma-Magnetic Susceptibility:-Iron deposition-Primary hemochromatosis-Hemosiderosis-Gamna-Gandy bodies-Hepatic siderotic nodules-Including case of Wilson's disease with siderotic nodules-Metallic Susceptibility-Surgical clip localization-Calcifications-Cholelithiasis-Nephrolithiasis-Blood

products-Gas-Within infected pancreatic necrosis-Pneumoperitoneum-Pneumobilia

MSEE-31 Introduction to Oncology Imaging: A Primer For Residents and Fellows

Participants
Jordan LeGout, MD, Ponte Vedra Beach, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learning to interpret oncology imaging can be a complex and daunting topic for residents and fellows. In this exhibit we will:-Provide a framework for approaching oncology cases for the trainee-Review the various tumor response criterion and their main takeaways for clinical use-Discuss differences in imaging assessment for chemotherapy and immunotherapy-Examine imaging response for local-regional therapies-Highlight the benefit of high-yield disease specific search patterns

TABLE OF CONTENTS/OUTLINE

1. Introduction a. Role of radiologist and importance of imaging in patient care b. Words matter! "Loaded words" and definitions i. Stable, response, progression2. Clinical history (the "what, when, and how") a. Key history elements to know for each case i. Original presentation 1. Always review the first scan = Each case a teaching file! 2. Establishes disease appearance and sites pre-therapy ii. Therapy type 1. Start date 2. How treatment type influences image interpretation iv. Time crunch: what are the highest yield priors v. Tumor markers and trend3. Tumor response criteria (the takeaways) a. RECIST 1.1 b. mRECIST c. iRECIST d. Choi e. Cheson/Lugano4. Immunotherapy a. Pseudoprogression b. Unique adverse effects5. Local-regional therapies a. Ablations and embolizations b. Radioembolization6. Disease specific high-yield search patterns a. Examples of common malignancies

MSEE-32 The Role of the Radiologist in LGBTQ+ Patient Care: A Comprehensive Curriculum

Participants
Janis Yee, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Understand the radiologist's role in delivering inclusive and culturally sensitive care to LGBTQ+ patients. ? Understand the current cancer screening guidelines for transgender patients. ? Recognize the normal postoperative appearance and postoperative complications related to gender affirmation surgeries. ? List complications related to hormone therapy, including increased risk of venous thromboembolism, ischemic heart disease, cerebrovascular events, and hormone-sensitive organ atrophy or cancers. ? Recognize complications related to HIV and highly active antiretroviral therapy (HAART).

TABLE OF CONTENTS/OUTLINE

? Background and definitions of LGBTQ+ ? Challenges to caring for the LGBTQ+ community ? Discuss imaging relevant to trans patients ? Preoperative imaging in planning for feminization surgery ? Preoperative imaging in planning for masculinization surgery ? Postoperative complications in gender-affirming surgery ? Normal appearance of feminization and masculinization after medical transition ? Complications of gender-affirming hormone therapy ? Provide an overview of imaging findings in lesbian, gay, bisexual, and queer patients related to stigmatized health concerns such as STDS, substance abuse, and certain types of cancer ? Review complications from common preventative medications prescribed to patients, for example, pre-exposure prophylaxis (PrEP) ? Qualitatively assess the availability of multidisciplinary care to LGBTQ+ patients at three different academic institutions across the country ? Discuss how radiology departments can improve their role in the care of this patient population ? Conclusion

MSEE-33 Skin Ultrasound in Lipolytic Aesthetic Procedures

Participants
Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Lipolysis and lipolytic aesthetic procedures are increasingly being performed, and minimal invasive types are preferable. Nonsurgical body contouring techniques, aimed at reducing the subcutaneous adipose tissue, includes cryolipolisis, injectable lipolytic (meso-therapy), low and high-intensity focused ultrasound and others therapies. In this context, the radiologist has been requested to recognize their usual aspects as well as to assess possible complications. To achieve accurate and timely detection and appropriate approach of each case, High frequency ultrasound (HFUS/24-33MHz) is the most effective method since it provides optimal anatomical information of the skin and allows evaluation before, during and after these procedures. This study aims to discuss and illustrate the radiologist's role in the evaluation of lipolytic aesthetic procedures with HFUS. The purpose of this exhibit is:- To describe the preprocedure evaluation.- To illustrate the anatomy of the skin layers.- To show the main image patterns and effects of the lipolytic aesthetic procedures.- To list and describe the most common procedures complications.- To highlight the importance of HFUS before, during and after nonsurgical body contouring techniques.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION.2. NORMAL ANATOMY.3. PREPROCEDURAL EVALUATION.4. PROCEDURES CHARACTERISTICS AND IMAGING FINDINGS5. COMPLICATIONS.6. PROCEDURE GUIDANCE.7. CONCLUSION.

MSEE-34 Polyps From Head to Toe: What's Your Impression?

Participants
Carlos Padula, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To understand the pathophysiology of polyps. To review most common presenting locations. To review imaging features of polyps across multiple modalities including ultrasound, fluoroscopy, CT, and MRI. To review differential diagnoses of polypoid lesions. To review current guidelines and literature regarding management of polyps.

TABLE OF CONTENTS/OUTLINE

1. Pathophysiology of polyps. 2. Anatomical locations 3. Imaging features of polyps 4. Case examples: Aural, sinonasal, oropharyngeal, vocal cord, esophageal, gastric, gallbladder, small bowel, colorectal, endometrial, and cervical.

MSEE-35 Metabolic Syndrome: Imaging Features and Clinical Outcomes

Participants
Mohamed Badawy, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Discuss obesity prevalence and different types of fat distribution - Review imaging techniques used to evaluate the obesity effects on different body organs - Describe clinical outcomes and imaging artifacts related to obesity Table of content

TABLE OF CONTENTS/OUTLINE

- Introduction- Differences between white and brown fat and between central and peripheral adipose tissue- Methods of obesity evaluation and the superiority of anthropometric measurement over body mass index (BMI) - Imaging quantitative assessment of visceral fat volume - MetS effects on the o Liver § Imaging used to diagnose non-alcoholic fatty liver disease including ultrasonography (ULS), elastogrophy, magnetic resonance (MR) spectroscopy, MR proton density fat fraction § Liver fat quantification o Pancreas § Imaging features of pancreatic infiltration and its mimics o Heart § Imaging and clinical effects of increased epicardial fat o Gastrointestinal tract § CT and MR appearances of fat deposition (e.g submcosal fat deposition, diffuse fat lipomatosis and fat halo sign) o Urinary tract § Imaging and mimics of fat deposition in the urinary bladder wall o Lumbosacral edema § Imaging features of lumbosacral edema correlated with MetS o Tumors development in different body organs § Malignances associated with obesity and their imaging features - Obesity Imaging artifacts - Obesity surgery pre and post-operative imaging

MSEE-36 A Confusion of Wild Catheters: A Review of Abdominal Medical Devices

Participants
Victoria Kim, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Recognize the normal appearance of various abdominal devices on multi-modality imaging.2. Identify potential complications related to abdominal devices which may have acute clinical implications.

TABLE OF CONTENTS/OUTLINE

I. Background: In the continuously changing landscape of medicine, abdominal imaging often captures a wide variety of medical devices. These can be bewildering when seen for the first time, especially for residents early in training. Recognizing potential complications related to unfamiliar devices is an even greater challenge but can have acute clinical implications for patient safety and outcomes.II. Gastrointestinal tract devices: Traditional enteric catheters; Gastrostomy/gastrojejunostomy tubes; Gastrointestinal and biliary stents.III. Genitourinary devices: Ureteral stents; Nephrostomy tubes; Contraceptive devices; Prosthetics.IV. Vascular devices: IVC filters; Vascular stents and grafts; ECMO cannulas and other vascular catheters; Ventricular assist device drivelines.V. Miscellaneous devices: Spinal catheters; Electronic stimulator devices; Peritoneal dialysis catheters; Surgical clips, sutures, and drains.

MSEE-37 Multimodality Imaging in Metabolic Syndrome: A State-of-the-Art Review

Awards
Cum Laude
Identified for RadioGraphics

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the etiology and complications of metabolic syndrome 2. To understand the role of multimodality imaging in metabolic syndrome 3. To illustrate the utility of imaging in diagnosis of metabolic syndrome and assessment of target organ injury

TABLE OF CONTENTS/OUTLINE

• METABOLIC SYNDROME- Definition and criteria • CAUSES AND RISK FACTORS • ROLE OF IMAGING - Diagnosis, target organ injury assessment, biomarkers for novel therapy • MODALITIES- CT, MRI (including MR spectroscopy, Elastography, PET/MRI), nuclear medicine, Ultrasound, DXA • FAT ASSESSMENT - Subcutaneous abdominal fat - Visceral abdominal fat- US (thickness, fat index), CT (inc single slice CT) MRI (FSE, chemical shift, fat selective), DXA - Parenchymal fat- MRS - Fat around organs- Eg. Pericardiac fat (echo, CT/MRI) - Fat around vessels- CT, MRI, 1H-MRS • INSULIN RESISTANCE - Intramyocellular lipid in skeletal muscle biopsy, 1H- MRS - Glucose metabolism using 18F-FDG PET, dynamic triple-tracer PET with 15O-H20, 11C-3-0-methylglucose, and 18F-FDG • TARGET ORGAN INJURY - Vessels- Atherosclerosis, elevated arterial stiffness- Doppler, CT, MRI - Cardiac- Dilation/hypertrophy, diastolic dysfunction, impaired strain, coronary atherosclerosis, ischemic heart disease- Echo, CT, MRI, Nuclear perfusion - Liver- Nonalcoholic fatty liver, cirrhosis- Ultrasound, CT, !H- MRS, Dixon MRI, 31P- MRS, MRI, MR Elastography, US elastography - Pancreas- Fatty disease- US, CT, MR, 1HMRS - Kidney- Chronic renal disease, renal stone- Ultrasound, CT, MRI, 99mTc-DTPA, dynamic CE- MRI, ASL-MRI, DWI, BOLD-MRI - Brain- Cognitive impairment, dementia, stroke- MRI, DTI, MTI, 18F-FDG PET • ALGORITHMIC APPROACH for diagnosis and target organ injury assessment

MSEE-38 Imaging Spectrum of Amyloidosis: What A Radiologist Should Know ?

Participants
Smily Sharma, MD, MBBS, Jodhpur, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Using a case-based approach: 1. To study the types of Amyloidosis and their pathophysiological basis 2. To study the imaging manifestations of Amyloidosis from head to toe. including CNS, Cardiothoracic, gastrointestinal and visceral manifestations 3. To study in details features of Airway and Pulmonary Amyloidosis 4. Using state of the art cases, discussing the role of Cardiac MRI in Amyloidosis including recent advances like T1 mapping

TABLE OF CONTENTS/OUTLINE

1. Amyloidosis: Classifications and Pathophysiological basis 2. CNS Manifestations of Amyloidosis 3. Airway Amyloidosis 4. Pulmonary

1. Amyloidosis: Classifications and Pathophysiological basis 2. CNS Manifestations of Amyloidosis 3. Airway Amyloidosis 4. Pulmonary Amyloidosis5. Cardiac Amyloidosis: Role of Cardiac MRI, Spectrum of cases, Differentials 6. GIT manifestations of Amyloidosis: Imaging features of Tongue, Esophagus, Stomach, Bowel involvement 7. Visceral Manifestations: Hepatosplenomegaly, Renal Involvement 8. Complications and Prognosis 9. Summary 10. References

MSEE-39 Imaging Features of Erdheim-Chester Disease

Awards
Certificate of Merit

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the pathogenesis and epidemiology of Erdheim-Chester disease; 2. Discuss possible clinical presentations and main organ systems affected; 3. Describe main imaging findings and modalities used in suspected diagnosis and follow-up; 4. Provide an overview of the main currently available therapies and their side effects

TABLE OF CONTENTS/OUTLINE

1. Pathogenesis, epidemiology, and clinical manifestations; 2. Role of imaging in diagnosis and follow-up, including main radiological findings: (a) Radiographs (eg, bilateral, symmetric, preponderance for lower extremities); (b) Bone scan (eg, lower extremity metaphysis diaphysis); (c) Whole body PET-CT (eg, avid 18F-FDG activity in the affected regions); (d) MRI brain orbits (eg, absence of pituitary bright spot on T1-weighted images, posterior fossa T2-hyperintense white matter lesions); (e) Cardiac MRI/CT (eg, right atrial pseudotumor, thickened interatrial septum); (f) CT chest, abdomen pelvis (eg, periaortic perinephric infiltration, ie, "coated aorta" "hairy kidney); 3. Definitive diagnosis including markers and specific mutations (eg, BRAF V600E); 4. Management of symptomatic versus asymptomatic patients; 5. Targeted (eg, BRAF and MEK inhibitors) and non-targeted (eg, steroids, interferon-a, pegylated-interferon alfa-2a, IL-1 inibitors, cladribine, etc) therapies

MSEE-4 Diverse Spectrum of Visceral and Somatic PEComas: Current Update on Pathology and Cross-sectional Imaging Findings

Participants
Akhilesh Pillai, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the taxonomy, epidemiology, clinical features, histopathology and biology of the diverse spectrum of PEComas.2. Describe the salient multimodality cross-sectional imaging features of these tumors.3. Review the genetics, management and prognosis of these tumors.

TABLE OF CONTENTS/OUTLINE

1. Introduction, epidemiology and clinical features.2. Histopathology, immunocytochemistry and molecular pathology.3. CT, MR and PET/CT imaging features and tumor biology of wide spectrum of PEComas.4. Prognosis and management.5. Diverse group of PEComas of varying biological potential.6. Heterogeneous imaging characteristics of tumors; advanced pathology techniques permit definitive diagnosis.7. Accurate diagnosis is essential for optimal treatment and management.8. Conclusion

MSEE-40 The Invasion of Fat-Silent and Dangerous: A Radiologic-Pathologic Correlation of Lipo-sarcoma in Usual and Unusual Locations

Participants
Nancy Margarita Gutierrez Castaneda, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To describe the general characteristics and subtypes of the liposarcoma.-To review liposarcoma subtypes and imaging characteristics for each subtypes.-To know clinical features and pathogenesis of liposarcoma.-To identify the imaging characteristics for each liposarcoma subtypes and all the radiological modalities (X-ray, CT- scan, PET-CT, SPECT-CT and others).-To associate the clinical presentation, the radiological studies and the histopathological result.-To discuss the appropriate management and follow u of the liposarcoma based on recent literature guideline and expert opinions.

TABLE OF CONTENTS/OUTLINE

-Introduction-General features of liposarcoma How to identify it?-Liposarcoma background and molecular pathogenesis-Usual and unusual locations of liposarcoma-Clinical presentation-Imaging findings and pathology of different subtypes of liposarcoma(Well-differentiated, dedifferentiated, myxoid, pleomorphic)-Ilustrative pathological cases-Appropriate management and follow up of the liposarcoma-Conclusion

MSEE-41 Li Fraumeni Syndrome (LFS): Multimodality Imaging Features from Head to Toe and Imaging Guidelines

Awards
Identified for RadioGraphics

Participants
Babina Gosangi, MD, MPH, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• LFS occurs due to TP53 mutation, is transmitted in an autosomal dominant mode and is associated with early onset of cancers and more than one cancer in a lifetime.• The most common tumors associated with LFS are Sarcomas, Leukemia, Adrenocortical carcinoma and Breast tumors (SLAB syndrome).• Individuals with LFS are screened from childhood for early detection of cancer with imaging including annual MRI brain, annual whole-body MRI, ultrasound of the abdomen every 3-4 months in children and once in 6 months in adults, annual breast MRI in women older than 20 years.

TABLE OF CONTENTS/OUTLINE

Imaging guidelines for LFS Head to toe description of tumors based on location• Brain tumors- medulloblastoma, glioblastoma, meningioma, choroid plexus carcinoma• Breast tumors- phyllodes tumor• Chest tumors- lung cancer, thymoma, thyroid cancer• Abdomen tumors- adrenocortical carcinoma, renal cell cancer, colon cancer, pancreatic cancer• Pelvic tumors- Ovarian cancer, testicular cancer, prostate cancer• Musculoskeletal- rhabdomyosarcomas, osteosarcomas• Skin cancer- melanoma• Others - Leukemia

MSEE-42 Don't Forget About Abdomen Radiographs Just Yet: Take Advantage of Natural "Contrast Agents"

Awards
Identified for RadioGraphics

Participants
David Disantis, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

As of 2019, in the U.S. alone, 10.1 million abdomen radiographs were performed. Being able to interpret them is still relevant.Abdominal radiographs have 3 innate "contrast agents" as clues to diagnoses: Gas: Normal (bowel gas) and abnormal (extra-luminal, mural pneumatosis, portal venous, biliary, abscess). Calcium: Benign (calculi, vascular, inflammatory, neoplasms) and malignant. Fat: Around things (organomegaly, masses) and in things (benign and malignant neoplasms)• Case-based examples will illustrate each

TABLE OF CONTENTS/OUTLINE

1. Recognizing the normal abdomen film 2. Clues from gas as "contrast": bowel obstruction/ileus, pneumoperitoneum/retroperitoneum; bowel/gallbladder/kidney/bladder pneumatosis, abscess.3. Clues from calcium as "contrast": urinary tract and biliary calculi, milk of calcium, nephrocalcinosis, porcelain gallbladder, calcified neoplasms.4. Clues from fat as "contrast": outlining organomegaly and masses; within masses.

MSEE-43 Abdominopelvic Applications for Intra-operative Ultrasound

Participants
Omar Shwaiki, MD, Canton, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

Intraoperative ultrasound (IOUS) is a useful technique that a radiologist can leverage to add value to his/her practice. The use of high frequency probes, often directly upon the organ of interest, allows one to obtain crisp images at resolutions not possible with other modalities. The use cases for IOUS are numerous but generally include localization and marking of lesions, lesion characterization, and survey for metastases. IOUS may also be used to facilitate intraoperative biopsy and/or device placement.

TABLE OF CONTENTS/OUTLINE

1) Provide overview of IOUS equipment and describe appropriate sterilization procedures for both the equipment and the radiologist. 2) Illustrate intraoperative ultrasound techniques and describe the advantages and disadvantages of each. Where appropriate, describe the relevant ultrasound anatomy. 3) Provide case examples of intraoperative ultrasound utility of various organ systems including the liver, pancreas, kidneys, and female pelvis.4) Describe limitations and pitfalls of intraoperative IOUS.

MSEE-44 Bone Marrow Lesions on MRI: A Proliferative Discussion

Participants
Blake Marmie, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Highlight the World Health Organization (WHO) classification scheme of myeloid and lymphoid neoplasms. 2. Review magnetic resonance imaging (MRI) techniques and approaches for evaluating bone marrow disorders. 3. Discuss imaging features of common marrow disorders and provide an imaging-based stratification approach via illustrations and case examples. 4. Provide a suggested imaging lexicon of common marrow lesions that allows for conforming radiology to the histopathology classification of marrow lesions.

TABLE OF CONTENTS/OUTLINE

1. Marrow tumor classification 1.1. WHO classification of hematopoietic and lymphoid tissue tumors 1.1.1. Myeloid neoplasms 1.1.2. Lymphoid neoplasms 1.2. Imaging-based stratifications of marrow neoplasms 1.2.1. Diffuse or multifocal marrow infiltration 1.2.2. Diffuse or multifocal marrow replacement 2. Imaging technique and concepts 2.1. Radiographs and computed tomography (CT) 2.2. MRI 2.2.1. Conventional sequences (T1-weighted and fluid-sensitive) 2.2.2. Contrast enhanced images 2.2.3. Chemical Shift (in-phase and out-of-phase) 2.2.4. Diffusion-weighted images 3. MRI pattern-based stratification of marrow lesions 3.1. Focal pattern 3.1.1. Unifocal 3.1.2. Multifocal 3.2. Variegated pattern 3.3. Diffuse 4. Proposed MR imaging lexicon for marrow lesions

MSEE-45 Skin Ultrasound (US): Not Everything Is Cellulitis Nor Lipoma

Participants
Fatima Lezcano Sticchi SR, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the different imaging presentations of common daily practice skin lesions. To identify the key findings in order to aproach the correct diagnosis and to learn how to report them. To identify suspicious features that should prompt further evaluation. To enhance the radiologist role into the differentiation of common soft tissue masses and its impact on the dermatologist practice.

TABLE OF CONTENTS/OUTLINE

Introduction Sonographic Anatomy Technique Benign skins lesions and cases Malignant skin lesions and cases Inflammatory/Infectious diseases and cases Conclusion

MSEE-46 Fibroblastic and Myofibroblastic Soft Tissue Tumors (WHO Classification 2020):Imaging Spectrum and Pathology Correlation - Benign Lesions (Part 1)

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Majid Chalian, MD, Seattle, WA (*Presenter*) Grant, The Boeing Company

TEACHING POINTS

1. Review of benign fibroblastic and myofibroblastic soft tissue tumors based on the most resent WHO classification.Review of radiologic features of fibroblastic and myofibroblastic tumors. Radiology-Pathology correlation for each tumor.

TABLE OF CONTENTS/OUTLINE

1. Nodular fasciitis 2. Proliferative fasciitis and proliferative myositis 3. Myositis ossificans and fibro-osseous pseudotumor of digits 4. Ischaemic fasciitis 5. Elastofibroma 6. Fibrous hamartoma of infancy 7. Fibromatosis colli 8. Juvenile hyaline fibromatosis 9. Inclusion body fibromatosis 10. Fibroma of tendon sheath 11. Desmoplastic fibroblastoma 12. Myofibroblastoma 13. Mammary-type myofibroblastoma 14. Calcifying aponeurotic fibroma 15. EWSR1-SMAD3-positive fibroblastic tumour (emerging) 16. Angiomyofibroblastoma 17. Cellular angiofibroma 18. Angiofibroma NOS 19. Nuchal fibroma 20. Acral fibromyxoma 21. Gardner fibroma

MSEE-47 I Can Be Anywhere On Your Body: Manifestations and Complications of Hydatid Disease

Participants
Cecilia Ruiz de Castaneda, Toledo, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To describe hydatid cyst structure and the life cycle of Echinococcus tapeworm 2. To review and illustrate the imaging features in US, CT, and MRI of hydatid disease throughout the body. 3. To review and illustrate the main potential complications of hydatid cysts.

TABLE OF CONTENTS/OUTLINE

Hydatid disease is a worldwide zoonosis produced by the larval stage of the Echinococcus tapeworm. Hydatid cyst demonstrates a variety of imaging features, varying according to growth stage, affected tissue, and complications. For this reason, a hydatid cyst should be kept in mind when a cystic lesion is encountered anywhere in the body, especially in endemic areas. Clinical symptoms may be related to the mass effect of the cyst, its infection, or anaphylactic reactions secondary to its rupture The classical findings in hydatid disease are well known. However, we review unusual anatomic locations and complications providing images of cases from our experience.

MSEE-48 Imaging Review of Diabetes Mellitus

Awards
Certificate of Merit

Participants
Thurl Hugh Cledera, MD, Taguig, Philippines (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diabetes Mellitus (DM) is a metabolic disorder characterized by a chronic hyperglycemic state and impairment of protein, fat, and carbohydrate metabolism due to alterations in insulin action. Complications in DM include microvascular (diabetic retinopathy, neuropathy, and nephropathy) and macrovascular (coronary artery, peripheral artery, and cerebrovascular disease). Non-ketotic hyperglycemia hemichorea may present with asymmetric hyperdensity or T1-weighted hyperintensity in the basal ganglia contralateral to the patient’s neurologic deficit. Cardiac MRI can demonstrate the presence of scar or fibrosis and even underlying ischemia. Diabetic mastopathy is a rare complication that is usually seen in late-stage diabetes. Imaging is not primarily indicated in assessing acute urinary tract infection but may be necessary for the presence in the clinical setting of known diabetes.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Pathogenesis 3. Head and Neck a. Non-Ketotic Hyperglycemia Hemichorea b. Stroke4. Cardiac a. Diabetic Cardiomyopathy b. Peripheral Artery Disease c. Coronary Artery Disease 5. Breast a. Diabetic Mastopathy 6. Gastrointestinal a. Subcapsular Fatty Infiltration of the Liver b. Emphysematous Cholecystitis 7. Genitourinary a. Renal Abscess b. Emphysematous Pyelonephritis c. Emphysematous Cystitis d. Ductus Deferens Calcification 8. Musculoskeletal a. Fasciitis b. Fournier Gangrene c. Diabetic Neuroarthropathy d. Diabetic Myopathy e. Medial Calcific Sclerosis f. Subcutaneous Amyloid Deposits

MSEE-49 Lose The Battle and Win the War: Multimodality Imaging of Diseases Unique to Immuno-Suppressed

Awards
Certificate of Merit

Participants
Pegah Khoshpouri, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Suppression of immune system can be primary-congenital immunodeficiency, secondary to chemo- or immuno-therapy medications, or acquired immunodeficiency syndrome (AIDS).• Immunosuppression predisposes patients to various opportunistic infections, inflammatory responses such as drug toxicity, or malignancies.• There are unique and overlapping imaging manifestations. Learning about unique radiologic findings can lead to earlier and more precise diagnosis.

TABLE OF CONTENTS/OUTLINE

To provide a comprehensive review of multimodality and multisystem unique imaging appearances of various scenarios in

immunocompromised patients in a case-based format. These scenarios are including but not limited to:• Infections such as pneumocystis jiroveci pneumonia, tuberculosis in patients with leukemia or HIV, aspergillosis in neutropenic patients or those on immunosuppressants after transplantation.• Malignancies such as Kaposi' sarcoma in HIV and post-transplant lymphoproliferative disorder after transplant.• Lymphoproliferative disorders in patients with congenital hypogammaglobulinemia.• Medication-induced pneumonitis or sarcoid-like reaction.• Table summarizing various predisposing diseases and commonly seen associated infections.

MSEE-5 Castleman Disease: A Multifaceted Diagnostic Dilemma

Awards
Identified for RadioGraphics

Participants
Marika Pitot, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review Castleman Disease, clinical subtypes, and implications for disease presentation and identification. 2. Describe the imaging features of Castleman Disease on different imaging modalities. 3. Raise awareness of Castleman Disease as a mimicker of other disease processes. 4. Discuss the potential known associations with and complications of Castleman Disease.

TABLE OF CONTENTS/OUTLINE

1. General overview of Castleman disease (CD) a. Unicentric (UCD) or multicentric (MCD) lymphoproliferative processes b. Several distinct clinical subtypes c. Histopathologic subtypes: hyaline vascular, plasma cell, mixed d. Spectrum of presentation and association with subtype: UCD - Localized, asymptomatic, indolent, incidentally discovered - localized mass; MCD - Systemic disease presenting acutely with constitutional symptoms, widespread lymphadenopathy, and hepatosplenomegaly 2. Imaging appearances on ultrasound, CT, MRI and PET a. Lymphadenopathy - single, regional, or widespread b. Soft tissue masses - thoracic, abdominal, retroperitoneal etc c. Specific organ involvement and appropriate imaging modalities for evaluation - hepatomegaly, splenomegaly, adrenal gland, salivary glands 3. Potential mimickers 4. Known associations and complications - POEMS syndrome

MSEE-50 A Call for Vigilance: Multimodality Imaging Evaluation of Malignancy in Solid Organ Transplant Recipients

Participants
Anthony Micetich, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Solid organ transplant recipients are at risk of numerous postoperative complications. A particularly dreaded immediate and long-term complication is malignancy. Development of these cancers is multifactorial and related to elements inherent to solid organ transplantation, with classification dependent on pathogenesis. Radiologists are often the first providers to identify these malignancies. We will review multimodality imaging presentation of various transplant related malignancies and their mimickers and emphasize the role of the radiologist in the care team.

TABLE OF CONTENTS/OUTLINE

1. Review various solid organ transplants with diagrammatic depiction 2. Review risk factors for malignancy in transplant recipients a. Increased risk compared to the general population b. Can develop in the transplanted organ(s) or elsewhere in the body 3. Review pathogenesis of malignancy in solid organ transplants: a. Pre-existing risk factors in the recipient, donor, and transplanted organ b. Long-term immunosuppression: type, intensity, duration of use c. Oncogenic and non-oncogenic viral infections 4. Three major classifications of solid organ malignancy in transplant recipients: a. De novo b. Recurrent malignancy c. Donor transmission i. Donor transmitted ii. Donor derived 5. Multimodality imaging of mimics of malignancy in solid organ transplants (including opportunistic infections and graft versus host disease) 6. Role of the radiologist (screening, biopsy, follow up, surveillance) 7. Summary table listing solid organs, related malignancies, and mimickers

MSEE-51 Comprehensive Imaging Review of Peritoneum and Implications of Disease Spread

Participants
Shruti Kumar, MBBS, Little Rock, AR (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review embryogenesis and complex imaging anatomy of peritoneal spaces, folds and ligaments.Formulate a differential diagnosis based on disease localization in different peritoneal compartments.Discuss the interconnections between peritoneal and extra-peritoneal spaces, with focus on interfascial disease spread.

TABLE OF CONTENTS/OUTLINE

Review embryogenesis of ventral and dorsal mesentery and their subsequent specialization into different peritoneal ligaments. Imaging examples of peritoneal ligaments and folds of the liver and stomach, small bowel mesentery, large bowel mesocolon, pelvic ligaments.Demonstrate peritoneal spaces on cross-sectional imaging including lesser sac, greater sac, perihepatic, supramesocolic, inframesocolic compartments, paracolic, and pelvic peritoneal spaces. CT/MRI examples of pathologies that frequently involve peritoneal ligaments and spaces, e.g acute pancreatitis, internal hernias, primary/metastatic peritoneal malignancies, intra-abdominal hematomas, sclerosing encapsulating peritonitis.Discuss clinical impact of peritoneal compartmentalization on disease pathogenesis and management decisions e.g. dissemination of gastric adenocarcinoma along perigastric ligaments, borderline resectability of pancreatic adenocarcinoma with mesocolon invasion.Peritoneal Cancer Index (PCI)

MSEE-52 A Comprehensive Review of Oncologic Emergencies: Update for Radiologists

Participants
Koichiro Mori, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Describe some of the oncologic emergencies for which diagnostic imaging has a significant impact on patient management •

Describe treatment-related oncologic emergencies in which imaging findings are useful for diagnosis • In particular, we also address complications associated with immune checkpoint inhibitors and CAR-T therapy, in which diagnostic imaging is now playing a significant role, including whether or not treatment should be continued.

TABLE OF CONTENTS/OUTLINE

I. Introduction and Imaging Findings &1;Classification of Oncologic Emergencies &1;Direct effects of a tumor -Neurological complication- II. Direct effects of a tumor -Thoracic, Abdominal complication- &1;Superior Vena Cava Syndrome &1;Pulmonary thromboembolism III. Treatment-related complications: Radiation therapy &1;Radiation-Induced Myelitis IV. Treatment-related complications: Immune checkpoint inhibitors &1;Myositis &1;Colonitis V. Treatment-related complications: CAR-T therapy &1;Cytokine Release Syndrome

MSEE-53 Precision Cancer Treatment Toxicity: What the Radiologist Should Know

Participants
Rozan Bokhari, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review precision cancer treatments, 2. Review the general mechanisms of anticancer treatment toxicity, 3. Present the spectrum of toxicities, 4. Illustrate the common and uncommon toxicities

TABLE OF CONTENTS/OUTLINE

1. Overview of anticancer treatment in the era of precision medicine: Molecular targeted therapies and immune checkpoint inhibitors, Illustrations on the mechanism of drugs and their toxicities (on-target and off-target), 2. Spectrum of toxicities: Acute, Chronic, Delayed, Recurrent, Marker for response and survival, 3. Representative examples with an organ based approach

MSEE-54 A Beginners Guide to Cinematic Rendering in Clinical Practice: What You Need to Know

Participants
Elliot Fishman, MD, Owings Mills, MD (*Presenter*) Co-founder, HipGraphics, Inc;Stockholder, HipGraphics, Inc;Institutional Grant support, Siemens AG;Institutional Grant support, General Electric Company;Consultant, Exact Sciences Corporation;Consultant, Imaging Endpoints

TEACHING POINTS

1. What is Cinematic Rendering and what are its advantages over classic 3D medical imaging?2. What are the clinical applications where Cinematic Rendering is helpful in either diagnosis or staging of disease or in guiding patient management.3. What CT techniques are needed for Cinematic Rendering and what is the Radiologists role in using Cinematic Rendering in clinical practice4. what is the role of Cinematic Rendering in pre-operative planning for surgery using Cinematic Rendering5. what are the future directions of Cinematic Rendering including Augmented Reality display with HoloLens and multimodality imaging like PET/CT

TABLE OF CONTENTS/OUTLINE

1. what is Cinematic Rendering and why is it different from other 3D rendering techniques like MIP and VRT2. what are the specific advantages of Cinematic Rendering from a technical perspective as a computer graphics technique3. what clinical applications is Cinematic Rendering ideal for and why4. what is the role of Cinematic Rendering in applications like Oncologic Staging and Surgical planning5. what is the role of Cinematic Rendering in applications like trauma and vascular imaging6. what are future direction of Cinematic Rendering including improved Augmented Reality displays as well as multimodality imaging like PET/CT7. what role can Cinematic Rendering play in medical education and in patient education

MSEE-55 Novel Uses of Contrast-Enhanced Ultrasound

Participants
Clayton Douglas, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Contrast-enhanced ultrasound is a well-established modality to characterize liver and renal masses in the setting of contraindication to both MRI and CT. Given this is generally a rare occurrence, many small- and medium-sized hospitals have yet to find adequate utility in adopting this imaging modality. Since the implementation of contrast-enhanced ultrasound at our institution, we have discovered many unique uses of US contrast in common and uncommon clinical scenarios. We aim to share these unique uses in order to increase contrast-enhanced ultrasound usage in medical practice.

TABLE OF CONTENTS/OUTLINE

1. Introduction to contrast-enhanced ultrasound and well-established uses in the literature. 2. Present unique uses of contrast-enhanced ultrasound to answer common and uncommon clinical questions. Case examples include evaluating central line location/functionality, solid organ transplant perfusion, solid organ mass versus abscess, and identification of subtle liver lesions for biopsy localization. 3. Discuss potential future applications.

MSEE-56 Imaging Spectrum of Radiation Induced”

Participants
Kota Yokoyama, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Imaging findings after radiotherapy are diverse, ranging from transient changes to irreversible tissue damage, fibrosis, angiogenesis, and radiation-induced tumors. - Transient imaging changes are seen in a variety of organs and are more often seen as reversible hyperaccumulation on FDG PET with subtle change in morphologic imaging. - Irreversible tissue damage and fibrosis can be seen on CT and MRI as leukoencephalopathy, lung damage, skin scarring, and vascular stenosis. Fragility fractures of the ribs and sacrum are also commonly encountered. - Angiogenesis can result in trabecular vascular malformation, especially hemorrhage and calcification. - Radiation-induced tumors often occur long after treatment. Meningiomas and gliomas tend to occur after whole-brain irradiation. Squamous cell carcinoma, adenocarcinoma, and hematologic tumors can also occur. Osteosarcoma

after tangential irradiation of breast cancer is also important to recognize.

TABLE OF CONTENTS/OUTLINE

Transient imaging changes after radiation therapy Irreversible tissue damage, fibrosis, and angiogenesis after radiation therapy Radiation-induced tumors

MSEE-57HC Not All Lumps Are The Same! The Role of High-frequency Ultrasound In the Differential Diagnosis of Benign Skin Lesions

Participants
Victor Alguz, MD, Santos, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cystic and solid benign skin lesions are commonly observed in clinical practice and high-frequency ultrasound (HFU) has been increasingly used to characterize them. HFU (>15 MHz) clearly define the skin layers and adnexal structures, allowing better characterization of the lesion's location, morphology, thickness and vascularity. Radiologists must know the ultrasound features of the most common benign skin lesions to avoid misdiagnosis. Epidermoid or epidermal inclusion cysts can appear anywhere in the body and typically present as a well-defined, oval, hypoechoic or heterogeneous, subcutaneous mass with an orifice in the epidermis (punctum). Other cysts may show typical locations, such as synovial or ganglion cysts, located near a joint or tendon, and trichilemmal cysts, originated from the outer hair root sheath, most commonly on the scalp. Common solid benign skin lesions include lipoma, dermatofibroma, pilomatricoma, glomus tumor, plantar fibromatosis, nevus sebaceous of Jadassohn, among others. Each lesion has characteristic findings on high-frequency ultrasound and proper correlation with dermoscopic evaluation can help in the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

General aspects of benign skin lesions. High-frequency ultrasound assessment of the most common lesions with dermoscopic correlation (eg. epidermoid cysts, synovial cysts, trichilemmal cysts, lipoma, dermatofibroma, pilomatricoma, glomus tumor, plantar fibromatosis and nevus sebaceous of Jadassohn). Summary and Differential Diagnosis.Please visit the Learning Center to also view this presentation in hardcopy format.

MSEE-58 Neoplastic and Non-neoplastic Conditions of the Skin and Superficial Tissue at Imaging

Participants
Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Describe classification of superficial tissue lesions on the basis of cellular origin 2.Discuss symptomatic and incidental cutaneous and subcutaneous lesions identified by imaging 3.Discuss systematic approach to achieve definitive diagnosis and limit the differential diagnosis

TABLE OF CONTENTS/OUTLINE

Superficial soft-tissue masses are common in clinical practice, and the expanding availability of radiologic imaging has increased radiologists' familiarity with these entities. Superficial soft-tissue masses may be classified in one of the following general diagnostic categories: neoplastic and non-neoplastic conditions. Neoplastic lesions: Neurofibroma, Lipoma, Lipofibroma, Desmoid tumors. Extra mammary Paget's disease of the skin, Liposarcoma, Squamous cell carcinoma, Melanoma. Metastases. Non neoplastic conditions Lymph node, Pilonidal cyst, Epidermoid inclusion cyst, Vascular malformation, Infection and inflammation Cellulitis and panniculitis, Dermatomyositis, Scleroderma, Injection granuloma, Hidradenitis suppurativa, Keloid, Abscess, Endometriosis, Inflammatory bowel disease (IBD), Post traumatic and iatrogenic Hematoma/seroma, Silicone injection

MSEE-59 Imaging Pearls for Post-Operative Complications in Simultaneous Liver-Kidney Transplant-

Awards
Certificate of Merit

Participants
Eric Cooper, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Simultaneous liver-kidney transplantations (SLKTs) are increasing in incidence in patients with end-stage liver disease (ESLD) and end-stage renal disease (ESRD). Understanding of the imaging findings for these transplants is crucial for timely detection and management of post-transplant complications. 1. We will review the operative technique and anatomy of traditional and en-bloc SLKTs. 2. We will discuss a systematic imaging approach for evaluation of transplanted grafts. 3. We will review the imaging pearls and techniques to work up common complications following SLKT.

TABLE OF CONTENTS/OUTLINE

I. Brief overview of the surgical anatomy of traditional and en-bloc approaches to SLKT II. Imaging approach and normal findings of transplanted grafts. Ultrasound evaluation including major vessel evaluation with doppler waveform characteristics and analysis. CT, MRI and angiography for confirmation of sonographic abnormalities and treatment planning III. Imaging patterns and workup for the most common SLKT complications including - Arterial: hepatic artery stenosis and thrombosis, renal artery stenosis; - Venous: hepatic vein and IVC stenosis and thrombosis; - Portal: portal vein stenosis and thrombosis; - Biliary: biliary leaks, biliary strictures, biliary duct dilation; - Ureteral: urinary tract obstruction, urinary leaks, and vesicoureteral reflux; - Fluid collections (e.g., seromas, hematomas, urinomas).

MSEE-6 Beyond Staging: A Genitourinary Tumor Board Navigation Guide for Radiologists with Emphasis on NCCN Guidelines

Participants
Daniela Garcia, MBBS, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Oncological management requires multidisciplinary approach driven by the NCCN guidelines • Radiologists fulfill a fundamental role in the decision making for best treatment available • Radiologist should be familiar with the association between different staging levels and their impact in surgical, systemic, adjuvant and neoadjuvant therapies

TABLE OF CONTENTS/OUTLINE

Modern day diagnosis and treatment of cancer has transformed what was once a somber sentence into a treatable condition with favorable outcomes. Oncological management is no longer limited to oncologists and surgeons, but requires a multidisciplinary discussion including radiologists, radiation oncologists, and pathologists, among others. In this setting, the radiologist fulfills the important role of custodian in every step of patient management. Radiologists are in a privileged position where we can understand the "big picture" and recommend the best next step in treatment algorithm. In this educational exhibit, we will review updated NCCN management guidelines for genitourinary tumors including kidney, ovarian, cervical, prostate, and penile cancer; highlighting pivotal points where imaging can determine change in management. The accessible format of this presentation is particularly targeted to help create an efficient work frame to successfully navigate tumor board discussion in clinical practice.

MSEE-60 Evolutionary Fails: A Radiological Exploration of Human Vestigiality and Associated Pathology

Participants
Akito Nicol, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vestigiality refers to evolutionarily conserved structures that have lost their original function These holdovers are useful in understanding patterns of organismal change Vestigial structures are usually harmless but may cause disease Knowledge of human evolution can further the radiologist's understanding and imaging analysis of diseases of vestigial structures

TABLE OF CONTENTS/OUTLINE

1. Vestigial structures in animals 2. Examples in humans organized by system and pathology (as follows)1) Gastrointestinal and Genitourinary Radiology a. Appendix (Appendicitis) b. Meckel's diverticulum (Hemorrhage, intussusception, perforation) c. Urachus (Patent urachus, urachal sinus/cyst)2) Neuroradiology a. Head and Neck i. Recurrent laryngeal nerve (Mediastinal trauma, neoplasms) ii. Wisdom teeth (Impaction, infection, cysts) iii. Platysma (Inflammation, infection, trauma) iv. Tonsils (Infection, neoplasm)b. Spine i. Lumbar degenerative disease related to bipedalism (Disc herniation and spondylolysis) ii. Coccyx (Trauma, infections)3) Musculoskeletal Imaging a. Levator claviculae (Confused for mass/lymphadenopathy; thoracic outlet syndrome) b. Fabella (Fabella pain syndrome, arthritis) c. Plantaris (Tendon graft source, rupture)4) Breast Imaging a. Male breast tissue (Gynecomastia, cancer) b. Supranumerary nipples (Cancer)5) Cardiac Imaging a. Left atrial appendage (Thrombus)

MSEE-61 Cystic Fibrosis in Children: A Multi-organ Approach From a Radiological Perspective

Participants
Alfonso Escobar Villalba, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The lungs are often severely affected, being the presence of thick-walled bronchiectasis the most characteristic finding.2. The pancreas is the most frequently involved abdominal organ, being fatty replacement the most common imaging finding. 3. Liver disease is frequent. SWE elastography and ATI are useful for diagnosis and management. 4. Meconium ileus is the earliest clinical manifestation of cystic fibrosis. 5. The appendix is often distended so its diameter alone is not an adequate parameter for diagnosing appendicitis.

TABLE OF CONTENTS/OUTLINE

- Etiology, epidemiology - Diagnosis, role of advanced techniques (elastography, ATI, SMI, lung MRI) - Imaging findings- Chest: bronchiectasis, hyperinflation, mucous plugging, consolidation, tree-in-bud, mosaic attenuation/air trapping, pneumothorax, pulmonary and bronchial arterial enlargement.- Abdomen: pancreatic disease (fatty replacement, cystosis, pancreatitis calcifications), liver disease (steatosis, focal biliary fibrosis, cirrhosis, portal hypertension), biliary system (cholelitiasis, microgallbladder, intrahepatic ductal strictures, sclerosing cholangitis), gastrointestinal tract (distal intestinal obstruction syndrome, meconium ileus, rectal prolapse, gastroesophageal reflux, distension of appendix, fibrosing colonopathy, ileocolic intussusception) - Genito-urinary: nephrolithiasis, vas deferens absence, testicular microlithiasis - Head and neck: chronic sinusitis, nasal polyposis - Musculoskeletal: low bone mineral density, kyphosis- Treatment, prognosis

MSEE-62 Imaging Features in Paroxysmal Nocturnal Hemoglobinuria (PNH)

Participants
Carlos Rubio Sanchez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Paroxysmal nocturnal hemoglobinuria (PNH) is a rare, acquired, clonal hematopoietic stem cell disorder. • Physiopathology: PIG-A gene mutation - glycosylphosphatidylinositol (GPI) molecule deficit - abnormal complement regulatory proteins CD55, CD59 - complement-mediated intravascular hemolysis - hemoglobinuria • Triad of clinical features: intravascular hemolysis, thromboembolic events, and cytopenia. • Thromboembolic events represent the leading cause of morbidity and mortality. They can occur in atypical locations in the body (venous sinus thrombosis, Budd-Chiari syndrome?), sometimes silent. • Imaging plays an important role in the diagnosis of thromboembolic events, infarcts, and abnormal iron deposits. • The follow-up protocol for PNH patients includes: CT, MRI, or Doppler-ultrasound techniques. MRI is the most sensitive test for detecting silent thrombosis and quantifying iron deposits. • The treatment with eculizumab has changed the paradigm of this disease, prolonging the life expectancy and quality of life of these patients.

TABLE OF CONTENTS/OUTLINE

• Introduction: pathogenesis, clinical manifestations, diagnosis criteria. • Imaging features: -Brain: thrombosis, infarcts, leukoencephalopathy, iron deposit. -Thoracic: cardiac infarcts, pulmonary thromboembolism, pulmonary hypertension signs. - Abdominal: Thrombosis (Sd. Budd Chiari, portal venous, cava?) infarcts, iron deposits. - Osteomuscular: deep vein thrombosis, osteonecrosis • Conclusions.

MSEE-63 You Are Not Alone: Solitary Fibrous Tumors Beyond the Chest

Participants
Flavia M. Starling, MD, Belo Horizonte, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

For a long time, solitary fibrous tumors (SFTs) were thought to be exclusive to the pleura. In fact, this is still the most common place to diagnose this rare pathology. With the advances in histologic, molecular, and genetic techniques and the discovery of the SFT fusion gene, other names of tumors with the same histologic spectrum were abandoned and after classified as SFT, such as hemangiopericytomas. This fact has changed the perception about its restricted location.Although visceral pleura is the most common site of this pathology, it can affect several body structures, such as the head and neck, thoracic and abdominal cavities.The radiological features are generally nonspecific, except for the low signal intensity foci on MRI T1 and T2-weighted sequences corresponding to collagen content, producing a chocolate chip cookie appearance, which may aid in the diagnosis. The behavior of TFS on 18 FDG PET-CT can also raise suspicion for this tumor.This work intends to demonstrate that solitary fibrous tumors are not solitary anymore, being found in many locations in the body, by demonstrating and reviewing their imaging features in the many possible topographies.

TABLE OF CONTENTS/OUTLINE

• Case-based review in different imaging methods illustrating the solitary fibrous tumor in its different locations.• Obtaining and understanding characteristic imaging findings of solitary fibrous tumor enables a proper diagnosis for early treatment.• Discuss different radiological findings of solitary fibrous tumor.

MSEE-64 Imaging Manifestations of Trisomy 21, from Pediatrics to Adults

Awards
Certificate of Merit

Participants
Christian Gomez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Trisomy 21 is the most common chromosomal anomaly in humans, affecting approximately 1 in every 700 babies and more than 350,000 people living in the United States. As medical management evolves, the average life expectancy for people living with Trisomy 21 has increased exponentially, with individuals now commonly living beyond their fifth decade of life. Medical imaging not only plays a critical role in prenatal diagnosis, but also aids in diagnosis and management of associated multiorgan anomalies throughout a patient's life.

TABLE OF CONTENTS/OUTLINE

Brief introduction to Trisomy 21Fetal US/MRI/EchoSoft MarkersCardiovascularCongenital heart anomaliesPulmonaryPulmonary congenital anomaliesPulmonary hypoplasia and hypertensionUpper airway obstructionLower airway obstructionGIForegut pathologyMidgut pathologyHindgut pathologyDiaphragmatic herniationMusculoskeletalAtlantoaxial instability, hypoplastic C1 archJoint laxity/dislocationHands/feet - Kirner deformityEleven ribsHypersegmented sternumDevelopmental hip dysplasia, mickey mouse pelvisGUCryptorchidismNeuroHearing loss secondary to temporal bone pathologyMoyamoyaEarly age neurodegenerationCerebellar and vermian hypoplasiaOncology Leukemia - ALL, AMLTesticular Cancer

MSEE-65 Imaging Atlas for Childhood Whole-body MRI

Participants
Mary-Louise Greer, MBBS, (*Presenter*) Research Grant, AbbVie Inc

TEACHING POINTS

1. To describe whole-body MRI imaging protocols and strategies to optimize these to the patient’s developmental and chronological age, co-morbidities and the clinical indication; 2. To illustrate the spectrum of normal anatomy from the neonatal period to adolescence seen on different whole-body MRI imaging sequences, 3. To demonstrate and compare normal, normal variant and abnormal imaging findings on pediatric whole-body MRI to improve diagnostic accuracy for a range of oncologic and non-oncologic diseases

TABLE OF CONTENTS/OUTLINE

*OutlineWhole-body MRI is now standardly performed in pediatric patients for a range of oncologic and non-oncologic indications, used for diagnostic and/or screening purposes. Diagnostic accuracy depends upon the recognition of disease patterns and familiarity with normal maturation that can be mimickers for disease.The purpose of this atlas is to provide an anatomy-based overview of specific imaging features to improve lesion detection and aid distinction from normal and normal variant observations, that can lead to a high rate of false positive findings, as well as offer a differential for imaging findings where the disease entity is as yet unknown.Whole-body MRI Protocols - generic: standard optional sequences coverage - indication-specific sequences coverageAnatomy-based Spectrum of Normal and Abnormal Whole-body MRI - normal for age - focal, multifocal and diffuse pathology - bones joints, muscle soft tissue, head neck, chest, abdomen pelvis

MSEE-66 Imaging Spectrum of Tuberculosis from Head to Toe with Updates

Participants
Onur Simsek, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of the exhibit is to· Explain pathogenesis and classical imaging findings of tuberculosis· Describe typical and atypical imaging spectrum of tuberculosis from head to toe with updates· Review the recent literature and discuss what changed through the years in imaging of tuberculosis · Highlight pearls and pitfalls in imaging tuberculosis

TABLE OF CONTENTS/OUTLINE

BackgroundTuberculosis is an infectious disease caused by the mycobacterium tuberculosis complex, and it is one of the leading

Background:Tuberculosis is an infectious disease caused by the mycobacterium tuberculosis complex, and it is one of the leading causes of death due to infectious diseases worldwide. Although tuberculosis is primarily seen as pulmonary infection, it can cause disease in almost any part of the body.Method and Outline: In line with the exhibit's purpose, cases that will set an example for different organ involvements of tuberculosis from the PACS system of our hospital were selected retrospectively.Selected cases include the following examples of tuberculosis:MeningitidisGastrointestinal tuberculosisGenitourinary tuberculosisSpondylodiscitisArthritisSplenic tuberculosisPulmonary patternsLymphadenitisImaging findings were discussed and evaluated with current literature. ConclusionTuberculosis is still a public health issue in most countries and an essential differential diagnosis all over the world. Even tuberculosis is mainly known for its pulmonary infiltration; it can be detected in almost any part of the body. Hereby, we provide different organ involvements with case examples. This educational exhibit will assist the radiologist in understanding the unexpected presentations of tuberculosis.

MSEE-67 Vasculitides from Head to Toe: Multimodality Imaging Diagnosis, Treatment, and Management

Participants
Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vasculidities and arterial wall diseases are rare conditions of the arterial system that may result in significant complications including luminal stenosis, arterial thrombosis, and infarction of the corresponding organs and structures. Development of pseudoaneurysms and dissections and arterial rupture are additional serious complications in this patient population. Doppler US is a first line imaging modality utilized for the assessment of the peripheral arterial system, abdominal aorta and its branches.a) types of arterial wall pathologiesb) normal arterial wall anatomy and physiology of waveforms on Doppler USc) sonographic findings associated with vasculidities and arterial wall disease with multi-imaging correlation

TABLE OF CONTENTS/OUTLINE

Review pathophysiology of various types of vasculidities and pathologies affecting the arterial wall (collagen vascular disease, giant cell arteritis, temporal arteritis, Systemic Lupus Erythematosus (SLE), Takayasu arteritis, Polyarteritis nodosa, Wegener's granulomatosis, and Kawasaki disease, radiation-induced, disease. Discuss general concepts of the assessment of the peripheral arterial system and abdominal aorta using Doppler US and CEUS: technique protocol, image optimization).Demonstrate key sonographic features of the discussed arterial pathologies with correlation other imaging modalities correlation. Review role of ultrasound is the diagnosis and surveillance of complications in this group of patients. Discuss management options with interventional radiology procedures.

MSEE-68 Pediatric Applications of Photon Counting Detector Computed Tomography (PCD CT)

Participants
Kelly Horst, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Photon counting detector computed tomography (PCD-CT) technology has qualities that stand to optimize pediatric imaging. 2) The spatial and contrast resolution are optimized by this technique. 3) Dose reduction is accomplished by the combined use of a decreased detector size, without septae, the addition of a tin filter, and the high resolution mode.

TABLE OF CONTENTS/OUTLINE

Multimodality imaging of pediatric cases illustrating the benefits of PCD CT, including: 1) Increased spatial resolution. 2) Decreased electronic noise. 3) Increased contrast to noise ratio. 4) Decreased beam-hardening artifact. 5) Multi-energy data acquisition 6) The ability to distinguish multiple contrast agents simultaneously.

MSEE-69 3D Printed Models for Pre-surgical Planning: What the Surgeon Wants to Know and Touch

Awards
Certificate of Merit

Participants
Sarah Bastawrous, DO, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the role, applications and benefits of 3D printed models in presurgical planning 2. Provide case-based examples of presurgical 3D printed models with applicable surgeon feedback 3. Explore success strategies for radiologists and radiology departments to create impactful 3D printing models 4. Define intended use of 3D printed models

TABLE OF CONTENTS/OUTLINE

1. Clinical impact and potential of presurgical 3D printed models in medicine and role of the radiologist. 2. Brief literature reports of applications and benefits of 3D presurgical printed models. 3. Multimodality, illustrative examples of 3D printed pre-surgical models. 4. Elements important to the surgeon and why. 5. End user and surgeon feedback. 6. "In-surgery" and "out-of-surgery" intended uses, to include patient education/informed consent, trainee simulation, procedure rehearsal, device/guide sizing. 7. Success strategies to include quality management and considerations for radiology departments. 8. Standardization and guidelines to include professional societies, ACR data registry, and appropriateness criteria to guide 3D printing of presurgical models.

MSEE-7 Diversity of Spinal Manifestations in Systemic Disease

Participants
Ryo Kurokawa, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this review is to summarize the spectrum of clinical and radiological findings of spinal abnormalities associated with systemic diseases.

TABLE OF CONTENTS/OUTLINE

I. Vertebral abnormalities- Infection: Tuberculous and Non-tuberculous infections.- Inflammation/autoimmune: Scleroderma, SAPHO syndrome, rheumatoid arthritis- Neoplasm: Systemic mastocytosis, metastasis, lymphoma, leukemia- Neoplasm-like: POEMS syndrome, IgG4-related disease, Langerhans cell histiocytosis- Phacomatosis- Miscellaneous: Alkaptonuria, acromegaly, dialysis-associated, spinal neuroarthropathy (Charcot spine) II. Spinal cord abnormalities- Infection: Varicella-zoster virus, Acute flaccid myelitis- Inflammation, autoimmune: Inflammatory bowel disease, Vasculitis, Systemic lupus erythematosus, Sjogren syndrome, Behcet's disease, HTLV-1-associated myelopathy, Sarcoidosis, GFAP astrocytopathy, Hereditary hemorrhagic telangiectasia- Demyelination: Adrenoleukodystrophy,- Neoplasm: Metastasis, Lymphoma, Leukemia, Paraneoplastic syndrome- Metabolic: Copper deficiency, Hepatic myelopathy, Subacute combined degeneration of the cord- Drug-induced: Heroin, TNF-alpha inhibitor-related demyelination, Immune-checkpoint-inhibitor-related polyradiculoneuropathy- Phacomatosis- Miscellaneous: amyloidosis, superficial siderosis with meningocele or Marfan syndrome Summary1. Imaging findings of the vertebrae, spinal cord and cauda equina, and associated clinical features in various systemic diseases are important for the correct diagnosis.2. Knowledge of X-ray, CT, MRI, bone scintigraphy, and PET imaging findings is essential for identifying these abnormalities.

MSEE-70 Neurologic Manifestations of Thoracic Conditions

Participants
Julian Sison, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologists frequently encounter multisystem diseases that produce findings across multiple subspecialties. This is true of several thoracic diseases with neurologic manifestations. When viewed in isolation many of these findings are nonspecific. However, correlation with imaging across both organ systems can provide clarity to the underlying diagnosis, or at least to the underlying etiology, which can then guide ordering clinicians to the next appropriate step in management so that these conditions can be recognized.

TABLE OF CONTENTS/OUTLINE

We will stratify diseases by etiology: 1) infectious - tuberculosis, nocardiosis, aspergillosis, mucormycosis, COVID-19, 2) inflammatory - sarcoidosis, polymyositis, 3) autoimmune - IgG4 sclerosing disease, 4) genetic - neurofibromatosis-1, tuberous sclerosis, Ehlers-Danlos syndrome, 5) vascular - hereditary hemorrhagic telangiectasia, and 6) neoplastic - lung cancer, lymphoma, paragangliomas. Within these subcategories we will conduct a case-based review of several diseases that demonstrate both thoracic and neurologic manifestations.

MSEE-71 Tumors Associated with Tobacco Use: Pathophysiology, Clinical Features Role of Imaging

Participants
Sanjana Dhakshinamoorthy, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Tobacco is the most important risk factor for lung cancers, with nearly 9 out of 10 cancers being related to smoking cigarettes or from exposure to second hand smoke. However, there is a wide spectrum of tobacco-induced cancers that can involve multiple organ systems, including in the oropharynx, larynx, esophagus, liver, pancreas, stomach, colon rectum, urinary bladder, kidney and uterine cervix. 2. Given that many tumors from various different organ systems can occur in patients with tobacco use, radiologists play a vital role in being able to detect these synchronous or metachronous tumors, even before they become symptomatic. 3. Lung-RADS (Lung Imaging Reporting and Data System), is a classification proposed to aid with findings in low-dose CT screening exams for lung cancer. The goal of the classification system is to standardize follow-up and management decisions.

TABLE OF CONTENTS/OUTLINE

1. Review the epidemiology, pathophysiology and clinical features of all the neoplasms associated with tobacco use 2. Discuss the multimodality imaging features of tobacco-induced neoplasms 3. Review the role of imaging in screening, diagnosis and surveillance of malignancies associated with tobacco use

MSEE-73 Emerging Complications in the Era of COVID-19 Vaccination: Role of Radiologist and Imaging

Participants
Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

In November 2019, a new RNA Coronavirus (SARS-CoV-2) responsible for a severe acute respiratory syndrome was identified in China. In early 2022, there were nearly 5.8 million deaths and a total of 10 billion doses of vaccination administered. Benefit of vaccine protecting against severe COVID-19 infection far outweighs the very small risk of development of some rare adverse events. Gaining familiarity with various adverse events following COVID-19 vaccination and their clinical presentation is important for radiologist as they come across different imaging modalities. Optimal utilization of imaging and promptly recognize these adverse events helps in better management of patients.

TABLE OF CONTENTS/OUTLINE

• Types and mechanisms of COVID-19 vaccines• Common reactions and adverse events• Emerging rare complications of COVID-19 vaccines-Radiation recall pneumonitis-Radiation recall dermatitis-Breast nodules-Axillary lymphadenopathy-Myocarditis• Role of Imaging• Differentiation from neoplastic disease• What radiologist need to know• Recommendations to oncology providers• Management of these complications• Multidisciplinary team approach

MSEE-74 Don't Overlook the Skin! Multimodality Imaging Review of Skin Subcutaneous Malignancies with Radiology-Pathology Correlation

Awards
Cum Laude
Identified for RadioGraphics

Participants
Priya Pathak, MBBS,MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Overview of the spectrum of primary and secondary skin and subcutaneous malignancies with a focus on the role of various imaging modalities for diagnosis, evaluation of anatomical extension, management, and surveillance.2) Highlight the clinical features, prognosis and modes of spread of cutaneous malignancies.3) Review relevant radiologic-pathologic correlation, differential diagnoses, imaging artifacts and pitfalls with a systematic approach to narrow the final diagnosis.

TABLE OF CONTENTS/OUTLINE

• Introduction: Multimodality imaging approach to skin and subcutaneous malignancies for an accurate evaluation of the lesion location, size, extension, margins, metabolic activity and spread patterns.Outline• Primary malignancies: Squamous cell carcinoma, Basal cell carcinoma, Merkel cell carcinoma and Melanoma• Secondary malignancies:-Mesenchymal: Dermatofibrosarcoma, Leiomyosarcoma, Angiosarcoma, liposarcoma, Desmoid tumor.-Lymphoma: Mycosis Fungoides, NK T cell lymphoma, Primary cutaneous B cell lymphoma, Follicular lymphoma.- Metastasis: Breast cancer, Lung cancer, Head and neck cancer, GI cancers, RCC, Ovarian cancer, endometrial cancer, Prostate cancer.• Benign entities/tumor-like lesions: -Systemic disorder: Sarcoidosis, Gout, vasculitis.-Autoimmune, inflammatory and infectious disorders.-Subcutaneous disorders: Fat necrosis, Lipodystrophy, Panniculitis, Epidermoid cyst, pilonidal cysts.-Iatrogenic: Keloids, scars, Injection granulomas, Foreign bodies.

MSEE-75 Multimodality Imaging in End-Stage Renal Disease

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To define and review the pathophysiology of end-stage renal disease (ESRD). 2. To discuss the renal and extrarenal manifestations of ESRD. 3. To describe the role of imaging in the evaluation of ESRD. 4. To illustrate the imaging appearances of various manifestations of ESRD

TABLE OF CONTENTS/OUTLINE

1. ESRD- DEFINITION, PATHOPHYSIOLOGY 2. ROLE OF IMAGING-Radiograph, ultrasound, CT, MRI, nuclear medicine, echocardiogram, 3. DISCUSSION AND ILLUSTRATION OF THE FOLLOWING MANIFESTATIONS OF ESRD A. Renal - Decreased size; Increased echogenicity; Decreased vascularity; Cystic disease; Renal neoplasms B. Musculoskeletal -Secondary hyperparathyroidism; Osteosclerosis, osteoporosis; Subchondral erosions; Osteomalacia/rickets; Brown tumors; Amyloidosis-arthritis; Destructive spondyloarthropathy; Crystal deposition; Soft tissue calcification; Aluminium toxicity ; AVN, Osteomyelitis C. Cardiac - Coronary atherosclerosis; Concentric LV thickening, cardiomegaly; Diastolic/systolic dysfunction; Cardiac failure; Myocardial calcification; Myocardial ischemia/infarction; Pericardial effusion D. Vascular - Calcifications; Decreased compliance; Peripheral vascular disease; PE; Thrombus in catheters E. Thoracic - Alveolar edema; Metastatic calcification; Calcifications; Infections F. Neurological - Cerebral atrophy, white matter lesions; Encephalopathy; Cerebral infarction/hemorrhage ; Posterior reversible encephalopathy; Osmotic demyelination ; Infection; Sinus thrombosis; Dialysis disequilibrium syndrome G. Abdominal - Encapsulating peritoneal sclerosis H. Dialysis access complications - Vascular stenosis; Thrombus/infection; Aneurysm/pseudoaneurysm

MSEE-76 What's New in Pathogenesis, Imaging Findings, Prevention, and Management of Human Papillomavirus (HPV)-Related Malignancies? 2022 Update

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Sammar Ghannam, MD, MPH, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review epidemiology pathogenesis of human papillomavirus (HPV)-associated neoplasms Discuss imaging findings of benign and malignant HPV-related neoplasms Describe role of imaging in screening, staging surveillance of HPV-associated cancers Review 2022 updates in treatment vaccination strategies

TABLE OF CONTENTS/OUTLINE

IntroductionEpidemiology Pathogenesis: Molecular pathways Benign tumors: Respiratory Papillomas condyloma acuminata (genital warts) Malignancies: Squamous cell cancer of the oropharyngeal region (oral cavity, palatine/lingual tonsils, tongue base, oropharynx larynx), bronchopulmonary anogenital region (penis, vagina, vulva, cervix anal canal) Updates in WHO Classification\ Imaging Techniques: CT, MRI 18FDG PET/CT Imaging Findings HPV positive vs. HPV negative cancers: How to differentiate on Imaging? HPV Vaccination: Type of vaccines Current guidelines Role of imaging in screening surveillance Novel treatment strategies: Immunotherapy Imaging Biomarkers: treatment response prognosis Conclusion Summary and Clinical ImplicationsNovel immunotherapies are being investigated and updated screening vaccination guidelines are used to improve outcomes in HPV-related cancers. HPV-positive oropharyngeal SCCs show well-defined borders cystic nodal metastases; have good treatment response, prognosis with better survival. Imaging plays an important role in the diagnosis, staging, and surveillance of HPV-associated lesions in both men women.

MSEE-8 Twists and Turns: The Torsion Tour

Participants
Mary J. Clingan, MD, Ponte Vedra Beach, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points Torsion can affect a number of organs and has a variety of imaging appearances. Abnormal ligamentous attachments and/or increased laxity can lead to increased mobility and predispose to torsion. Increased organ size or a focal mass

can also predispose to torsion. Alternatively, an organ may herniate and twist into a defect left by organ removal or surgical change. Clues to diagnosis vary by location, but include organ displacement, organ enlargement, and a twisted vascular pedicle. Torsion can be intermittent, incomplete, acute, or chronic. In late cases, decreased vascular flow can lead to infarction. There are clues with color and spectral doppler that may be seen in cases of incomplete or intermittent torsion.

TABLE OF CONTENTS/OUTLINE

OutlineChest: Lung; RUQ: Gallbladder, Wandering liver, Omental Infarct; LUQ: Splenic, epiploic appendage; Pelvis: Adnexal, fibroid, renal transplant; Scrotum: epidydimal appendix, testicular/spermatic cord; Bowel: gastric, small bowel, colon

Pre-and Post Procedure CT for Cardiac Implantable Electronic Devices Extraction: A Primer for Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Samuel Cesconetto, MD, SAO PAULO, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learning objectives: - To review the principles of extraction technique and the role of computed tomography for planning the extraction of cardiac implantable electronic devices - To illustrate a spectrum of different complications related to cardiac electronic devices and their extraction - To discuss how to assess by imaging the risk of major complications during the procedure - To propose a systematic approach and a structured reporting.

TABLE OF CONTENTS/OUTLINE

Table of contents: - Introduction: - Cardiac implantable electronic devices: Overview, types, components, follow up and complications. - Extraction technique. - Patient selection. - CT: Acquisition protocol, image interpretation and clinical application. - Case-based review. - Pre-and postprocedure multidisciplinary assessment and complication score. - Proposal for a structured reporting. - Future directions and take home messages.

MSEE-11

MRI Safety: Bullets, Ballistics, Shrapnel

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Kyle Stumetz, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In the United States, more than 100,000 patients per year present to the emergency room for gun-related trauma or other ballistic related injuries. Many of these patients may require an MRI (during the initial visit or years later), and thus the presence of retained bullet fragments and/or metallic shrapnel impose important safety concerns. With this information in mind, the goal of this presentation is to: 1) Review an algorithmic approach to imaging patients with suspected retained bullets and/or shrapnel. 2) Identify the most common types of bullets and projectiles, including their metallic compositions. 3) Explain commonly encountered MRI metallic artifacts and common techniques employed to diminish them. 4) Identify scenarios in which MRI imaging is and is not appropriate for retained bullet fragments via a case-based review.

TABLE OF CONTENTS/OUTLINE

1. Can my patient with a bullet in their _____ get an MRI? 2. Most common questions 3. Algorithmic Approach 4. Types of Projectiles 5. Bullet/Projectile Composition 6. MR Metal Artifacts 7. MR Metal Artifact Reduction Sequences (MARS) 8. Case-based review

MSEE-12

Genetics and Its Advances: What a Pediatric Radiologist Needs to Know?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Sara Rodriguez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. New advances and understanding in genetics is driving the diagnostic workup, management and clinical practice. 2. Learning the basic concepts of genetics can help radiologists to have a better understanding of diseases and their imaging characteristics, and help decide imaging workup and screening protocols.3. In this primer, we aim to provide basic concepts and terminology in genetics, to familiarize radiologists with different types of genetic testing and to understand the impact of genetics in different groups of pediatric diseases including cancers and cancer predisposition syndromes, skeletal dysplasia, vascular anomalies, autoimmune diseases and others.

TABLE OF CONTENTS/OUTLINE

IntroductionBasic concepts and terminology in genetics: Gene expression and regulation: from DNA to mRNA to amino acids to proteinGene inheritance, transmission and genetic imprintingGenetic dominance: genotype-phenotype relationships, phenotype variability Genetic mutationsGenes and diseases: monogenetic, chromosomal, multifactorial. Genetic testing: Molecular test (target single variant, single gene, gene panel, whole genome sequence)Chromosomal microarrayGene expression testBiochemical tests. Genetics in cancer predisposition syndromes: Tumor suppressor genes Proto oncogenesRadiological screening in cancer predisposition syndromes. Genetics in skeletal dysplasia: Skeletal dysplasia panelImplications on imaging. Genetics in vascular malformations: RAS/ MEK/ERK and PI3 kinase/mTOR signaling pathway. Genetics in autoimmune diseases. Genetics in other pediatric diseases. Summary

MSEE-13

Abdominal Abbreviated MRI Protocols: From Description to Implementation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Maria Tello, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the need of having abbreviated MRI protocols and describe their role.2. Explain the clinical scenarios where they can be applied.3. Describe how to perform some of these abdominal abbreviated MRI protocols4. Illustrate the workflow of how to implement the described above protocols

TABLE OF CONTENTS/OUTLINE

1. MRI nowadays, why to perform abbreviated protocols, advantages and disadvantages. 2. Description of the MRI situation at our institution, selecting the abbreviated protocols that we can benefit the most. 3. Description of the abbreviated MRI protocols we are going to implementPancreatic cystic lesions Liver metastases, including the role in colorectal cancerAdrenal incidentalomasActive surveillance for small renal masses4. Implementation at our institution, how we are going to do it? A brief guide step by step.

MSEE-14

DECT In The Emergency Room: Play Your Best Game and Leave It All Out On The Field!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Certificate of Merit

Participants
Kirbi Sullivan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Dual Energy CT (DECT) may aid in diagnosis for Emergency Department (ED) patients but is only impactful if radiologists maximize utilization of the extra information.2. Workflow changes are needed to optimally incorporate DECT into a busy ED.

TABLE OF CONTENTS/OUTLINE

1. Introductiona. Discuss patient selection strategies for DECT from both the radiologist and technologist perspectiveb. Review high-yield DECT reconstructions to detect pathology and problem-solve2. DECT winsa. Avoiding downstream testingi. Differentiating between gastrointestinal bleeding and ingested contents, avoiding endoscopyii. Differentiating hematoma from tumor in a hypotensive patient with peritoneal carcinomatosisb. Expediting carei. Detection of postoperative hemorrhage on a portal venous phase CT, bypassing CT angiography for rapid embolizationii. Detection of early bowel ischemia on iodine maps, leading to rapid surgery and avoiding bowel resectioniii. Subtle fracture detection with bone marrow edema mapsiv. Active extravasation detection in intracranial hemorrhage on iodine maps3. DECT losses: underutilized information negatively impacted downstream testing and carea. Unnecessary testingi. Mischaracterization of suture material as active extravasation in a postoperative patient, leading to unnecessary angiographyii. Unnecessary workup of incidentalomas not fully characterized with DECT at the time of detectionb. Delayed carei. Missed subtle pyelonephritis, leading to a second ED visit 1 month later

Recent Advances in Cardiothoracic Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Joshua Hunter, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review novel techniques in cardiothoracic imaging and how they improve upon existing methodologies. 2. Discuss technical parameters and protocol considerations of the new techniques. 3. Illustrate use cases of novel cardiothoracic imaging techniques.

TABLE OF CONTENTS/OUTLINE

1. Discuss existing cardiothoracic imaging modalities and briefly cover the pathologies that they diagnose2. Discuss limitations of existing techniques3. Enumerate the new techniques in cardiothoracic imaging and how they alleviate some of the existing limitations4. Discuss technical and protocol implications of the new techniques5. Compare the advantages and disadvantages afforded by the new techniques, when compared to existing imaging methodologies6. Brief overview of several novel imaging techniques7. Novel Cardiothoracic Imaginga. Radiography i.Dual energy subtraction radiography (DESR)1. Bone-selective radiograph improves detection of bony lesions2. Soft tissue-selective radiograph eliminates potential for obstruction by bones ii.AI-enabled detection1. Thoracic Pathologies (Pneumothorax, Pneumonia)2. Lines and tube malpositioning (ET tube, Enteric tube) iii.AI-enabled prognostication1. COVID-19 patients needing urgent mechanical ventilation. Low Field Body MRI: Challenges and Opportunities at 0.55T

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Identified for RadioGraphics

Participants
Anup Shetty, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

Low-field MRI (0.55T) for body imaging presents challenges and opportunities for patients, radiologists, and enterprises compared to high-field (1.5T or 3T) MRI. This exhibit will:1. Discuss imaging advantages and challenges of low-field body MRI compared to high-field body MRI2. Discuss logistical and workflow challenges of low-field body MRI compared to high-field body MRI3. Illustrate use cases, strategies, and nuances in low-field body MRI through a series of case examples

TABLE OF CONTENTS/OUTLINE

- Low-field MRI advantages: lower cost; easier installation (including lighter weight, less shielding, less helium), larger bore size, MR physics benefits (longer T2* [i.e., reduced susceptibility], lower SAR, shorter T1 [i.e., faster acquisition], easier shimming for B0 homogeneity), less acoustic noise- Low-field MRI challenges: lower SNR, fewer receiver coil options, weaker gradients, longer acquisition times, longer TE for chemical-shift imaging- Comparison of sequences across field strengths, highlighting key limitations and observations of each sequence at 0.55T- comparison of lesion conspicuity with example cases acquired at both low and high field strengths- discussion of sequence modifications and strategies at 0.55T to overcome imaging limitations and maintain comparable image quality- exploration of uses cases (lung imaging, pancreatic cyst follow-up, hepatic imaging after locoregional therapy, emergency imaging, adrenal/renal imaging, pelvic imaging, etc.)

Whole Body MRI In Children: A Primer for Beginners

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Daniela Carrascal-Penaranda, MD, MSc, Bogota D.C, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

To explain the usefulness of Whole body MRI in the pediatric population, its utility and indications.To review basic concepts on used sequences and different protocols, which one is the most appropriate to make a successful evaluation of the body.To discuss and exemplify through cases the possible scenarios of imaging findings in patients with cancer and the broad spectrum of cancer predisposition syndromes.To discuss the principal indications of whole body MRI in infectious - inflammatory disease as well as in general population.

TABLE OF CONTENTS/OUTLINE

Introduction - Definitions.Applications and indicationsStandard protocol -Technical requirementsCancer predisposition syndromes Indications in non-oncological pathology: MiscellaneousIncidental findings and further implications to the patientStructured report in pediatricsSummaryConclusionsPlease visit the Learning Center to also view this presentation in hardcopy format.

Imaging of Oncologic Pain: A Multi System Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Thais Kuwazuru, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibition is to:1. Review the current concepts about oncologic pain syndromes;2. Describe the role of imaging in oncologic pain, focusing on diagnosis;3. Correlate imaging findings with clinical syndromes and therapeutic strategies;4. Illustrate the causes of oncologic pain with illustrative cases.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION:a. Definitions and classification of oncologic pain;b. Impact of pain syndromes in patient quality of life and prognosis.2. ACUTE PAIN SYNDROMES:a. Associated with tumor: Tumor bleeding, pathologic fractures, obstruction and perforation of viscera, superior vena cava syndrome, acute thrombosis;b. Associated with treatment: Chemotherapy-induced neuropathy, radiation therapy-induced bone pain and plexopathy, oral mucositis, enteritis and proctitis.3. CHRONIC PAIN SYNDROMES:a. Somatic pain: Bone and soft tissue pain;b. Visceral pain: Abdominal pain syndromes;c. Neuropathic pain: Leptomeningeal metastasis, cranial and peripheral neuropathies;d. Headaches;e. Related to treatment: Post-chemotherapy, post-surgical and post-radiation pain syndromes;4. CONCLUSION:a. Pain assessment in cancer patients very often include imaging investigation;b. When interpreting imaging exams, it is essential to understand the imaging patterns of each syndrome and the important findings for therapeutic planning.

Strategies to Identify, Treat, and Eliminate MRI Radiofrequency Burns

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Anshuman Panda, PhD, Scottsdale, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Thermal burns are a potential cause of injury during MRI scans. Recognition, diagnosis, and management of these burns can be challenging and may often go unrecognized.2. We implemented a multidisciplinary team, led by a radiology physician assistant, to help in the timely identification, assessment, and management of patients with suspected MRI burns.3. As a result of this initiative, we have collected numerous cases of MRI burns. In this exhibit, we will use these cases to demonstrate causes of MRI burns, physical findings of these burns, and discuss management strategies.

TABLE OF CONTENTS/OUTLINE

A. Background of MRI burns with an emphasis on physics aspect of burns and excessive power deposition.B. Pathophysiology of radiofrequency burns.C. Clinical presentation and treatment.D. Discussion of our local burn initiative including physical assessment of patients and the review by MR technologists and physicists to address root cause of burn cases.E. Case based review and management of burn cases identified in our practicePlease visit the Learning Center to also view this presentation in hardcopy format.

Solitary Fibrous Tumor in the Brain, Head and Neck, and Spine: Basic and Advanced Neuroimaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Certificate of Merit

Participants
Ryo Kurokawa, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibit is to1. Review the etiology, histology, and epidemiology of solitary fibrous tumor (SFT) in the brain, head and neck, and spine2. Demonstrate the imaging characteristics on the conventional modalities/sequences3. Show how advanced modalities/sequences can help diagnose SFT

TABLE OF CONTENTS/OUTLINE

Content organization1. Introduction-Etiology, histology, and epidemiology of SFT in the brain, head and neck, and spine 2. Typical imaging findings 3. Advanced imaging-MRS-Diffusion-weighted imaging-Contrast-enhanced perfusion-weighted imaging-FDG-PET 4. Atypical imaging findings-Atypical localization: Cavernous sinus, Orbit-Atypical manifestation: Metastasis, Doege-Potter syndrome, Intracranial hemorrhage 5. Differential diagnosis-Various neoplasms 6. Summary

The Forgotten System: Lymphatics of Abdomen and Pelvis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Rodrigo Loto, MD, Rosario, Argentina (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Presentation of the organization and function of the lymphatic vascular system.-Overview of lymphatic vascular development (lymphangiogenesis).-Importantly, lymphangiogenesis occurs in adult tissues during inflammation, wound healing, and tumor metastasis.-Radiology is playing an important and growing role in the diagnosis and treatment of many lymphatic conditions.

TABLE OF CONTENTS/OUTLINE

Studies of the last decades have revealed the importance of angiogenesis for normal growth and for the pathogenesis of numerous diseases. Much less studied is lymphangiogenesis , the growth of lymphatic vessels, which drain extravasated fluid, proteins, and cells and transport them back to the venous circulation. Nonetheless, insufficient lymphangiogenesis causes incapacitating lymphedema, while lymphatic growth around tumors may facilitate metastatic spread of malignant cells that ultimately kill the patient.During inflammation, lymph flow increases to limit edema and prevents tissue antigen-presenting cell transport. Lymphatics also adjust their contractile activity to increase fluid transfer during acute inflammation. Conversely, chronic inflammation can provoke lymphostasis, which might limit pathogen spread within the circulation; however, decreased lymph flow leads to the persistence of immune cells and mediators in tissues to intensifying injury.Knowledge of lymphatic anatomy, physiology, and expected imaging appearances is crucial in understanding the pattern of cancer spread.Lymphatics have been proposed as transphrenic dissemination pathway for multiple phenomena, including neoplasms, septic processes, urinothorax, and porous diaphragm syndromes.

Not Too Young to Know: Multimodality Imaging Review of Commonly Encountered Pathologies in Institution-Living Elderly

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Andy Guo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Define the institutional elderly patient population and explain how they are a vulnerable population2- Learn about common pathologic conditions specifically affecting the institutional elderly3- There are special considerations in clinical and imaging approach for evaluating these patients that are different from the general population including compassionate care, imaging techniques and accounting for limitations in the institutional elderly

TABLE OF CONTENTS/OUTLINE

1- Review examples of common pathologies in the institutional elderly, including but not limited to:Musculoskeletal- falls and traumaInfectious disease- aspiration pneumoniaGastrointestinal- chronic constipationGenitourinary- incontinenceDrug Toxicity- confusion and over-sedationNeurological- dementia and strokeUnderlying Medical Condition- heart failure, hypertension and type 2 diabetes2- Describe specific imaging findings in evaluation of example pathologies, with teaching points about underlying pathophysiology3- Review special considerations that radiologists and technologists must make in evaluating this vulnerable patient population to align with compassionate care

Lymphatics: Imaging and Interventions- A Comprehensive Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Smily Sharma, MD, MBBS, Jodhpur, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To study the anatomy of the lymphatic system and its pathophysiological basis 2. To study in detail the methodology and protocols of MR and Conventional Lymphangiography 3. To discuss imaging features of various disorders of the lymphatic system including macrocytic, microcystic, mixed lymphatic malformations, renal lymphangiectasia and syndromes associated with lymphatic disorders 4. To discuss imaging features of congenital abnormalities of lymphatics like vanishing bone disease, primary lymphedema 5. To discuss imaging features of acquired lymphatic disorders like chyle leak, pulmonary lymphatic perfusion syndrome, and the role of MR and conventional lymphangiogram in these disorders using state of the art cases 6. To discuss the role of Interventional Radiology in the management of lymphatic disorders including sclerosing agents and thoracic duct embolization

TABLE OF CONTENTS/OUTLINE

1. Anatomy of Lymphatic System and Pathophysiological Basis of Lymphatic Disorders 2. Conventional Lymphangiography: Method 3. MR Lymphangiography: Method and Protocols 4. Lymphatic Malformations 5. Renal Lymphangiectasia6. Syndromes associated with Lymphatic disorders 7. Congenital Lymphatic Disorders: Generalized Lymphatic Anomaly, Gorham Stout Disease, Primary Lymphedema 8. Acquired Lymphatic disorders: chyle leak, pulmonary lymphatic perfusion syndrome, secondary lymphedema 9. Interventional Radiology in treatment of lymphatics: Sclerosing Agents, Thoracic Duct Embolization 10. Summary

Free-Breathing T1-Weighted Motion Correction in Abdominal MRI: Technical Principles, Applications, and Current Limitations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Identified for RadioGraphics

Participants
Ebru Yaman Akcicek, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Understand the technical principles of free breathing T1 weighted pulse sequences 2. Learn the difference between non-dynamic and dynamic contrast enhanced acquisitions using radial k space trajectories 3. Examine the currently established indications for motion corrected contrast techniques 4. Discuss limitations of current free breathing techniques and accelerated cartesian acquisitions 5. Learn how to identify the best patient-adapted protocol strategy 6. Review newly emerging techniques for motion reduction

TABLE OF CONTENTS/OUTLINE

1. Principals of radial imaging: description of radial k-space trajectories (stack of stars) 2. Dynamic contrast acquisitions with view sharing 3. Abdominal applications of free breathing motion correction indications in liver, pancreas and kidneys 4. Strategies for patient-adapted abdominal examination protocols using free breathing techniques 5. Limitations of motion correction techniques, and mitigation strategies 6. Novel developments of free breathing pulse sequences

Focusing the Retrospectoscope: Challenging and Easily Overlooked Patterns of Recurrence and Metastases in Abdominopelvic Oncologic Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Molly Roseland, MD, Northville, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Accurate recognition of recurrent and metastatic cancers by CT, MRI, and PET/CT may be challenging. 2. Post-surgical scarring and distortion is a common mimic of recurrence. Enlarging enhancing tissue should be considered suspicious. 3. Common features of missed recurrent malignancy include small size, slow or infiltrative growth pattern, obscuration by irregular surgical margins, or location in an imaging "blind-spot." Comparisons over time, surgical history, and thorough search pattern are essential. PET may improve detection.

TABLE OF CONTENTS/OUTLINE

1. General principles: use history, many comparisons 2. Individual Cancer Recurrence Patterns A. Pancreatic adenocarcinoma -Recurrence: perivascular cuffing, pancreatic mass; Mimic: Post-Whipple fibrosis -Metastases: peritoneum, liver; mimic: fat necrosis, micro-abscesses B. Cholangiocarcinoma -Recurrence: mass at surgical margin, biliary stricture; mimic: postsurgical change, cholangitis C. Colorectal cancer -Recurrence: perianasatomotic, lymph nodes; mimic: scarring (presacral) D. Renal cell carcinoma -Recurrence: surgical bed, IVC; Pitfall: post-treatment change (noncontrast) -Metastases: Adrenal, pancreas (unique), bone; Pitfall: Small; no arterial-phase; adrenal washout E. Bladder cancer -Recurrence: ureteral stricture, mass; Mimic: Reflux post-cystectomy F. Prostate cancer -Local Recurrence; PSMA PET Pitfall: obscuration by urinary excretion -Metastases: bone, lymph nodes; Pitfall: epidural extension, fracture; Pitfall: rare sites (sacral nerves, penis) 3. Summary and recommendations

Lymph Nodes in Abdominal and Pelvis Neoplasms: Evaluation From Stagng to Post - Treatment: Messengers of the Force or Dark Side Sentinel?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Certificate of Merit

Participants
Thamiris De Sousa Garcia, MD, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Use of different imaging methods to assess lymph nodes for tumor dissemination, what each method can add and how to proceed for further investigation. - Evaluation of heterogeneity of staging criteria and treatment response of lymph nodes involved in abdominal and pelvic neoplasms. - Better understanding of regional lymph nodes involved in different neoplasms, with revision of the anatomy of lymph node chains and dissemination routes.

TABLE OF CONTENTS/OUTLINE

- Introduction - Lymph nodes of abdomen and pelvis: anatomy. - Evaluation of lymph nodes using different imaging methods: findings of normality and criteria for tumor involvement. - Staging of the main neoplasms of the abdomen and pelvis with characterization of regional involvement and dissemination pathways, as well as its particularities. - Comparison between different types of methods and criteria for evaluating lymph node response to surgical and non-surgical treatment. - Teaching points.

Flap Anatomy After Pelvic Reconstructive Surgery: A Brief Survival Guide

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Paula Otermin Barrera, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To describe in a practical way the resulting anatomy after various flap-based reconstructive surgery techniques, as well as potential complications, providing specific iconography selected from our tertiary referral center, with special emphasis on myocutaneous flaps and their application in pelvic reconstruction after oncological resections

TABLE OF CONTENTS/OUTLINE

1. Introduction. Definition of flap and benefits provided by flap coverage.2. Types of flap according to their vascular anatomy and tissue composition.3. Myocutaneous flaps. Imaging characteristics and applications in pelvic reconstruction of rectus abdominis muscle flaps (TRAM, VRAM and variants) and gracilis muscle flaps. 4. Omental flap.5. Deep Inferior Epigastric Perforator flap (DIEP). Preoperative CT study for selection and marking of optimal perforators. Imaging characteristics and applications in pelvic reconstruction.6. Complications (flap and donor area): post-surgical fluid collections and surgical wound infection, fat necrosis, flap ischemia, dehiscence, tumor recurrence.

Ciliopathy Syndromes: Pathogenesis and Multisystem Multimodality Imaging Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Yarik Bezkor, BS, MD, Lexington, KY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points: 1. Ciliopathies are a diverse group of disorders occurring secondary to abnormal development and/or structural or functional defects of the cilia. 2. Cilia are highly evolved, complex organelles, found ubiquitously on the surface of almost all the cell types, and have diverse mechanosensory and chemosensory signal transduction roles and there have been significant recent advances in the understanding of these key organelles.3. Ciliopathy syndromes affecting non-motile cilia are associated with multisystem developmental disorders predominantly affecting renal, skeletal, and nervous systems.4. Renal ciliopathies are the most common which include autosomal polycystic kidney disease, and nephronophthisis, Ciliopathy syndromes associated with neurodevelopmental features include Meckel-Gruber syndrome, Joubert syndrome, orofacial digital syndrome as well as Bardet-Biedl syndrome. Motile ciliopathies, grouped as “primary ciliary dyskinesia” most commonly present as Kartagener's syndrome.5. Multimodality imaging with Ultrasound, CT, and MRI is crucial for the diagnosis and management of these syndromes.

TABLE OF CONTENTS/OUTLINE

1. A. Embryology and pathogenesis of ciliopathy syndromes 2. B. Multimodality imaging of Motile and non-motile ciliopathy syndromes.

New CT Technology: A Practical Approach to Convert CT Acquisition Protocols from Energy Integrating Detector (EID) CT to Photon Counting Detector (PCD) CT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Nikkole Weber, ARRT, RT, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Explain the differences between energy integrating detector (EID) and photon counting detector (PCD) technologies 2. Understand critical differences in PCD technology that need to be taken into account when designing PCD scanning acquisition protocols.

TABLE OF CONTENTS/OUTLINE

1. Explain differences between PCD and EID technologies used on commercial CT scanners a. PCD: Directly convert X-ray into electronic signals, count individual photon and record its energy b. EID: Indirect, 2 stage conversion of X-ray of light to electronic signal. No information on individual photon energy 2. Create a core team of experts a. Medical Physicists b. CT technologists c. Subspecialized radiologists 3. Explore new CT scanner technology and its benefits 4. As a practice, decide protocol conversion approach: a. Apples-to-apples: i. Acquisitions with similar appearance and diagnostic quality as current EID CT b. Apples-to-oranges: i. Acquisitions leveraging technical advantages of PCD technology (high matrix, sharper kernels, higher IR) 5. Define parameters that do not allow an apples-to-apples protocol conversion a. Scan modes (high res, multi-energy, combined-lower kV) b. Conventional tube potential selection (conventional) vs. Virtual monoenergetic selection (PCD) c. System-specific reconstruction kernels and reconstruction nomenclature 6. Protocol evaluation through image review sessions a. Define two lists of protocols i. Commonly used protocols in your practice ii. Protocols or indications that would benefit from new technology b. Change acquisition and reconstruction parameters, iteratively reevaluating images with core experts

Thinking IN and OUT of the Box: Using Chemical Shift Imaging as a Problem-Solving Tool

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Anthony Larder, DO, Milford, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review basic physics concepts of chemical shift and magnetic susceptibility in MRI-Discuss tissue characteristics that can be used for diagnosis with chemical shift imaging including: macroscopic fat, microscopic fat, calcifications, gas, and iron-Review imaging findings and associated pathophysiology of multiple scenarios in which chemical shift artifact aids in diagnosis

TABLE OF CONTENTS/OUTLINE

Review of physics concepts related to chemical shift imaging including original illustrations and relevant case examples-Precession of fat and water-Signal characteristics and physical properties of Type 1 and Type 2 chemical shift artifact-Liver fat quantification-Magnetic susceptibility-T2* decay based on TE-Properties of diamagnetic, paramagnetic, and ferromagnetic substances-Liver iron quantificationReview of chemical shift as a diagnostic tool, including differential diagnoses, discussion of relevant pathophysiology, and clinical issues. Case examples including-Macroscopic fat:-Renal angiomyolipoma-Mature teratoma-Liposarcoma-Fat-containing hepatocellular carcinoma-Microscopic fat:-Hepatic steatosis-Nodular-Companion case of hepatic melanoma metastases -Hepatic adenoma-Adrenal adenoma-Metastatic marrow replacement -Fat-containing hepatocellular carcinoma-Magnetic Susceptibility:-Iron deposition-Primary hemochromatosis-Hemosiderosis-Gamna-Gandy bodies-Hepatic siderotic nodules-Including case of Wilson's disease with siderotic nodules-Metallic Susceptibility-Surgical clip localization-Calcifications-Cholelithiasis-Nephrolithiasis-Blood products-Gas-Within infected pancreatic necrosis-Pneumoperitoneum-Pneumobilia

Introduction to Oncology Imaging: A Primer For Residents and Fellows

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Jordan LeGout, MD, Ponte Vedra Beach, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Learning to interpret oncology imaging can be a complex and daunting topic for residents and fellows. In this exhibit we will:-Provide a framework for approaching oncology cases for the trainee-Review the various tumor response criterion and their main takeaways for clinical use-Discuss differences in imaging assessment for chemotherapy and immunotherapy-Examine imaging response for local-regional therapies-Highlight the benefit of high-yield disease specific search patterns

TABLE OF CONTENTS/OUTLINE

1. Introduction a. Role of radiologist and importance of imaging in patient care b. Words matter! "Loaded words" and definitions i. Stable, response, progression2. Clinical history (the "what, when, and how") a. Key history elements to know for each case i. Original presentation 1. Always review the first scan = Each case a teaching file! 2. Establishes disease appearance and sites pre-therapy ii. Therapy type 1. Start date 2. How treatment type influences image interpretation iv. Time crunch: what are the highest yield priors v. Tumor markers and trend3. Tumor response criteria (the takeaways) a. RECIST 1.1 b. mRECIST c. iRECIST d. Choi e. Cheson/Lugano4. Immunotherapy a. Pseudoprogression b. Unique adverse effects5. Local-regional therapies a. Ablations and embolizations b. Radioembolization6. Disease specific high-yield search patterns a. Examples of common malignancies

The Role of the Radiologist in LGBTQ+ Patient Care: A Comprehensive Curriculum

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Janis Yee, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Understand the radiologist's role in delivering inclusive and culturally sensitive care to LGBTQ+ patients. ? Understand the current cancer screening guidelines for transgender patients. ? Recognize the normal postoperative appearance and postoperative complications related to gender affirmation surgeries. ? List complications related to hormone therapy, including increased risk of venous thromboembolism, ischemic heart disease, cerebrovascular events, and hormone-sensitive organ atrophy or cancers. ? Recognize complications related to HIV and highly active antiretroviral therapy (HAART).

TABLE OF CONTENTS/OUTLINE

? Background and definitions of LGBTQ+ ? Challenges to caring for the LGBTQ+ community ? Discuss imaging relevant to trans patients ? Preoperative imaging in planning for feminization surgery ? Preoperative imaging in planning for masculinization surgery ? Postoperative complications in gender-affirming surgery ? Normal appearance of feminization and masculinization after medical transition ? Complications of gender-affirming hormone therapy ? Provide an overview of imaging findings in lesbian, gay, bisexual, and queer patients related to stigmatized health concerns such as STDS, substance abuse, and certain types of cancer ? Review complications from common preventative medications prescribed to patients, for example, pre-exposure prophylaxis (PrEP) ? Qualitatively assess the availability of multidisciplinary care to LGBTQ+ patients at three different academic institutions across the country ? Discuss how radiology departments can improve their role in the care of this patient population ? Conclusion

Skin Ultrasound in Lipolytic Aesthetic Procedures

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Lipolysis and lipolytic aesthetic procedures are increasingly being performed, and minimal invasive types are preferable. Nonsurgical body contouring techniques, aimed at reducing the subcutaneous adipose tissue, includes cryolipolisis, injectable lipolytic (meso-therapy), low and high-intensity focused ultrasound and others therapies. In this context, the radiologist has been requested to recognize their usual aspects as well as to assess possible complications. To achieve accurate and timely detection and appropriate approach of each case, High frequency ultrasound (HFUS/24-33MHz) is the most effective method since it provides optimal anatomical information of the skin and allows evaluation before, during and after these procedures. This study aims to discuss and illustrate the radiologist's role in the evaluation of lipolytic aesthetic procedures with HFUS. The purpose of this exhibit is:- To describe the preprocedure evaluation.- To illustrate the anatomy of the skin layers.- To show the main image patterns and effects of the lipolytic aesthetic procedures.- To list and describe the most common procedures complications.- To highlight the importance of HFUS before, during and after nonsurgical body contouring techniques.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION.2. NORMAL ANATOMY.3. PREPROCEDURAL EVALUATION.4. PROCEDURES CHARACTERISTICS AND IMAGING FINDINGS5. COMPLICATIONS.6. PROCEDURE GUIDANCE.7. CONCLUSION.

A Confusion of Wild Catheters: A Review of Abdominal Medical Devices

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Victoria Kim, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Recognize the normal appearance of various abdominal devices on multi-modality imaging.2. Identify potential complications related to abdominal devices which may have acute clinical implications.

TABLE OF CONTENTS/OUTLINE

I. Background: In the continuously changing landscape of medicine, abdominal imaging often captures a wide variety of medical devices. These can be bewildering when seen for the first time, especially for residents early in training. Recognizing potential complications related to unfamiliar devices is an even greater challenge but can have acute clinical implications for patient safety and outcomes.II. Gastrointestinal tract devices: Traditional enteric catheters; Gastrostomy/gastrojejunostomy tubes; Gastrointestinal and biliary stents.III. Genitourinary devices: Ureteral stents; Nephrostomy tubes; Contraceptive devices; Prosthetics.IV. Vascular devices: IVC filters; Vascular stents and grafts; ECMO cannulas and other vascular catheters; Ventricular assist device drivelines.V. Miscellaneous devices: Spinal catheters; Electronic stimulator devices; Peritoneal dialysis catheters; Surgical clips, sutures, and drains.

Multimodality Imaging in Metabolic Syndrome: A State-of-the-Art Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Cum Laude
Identified for RadioGraphics

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the etiology and complications of metabolic syndrome 2. To understand the role of multimodality imaging in metabolic syndrome 3. To illustrate the utility of imaging in diagnosis of metabolic syndrome and assessment of target organ injury

TABLE OF CONTENTS/OUTLINE

• METABOLIC SYNDROME- Definition and criteria • CAUSES AND RISK FACTORS • ROLE OF IMAGING - Diagnosis, target organ injury assessment, biomarkers for novel therapy • MODALITIES- CT, MRI (including MR spectroscopy, Elastography, PET/MRI), nuclear medicine, Ultrasound, DXA • FAT ASSESSMENT - Subcutaneous abdominal fat - Visceral abdominal fat- US (thickness, fat index), CT (inc single slice CT) MRI (FSE, chemical shift, fat selective), DXA - Parenchymal fat- MRS - Fat around organs- Eg. Pericardiac fat (echo, CT/MRI) - Fat around vessels- CT, MRI, 1H-MRS • INSULIN RESISTANCE - Intramyocellular lipid in skeletal muscle biopsy, 1H- MRS - Glucose metabolism using 18F-FDG PET, dynamic triple-tracer PET with 15O-H20, 11C-3-0-methylglucose, and 18F-FDG • TARGET ORGAN INJURY - Vessels- Atherosclerosis, elevated arterial stiffness- Doppler, CT, MRI - Cardiac- Dilation/hypertrophy, diastolic dysfunction, impaired strain, coronary atherosclerosis, ischemic heart disease- Echo, CT, MRI, Nuclear perfusion - Liver- Nonalcoholic fatty liver, cirrhosis- Ultrasound, CT, !H- MRS, Dixon MRI, 31P- MRS, MRI, MR Elastography, US elastography - Pancreas- Fatty disease- US, CT, MR, 1HMRS - Kidney- Chronic renal disease, renal stone- Ultrasound, CT, MRI, 99mTc-DTPA, dynamic CE- MRI, ASL-MRI, DWI, BOLD-MRI - Brain- Cognitive impairment, dementia, stroke- MRI, DTI, MTI, 18F-FDG PET • ALGORITHMIC APPROACH for diagnosis and target organ injury assessment

Imaging Spectrum of Amyloidosis: What A Radiologist Should Know ?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Smily Sharma, MD, MBBS, Jodhpur, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Using a case-based approach: 1. To study the types of Amyloidosis and their pathophysiological basis 2. To study the imaging manifestations of Amyloidosis from head to toe. including CNS, Cardiothoracic, gastrointestinal and visceral manifestations 3. To study in details features of Airway and Pulmonary Amyloidosis 4. Using state of the art cases, discussing the role of Cardiac MRI in Amyloidosis including recent advances like T1 mapping

TABLE OF CONTENTS/OUTLINE

1. Amyloidosis: Classifications and Pathophysiological basis 2. CNS Manifestations of Amyloidosis 3. Airway Amyloidosis 4. Pulmonary Amyloidosis5. Cardiac Amyloidosis: Role of Cardiac MRI, Spectrum of cases, Differentials 6. GIT manifestations of Amyloidosis: Imaging features of Tongue, Esophagus, Stomach, Bowel involvement 7. Visceral Manifestations: Hepatosplenomegaly, Renal Involvement 8. Complications and Prognosis 9. Summary 10. References

Imaging Features of Erdheim-Chester Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Certificate of Merit

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the pathogenesis and epidemiology of Erdheim-Chester disease; 2. Discuss possible clinical presentations and main organ systems affected; 3. Describe main imaging findings and modalities used in suspected diagnosis and follow-up; 4. Provide an overview of the main currently available therapies and their side effects

TABLE OF CONTENTS/OUTLINE

1. Pathogenesis, epidemiology, and clinical manifestations; 2. Role of imaging in diagnosis and follow-up, including main radiological findings: (a) Radiographs (eg, bilateral, symmetric, preponderance for lower extremities); (b) Bone scan (eg, lower extremity metaphysis diaphysis); (c) Whole body PET-CT (eg, avid 18F-FDG activity in the affected regions); (d) MRI brain orbits (eg, absence of pituitary bright spot on T1-weighted images, posterior fossa T2-hyperintense white matter lesions); (e) Cardiac MRI/CT (eg, right atrial pseudotumor, thickened interatrial septum); (f) CT chest, abdomen pelvis (eg, periaortic perinephric infiltration, ie, "coated aorta" "hairy kidney); 3. Definitive diagnosis including markers and specific mutations (eg, BRAF V600E); 4. Management of symptomatic versus asymptomatic patients; 5. Targeted (eg, BRAF and MEK inhibitors) and non-targeted (eg, steroids, interferon-a, pegylated-interferon alfa-2a, IL-1 inibitors, cladribine, etc) therapies

Diverse Spectrum of Visceral and Somatic PEComas: Current Update on Pathology and Cross-sectional Imaging Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Akhilesh Pillai, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the taxonomy, epidemiology, clinical features, histopathology and biology of the diverse spectrum of PEComas.2. Describe the salient multimodality cross-sectional imaging features of these tumors.3. Review the genetics, management and prognosis of these tumors.

TABLE OF CONTENTS/OUTLINE

1. Introduction, epidemiology and clinical features.2. Histopathology, immunocytochemistry and molecular pathology.3. CT, MR and PET/CT imaging features and tumor biology of wide spectrum of PEComas.4. Prognosis and management.5. Diverse group of PEComas of varying biological potential.6. Heterogeneous imaging characteristics of tumors; advanced pathology techniques permit definitive diagnosis.7. Accurate diagnosis is essential for optimal treatment and management.8. Conclusion

The Invasion of Fat-Silent and Dangerous: A Radiologic-Pathologic Correlation of Lipo-sarcoma in Usual and Unusual Locations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Nancy Margarita Gutierrez Castaneda, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To describe the general characteristics and subtypes of the liposarcoma.-To review liposarcoma subtypes and imaging characteristics for each subtypes.-To know clinical features and pathogenesis of liposarcoma.-To identify the imaging characteristics for each liposarcoma subtypes and all the radiological modalities (X-ray, CT- scan, PET-CT, SPECT-CT and others).-To associate the clinical presentation, the radiological studies and the histopathological result.-To discuss the appropriate management and follow u of the liposarcoma based on recent literature guideline and expert opinions.

TABLE OF CONTENTS/OUTLINE

-Introduction-General features of liposarcoma How to identify it?-Liposarcoma background and molecular pathogenesis-Usual and unusual locations of liposarcoma-Clinical presentation-Imaging findings and pathology of different subtypes of liposarcoma(Well-differentiated, dedifferentiated, myxoid, pleomorphic)-Ilustrative pathological cases-Appropriate management and follow up of the liposarcoma-Conclusion

Li Fraumeni Syndrome (LFS): Multimodality Imaging Features from Head to Toe and Imaging Guidelines

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Identified for RadioGraphics

Participants
Babina Gosangi, MD, MPH, New Haven, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• LFS occurs due to TP53 mutation, is transmitted in an autosomal dominant mode and is associated with early onset of cancers and more than one cancer in a lifetime.• The most common tumors associated with LFS are Sarcomas, Leukemia, Adrenocortical carcinoma and Breast tumors (SLAB syndrome).• Individuals with LFS are screened from childhood for early detection of cancer with imaging including annual MRI brain, annual whole-body MRI, ultrasound of the abdomen every 3-4 months in children and once in 6 months in adults, annual breast MRI in women older than 20 years.

TABLE OF CONTENTS/OUTLINE

Imaging guidelines for LFS Head to toe description of tumors based on location• Brain tumors- medulloblastoma, glioblastoma, meningioma, choroid plexus carcinoma• Breast tumors- phyllodes tumor• Chest tumors- lung cancer, thymoma, thyroid cancer• Abdomen tumors- adrenocortical carcinoma, renal cell cancer, colon cancer, pancreatic cancer• Pelvic tumors- Ovarian cancer, testicular cancer, prostate cancer• Musculoskeletal- rhabdomyosarcomas, osteosarcomas• Skin cancer- melanoma• Others - Leukemia

Don't Forget About Abdomen Radiographs Just Yet: Take Advantage of Natural "Contrast Agents"

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Identified for RadioGraphics

Participants
David Disantis, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

As of 2019, in the U.S. alone, 10.1 million abdomen radiographs were performed. Being able to interpret them is still relevant.Abdominal radiographs have 3 innate “contrast agents” as clues to diagnoses: Gas: Normal (bowel gas) and abnormal (extra-luminal, mural pneumatosis, portal venous, biliary, abscess). Calcium: Benign (calculi, vascular, inflammatory, neoplasms) and malignant. Fat: Around things (organomegaly, masses) and in things (benign and malignant neoplasms)• Case-based examples will illustrate each

TABLE OF CONTENTS/OUTLINE

1. Recognizing the normal abdomen film 2. Clues from gas as "contrast": bowel obstruction/ileus, pneumoperitoneum/retroperitoneum; bowel/gallbladder/kidney/bladder pneumatosis, abscess.3. Clues from calcium as "contrast": urinary tract and biliary calculi, milk of calcium, nephrocalcinosis, porcelain gallbladder, calcified neoplasms.4. Clues from fat as "contrast": outlining organomegaly and masses; within masses.

Abdominopelvic Applications for Intra-operative Ultrasound

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Omar Shwaiki, MD, Canton, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

Intraoperative ultrasound (IOUS) is a useful technique that a radiologist can leverage to add value to his/her practice. The use of high frequency probes, often directly upon the organ of interest, allows one to obtain crisp images at resolutions not possible with other modalities. The use cases for IOUS are numerous but generally include localization and marking of lesions, lesion characterization, and survey for metastases. IOUS may also be used to facilitate intraoperative biopsy and/or device placement.

TABLE OF CONTENTS/OUTLINE

1) Provide overview of IOUS equipment and describe appropriate sterilization procedures for both the equipment and the radiologist. 2) Illustrate intraoperative ultrasound techniques and describe the advantages and disadvantages of each. Where appropriate, describe the relevant ultrasound anatomy. 3) Provide case examples of intraoperative ultrasound utility of various organ systems including the liver, pancreas, kidneys, and female pelvis.4) Describe limitations and pitfalls of intraoperative IOUS.

Bone Marrow Lesions on MRI: A Proliferative Discussion

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Blake Marmie, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Highlight the World Health Organization (WHO) classification scheme of myeloid and lymphoid neoplasms. 2. Review magnetic resonance imaging (MRI) techniques and approaches for evaluating bone marrow disorders. 3. Discuss imaging features of common marrow disorders and provide an imaging-based stratification approach via illustrations and case examples. 4. Provide a suggested imaging lexicon of common marrow lesions that allows for conforming radiology to the histopathology classification of marrow lesions.

TABLE OF CONTENTS/OUTLINE

1. Marrow tumor classification 1.1. WHO classification of hematopoietic and lymphoid tissue tumors 1.1.1. Myeloid neoplasms 1.1.2. Lymphoid neoplasms 1.2. Imaging-based stratifications of marrow neoplasms 1.2.1. Diffuse or multifocal marrow infiltration 1.2.2. Diffuse or multifocal marrow replacement 2. Imaging technique and concepts 2.1. Radiographs and computed tomography (CT) 2.2. MRI 2.2.1. Conventional sequences (T1-weighted and fluid-sensitive) 2.2.2. Contrast enhanced images 2.2.3. Chemical Shift (in-phase and out-of-phase) 2.2.4. Diffusion-weighted images 3. MRI pattern-based stratification of marrow lesions 3.1. Focal pattern 3.1.1. Unifocal 3.1.2. Multifocal 3.2. Variegated pattern 3.3. Diffuse 4. Proposed MR imaging lexicon for marrow lesions

I Can Be Anywhere On Your Body: Manifestations and Complications of Hydatid Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Cecilia Ruiz de Castaneda, Toledo, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. To describe hydatid cyst structure and the life cycle of Echinococcus tapeworm 2. To review and illustrate the imaging features in US, CT, and MRI of hydatid disease throughout the body. 3. To review and illustrate the main potential complications of hydatid cysts.

TABLE OF CONTENTS/OUTLINE

Hydatid disease is a worldwide zoonosis produced by the larval stage of the Echinococcus tapeworm. Hydatid cyst demonstrates a variety of imaging features, varying according to growth stage, affected tissue, and complications. For this reason, a hydatid cyst should be kept in mind when a cystic lesion is encountered anywhere in the body, especially in endemic areas. Clinical symptoms may be related to the mass effect of the cyst, its infection, or anaphylactic reactions secondary to its rupture The classical findings in hydatid disease are well known. However, we review unusual anatomic locations and complications providing images of cases from our experience.

Imaging Review of Diabetes Mellitus

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Certificate of Merit

Participants
Thurl Hugh Cledera, MD, Taguig, Philippines (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diabetes Mellitus (DM) is a metabolic disorder characterized by a chronic hyperglycemic state and impairment of protein, fat, and carbohydrate metabolism due to alterations in insulin action. Complications in DM include microvascular (diabetic retinopathy, neuropathy, and nephropathy) and macrovascular (coronary artery, peripheral artery, and cerebrovascular disease). Non-ketotic hyperglycemia hemichorea may present with asymmetric hyperdensity or T1-weighted hyperintensity in the basal ganglia contralateral to the patient's neurologic deficit. Cardiac MRI can demonstrate the presence of scar or fibrosis and even underlying ischemia. Diabetic mastopathy is a rare complication that is usually seen in late-stage diabetes. Imaging is not primarily indicated in assessing acute urinary tract infection but may be necessary for the presence in the clinical setting of known diabetes.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Pathogenesis 3. Head and Neck a. Non-Ketotic Hyperglycemia Hemichorea b. Stroke4. Cardiac a. Diabetic Cardiomyopathy b. Peripheral Artery Disease c. Coronary Artery Disease 5. Breast a. Diabetic Mastopathy 6. Gastrointestinal a. Subcapsular Fatty Infiltration of the Liver b. Emphysematous Cholecystitis 7. Genitourinary a. Renal Abscess b. Emphysematous Pyelonephritis c. Emphysematous Cystitis d. Ductus Deferens Calcification 8. Musculoskeletal a. Fasciitis b. Fournier Gangrene c. Diabetic Neuroarthropathy d. Diabetic Myopathy e. Medial Calcific Sclerosis f. Subcutaneous Amyloid Deposits

Lose The Battle and Win the War: Multimodality Imaging of Diseases Unique to Immuno-Suppressed

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Certificate of Merit

Participants
Pegah Khoshpouri, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Suppression of immune system can be primary-congenital immunodeficiency, secondary to chemo- or immuno-therapy medications, or acquired immunodeficiency syndrome (AIDS).• Immunosuppression predisposes patients to various opportunistic infections, inflammatory responses such as drug toxicity, or malignancies.• There are unique and overlapping imaging manifestations. Learning about unique radiologic findings can lead to earlier and more precise diagnosis.

TABLE OF CONTENTS/OUTLINE

To provide a comprehensive review of multimodality and multisystem unique imaging appearances of various scenarios in immunocompromised patients in a case-based format. These scenarios are including but not limited to:• Infections such as pneumocystis jiroveci pneumonia, tuberculosis in patients with leukemia or HIV, aspergillosis in neutropenic patients or those on immunosuppressants after transplantation.• Malignancies such as Kaposi' sarcoma in HIV and post-transplant lymphoproliferative disorder after transplant.• Lymphoproliferative disorders in patients with congenital hypogammaglobulinemia.• Medication-induced pneumonitis or sarcoid-like reaction.• Table summarizing various predisposing diseases and commonly seen associated infections.

Castleman Disease: A Multifaceted Diagnostic Dilemma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Identified for RadioGraphics

Participants
Marika Pitot, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review Castleman Disease, clinical subtypes, and implications for disease presentation and identification. 2. Describe the imaging features of Castleman Disease on different imaging modalities. 3. Raise awareness of Castleman Disease as a mimicker of other disease processes. 4. Discuss the potential known associations with and complications of Castleman Disease.

TABLE OF CONTENTS/OUTLINE

1. General overview of Castleman disease (CD) a. Unicentric (UCD) or multicentric (MCD) lymphoproliferative processes b. Several distinct clinical subtypes c. Histopathologic subtypes: hyaline vascular, plasma cell, mixed d. Spectrum of presentation and association with subtype: UCD - Localized, asymptomatic, indolent, incidentally discovered - localized mass; MCD - Systemic disease presenting acutely with constitutional symptoms, widespread lymphadenopathy, and hepatosplenomegaly 2. Imaging appearances on ultrasound, CT, MRI and PET a. Lymphadenopathy - single, regional, or widespread b. Soft tissue masses - thoracic, abdominal, retroperitoneal etc c. Specific organ involvement and appropriate imaging modalities for evaluation - hepatomegaly, splenomegaly, adrenal gland, salivary glands 3. Potential mimickers 4. Known associations and complications - POEMS syndrome

A Call for Vigilance: Multimodality Imaging Evaluation of Malignancy in Solid Organ Transplant Recipients

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Anthony Micetich, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Solid organ transplant recipients are at risk of numerous postoperative complications. A particularly dreaded immediate and long-term complication is malignancy. Development of these cancers is multifactorial and related to elements inherent to solid organ transplantation, with classification dependent on pathogenesis. Radiologists are often the first providers to identify these malignancies. We will review multimodality imaging presentation of various transplant related malignancies and their mimickers and emphasize the role of the radiologist in the care team.

TABLE OF CONTENTS/OUTLINE

1. Review various solid organ transplants with diagrammatic depiction 2. Review risk factors for malignancy in transplant recipients a. Increased risk compared to the general population b. Can develop in the transplanted organ(s) or elsewhere in the body 3. Review pathogenesis of malignancy in solid organ transplants: a. Pre-existing risk factors in the recipient, donor, and transplanted organ b. Long-term immunosuppression: type, intensity, duration of use c. Oncogenic and non-oncogenic viral infections 4. Three major classifications of solid organ malignancy in transplant recipients: a. De novo b. Recurrent malignancy c. Donor transmission i. Donor transmitted ii. Donor derived 5. Multimodality imaging of mimics of malignancy in solid organ transplants (including opportunistic infections and graft versus host disease) 6. Role of the radiologist (screening, biopsy, follow up, surveillance) 7. Summary table listing solid organs, related malignancies, and mimickers

Comprehensive Imaging Review of Peritoneum and Implications of Disease Spread

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Shruti Kumar, MBBS, Little Rock, AR (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review embryogenesis and complex imaging anatomy of peritoneal spaces, folds and ligaments.Formulate a differential diagnosis based on disease localization in different peritoneal compartments.Discuss the interconnections between peritoneal and extra-peritoneal spaces, with focus on interfascial disease spread.

TABLE OF CONTENTS/OUTLINE

Review embryogenesis of ventral and dorsal mesentery and their subsequent specialization into different peritoneal ligaments. Imaging examples of peritoneal ligaments and folds of the liver and stomach, small bowel mesentery, large bowel mesocolon, pelvic ligaments.Demonstrate peritoneal spaces on cross-sectional imaging including lesser sac, greater sac, perihepatic, supramesocolic, inframesocolic compartments, paracolic, and pelvic peritoneal spaces. CT/MRI examples of pathologies that frequently involve peritoneal ligaments and spaces, e.g acute pancreatitis, internal hernias, primary/metastatic peritoneal malignancies, intra-abdominal hematomas, sclerosing encapsulating peritonitis.Discuss clinical impact of peritoneal compartmentalization on disease pathogenesis and management decisions e.g. dissemination of gastric adenocarcinoma along perigastric ligaments, borderline resectability of pancreatic adenocarcinoma with mesocolon invasion.Peritoneal Cancer Index (PCI)

Novel Uses of Contrast-Enhanced Ultrasound

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Clayton Douglas, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Contrast-enhanced ultrasound is a well-established modality to characterize liver and renal masses in the setting of contraindication to both MRI and CT. Given this is generally a rare occurrence, many small- and medium-sized hospitals have yet to find adequate utility in adopting this imaging modality. Since the implementation of contrast-enhanced ultrasound at our institution, we have discovered many unique uses of US contrast in common and uncommon clinical scenarios. We aim to share these unique uses in order to increase contrast-enhanced ultrasound usage in medical practice.

TABLE OF CONTENTS/OUTLINE

1. Introduction to contrast-enhanced ultrasound and well-established uses in the literature. 2. Present unique uses of contrast-enhanced ultrasound to answer common and uncommon clinical questions. Case examples include evaluating central line location/functionality, solid organ transplant perfusion, solid organ mass versus abscess, and identification of subtle liver lesions for biopsy localization. 3. Discuss potential future applications.

MSEE-56

Imaging Spectrum of Radiation Induced”

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Kota Yokoyama, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Imaging findings after radiotherapy are diverse, ranging from transient changes to irreversible tissue damage, fibrosis, angiogenesis, and radiation-induced tumors. - Transient imaging changes are seen in a variety of organs and are more often seen as reversible hyperaccumulation on FDG PET with subtle change in morphologic imaging. - Irreversible tissue damage and fibrosis can be seen on CT and MRI as leukoencephalopathy, lung damage, skin scarring, and vascular stenosis. Fragility fractures of the ribs and sacrum are also commonly encountered. - Angiogenesis can result in trabecular vascular malformation, especially hemorrhage and calcification. - Radiation-induced tumors often occur long after treatment. Meningiomas and gliomas tend to occur after whole-brain irradiation. Squamous cell carcinoma, adenocarcinoma, and hematologic tumors can also occur. Osteosarcoma after tangential irradiation of breast cancer is also important to recognize.

TABLE OF CONTENTS/OUTLINE

Transient imaging changes after radiation therapy Irreversible tissue damage, fibrosis, and angiogenesis after radiation therapy Radiation-induced tumors

Not All Lumps Are The Same! The Role of High-frequency Ultrasound In the Differential Diagnosis of Benign Skin Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Victor Alguz, MD, Santos, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Cystic and solid benign skin lesions are commonly observed in clinical practice and high-frequency ultrasound (HFU) has been increasingly used to characterize them. HFU (>15 MHz) clearly define the skin layers and adnexal structures, allowing better characterization of the lesion's location, morphology, thickness and vascularity. Radiologists must know the ultrasound features of the most common benign skin lesions to avoid misdiagnosis. Epidermoid or epidermal inclusion cysts can appear anywhere in the body and typically present as a well-defined, oval, hypoechoic or heterogeneous, subcutaneous mass with an orifice in the epidermis (punctum). Other cysts may show typical locations, such as synovial or ganglion cysts, located near a joint or tendon, and trichilemmal cysts, originated from the outer hair root sheath, most commonly on the scalp. Common solid benign skin lesions include lipoma, dermatofibroma, pilomatricoma, glomus tumor, plantar fibromatosis, nevus sebaceous of Jadassohn, among others. Each lesion has characteristic findings on high-frequency ultrasound and proper correlation with dermoscopic evaluation can help in the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

General aspects of benign skin lesions. High-frequency ultrasound assessment of the most common lesions with dermoscopic correlation (eg. epidermoid cysts, synovial cysts, trichilemmal cysts, lipoma, dermatofibroma, pilomatricoma, glomus tumor, plantar fibromatosis and nevus sebaceous of Jadassohn). Summary and Differential Diagnosis.Please visit the Learning Center to also view this presentation in hardcopy format.

Neoplastic and Non-neoplastic Conditions of the Skin and Superficial Tissue at Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Describe classification of superficial tissue lesions on the basis of cellular origin 2.Discuss symptomatic and incidental cutaneous and subcutaneous lesions identified by imaging 3.Discuss systematic approach to achieve definitive diagnosis and limit the differential diagnosis

TABLE OF CONTENTS/OUTLINE

Superficial soft-tissue masses are common in clinical practice, and the expanding availability of radiologic imaging has increased radiologists' familiarity with these entities. Superficial soft-tissue masses may be classified in one of the following general diagnostic categories: neoplastic and non-neoplastic conditions. Neoplastic lesions: Neurofibroma, Lipoma, Lipofibroma, Desmoid tumors. Extra mammary Paget's disease of the skin, Liposarcoma, Squamous cell carcinoma, Melanoma. Metastases. Non neoplastic conditions Lymph node, Pilonidal cyst, Epidermoid inclusion cyst, Vascular malformation, Infection and inflammation Cellulitis and panniculitis, Dermatomyositis, Scleroderma, Injection granuloma, Hidradenitis suppurativa, Keloid, Abscess, Endometriosis, Inflammatory bowel disease (IBD), Post traumatic and iatrogenic Hematoma/seroma, Silicone injection

Imaging Pearls for Post-Operative Complications in Simultaneous Liver-Kidney Transplant-

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Certificate of Merit

Participants
Eric Cooper, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Simultaneous liver-kidney transplantations (SLKTs) are increasing in incidence in patients with end-stage liver disease (ESLD) and end-stage renal disease (ESRD). Understanding of the imaging findings for these transplants is crucial for timely detection and management of post-transplant complications. 1. We will review the operative technique and anatomy of traditional and en-bloc SLKTs. 2. We will discuss a systematic imaging approach for evaluation of transplanted grafts. 3. We will review the imaging pearls and techniques to work up common complications following SLKT.

TABLE OF CONTENTS/OUTLINE

I. Brief overview of the surgical anatomy of traditional and en-bloc approaches to SLKT II. Imaging approach and normal findings of transplanted grafts. Ultrasound evaluation including major vessel evaluation with doppler waveform characteristics and analysis. CT, MRI and angiography for confirmation of sonographic abnormalities and treatment planning III. Imaging patterns and workup for the most common SLKT complications including - Arterial: hepatic artery stenosis and thrombosis, renal artery stenosis; - Venous: hepatic vein and IVC stenosis and thrombosis; - Portal: portal vein stenosis and thrombosis; - Biliary: biliary leaks, biliary strictures, biliary duct dilation; - Ureteral: urinary tract obstruction, urinary leaks, and vesicoureteral reflux; - Fluid collections (e.g., seromas, hematomas, urinomas).

Beyond Staging: A Genitourinary Tumor Board Navigation Guide for Radiologists with Emphasis on NCCN Guidelines

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Daniela Garcia, MBBS, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Oncological management requires multidisciplinary approach driven by the NCCN guidelines • Radiologists fulfill a fundamental role in the decision making for best treatment available • Radiologist should be familiar with the association between different staging levels and their impact in surgical, systemic, adjuvant and neoadjuvant therapies

TABLE OF CONTENTS/OUTLINE

Modern day diagnosis and treatment of cancer has transformed what was once a somber sentence into a treatable condition with favorable outcomes. Oncological management is no longer limited to oncologists and surgeons, but requires a multidisciplinary discussion including radiologists, radiation oncologists, and pathologists, among others. In this setting, the radiologist fulfills the important role of custodian in every step of patient management. Radiologists are in a privileged position where we can understand the "big picture" and recommend the best next step in treatment algorithm. In this educational exhibit, we will review updated NCCN management guidelines for genitourinary tumors including kidney, ovarian, cervical, prostate, and penile cancer; highlighting pivotal points where imaging can determine change in management. The accessible format of this presentation is particularly targeted to help create an efficient work frame to successfully navigate tumor board discussion in clinical practice.

Evolutionary Fails: A Radiological Exploration of Human Vestigiality and Associated Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Akito Nicol, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vestigiality refers to evolutionarily conserved structures that have lost their original function These holdovers are useful in understanding patterns of organismal change Vestigial structures are usually harmless but may cause disease Knowledge of human evolution can further the radiologist's understanding and imaging analysis of diseases of vestigial structures

TABLE OF CONTENTS/OUTLINE

1. Vestigial structures in animals 2. Examples in humans organized by system and pathology (as follows)1) Gastrointestinal and Genitourinary Radiology a. Appendix (Appendicitis) b. Meckel's diverticulum (Hemorrhage, intussusception, perforation) c. Urachus (Patent urachus, urachal sinus/cyst)2) Neuroradiology a. Head and Neck i. Recurrent laryngeal nerve (Mediastinal trauma, neoplasms) ii. Wisdom teeth (Impaction, infection, cysts) iii. Platysma (Inflammation, infection, trauma) iv. Tonsils (Infection, neoplasm)b. Spine i. Lumbar degenerative disease related to bipedalism (Disc herniation and spondylolysis) ii. Coccyx (Trauma, infections)3) Musculoskeletal Imaging a. Levator claviculae (Confused for mass/lymphadenopathy; thoracic outlet syndrome) b. Fabella (Fabella pain syndrome, arthritis) c. Plantaris (Tendon graft source, rupture)4) Breast Imaging a. Male breast tissue (Gynecomastia, cancer) b. Supranumerary nipples (Cancer)5) Cardiac Imaging a. Left atrial appendage (Thrombus)

Cystic Fibrosis in Children: A Multi-organ Approach From a Radiological Perspective

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Alfonso Escobar Villalba, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The lungs are often severely affected, being the presence of thick-walled bronchiectasis the most characteristic finding.2. The pancreas is the most frequently involved abdominal organ, being fatty replacement the most common imaging finding. 3. Liver disease is frequent. SWE elastography and ATI are useful for diagnosis and management. 4. Meconium ileus is the earliest clinical manifestation of cystic fibrosis. 5. The appendix is often distended so its diameter alone is not an adequate parameter for diagnosing appendicitis.

TABLE OF CONTENTS/OUTLINE

- Etiology, epidemiology - Diagnosis, role of advanced techniques (elastography, ATI, SMI, lung MRI) - Imaging findings- Chest: bronchiectasis, hyperinflation, mucous plugging, consolidation, tree-in-bud, mosaic attenuation/air trapping, pneumothorax, pulmonary and bronchial arterial enlargement.- Abdomen: pancreatic disease (fatty replacement, cystosis, pancreatitis calcifications), liver disease (steatosis, focal biliary fibrosis, cirrhosis, portal hypertension), biliary system (cholelitiasis, microgallbladder, intrahepatic ductal strictures, sclerosing cholangitis), gastrointestinal tract (distal intestinal obstruction syndrome, meconium ileus, rectal prolapse, gastroesophageal reflux, distension of appendix, fibrosing colonopathy, ileocolic intussusception) - Genito-urinary: nephrolithiasis, vas deferens absence, testicular microlithiasis - Head and neck: chronic sinusitis, nasal polyposis - Musculoskeletal: low bone mineral density, kyphosis- Treatment, prognosis

Imaging Features in Paroxysmal Nocturnal Hemoglobinuria (PNH)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Carlos Rubio Sanchez, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Paroxysmal nocturnal hemoglobinuria (PNH) is a rare, acquired, clonal hematopoietic stem cell disorder. • Physiopathology: PIG-A gene mutation - glycosylphosphatidylinositol (GPI) molecule deficit - abnormal complement regulatory proteins CD55, CD59 - complement-mediated intravascular hemolysis - hemoglobinuria • Triad of clinical features: intravascular hemolysis, thromboembolic events, and cytopenia. • Thromboembolic events represent the leading cause of morbidity and mortality. They can occur in atypical locations in the body (venous sinus thrombosis, Budd-Chiari syndrome?), sometimes silent. • Imaging plays an important role in the diagnosis of thromboembolic events, infarcts, and abnormal iron deposits. • The follow-up protocol for PNH patients includes: CT, MRI, or Doppler-ultrasound techniques. MRI is the most sensitive test for detecting silent thrombosis and quantifying iron deposits. • The treatment with eculizumab has changed the paradigm of this disease, prolonging the life expectancy and quality of life of these patients.

TABLE OF CONTENTS/OUTLINE

• Introduction: pathogenesis, clinical manifestations, diagnosis criteria. • Imaging features: -Brain: thrombosis, infarcts, leukoencephalopathy, iron deposit. -Thoracic: cardiac infarcts, pulmonary thromboembolism, pulmonary hypertension signs. -Abdominal: Thrombosis (Sd. Budd Chiari, portal venous, cava?) infarcts, iron deposits. - Osteomuscular: deep vein thrombosis, osteonecrosis • Conclusions.

You Are Not Alone: Solitary Fibrous Tumors Beyond the Chest

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Flavia M. Starling, MD, Belo Horizonte, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

For a long time, solitary fibrous tumors (SFTs) were thought to be exclusive to the pleura. In fact, this is still the most common place to diagnose this rare pathology. With the advances in histologic, molecular, and genetic techniques and the discovery of the SFT fusion gene, other names of tumors with the same histologic spectrum were abandoned and after classified as SFT, such as hemangiopericytomas. This fact has changed the perception about its restricted location.Although visceral pleura is the most common site of this pathology, it can affect several body structures, such as the head and neck, thoracic and abdominal cavities.The radiological features are generally nonspecific, except for the low signal intensity foci on MRI T1 and T2-weighted sequences corresponding to collagen content, producing a chocolate chip cookie appearance, which may aid in the diagnosis. The behavior of TFS on 18 FDG PET-CT can also raise suspicion for this tumor.This work intends to demonstrate that solitary fibrous tumors are not solitary anymore, being found in many locations in the body, by demonstrating and reviewing their imaging features in the many possible topographies.

TABLE OF CONTENTS/OUTLINE

• Case-based review in different imaging methods illustrating the solitary fibrous tumor in its different locations.• Obtaining and understanding characteristic imaging findings of solitary fibrous tumor enables a proper diagnosis for early treatment.• Discuss different radiological findings of solitary fibrous tumor.

Imaging Manifestations of Trisomy 21, from Pediatrics to Adults

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Certificate of Merit

Participants
Christian Gomez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Trisomy 21 is the most common chromosomal anomaly in humans, affecting approximately 1 in every 700 babies and more than 350,000 people living in the United States. As medical management evolves, the average life expectancy for people living with Trisomy 21 has increased exponentially, with individuals now commonly living beyond their fifth decade of life. Medical imaging not only plays a critical role in prenatal diagnosis, but also aids in diagnosis and management of associated multiorgan anomalies throughout a patient's life.

Imaging Atlas for Childhood Whole-body MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Mary-Louise Greer, MBBS, (*Presenter*) Research Grant, AbbVie Inc

TEACHING POINTS

1. To describe whole-body MRI imaging protocols and strategies to optimize these to the patient's developmental and chronological age, co-morbidities and the clinical indication; 2. To illustrate the spectrum of normal anatomy from the neonatal period to adolescence seen on different whole-body MRI imaging sequences, 3. To demonstrate and compare normal, normal variant and abnormal imaging findings on pediatric whole-body MRI to improve diagnostic accuracy for a range of oncologic and non-oncologic diseases

TABLE OF CONTENTS/OUTLINE

*OutlineWhole-body MRI is now standardly performed in pediatric patients for a range of oncologic and non-oncologic indications, used for diagnostic and/or screening purposes. Diagnostic accuracy depends upon the recognition of disease patterns and familiarity with normal maturation that can be mimickers for disease.The purpose of this atlas is to provide an anatomy-based overview of specific imaging features to improve lesion detection and aid distinction from normal and normal variant observations, that can lead to a high rate of false positive findings, as well as offer a differential for imaging findings where the disease entity is as yet unknown.Whole-body MRI Protocols - generic: standard optional sequences coverage - indication-specific sequences coverageAnatomy-based Spectrum of Normal and Abnormal Whole-body MRI - normal for age - focal, multifocal and diffuse pathology - bones joints, muscle soft tissue, head neck, chest, abdomen pelvis

Imaging Spectrum of Tuberculosis from Head to Toe with Updates

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Onur Simsek, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of the exhibit is to· Explain pathogenesis and classical imaging findings of tuberculosis· Describe typical and atypical imaging spectrum of tuberculosis from head to toe with updates· Review the recent literature and discuss what changed through the years in imaging of tuberculosis · Highlight pearls and pitfalls in imaging tuberculosis

TABLE OF CONTENTS/OUTLINE

BackgroundTuberculosis is an infectious disease caused by the mycobacterium tuberculosis complex, and it is one of the leading causes of death due to infectious diseases worldwide. Although tuberculosis is primarily seen as pulmonary infection, it can cause disease in almost any part of the body.Method and Outline: In line with the exhibit's purpose, cases that will set an example for different organ involvements of tuberculosis from the PACS system of our hospital were selected retrospectively.Selected cases include the following examples of tuberculosis:MeningitidisGastrointestinal tuberculosisGenitourinary tuberculosisSpondylodiscitisArthritisSplenic tuberculosisPulmonary patternsLymphadenitisImaging findings were discussed and evaluated with current literature. ConclusionTuberculosis is still a public health issue in most countries and an essential differential diagnosis all over the world. Even tuberculosis is mainly known for its pulmonary infiltration; it can be detected in almost any part of the body. Hereby, we provide different organ involvements with case examples. This educational exhibit will assist the radiologist in understanding the unexpected presentations of tuberculosis.

Vasculitides from Head to Toe: Multimodality Imaging Diagnosis, Treatment, and Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Anne Sailer, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Vasculidities and arterial wall diseases are rare conditions of the arterial system that may result in significant complications including luminal stenosis, arterial thrombosis, and infarction of the corresponding organs and structures. Development of pseudoaneurysms and dissections and arterial rupture are additional serious complications in this patient population. Doppler US is a first line imaging modality utilized for the assessment of the peripheral arterial system, abdominal aorta and its branches.a) types of arterial wall pathologiesb) normal arterial wall anatomy and physiology of waveforms on Doppler USc) sonographic findings associated with vasculidities and arterial wall disease with multi-imaging correlation

TABLE OF CONTENTS/OUTLINE

Review pathophysiology of various types of vasculidities and pathologies affecting the arterial wall (collagen vascular disease, giant cell arteritis, temporal arteritis, Systemic Lupus Erythematosus (SLE), Takayasu arteritis, Polyarteritis nodosa, Wegener's granulomatosis, and Kawasaki disease, radiation-induced, disease. Discuss general concepts of the assessment of the peripheral arterial system and abdominal aorta using Doppler US and CEUS: technique protocol, image optimization).Demonstrate key sonographic features of the discussed arterial pathologies with correlation other imaging modalities correlation. Review role of ultrasound is the diagnosis and surveillance of complications in this group of patients. Discuss management options with interventional radiology procedures.

3D Printed Models for Pre-surgical Planning: What the Surgeon Wants to Know and Touch

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Certificate of Merit

Participants
Sarah Bastawrous, DO, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the role, applications and benefits of 3D printed models in presurgical planning 2. Provide case-based examples of presurgical 3D printed models with applicable surgeon feedback 3. Explore success strategies for radiologists and radiology departments to create impactful 3D printing models 4. Define intended use of 3D printed models

TABLE OF CONTENTS/OUTLINE

1. Clinical impact and potential of presurgical 3D printed models in medicine and role of the radiologist. 2. Brief literature reports of applications and benefits of 3D presurgical printed models. 3. Multimodality, illustrative examples of 3D printed pre-surgical models. 4. Elements important to the surgeon and why. 5. End user and surgeon feedback. 6. "In-surgery" and "out-of-surgery" intended uses, to include patient education/informed consent, trainee simulation, procedure rehearsal, device/guide sizing. 7. Success strategies to include quality management and considerations for radiology departments. 8. Standardization and guidelines to include professional societies, ACR data registry, and appropriateness criteria to guide 3D printing of presurgical models.

Diversity of Spinal Manifestations in Systemic Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Ryo Kurokawa, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this review is to summarize the spectrum of clinical and radiological findings of spinal abnormalities associated with systemic diseases.

TABLE OF CONTENTS/OUTLINE

I. Vertebral abnormalities- Infection: Tuberculous and Non-tuberculous infections.- Inflammation/autoimmune: Scleroderma, SAPHO syndrome, rheumatoid arthritis- Neoplasm: Systemic mastocytosis, metastasis, lymphoma, leukemia- Neoplasm-like: POEMS syndrome, IgG4-related disease, Langerhans cell histiocytosis- Phacomatosis- Miscellaneous: Alkaptonuria, acromegaly, dialysis-associated, spinal neuroarthropathy (Charcot spine) II. Spinal cord abnormalities- Infection: Varicella-zoster virus, Acute flaccid myelitis- Inflammation, autoimmune: Inflammatory bowel disease, Vasculitis, Systemic lupus erythematosus, Sjogren syndrome, Behcet's disease, HTLV-1-associated myelopathy, Sarcoidosis, GFAP astrocytopathy, Hereditary hemorrhagic telangiectasia- Demyelination: Adrenoleukodystrophy,- Neoplasm: Metastasis, Lymphoma, Leukemia, Paraneoplastic syndrome- Metabolic: Copper deficiency, Hepatic myelopathy, Subacute combined degeneration of the cord- Drug-induced: Heroin, TNF-alpha inhibitor-related demyelination, Immune-checkpoint-inhibitor-related polyradiculoneuropathy- Phacomatosis- Miscellaneous: amyloidosis, superficial siderosis with meningocele or Marfan syndrome Summary1. Imaging findings of the vertebrae, spinal cord and cauda equina, and associated clinical features in various systemic diseases are important for the correct diagnosis.2. Knowledge of X-ray, CT, MRI, bone scintigraphy, and PET imaging findings is essential for identifying these abnormalities.

Neurologic Manifestations of Thoracic Conditions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Julian Sison, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologists frequently encounter multisystem diseases that produce findings across multiple subspecialties. This is true of several thoracic diseases with neurologic manifestations. When viewed in isolation many of these findings are nonspecific. However, correlation with imaging across both organ systems can provide clarity to the underlying diagnosis, or at least to the underlying etiology, which can then guide ordering clinicians to the next appropriate step in management so that these conditions can be recognized.

TABLE OF CONTENTS/OUTLINE

We will stratify diseases by etiology: 1) infectious - tuberculosis, nocardiosis, aspergillosis, mucormycosis, COVID-19, 2) inflammatory - sarcoidosis, polymyositis, 3) autoimmune - IgG4 sclerosing disease, 4) genetic - neurofibromatosis-1, tuberous sclerosis, Ehlers-Danlos syndrome, 5) vascular - hereditary hemorrhagic telangiectasia, and 6) neoplastic - lung cancer, lymphoma, paragangliomas. Within these subcategories we will conduct a case-based review of several diseases that demonstrate both thoracic and neurologic manifestations.

Tumors Associated with Tobacco Use: Pathophysiology, Clinical Features Role of Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Sanjana Dhakshinamoorthy, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Tobacco is the most important risk factor for lung cancers, with nearly 9 out of 10 cancers being related to smoking cigarettes or from exposure to second hand smoke. However, there is a wide spectrum of tobacco-induced cancers that can involve multiple organ systems, including in the oropharynx, larynx, esophagus, liver, pancreas, stomach, colon rectum, urinary bladder, kidney and uterine cervix. 2. Given that many tumors from various different organ systems can occur in patients with tobacco use, radiologists play a vital role in being able to detect these synchronous or metachronous tumors, even before they become symptomatic. 3. Lung-RADS (Lung Imaging Reporting and Data System), is a classification proposed to aid with findings in low-dose CT screening exams for lung cancer. The goal of the classification system is to standardize follow-up and management decisions.

TABLE OF CONTENTS/OUTLINE

1. Review the epidemiology, pathophysiology and clinical features of all the neoplasms associated with tobacco use 2. Discuss the multimodality imaging features of tobacco-induced neoplasms 3. Review the role of imaging in screening, diagnosis and surveillance of malignancies associated with tobacco use

Emerging Complications in the Era of COVID-19 Vaccination: Role of Radiologist and Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Janardhana Ponnatapura, MD, Winston Salem, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

In November 2019, a new RNA Coronavirus (SARS-CoV-2) responsible for a severe acute respiratory syndrome was identified in China. In early 2022, there were nearly 5.8 million deaths and a total of 10 billion doses of vaccination administered. Benefit of vaccine protecting against severe COVID-19 infection far outweighs the very small risk of development of some rare adverse events. Gaining familiarity with various adverse events following COVID-19 vaccination and their clinical presentation is important for radiologist as they come across different imaging modalities. Optimal utilization of imaging and promptly recognize these adverse events helps in better management of patients.

TABLE OF CONTENTS/OUTLINE

• Types and mechanisms of COVID-19 vaccines• Common reactions and adverse events• Emerging rare complications of COVID-19 vaccines-Radiation recall pneumonitis-Radiation recall dermatitis-Breast nodules-Axillary lymphadenopathy-Myocarditis• Role of Imaging• Differentiation from neoplastic disease• What radiologist need to know• Recommendations to oncology providers• Management of these complications• Multidisciplinary team approach

MSEE-74

Don't Overlook the Skin! Multimodality Imaging Review of Skin Subcutaneous Malignancies with Radiology-Pathology Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Cum Laude
Identified for RadioGraphics

Participants
Priya Pathak, MBBS,MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Overview of the spectrum of primary and secondary skin and subcutaneous malignancies with a focus on the role of various imaging modalities for diagnosis, evaluation of anatomical extension, management, and surveillance.2) Highlight the clinical features, prognosis and modes of spread of cutaneous malignancies.3) Review relevant radiologic-pathologic correlation, differential diagnoses, imaging artifacts and pitfalls with a systematic approach to narrow the final diagnosis.

TABLE OF CONTENTS/OUTLINE

• Introduction: Multimodality imaging approach to skin and subcutaneous malignancies for an accurate evaluation of the lesion location, size, extension, margins, metabolic activity and spread patterns.Outline• Primary malignancies: Squamous cell carcinoma, Basal cell carcinoma, Merkel cell carcinoma and Melanoma• Secondary malignancies:-Mesenchymal: Dermatofibrosarcoma, Leiomyosarcoma, Angiosarcoma, liposarcoma, Desmoid tumor.-Lymphoma: Mycosis Fungoides, NK T cell lymphoma, Primary cutaneous B cell lymphoma, Follicular lymphoma.- Metastasis: Breast cancer, Lung cancer, Head and neck cancer, GI cancers, RCC, Ovarian cancer, endometrial cancer, Prostate cancer.• Benign entities/tumor-like lesions: -Systemic disorder: Sarcoidosis, Gout, vasculitis.-Autoimmune, inflammatory and infectious disorders.-Subcutaneous disorders: Fat necrosis, Lipodystrophy, Panniculitis, Epidermoid cyst, pilonidal cysts.-Iatrogenic: Keloids, scars, Injection granulomas, Foreign bodies.

MSEE-75

Multimodality Imaging in End-Stage Renal Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To define and review the pathophysiology of end-stage renal disease (ESRD). 2. To discuss the renal and extrarenal manifestations of ESRD. 3. To describe the role of imaging in the evaluation of ESRD. 4. To illustrate the imaging appearances of various manifestations of ESRD

TABLE OF CONTENTS/OUTLINE

1. ESRD- DEFINITION, PATHOPHYSIOLOGY 2. ROLE OF IMAGING-Radiograph, ultrasound, CT, MRI, nuclear medicine, echocardiogram, 3. DISCUSSION AND ILLUSTRATION OF THE FOLLOWING MANIFESTATIONS OF ESRD A. Renal - Decreased size; Increased echogenicity; Decreased vascularity; Cystic disease; Renal neoplasms B. Musculoskeletal -Secondary hyperparathyroidism; Osteosclerosis, osteoporosis; Subchondral erosions; Osteomalacia/rickets; Brown tumors; Amyloidosis-arthritis; Destructive spondyloarthropathy; Crystal deposition; Soft tissue calcification; Aluminium toxicity ; AVN, Osteomyelitis C. Cardiac - Coronary atherosclerosis; Concentric LV thickening, cardiomegaly; Diastolic/systolic dysfunction; Cardiac failure; Myocardial calcification; Myocardial ischemia/infarction; Pericardial effusion D. Vascular - Calcifications; Decreased compliance; Peripheral vascular disease; PE; Thrombus in catheters E. Thoracic - Alveolar edema; Metastatic calcification; Calcifications; Infections F. Neurological - Cerebral atrophy, white matter lesions; Encephalopathy; Cerebral infarction/hemorrhage ; Posterior reversible encephalopathy; Osmotic demyelination ; Infection; Sinus thrombosis; Dialysis disequilibrium syndrome G. Abdominal - Encapsulating peritoneal sclerosis H. Dialysis access complications - Vascular stenosis; Thrombus/infection; Aneurysm/pseudoaneurysm

What's New in Pathogenesis, Imaging Findings, Prevention, and Management of Human Papillomavirus (HPV)-Related Malignancies? 2022 Update

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Awards
Identified for RadioGraphics
Magna Cum Laude

Participants
Sammar Ghannam, MD, MPH, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review epidemiology pathogenesis of human papillomavirus (HPV)-associated neoplasms Discuss imaging findings of benign and malignant HPV-related neoplasms Describe role of imaging in screening, staging surveillance of HPV-associated cancers Review 2022 updates in treatment vaccination strategies

TABLE OF CONTENTS/OUTLINE

IntroductionEpidemiology Pathogenesis: Molecular pathways Benign tumors: Respiratory Papillomas condyloma acuminata (genital warts) Malignancies: Squamous cell cancer of the oropharyngeal region (oral cavity, palatine/lingual tonsils, tongue base, oropharynx larynx), bronchopulmonary anogenital region (penis, vagina, vulva, cervix anal canal) Updates in WHO Classification\ Imaging Techniques: CT, MRI 18FDG PET/CT Imaging Findings HPV positive vs. HPV negative cancers: How to differentiate on Imaging? HPV Vaccination: Type of vaccines Current guidelines Role of imaging in screening surveillance Novel treatment strategies: Immunotherapy Imaging Biomarkers: treatment response prognosis Conclusion Summary and Clinical ImplicationsNovel immunotherapies are being investigated and updated screening vaccination guidelines are used to improve outcomes in HPV-related cancers. HPV-positive oropharyngeal SCCs show well-defined borders cystic nodal metastases; have good treatment response, prognosis with better survival. Imaging plays an important role in the diagnosis, staging, and surveillance of HPV-associated lesions in both men women.

Twists and Turns: The Torsion Tour

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - MS

Participants
Mary J. Clingan, MD, Ponte Vedra Beach, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points Torsion can affect a number of organs and has a variety of imaging appearances. Abnormal ligamentous attachments and/or increased laxity can lead to increased mobility and predispose to torsion. Increased organ size or a focal mass can also predispose to torsion. Alternatively, an organ may herniate and twist into a defect left by organ removal or surgical change. Clues to diagnosis vary by location, but include organ displacement, organ enlargement, and a twisted vascular pedicle. Torsion can be intermittent, incomplete, acute, or chronic. In late cases, decreased vascular flow can lead to infarction. There are clues with color and spectral doppler that may be seen in cases of incomplete or intermittent torsion.

TABLE OF CONTENTS/OUTLINE

OutlineChest: Lung; RUQ: Gallbladder, Wandering liver, Omental Infarct; LUQ: Splenic, epiploic appendage; Pelvis: Adnexal, fibroid, renal transplant; Scrotum: epidydimal appendix, testicular/spermatic cord; Bowel: gastric, small bowel, colon

Nuclear Medicine & Molecular Imaging Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Sub-Events

NMMIEE-1 Integrating Molecular Imaging to Meningiomas: Is PET with Somatostatin Receptors Our New Buddy?

Participants
Rodrigo Hernandez Ramirez, MD, Leon, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

To identify the importance of somatostatin receptors in meningioma.To show the applications of PET in the evaluation of meningiomas specifically in detection and delimitation of the tumor, diagnosis of recurrence and radiotherapy planning.

TABLE OF CONTENTS/OUTLINE

Meningiomas are the most common primary brain tumors and represent about 30% of intracranial tumors. Neuro-Oncology guidelines recommend contrast-enhanced MRI as the primary radiologic modality of choice because it has a sensitivity of 90%. Meningiomas can express somatostatin receptors type 2. Molecular imaging technics allow the incorporation of functional information for diagnostic purposes. PET tracers for SSTR evaluation provide high sensitivity with excellent target-to-background contrast due to low uptake in bone and healthy brain tissue. SSTR PET has demonstrated benefits for noninvasive differential diagnosis, delineation tumor and treatment planning. Although PET plays only a minor role in the initial diagnosis of meningiomas, it may be add value for meningioma detection, with a sensitivity of 100%. Clinically, this is relevant because meningiomas located at the skull base or nearby the falx cerebri, with transosseous extension, or equivocal imaging findings related to artifacts or calcifications were difficult to detect by MRI. For the differentiation of scar tissue from active tumor, SSTR PET has a high sensitivity of 90%, outperforming standard MRI with 79%. PET can obtain an optimized target volume delineation for fractionated radiation therapy in patients with meningiomas grade I-III.

NMMIEE-10 Punctiliously Perfect PSMA PET: Pearls and Pitfalls

Participants
Daniel Wale, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Several PET radiopharmaceuticals targeting prostate specific membrane antigen (PSMA) are now FDA-approved for assessment of metastatic prostate cancer.2. PSMA PET agents have a normal biodistribution that includes salivary and lacrimal glands, kidneys, and small bowel, as well as urinary excretion. Familiarity with normal uptake decreases potential for misdiagnosis.3. PSMA expression is not prostate-specific, and uptake can be identified in a variety of other benign and malignant processes. Awareness of commonly encountered non-prostatic lesions, combined with knowledge of common metastatic patterns of prostate cancer, allows the radiologist to avoid potential pitfalls.

TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Prostate cancerA. PSMA expressionB. Utility of PSMA expression for diagnosisC. Utility of PSMA expression for treatmentIII. Nuclear imagingA. Indium 111 capromab pendetide (historical)B. PET agents targeting PSMA1. Gallium 68 PSMA-112. Fluorine 18 piflufolastatC. Clinical indicationsD. Imaging protocolsIV. Pearls and pitfallsA. Normal biodistributionB. Pitfalls regarding normal biodistributiona. Accessory salivary gland tissueb. Urine activityC. Parasympathetic gangliaD. Osseousa. Degenerative disease and inflammationb. Fibro-osseous lesionsE. Non-prostatic neoplasmsa. Meningiomab. Thyroid nodulesc. Hemangiomad. PSMA avid non-prostate malignanciesV. Treatment utilizing PSMAA. Lutetium 177 PSMA B. Localize anatomically occult disease for external radiationVI. Conclusion

NMMIEE-11 Hybrid PSMA Imaging of The Prostate: A Guide For the Beginner- A Reference For the Expert

Participants
Felipe Furtado, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate-specific membrane antigen (PSMA) PET is revolutionizing the management of prostate cancer in all clinical settings, from treatment-naive cancer to biochemical recurrence. Different PSMA ligands share a high affinity toward PSMA but differ in sensitivity, specificity, half-life, biodistribution, pitfalls, and excretion profile. Workflows, acquisition protocols, hybrid imaging modality (PET/CT vs. PET/MRI), and interpretation must be tailored to the appropriate clinical scenario and specific PSMA radiopharmaceutical. Adequately performed and interpreted PSMA hybrid imaging will revolutionize personalized medicine in prostate cancer patients.

TABLE OF CONTENTS/OUTLINE

1) PSMA ligands; 2)PET/CT and PET/MRI strengths, weaknesses, acquisition protocols, and workflows; 3) How to perform the best PSMA hybrid study for each clinical scenario; 4) PSMA PET/CT and PET/MRI interpretation, for the beginner and the expert

NMMIEE-12 Post PRRT Imaging: What To Look For On Routine and Emergent Imaging?

Participants
Malak Itani, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is for radiologists, nuclear medicine physicians, radiation oncologists and medical oncologists and trainees to:- Know what to look for on post-PRRT SPECT-CT imaging- Be familiar with most common complications of PRRT and their imaging manifestations in the acute, subacute, and chronic setting- Understand the appropriate timeline for routine follow-up after PRRT- Evaluate response to treatment after PRRT using anatomic and functional imaging modalities

TABLE OF CONTENTS/OUTLINE

I. Brief overview of PRRT complications with no imaging correlateA. MyelosuppressionB. Renal toxicityC. HepatotoxicityD. Neuroendocrine hormonal crisisE. Secondary leukemia and myelodysplastic syndromeF. Reproductive side effectsII. Post-PRRT Imaging by Timeline:A. Post-PRRT SPECT/CT:i. SPECT: Localize sites of uptake, compare intensity relative to pre-treatment SSTR-PETii. CT: Correlate gross tumor burden with pre-PRRT imaging, evaluate for immediate post-treatment complications, general CT readB. Acute presentations after PRRT:i. CT/MRI: tumor necrosis, hepatitis, cholangitis, hepatic abscess, radiation peritonitis, ascites, perforation, vascular thrombosisC. Routine follow-up post-treatment:i. CT/MRI: timing, changes in lesion size, criteria for progression vs pseudo-progression, potential side effectsii. PET: Indications, timing, comparison, quantitative measures and scores, potential complications

NMMIEE-13 18F-DCFPyL PSMA PET/CT for Prostate Cancer Imaging: A Primer on Technique, Interpretation Structured reporting

Participants
Harit Kapoor, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) 18F-DCFPyL (PyL) is the first commercially available PSMA PET agent for Prostate Cancer (PCa) evaluation, FDA approved for both staging and biochemical recurrence.2) PyL has an unprecedented diagnostic performance, especially in the setting of small volume recurrence, detecting nodal metastasis in the 2-5 mm range.3) Aside from superior logistics inherent to being a F-18 based agent, PyL also shows higher spatial resolution and tumor to background ratio compared to Ga-68 PSMA-11 PET.4) PyL imaging has been hailed as a paradigm shift, altering patient management in >50% of published cohorts.5) Radiologist's awareness of the interpretative limitations and pitfalls as well as the use of standardized evaluation criteria, is vital in order to prepare for anticipated rapid utilization.6) Initiation of androgen deprivation therapy can create flare-like imaging appearance due to PSMA upregulation.

TABLE OF CONTENTS/OUTLINE

1) Role and evolution of PET tracers in the clinical continuum of recurrent prostate cancer2) Imaging protocol and normal biodistribution for PyL PSMA PET/CT3) Standardized evaluation criteria for staging, recurrence and treatment response.4) Case examples of pearls and pitfalls (e.g. ganglionic uptake, follicular hyperplasia and tumor-neovascularity etc.)5) Into the future: Metastasis directed therapy 177Lu-PSMA theranostics

NMMIEE-14 An Illustrative Review of Nuclear Medicine Thyroid Studies

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Andrew Schneider, MD, MPH, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Nuclear medicine thyroid studies are a common type of imaging that require a broad understanding of the microbiology, physiology, and clinical manifestations of the underlying disease in order to interpret successfully. For trainees who are learning to interpret these studies, the intricate integration of multiple lines of clinical, laboratory, imaging, and pathological evidence can be intimidating and confusing. Here we provide an educational resource for trainees designed to build understanding by walking through the basic biology, radiopharmaceuticals, principles, indications, protocols, and interpretation of nuclear medicine thyroid studies. A key component of this resource is a representative collection of illustrative cases with a combination of clinical information, laboratory data, nuclear medicine and other imaging studies, and pathology findings.

TABLE OF CONTENTS/OUTLINE

Thyroid Anatomy / Physiology; Radiopharmaceuticals; Study Indications; Imaging Protocols; Decision-Making; Illustrative Cases

NMMIEE-15 PSMA-Targeted PET Imaging Interpretation Frameworks Comparison of PROMISE Classification and PSMA RADS Version 1.0

Awards
Certificate of Merit

Participants
Vanessa Murad, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) PSMA-targeted PET imaging interpretation schemes have been devised to ensure consistency in reporting and avoid potential pitfalls. 2) PROMISE classification is based on the molecular imaging PSMA (miPSMA) expression score, assigned to each lesion with

respect to uptake in reference tissues (Figure 1). miPSMA score together with the presence or absence of morphological findings provide diagnostic certainty (positive, negative or equivocal). 3) When applying PROMISE classification for PSMA-targeted imaging with predominantly hepatobiliary excretion (e.g. 18F-PSMA-1007), the spleen is recommended as the intermediate reference. 4) On PSMA-RADS, findings are categorized on a 5-point scale according to PSMA-uptake and morphological characteristics, where the higher the number, the greater the likelihood of a cancer related lesion (Table 3)

TABLE OF CONTENTS/OUTLINE

1) Introduction/Aim. 2) PROMISE Classification 2.1) Description and interpretation: Tables 1,2. 2.2) Illustrative examples: Figure 2. 2.3) Advantages and disadvantages. 3) PSMA-RADS Version 1.0. 3.1) Description and interpretation. 3.2) Illustrative examples: Figure 3. 3.3) Advantages and disadvantages

NMMIEE-16 Practical Interpretation of 18F PSMA PET/CT: Spectrum of Findings

Participants
Kenneth Huynh, BS, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.To familiarize the viewers with 18F PSMA normal biodistribution 2.To present all potential incidental findings detected by 18F PSMA PET/CT. 3.To review the staging and monitoring of prostate cancer and its locoregional and distant metastasis depicted by PET/CT.

TABLE OF CONTENTS/OUTLINE

The exhibit has three components: (1) the presentation of normal 18F PSMA features with characteristic physiologic uptake at lacrimal glands, glottis and sympathetic ganglion chains, differentiating this tracer from 18F FACBC and 11C Choline, (2) the review of incidental findings such as accessory parotid gland, lung inflammatory and infectious processes, osseous fractures, splenosis, and hibernoma, and (3) the description of common and atypical/rare features of prostate cancer and metastasis such as lesions of bones, nodes, liver, peritoneum, penis, adrenal glands and thyroid cartilage. The 177 Lu PSMA therapy of prostate cancer with related imaging is also addressed in the exhibit.

NMMIEE-18 The History and Evolution of the Molecular Evaluation of Neuroendocrine Tumors

Participants
Jorge Espinosa, MD,MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To understand the pathophysiology of the neuroendocrine tumors.To briefly know the history of radiotracers.To show the current radiotracers and its different applications in nuclear and imaging medicine.

TABLE OF CONTENTS/OUTLINE

Table of contents1. Introduction on neuroendocrine tumors2. Brief history of radiotracers and its evolutions3. Line time of evolutions of radiotracers and its applications4. Comparative table.5. The newest radiotracers and new applications6. CT-PET protocols7. Comparative images8. Examples of CT-PETOutline Since the discovery of In-111 OctreoScan in 1983, the role of molecular imaging in the diagnosis, follow-up and even treatment of neuroendocrine tumors has revolutionized the management of these lesions.Twenty years ago, the introduction of somatostatin analogues labeled with Ga68 in PET studies, improved the diagnostic sensitivity mainly as a result of improvements in spatial resolution.Knowledge of the evolution of molecular imaging during the diagnostic approach on neuroendocrine tumors aids in better selection of the method in patients with suspected neuroendocrine tumors.

NMMIEE-19 Incidental Uptake on FAPI PET/CT Imaging: Physiologies, Pathologies, and Pitfalls

Participants
Masatoshi Hotta, (*Presenter*) Nothing to Disclose

TEACHING POINTS

FAPI PET/CT can identify tumor lesions with a higher tumor-to-background ratio in various tumor entities, and has sparked considerable interest in the oncologic community. As studies on FAPI PET grow in number and size, incidental findings related to non-oncologic conditions have been increasingly reported.The purpose of this exhibit is to:1) Review the physiological FAPI uptake of each organ system2) Describe the main pathologies of non-oncological uptake3) Demonstrate FAPI PET/CT of non-oncologic diseases.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Physiological and non-oncological uptake of each organ system:a) Brainb) Head and Neck (Thyroid, Salivary glands, Dental)c) Thorax (Lung, Cardiac, Breast, Esophagus)d) Abdomen (Gastrointestinal, Liver, Pancreas, Bile duct, Spleen, Kidney, Uterus)e) Musculoskeletal (Bone, Joint, Muscle, Skin)f) Other systems (Vascular, Lymph node)

NMMIEE-2 Multimodality Imaging of Adenoid Cystic Carcinoma With Emphasis On PET/CT

Awards
Certificate of Merit

Participants
Ba D. Nguyen, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the clinical, pathological and imaging features of Adenoid Cystic Carcinoma (ACC). 2. To present the PET/CT impact of ACC evaluation for metastases, recurrence, and treatment monitoring.

TABLE OF CONTENTS/OUTLINE

ACC is a rare cancer that typically arises in the head and neck region as a salivary gland tumor, composing 1% of head and neck tumors and 10% of salivary gland tumors. Other presenting locations within the head and neck include the hard palate, auditory canal, nasopharynx, epiglottis, lacrimal gland, and tongue. Outside of the head and neck, ACC may target the skin, trachea, breast, and reproductive tract. Most ACC are indolent, presenting as a slow growing, painless mass. However, perineurial invasion is common and there are potential distant metastases via lymphatic or hematogenous spread. Primary management is via complete resection, often with adjuvant radiation and chemotherapy. MRI and CT are most useful for head and neck assessment of ACC. Diagnosis relies on histology. PET/CT is used for staging, evaluating for metastasis, and monitoring for recurrence. This exhibit reviews PET/CT features of ACC at common and atypical sites of the body with emphasis on the PET/CT impact on staging and post-therapeutic surveillance of ACC.

NMMIEE-20 Myocardial Perfusion Imaging: Past, Present, and Future

Participants
Saif Azam, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Explore the physiology underlying the distribution of radiopharmaceuticals used in myocardial perfusion imaging2. Review classic patterns of uptake and how they may guide clinical management3. Understand the pros and cons of different modalities available for the assessment of myocardial perfusion4. Increase awareness of factors that can cause false positive and false negative results

TABLE OF CONTENTS/OUTLINE

• Introduction and review of anatomy and physiology pertaining to myocardial perfusion imaging• Exercise versus pharmaceutical stress testing• Cadmium-zinc-telluride camera utility• Logistics of radiotracers used in cardiac single photon emission computed tomography (SPECT): Thallium-201 (201-Tl), Technetium-99m sestamibi, Technetium-99m tetrofosmin• Case-based review of positron emission tomography (PET) radiotracers: Rubidium-82 (82-Rb), Nitrogen-13 ammonia (13N-NH3), Oxygen-15 water (15O-H2O)], Fluorine-18 flurpirdaz• Spectrum of imaging findings in the evaluation of ischemic heart disease• Causes and troubleshooting of false positives, false negatives, and other artifacts• Questions

NMMIEE-21 Essentials of Theranostics: A Guide for Physicians and Medical Physicists

Awards
Identified for RadioGraphics

Participants
Celeste Winters, PHD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Understand the basic physics principles and radiation biology involved in Theranostics. 2) Describe the factors involved in the choice and application of radionuclide therapies, including eligibility for treatment based on patient and tumor factors. 3) Apply the concepts above to currently available radionuclide therapies.

TABLE OF CONTENTS/OUTLINE

1) Physics overview of radionuclides used in theranostics: a. Decay pathways of radionuclides used for imaging (?, ß+ emissions) and therapy (ß- and a) emissions b. Desirable characteristics of theranostics agents c. Clinical examples of imaging/therapeutic pairs, with the characteristics of radionuclides used (half-life, energies, range, and imaging modality): i. 123I-MIBG/ 131I-MIBG (Azedra®) ii. 68Ga/64Cu-DOTATATE/ 177Lu-DOTATATE (Luthatera®) iii. 68Ga-PSMA-11/ 177Lu-PSMA-617 (Pluvicto ®) iv. 99mTc-MDP/223Ra (Xofigo®) 2) Concepts of radiation biology and dosimetry: a. Biological descriptors of uptake pathways and pharmacokinetics b. Types of dosimetry calculation: Tumor, blood and solid organ at risk (OAR) i. MIRD Schema and Voxel Based ii. Generating time activity curves c. Implications on side effects from the therapy 3) Additional factors involved in the choice and application of radionuclide therapies: a. Patient factors: such as clearance rates and baseline function of OAR b. Tumor factors: level of uptake of the therapeutic agent by the tumor, and tumor heterogeneity

NMMIEE-22 Towards Structured PET Reporting with PSMA Tracers in Prostate Cancer

Participants
Patricia Romero Fernandez, MBBS, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

To highlight the importance of having a solo criteria for performance and interpretation of PET-CT images using prostate-specific membrane antigen based tracersTo discuss the role of different imaging modalities in the biochemical recurrence of prostate cancer To distinguish between physiological findings and those that could be consider as positive for prostate cancer recurrenceTo describe 18F-DCFPyL PET-CT findings in our deparment according to PROMISE system

TABLE OF CONTENTS/OUTLINE

-Introduction: generalities, biochemical recurrence definitions, other imaging modalities -Imaging findings characteristics with 18F-DCFPyL-Standardization of PSMA-PET interpretation: Prostate cancer recurrence sites classification PROMISE (Prostate Cancer Molecular Imaging Standardized Evaluation)1/E-PSMA: the EANM standardized reporting guidelines v1.0 for PSMA-PET2: our experience-Conclusions(1) Eiber M, Herrmann K, Calais J, Hadaschik B, Giesel FL, Hartenbach M, Hope T, Reiter R, Maurer T, Weber WA, Fendler WP. Prostate Cancer Molecular Imaging Standardized Evaluation (PROMISE): Proposed miTNM Classification for the Interpretation of PSMA-Ligand PET/CT. J Nucl Med. 2018 Mar;59(3):469-478. doi: 10.2967/jnumed.117.198119. Epub 2017 Nov 9. Erratum in: J Nucl Med. 2018 Jun;59(6):992. NMMIEE-23 Added Value of FDG-PET/MRI in Gynecologic Oncology: A Pictorial Review

Awards
Identified for RadioGraphics
Cum Laude

Participants
Malak Itani, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

PET/MRI is becoming increasingly available and provides physiologic information from the PET with accurate localization to high soft-tissue contrast images from MRI.PET/MRI plays an important role in staging and assessing treatment response in patients with uterine, cervical, vulvar and vaginal cancers. PET/MRI has a more limited role in ovarian malignancies but can be used as a problem solving tool in patients with negative CT scan and persistent concern for disease recurrence

TABLE OF CONTENTS/OUTLINE

- Review of instrumentation and techniques- Role of FDG PET/MRI in specific malignancies:o Endometrial cancero Cervical cancero Ovarian cancero Vaginal cancero Vulvar cancer- Future directions

NMMIEE-24 First Pass PET Imaging of Various Cardiovascular Disease

Participants
Takashi Norikane, MD, PhD, Kita-gun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Positron emission tomography (PET) is usually used for evaluating metabolic activity of the cells of body tissues. However, adding first pass PET imaging to standard imaging can provide information about vessel morphology and perfusion. The major teaching points of this exhibit are: 1: Knowledge of technique of first pass PET is important for an alternative imaging to conventional angiography for evaluation of vessels. 2: Knowledge of combination first pass and standard PET imaging provides further findings for radiologists to understand the disease condition accurately.

TABLE OF CONTENTS/OUTLINE

Technique List mode dynamic scan in selected region ECG-gated early phase scan Whole body PET angiography using continuous bed motion mode Disease Takayasu arteritis Giant cell arteritis Infectious aortitis Behcet's disease IgG4-related disease Pulmonary arterial venous malformation Pelvic arterial venous malformation Tubulointerstitial nephritis and uveitis Leriche syndrome Carotid artery stenosis Cardiac amyloidosis Constrictive pericarditis

NMMIEE-25 Imaging Features of Atypical Thoracic Metastases From Biochemically Recurrent Prostate Adenocarcinoma

Participants
Hala Khasawneh, MBBS, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Using a case-based approach we will reinforce the following: 1. Treatment advancements and improved patient survival have led to an increase in the frequency of encountering atypical sites of biochemically recurrent (BCR) prostate cancer (PCa) metastasis 2. Novel PET radiotracers including 11C-choline and 68Ga-PSMA have the potential to detect atypical sites of metastases early in the disease course and often at very low PSA levels 3. Multimodality imaging evaluation of atypical sites of tracer uptake is essential for metastasis detection and characterization 4. Information on the site and burden of disease is required for personalized management of BCR PCa 5. Awareness of atypical sites of metastasis is critical given the essential role of radiologists in guiding patient care

TABLE OF CONTENTS/OUTLINE

1. Brief overview of BCR in PCa 2. Available imaging modalities used in patients with suspected BCR; Conventional versus PET imaging. 3. PET radiotracers used in early detection of BCR PCa: a) Comparison of available PET radiotracers for imaging of BCR PCa. b) Imaging protocol and patient preparation. c) Normal biodistribution of commonly used PET radiotracers. 4. Metastatic pattern in BCR PCa a) Typical versus atypical metastases sites b) Oligo-metastasis versus widespread disease 5. Case-based review of imaging features for a variety of atypical sites of BCR metastasis in the thorax with multimodality correlation: a) The respiratory system; lungs, pleura, and airways b) Supradiaphragmatic lymph nodes c) Breast metastasis d) Atypical bone metastasis and mimickers 6. Discuss relevant differential diagnosis and potential imaging pitfalls 7. Impact of early BCR localization on clinical management

NMMIEE-26 Always Wear Sunscreen: Conventional and Hybrid Imaging of Melanoma

Participants
Craig Ferguson, BMBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To describe the variety of imaging investigations to detect disease extent and evaluate their relative merits and limitations (including ultrasound, CT, MRI and 18F-FDG PET/CT)- To define the rationale of sentinel lymph node biopsy and highlight the benefit of SPECT over conventional planar lymphoscintgraphy for sentinel node localization- To discuss the role of imaging in surveillance and response assessment, and associated challenges relating to novel therapies including immunotherapy- To identify disease mimics that the radiologist must recognize to ensure patients are not inappropriately denied treatment- To highlight the role of MRI in assessing CNS disease, including characteristic imaging appearances and common pitfalls

TABLE OF CONTENTS/OUTLINE

Background- Melanoma subtypes (cutaneous and non-cutaneous) including histopathology- Epidemiology, pathogenesis and management- Review of current guidelines relating to imaging workup in melanoma- Lymphoscintigraphy to identify the sentinel node; indications and technique- Role of cross-sectional imaging for initial staging, surveillance and response assessment; focusing on the benefits and limitations of 18F-FDG PET/CT- Top-to-toe review of multimodality imaging throughout a range of organ systems using selected case studies, including atypical presentations, important mimics, and imaging pitfalls

NMMIEE-27 Assessment of Response to Androgen Deprivation Therapy in Patients With Metastatic Castration-Resistant or Hormone-Sensitive Prostate Cancer by Radiolabeled Choline PET/CT: A Pictorial Essay

Participants
Elisabet Vila, (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will:- Review the concept of castration resistant prostate carcinoma (CRPC) and the use of choline PET/CT for response assessment.- Discuss the role of androgen receptor blockers in CRPC, and their mechanism of action.- Present radiological choline PET/CT CRPC cases and their different responses to treatment.- Assess the overall response to therapy and management in patients with CRPC as well as the utility of choline PET/CT in this scenario.

TABLE OF CONTENTS/OUTLINE

1. Introduction to prostate cancer1.1 Background and epidemiology1.2 Clinical Course1.3 Imaging findings of prostate cancer recurrence1.4 Metastatic Castration Resistant Prostate Carcinoma (mCRPC) 1.4.1 Definition1.4.2 Metastatic spread2. Treatment options2.1 Androgen receptor blockers (enzalutamide, abiraterone)2.2 Chemotherapies (docetaxel)2.3 Actual management3. Role of Choline PET/CT in the evaluation of tumor response3.1 Target and normal distribution of choline3.2 Strengths and weaknesses3.3 Use of choline PET/CT in mCRPC3.4 Pitfalls and artifacts4. Presentation of mCRPC cases at our center and evaluation of the response to treatment

NMMIEE-28 Nuking Dementia: Adding Some Colour to The Dementia Diagnostic Pathway

Participants
Peter Jarvis, FRCR, MBBS, Bournemouth, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Provide an overview of the different molecular imaging techniques, with sample protocols, used in the diagnostic work up of dementia. 2. Appreciate normal images (including typical ageing) and give a strategy to identify the most common dementia sub-types using FDG-PET examples. 3. Overview of the specific role of DaTscan imaging in the diagnosis of Parkinson's disease and Lewy body dementia. 4. Determine which patients would benefit from functional imaging and lay out a suggested diagnostic pathway to be used in conjunction with conventional structural imaging. 5. Explore some of the newer molecular imaging techniques currently in practice and under development.

TABLE OF CONTENTS/OUTLINE

*Aims? *Background and purpose of nuclear imaging? *Molecules overexpressed in dementia subtypes? *Overview of HMPAO SPECT/CT? *Overview of FDG PET/CT? *Comparison of HMPAO and FDG PET? *Statistical parametric mapping? *Important regions for interpretation? *Normal images (FDG PET and HMPAO)? *Normal ageing (FDG PET)? *FDG PET imaging of dementia subtypes? *Alzheimer's disease?(typical) *Mild cognitive impairment? *Logophenic aphasia *Posterior cortical atrophy *Fronto-temporal dementia?(typical) *Behavioral variant FTD *Semantic dementia? *Progressive non-fluent aphasia *Lewy body dementia? *Cautions and pitfalls? *DaTscan?- overview and clinical uses? *Newer PET imaging agents? *Amyloid PET? *Tau PET? *TSPO PET (neuroinflammation)? *When functional imaging should be used / pathway? *Summary? *References?

NMMIEE-29 Practical Overview of I-123 Ioflupane (DaTscan) Imaging for Parkinsonian Syndromes: Clinical Applications Findings and Pitfalls of Interpretation

Awards
Identified for RadioGraphics

Participants
Megan Mercer, MD, Charleston, SC (*Presenter*) Nothing to Disclose

TEACHING POINTS

I-123 Ioflupane (DaTscan) imaging is routinely performed in nuclear medicine departments nationwide. The clinical symptoms of Parkinsonian syndromes are not always specific, and radiologists are frequently called upon to help provide a diagnosis. The goal of this exhibit is to provide a focused guide for radiologists on important aspects of patient preparation, protocoling, troubleshooting, interpretation, and reporting of DaTscan imaging, through both a didactic and case-based approach. Multimodality correlation of DaTscan findings with other molecular (FDG PET-CT) and cross-sectional imaging (CT, MRI) is also incorporated.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Pathophysiology 3. Indications 4. Protocol 5. Patient Preparation 6. Troubleshooting 7. Pitfalls 8. Interpretation 9. Reporting 10. Case examples with multimodality correlation 11. Conclusion.

NMMIEE-3 Musculoskeletal Involvement in Oncological Diseases: Strengths and Weaknesses of 18F-FDG-PET/CT

Participants
Patricia Garcia, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To illustrate the spectrum of hematological diseases and oncological pathologies with musculoskeletal involvement in FDG-PET/CT with histological correlation -To discuss strengths and limitations of FDG-PET/CT in the diagnostic and follow up of these diseases

TABLE OF CONTENTS/OUTLINE

FDG-PET/CT is proved to be the best technique for diagnosis and follow up of myeloma and lymphoma. One limitation in these diseases is the diffuse affection of the bone marrow, where there can be false negatives and positives findings. FDG-PET/CT plays also an important role for detection of metastases.FDG uptake alone is not adequate for characterizing primary bone tumors and morphologic evaluation is an important factor in the interpretation of FDG-PET/CT scans. In many cases other imaging studies or biopsy is required for definitive diagnosis.We reviewed the hematological and oncological FDG-PET/CT studies from the last 10 years in two institutions. Regarding the musculoskeletal involvement we divided them in: - Bone lesions: I.e. scapular telangiectatic sarcoma, different patterns of presentation of myeloma, lymphoma, metastases - Soft tissue lesions: I.e. cell T skin lymphoma, cell

B lymphoma - Complications: spinal cord compressions and pathological fractures We discuss the actual importance of FDG-PET/CT in each pathology and its limitations.

NMMIEE-31 Neoplastic Neurocristopathies in Nuclear Medicine: Embryology, Pathophysiology, and Theranostics

Participants
Edgar Zamora, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Familiarize the reader with neural crest cell (NCC) embryology, pathophysiology of neoplastic neurocristopathies (NCP) and biochemical phenotypes, and the role of nuclear imaging and therapy. The exhibit includes illustrations and cases categorized based on primary NCC lineages involved (i.e., cranial, truncal, vagal, sacral).

TABLE OF CONTENTS/OUTLINE

NCCs arise from unfused neural folds, migrate extensively, and differentiate into specialized tissues in multiple systems. Mutations in crucial genes can lead to various neoplasms and dysgenetic conditions, originally presumed unrelated. Neuroblastomas (sympathoadrenal progenitor cells) result from epigenetic alterations (MYCN overexpression) or mutations in key genes (ALK, PHOX2B), while pheochromocytomas/paragangliomas (chromaffin/ chief cells) are more often familial (SDHx, VHL, RET). Targeted imaging can be performed with 123I-MIBG, and 111In- or 68Ga-SSTR binding agents, the latter also available for differentiated NETs. Theranostic ß- and ? emitting radiopharmaceuticals are useful in select conditions. Familial syndromes such as NF1 and MEN are associated with various NCPs, such as MTC, pancreatic islet cell tumors, and parathyroid adenomas. Radiolabeled SSTR binding agents can be used for pancreatic islet cell tumors, 18F-FDG for MTC, and 99mTc-Sestamibi for parathyroid adenomas. Other conditions resulting from dysgenesis or abnormal migration/differentiation of NCCs include meningioma, melanoma, and neurocutaneous syndromes. Biochemical phenotypes have an important role in radiopharmaceutical selection. Therefore, understanding the pathophysiology of NCPs is essential for diagnosis and management strategy.

NMMIEE-32 PSMA PET/CT: A Pictorial Review of Common Pitfalls in Interpretation

Participants
Venkata Kal Byrapogu, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Our studies indicate that uptake of PSMA by PCa bone metastatic lesions tends to be homogeneous and more intense. In contrast, uptake by other pathologies presented here tend to be heterogenous and less intense.

TABLE OF CONTENTS/OUTLINE

Introduction:Prostate cancer (PCa) is the one of the most common cancers affecting men in the United States and worldwide[1]. Advanced PCa presents with bone metastases - most commonly osteoblastic while rarely osteolytic metastases. Accurate and reliable detection of these bone metastases is critical for patient survival as well as for improving patient's quality of life[2].Technique:Prostate-specific membrane antigen (PSMA) is a cell surface glycoprotein that is predominantly expressed in prostate epithelium, proximal tubules of the kidney, jejunal brush border of the small intestine and ganglia of nervous system[3]. Hence, PSMA can be expressed in benign processes of these tissues, PCa, and other cancers. PCa expresses significantly higher (100x - 1000x) PSMA than normal tissues making PSMA an excellent target for nuclear imaging[4]. PSMA PET/CT technique has emerged as a novel receptor-based imaging technique for whole-body detection of PCa bone metastases[5].Pathologic Correlation:It is important for radiologists to be aware of false-positives when evaluating PSMA PET/CT studies. In this study, we present examples of false positive uptake in patients with PCa. For comparison, we also present a typical sclerotic bone lesion of PCa.References:1. Fitzmaurice, C., et al., 2017.2. Lin, S.C., et al 2018..3. Chang, S.S., et al., 2004.4. Evans, J.D., et al., 2018.5. Rowe, S., et al., 2019.6. Savir-Baruch, B., et al., 2021.

NMMIEE-33 Assessing Tumor Response to Therapy With Hybrid Imaging: Practical Aspects

Participants
Laith Abandeh, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Illustrate the primary role of conventional and hybrid imaging in the evaluation of tumor response to treatment. • Review the general concepts and existing imaging-based criteria for evaluating tumor response to therapy. • Outline the challenges encountered during tumor response assessment using anatomic imaging/size-based criteria. • Learn the emerging approaches and challenges in evaluating imaging-based tumor response to immunotherapeutic agents and targeted treatment. • Outline the synergy between PET and CT to overcome diagnostic challenges and achieve a comprehensive tumor response assessment.

TABLE OF CONTENTS/OUTLINE

§ Introduction and U.S Cancer Facts § Treatment Outcome Prediction via Response Monitoring § Cancers Evade Therapy: Mechanisms § Role of Anatomic Imaging - WHO Response Criteria -Limitations -Responses RECIST does not capture § Treatment Monitoring: Role of Hybrid Imaging (Integration of Data) § Practical Use of SUV § Artifacts and Pitfalls § Cases/Examples § Conclusion

NMMIEE-34 Expect the Unexpected! Pictorial Review of Acute and Emergent Findings on Oncologic F18-FDG PET/CT

Participants
Priya Pathak, MBBS,MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Overview of FDG uptake patterns in commonly encountered oncologic emergencies and non-cancer related acute findings in oncologic patients on F18-FDG PET/CT.2. Encourage identification of key imaging findings based on the attenuation corrected PET images with approach to differential diagnosis.3. Highlight the clinical features, prognosis and treatment options for these entities.4. Provide correlation between PET and anatomic imaging (US/CT/MRI).

TABLE OF CONTENTS/OUTLINE

Introduction: Discussion of the following entities with case examples and approach to imaging features.ONCOLOGIC EMERGENCIES AND ACUTE DISORDERS Vascular: SVC syndrome, DVT, Pulmonary embolism CNS: Brain metastasis, Spinal cord compression Chest: Airway obstruction, Pneumonia, Esophagorespiratory fistula, Pericardial effusion tamponade Abdomen Pelvis: Bowel obstruction, Typhilitis, Biliary obstruction, Cholangitis, Pancreatitis, Urinary tract obstruction Treatment related: Intracranial bleed, Pneumothorax, Invasive fungal pneumonia, Drug radiation related pneumonitis, Pericarditis, Pancreatitis, Enterocolitis MSK: Pathological fractures, Radiation osteonecrosis NON-CANCER RELATED ACUTE DISORDERS Vascular: Aortic dissection, Aneurysm, Vasculitis Chest: COVID, Aspiration pneumonitis, Lung abscess, Atrial fibrillation Abdomen: Infective and inflammatory enteritis, Diverticulitis, Appendicitis, Obstructed hernia, Cholecystitis, Hepatic abscess MSK: Discitis, Osteomyelitis, Septic arthritis, AVN, Myositis

NMMIEE-35 Gastrointestinal Motility on Nuclear Scintigraphy: Protocols, and Pathologies with Multimodality Correlates

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Jonathan Revels, DO, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points 1- Learn the clinical approach and role of radiology in the assessment and management of patients with GI motility disorders. 2- Recognize imaging patterns of normal and abnormal gastric, small bowel, and large bowel motility on nuclear scintigraphy. 3- Learn potential limitations of nuclear medicine examinations for GI motility assessment. 4- Learn the complimentary role nuclear scintigraphy and other radiologic examinations have in evaluation of GI motility disorders.

TABLE OF CONTENTS/OUTLINE

1- Introduction a. Review gastrointestinal motility disorder epidemiology and pathophysiology. b. Review the clinical approach to diagnosis of gastric, small bowel, and large bowel dysmotility, and the role of nuclear scintigraphy in evaluation of these patients. 2- Review protocols for gastrointestinal motility patient preparation and evaluation with nuclear scintigraphy. a. Various approaches to gastric emptying studies, and small bowel and large bowel transit studies. b. Briefly review gastric motility assessment in pre and post-operative setting (gastric bypass, colectomy) and following medical therapy (initiation of prokinetic medication). 3- Review how to evaluate GI motility scintigraphy examinations visually and quantitatively. a. Intragastric meal distribution for gastric emptying i. Fundal -vs- antral dysfunction, rapid gastric emptying. b. Quality control of regions of interest and quantitative assessment. 4- Provide case examples of: a. GI dysmotility on nuclear scintigraphy with fluoroscopic, radiographic, and cross-sectional correlates. b. Incidental findings on nuclear scintigraphy with clinical implications (gastroesophageal reflux, hiatal hernia).

NMMIEE-4 Triaging Frostbite Injuries with Tc99 MDP Multiphase Imaging

Participants
Austin Promersberger, Fargo, ND (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Extreme cold exposure/frostbite leads to distal arterial vasoconstriction and ischemia. • Management of frostbite varies widely based on the severity of injury. Treatments range from noninvasive care to catheter directed thrombolytic therapy and amputation. • Patient selection for invasive frostbite management requires timely decision making. • NM multiphase Tc99 MDP scintigraphy provides a noninvasive evaluation demarcating viable perfused tissue from ischemic/infarcted tissue. • MDP imaging can be used to select patients for catheter directed thrombolytic therapy as well as guide amputation planning.

TABLE OF CONTENTS/OUTLINE

1. Review the pathophysiology of frostbite and staging classifications. 2. Illustrate utility of early Tc99 MDP multiphase imaging in guiding thrombolytic therapy. 3. Emphasize the use of delayed Tc99 MDP planar imaging and SPECT/CT for assessing depth and extent of infarcted tissue for surgical debridement and amputation. 4. Pictorially review lessons and caveats learned at a level 1 trauma center during algorithmic implementation of MDP frostbite imaging including sequalae of bandaging, early rewarming, and distal digital marker use to improve diagnostic abilities and patient outcome. 5. Provide a detailed protocol for institutional frostbite imaging implementation.

NMMIEE-5 Spectrum of Vocal Cord FDG Avidity on18F-FDG PET/CT: Presentations Causes and Sites of Nerve Injury

Participants
Reema Goel, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Objectives 1. Describe the course of the vagus and recurrent laryngeal nerves. 2. Identify accurate PET/CT signs of unilateral vocal cord paralysis and avoid mimics and pitfalls. 3. Recognize the role of FDG PET/CT in assessing common and uncommon head and neck as well as mediastinal benign and malignant conditions that may lead to vocal cord paralysis as well as its role in evaluating primary vocal cord tumors

TABLE OF CONTENTS/OUTLINE

Examples of FDG PET/CT imaging highlighting the following benign and malignant causes of vocal cord paralysis : 1. 1. Masses, tumors compressing vagal nerve/its branches at various levels-at base of the skull, neck, thyroid region, and thoracic cavity especially as the recurrent laryngeal nerve (RLN) loops around the aorta at aorticopulmonary window 2. 2. Surgical interventions (especially thyroid surgery)-It would be highlighted that in the lower neck, the course of the right RLN is more lateral and oblique than the left, making it prone to injury particularly secondary to trauma and surgery, most commonly thyroid dissection. However, the length of the left RLN is at times more than double that of the right RLN causing the left RLN to a higher rate of injury from nontraumatic causes, such as neoplastic infiltration. 3. 3. Being secondary to intubation 4. 4. Viral neuritis and

idiopathic/paraneoplastic conditions 5. Additionally examples of role of FDG PET in assessing vocal cord tumors at initial diagnosis and post treatment stage/follow up would also be included.

NMMIEE-6 What Do We Know About Emerging Methods for Imaging The Glymphatic System?

Participants
Yuichi Morita, Bunkyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The glymphatic system describes the brain perivascular network promoting cerebrospinal and interstitial fluids exchange that facilitates the clearance of solutes and waste from the brain. Dysfunction of the glymphatic system is related to numerous neurological disorders. MRI tracer-based methods have been used to evaluate glymphatic function in humans; however, tracer administration is relatively invasive and limited in its clinical application. Recent studies have showed the potential of structural and diffusion MRI to investigate the glymphatic system non-invasively.The teaching points are:1. To review the current knowledge of the glymphatic system.2. To overview invasive and non-invasive methods for imaging the glymphatic system.3. To introduce clinical applications of glymphatic imaging using MRI.

TABLE OF CONTENTS/OUTLINE

1. The description of the glymphatic system hypothesis.2. Glymphatic imaging methods using tracers (i.e., Gadolinium-based contrast agents and 17O isotope).3. Non-invasive glymphatic imaging methods (i.e., perivascular space volumetry, diffusion tensor image analysis along the perivascular space, free water imaging, etc.).4. Clinical applications of glymphatic imaging methods, including Alzheimer's disease, Parkinson's disease, idiopathic normal pressure hydrocephalus, etc., and the future prospective application.

NMMIEE-8 Keep Calm and Image On: Safely Employing PET/CT In Pediatric Malignancies

Participants
Jaron Hansen, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Learn the oncologic indications for performing PET/CT in pediatric patients2. Recognize the normal biodistribution of 18F-FDG in pediatric patients3. Present case examples which highlight the utility of pediatric PET/CT in oncologic conditions4. Discuss mechanisms for reducing pediatric radiation doses while still obtaining a diagnostic imaging exam

TABLE OF CONTENTS/OUTLINE

1. Pediatric oncologic PET/CT a. Indications for PET/CT in the work up of pediatric cancer patients b. PET radiopharmaceuticalsi. 18F-FDG in cancer staging and treatment response assessment ii. 68Ga-DOTATATE in neuroblastoma and neuroendocrine tumor imaging 2. Oncologic case examples a. Lymphoma i. 18F-FDG PET/CT imaging in staging and treatment response assessment b. Sarcomas i. 18F-FDG PET/CT for staging, treatment response assessment, and PET-guided biopsies c. Neural origin tumors i. 18F-FDG PET/CT to characterize peripheral nerve sheath tumors ii. 68Ga-DOTATATE in neuroblastoma staging d. Malignancies associated with congenital syndromes i. Using 18F-FDG PET/CT to identify and stage malignancy in cancer predisposition syndromes, including Li Fraumeni and Lynch Syndrome 3. Pediatric PET/CT scanning considerations a. Understanding the balance between dose reduction and high-quality imaging, including the pros and cons of anesthesia and radiation in pediatric patients b. Technologies that help reduce dose or scan time for PET/CT scans c. Targeting the right PET/CT protocol for the clinical management decision

NMMIEE-9 Spectrum of PET Emergent Findings Among Various Radiotracers

Awards
Certificate of Merit

Participants
Hiroaki Takahashi, MD, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Unexpected emergent findings are occasionally detected on PET. Since PET scans routinely cover almost the entire body, there is a higher probability of incidental emergent findings than focused imaging. However, anatomical assessment is limited on the portion of these exams that are performed primarily for attenuation correction and colocalization of PET findings. While the appearance of emergent findings on FDG PET has been well-documented, reports on these findings as seen with other newly emerging PET radiotracers are scarce. In this exhibit we will present methods to detect the most common emergent diagnostic challenges radiologists will face on PET, focusing on their different appearance on various radiotracers including FDG, Choline, DOTATATE, Ammonia and PSMA. The purposes of this exhibit are: 1. To review varying appearances of incidental emergent conditions detected with different PET radiotracers. 2. To review appropriate management.

TABLE OF CONTENTS/OUTLINE

1. Overview of emergent findings on PET. 2. Basic mechanism and imaging of various PET radiotracers. 3. Findings of the emergent abdomen, including diverticulitis, cholecystitis/cholangitis, appendicitis, bowel obstruction, pyelonephritis, and pancreatitis. 4. Findings of the emergent chest, including pulmonary embolism, pneumothorax, and infection including COVID-19. 5. Findings of vascular emergencies, including deep venous thrombus, intramural hematoma, and pseudoaneurysm. 6. Findings of neurological emergencies, including intracranial hemorrhage, and large volume brain metastasis/tumor. 7. Findings of spine and musculoskeletal emergencies, including spinal stenosis, osteomyelitis and unstable fracture.

NMMIEE-1

Integrating Molecular Imaging to Meningiomas: Is PET with Somatostatin Receptors Our New Buddy?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Rodrigo Hernandez Ramirez, MD, Leon, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

To identify the importance of somatostatin receptors in meningioma.To show the applications of PET in the evaluation of meningiomas specifically in detection and delimitation of the tumor, diagnosis of recurrence and radiotherapy planning.

TABLE OF CONTENTS/OUTLINE

Meningiomas are the most common primary brain tumors and represent about 30% of intracranial tumors. Neuro-Oncology guidelines recommend contrast-enhanced MRI as the primary radiologic modality of choice because it has a sensitivity of 90%. Meningiomas can express somatostatin receptors type 2. Molecular imaging technics allow the incorporation of functional information for diagnostic purposes. PET tracers for SSTR evaluation provide high sensitivity with excellent target-to-background contrast due to low uptake in bone and healthy brain tissue. SSTR PET has demonstrated benefits for noninvasive differential diagnosis, delineation tumor and treatment planning. Although PET plays only a minor role in the initial diagnosis of meningiomas, it may be add value for meningioma detection, with a sensitivity of 100%. Clinically, this is relevant because meningiomas located at the skull base or nearby the falx cerebri, with transosseous extension, or equivocal imaging findings related to artifacts or calcifications were difficult to detect by MRI. For the differentiation of scar tissue from active tumor, SSTR PET has a high sensitivity of 90%, outperforming standard MRI with 79%. PET can obtain an optimized target volume delineation for fractionated radiation therapy in patients with meningiomas grade I-III.

NMMIEE-10

Punctiliously Perfect PSMA PET: Pearls and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Daniel Wale, DO, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Several PET radiopharmaceuticals targeting prostate specific membrane antigen (PSMA) are now FDA-approved for assessment of metastatic prostate cancer.2. PSMA PET agents have a normal biodistribution that includes salivary and lacrimal glands, kidneys, and small bowel, as well as urinary excretion. Familiarity with normal uptake decreases potential for misdiagnosis.3. PSMA expression is not prostate-specific, and uptake can be identified in a variety of other benign and malignant processes. Awareness of commonly encountered non-prostatic lesions, combined with knowledge of common metastatic patterns of prostate cancer, allows the radiologist to avoid potential pitfalls.

TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Prostate cancerA. PSMA expressionB. Utility of PSMA expression for diagnosisC. Utility of PSMA expression for treatmentIII. Nuclear imagingA. Indium 111 capromab pendetide (historical)B. PET agents targeting PSMA1. Gallium 68 PSMA-112. Fluorine 18 piflufolastatC. Clinical indicationsD. Imaging protocolsIV. Pearls and pitfallsA. Normal biodistributionB. Pitfalls regarding normal biodistributiona. Accessory salivary gland tissueb. Urine activityC. Parasympathetic gangliaD. Osseousa. Degenerative disease and inflammationb. Fibro-osseous lesionsE. Non-prostatic neoplasmsa. Meningiomab. Thyroid nodulesc. Hemangiomad. PSMA avid non-prostate malignanciesV. Treatment utilizing PSMAA. Lutetium 177 PSMA B. Localize anatomically occult disease for external radiationVI. Conclusion

Hybrid PSMA Imaging of The Prostate: A Guide For the Beginner- A Reference For the Expert

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Felipe Furtado, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Prostate-specific membrane antigen (PSMA) PET is revolutionizing the management of prostate cancer in all clinical settings, from treatment-naive cancer to biochemical recurrence. Different PSMA ligands share a high affinity toward PSMA but differ in sensitivity, specificity, half-life, biodistribution, pitfalls, and excretion profile. Workflows, acquisition protocols, hybrid imaging modality (PET/CT vs. PET/MRI), and interpretation must be tailored to the appropriate clinical scenario and specific PSMA radiopharmaceutical. Adequately performed and interpreted PSMA hybrid imaging will revolutionize personalized medicine in prostate cancer patients.

TABLE OF CONTENTS/OUTLINE

1) PSMA ligands; 2)PET/CT and PET/MRI strengths, weaknesses, acquisition protocols, and workflows; 3) How to perform the best PSMA hybrid study for each clinical scenario; 4) PSMA PET/CT and PET/MRI interpretation, for the beginner and the expert

Post PRRT Imaging: What To Look For On Routine and Emergent Imaging?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Malak Itani, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is for radiologists, nuclear medicine physicians, radiation oncologists and medical oncologists and trainees to:- Know what to look for on post-PRRT SPECT-CT imaging- Be familiar with most common complications of PRRT and their imaging manifestations in the acute, subacute, and chronic setting- Understand the appropriate timeline for routine follow-up after PRRT- Evaluate response to treatment after PRRT using anatomic and functional imaging modalities

TABLE OF CONTENTS/OUTLINE

I. Brief overview of PRRT complications with no imaging correlateA. MyelosuppressionB. Renal toxicityC. HepatotoxicityD. Neuroendocrine hormonal crisisE. Secondary leukemia and myelodysplastic syndromeF. Reproductive side effectsII. Post-PRRT Imaging by Timeline:A. Post-PRRT SPECT/CT:i. SPECT: Localize sites of uptake, compare intensity relative to pre-treatment SSTR-PETii. CT: Correlate gross tumor burden with pre-PRRT imaging, evaluate for immediate post-treatment complications, general CT readB. Acute presentations after PRRT:i. CT/MRI: tumor necrosis, hepatitis, cholangitis, hepatic abscess, radiation peritonitis, ascites, perforation, vascular thrombosisC. Routine follow-up post-treatment:i. CT/MRI: timing, changes in lesion size, criteria for progression vs pseudo-progression, potential side effectsii. PET: Indications, timing, comparison, quantitative measures and scores, potential complications

18F-DCFPyL PSMA PET/CT for Prostate Cancer Imaging: A Primer on Technique, Interpretation Structured reporting

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Harit Kapoor, MD, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) 18F-DCFPyL (PyL) is the first commercially available PSMA PET agent for Prostate Cancer (PCa) evaluation, FDA approved for both staging and biochemical recurrence.2) PyL has an unprecedented diagnostic performance, especially in the setting of small volume recurrence, detecting nodal metastasis in the 2-5 mm range.3) Aside from superior logistics inherent to being a F-18 based agent, PyL also shows higher spatial resolution and tumor to background ratio compared to Ga-68 PSMA-11 PET.4) PyL imaging has been hailed as a paradigm shift, altering patient management in >50% of published cohorts.5) Radiologist's awareness of the interpretative limitations and pitfalls as well as the use of standardized evaluation criteria, is vital in order to prepare for anticipated rapid utilization.6) Initiation of androgen deprivation therapy can create flare-like imaging appearance due to PSMA upregulation.

TABLE OF CONTENTS/OUTLINE

1) Role and evolution of PET tracers in the clinical continuum of recurrent prostate cancer2) Imaging protocol and normal biodistribution for PyL PSMA PET/CT3) Standardized evaluation criteria for staging, recurrence and treatment response.4) Case examples of pearls and pitfalls (e.g. ganglionic uptake, follicular hyperplasia and tumor-neovascularity etc.)5) Into the future: Metastasis directed therapy 177Lu-PSMA theranostics

NMMIEE-14

An Illustrative Review of Nuclear Medicine Thyroid Studies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Andrew Schneider, MD, MPH, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Nuclear medicine thyroid studies are a common type of imaging that require a broad understanding of the microbiology, physiology, and clinical manifestations of the underlying disease in order to interpret successfully. For trainees who are learning to interpret these studies, the intricate integration of multiple lines of clinical, laboratory, imaging, and pathological evidence can be intimidating and confusing. Here we provide an educational resource for trainees designed to build understanding by walking through the basic biology, radiopharmaceuticals, principles, indications, protocols, and interpretation of nuclear medicine thyroid studies. A key component of this resource is a representative collection of illustrative cases with a combination of clinical information, laboratory data, nuclear medicine and other imaging studies, and pathology findings.

PSMA-Targeted PET Imaging Interpretation Frameworks Comparison of PROMISE Classification and PSMA RADS Version 1.0

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Awards
Certificate of Merit

Participants
Vanessa Murad, MD, Bogota, Colombia (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) PSMA-targeted PET imaging interpretation schemes have been devised to ensure consistency in reporting and avoid potential pitfalls. 2) PROMISE classification is based on the molecular imaging PSMA (miPSMA) expression score, assigned to each lesion with respect to uptake in reference tissues (Figure 1). miPSMA score together with the presence or absence of morphological findings provide diagnostic certainty (positive, negative or equivocal). 3) When applying PROMISE classification for PSMA-targeted imaging with predominantly hepatobiliary excretion (e.g. 18F-PSMA-1007), the spleen is recommended as the intermediate reference. 4) On PSMA-RADS, findings are categorized on a 5-point scale according to PSMA-uptake and morphological characteristics, where the higher the number, the greater the likelihood of a cancer related lesion (Table 3)

TABLE OF CONTENTS/OUTLINE

1) Introduction/Aim. 2) PROMISE Classification 2.1) Description and interpretation: Tables 1,2. 2.2) Illustrative examples: Figure 2. 2.3) Advantages and disadvantages. 3) PSMA-RADS Version 1.0. 3.1) Description and interpretation. 3.2) Illustrative examples: Figure 3. 3.3) Advantages and disadvantages

Practical Interpretation of 18F PSMA PET/CT: Spectrum of Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Kenneth Huynh, BS, Orange, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.To familiarize the viewers with 18F PSMA normal biodistribution 2.To present all potential incidental findings detected by 18F PSMA PET/CT. 3.To review the staging and monitoring of prostate cancer and its locoregional and distant metastasis depicted by PET/CT.

TABLE OF CONTENTS/OUTLINE

The exhibit has three components: (1) the presentation of normal 18F PSMA features with characteristic physiologic uptake at lacrimal glands, glottis and sympathetic ganglion chains, differentiating this tracer from 18F FACBC and 11C Choline, (2) the review of incidental findings such as accessory parotid gland, lung inflammatory and infectious processes, osseous fractures, splenosis, and hibernoma, and (3) the description of common and atypical/rare features of prostate cancer and metastasis such as lesions of bones, nodes, liver, peritoneum, penis, adrenal glands and thyroid cartilage. The 177 Lu PSMA therapy of prostate cancer with related imaging is also addressed in the exhibit.

The History and Evolution of the Molecular Evaluation of Neuroendocrine Tumors

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Jorge Espinosa, MD,MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To understand the pathophysiology of the neuroendocrine tumors.To briefly know the history of radiotracers.To show the current radiotracers and its different applications in nuclear and imaging medicine.

TABLE OF CONTENTS/OUTLINE

Table of contents1. Introduction on neuroendocrine tumors2. Brief history of radiotracers and its evolutions3. Line time of evolutions of radiotracers and its applications4. Comparative table.5. The newest radiotracers and new applications6. CT-PET protocols7. Comparative images8. Examples of CT-PETOutline Since the discovery of In-111 OctreoScan in 1983, the role of molecular imaging in the diagnosis, follow-up and even treatment of neuroendocrine tumors has revolutionized the management of these lesions.Twenty years ago, the introduction of somatostatin analogues labeled with Ga68 in PET studies, improved the diagnostic sensitivity mainly as a result of improvements in spatial resolution.Knowledge of the evolution of molecular imaging during the diagnostic approach on neuroendocrine tumors aids in better selection of the method in patients with suspected neuroendocrine tumors.

Incidental Uptake on FAPI PET/CT Imaging: Physiologies, Pathologies, and Pitfalls

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Masatoshi Hotta, (*Presenter*) Nothing to Disclose

TEACHING POINTS

FAPI PET/CT can identify tumor lesions with a higher tumor-to-background ratio in various tumor entities, and has sparked considerable interest in the oncologic community. As studies on FAPI PET grow in number and size, incidental findings related to non-oncologic conditions have been increasingly reported.The purpose of this exhibit is to:1) Review the physiological FAPI uptake of each organ system2) Describe the main pathologies of non-oncological uptake3) Demonstrate FAPI PET/CT of non-oncologic diseases.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Physiological and non-oncological uptake of each organ system:a) Brainb) Head and Neck (Thyroid, Salivary glands, Dental)c) Thorax (Lung, Cardiac, Breast, Esophagus)d) Abdomen (Gastrointestinal, Liver, Pancreas, Bile duct, Spleen, Kidney, Uterus)e) Musculoskeletal (Bone, Joint, Muscle, Skin)f) Other systems (Vascular, Lymph node)

Multimodality Imaging of Adenoid Cystic Carcinoma With Emphasis On PET/CT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Awards
Certificate of Merit

Participants
Ba D. Nguyen, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the clinical, pathological and imaging features of Adenoid Cystic Carcinoma (ACC). 2. To present the PET/CT impact of ACC evaluation for metastases, recurrence, and treatment monitoring.

TABLE OF CONTENTS/OUTLINE

ACC is a rare cancer that typically arises in the head and neck region as a salivary gland tumor, composing 1% of head and neck tumors and 10% of salivary gland tumors. Other presenting locations within the head and neck include the hard palate, auditory canal, nasopharynx, epiglottis, lacrimal gland, and tongue. Outside of the head and neck, ACC may target the skin, trachea, breast, and reproductive tract. Most ACC are indolent, presenting as a slow growing, painless mass. However, perineurial invasion is common and there are potential distant metastases via lymphatic or hematogenous spread. Primary management is via complete resection, often with adjuvant radiation and chemotherapy. MRI and CT are most useful for head and neck assessment of ACC. Diagnosis relies on histology. PET/CT is used for staging, evaluating for metastasis, and monitoring for recurrence. This exhibit reviews PET/CT features of ACC at common and atypical sites of the body with emphasis on the PET/CT impact on staging and post-therapeutic surveillance of ACC.

Myocardial Perfusion Imaging: Past, Present, and Future

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Saif Azam, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Explore the physiology underlying the distribution of radiopharmaceuticals used in myocardial perfusion imaging2. Review classic patterns of uptake and how they may guide clinical management3. Understand the pros and cons of different modalities available for the assessment of myocardial perfusion4. Increase awareness of factors that can cause false positive and false negative results

TABLE OF CONTENTS/OUTLINE

• Introduction and review of anatomy and physiology pertaining to myocardial perfusion imaging• Exercise versus pharmaceutical stress testing• Cadmium-zinc-telluride camera utility• Logistics of radiotracers used in cardiac single photon emission computed tomography (SPECT): Thallium-201 (201-Tl), Technetium-99m sestamibi, Technetium-99m tetrofosmin• Case-based review of positron emission tomography (PET) radiotracers: Rubidium-82 (82-Rb), Nitrogen-13 ammonia (13N-NH3), Oxygen-15 water (15O-H2O)], Fluorine-18 flurpirdaz• Spectrum of imaging findings in the evaluation of ischemic heart disease• Causes and troubleshooting of false positives, false negatives, and other artifacts• Questions

Essentials of Theranostics: A Guide for Physicians and Medical Physicists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Awards
Identified for RadioGraphics

Participants
Celeste Winters, PHD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Understand the basic physics principles and radiation biology involved in Theranostics. 2) Describe the factors involved in the choice and application of radionuclide therapies, including eligibility for treatment based on patient and tumor factors. 3) Apply the concepts above to currently available radionuclide therapies.

TABLE OF CONTENTS/OUTLINE

1) Physics overview of radionuclides used in theranostics: a. Decay pathways of radionuclides used for imaging (?, ß+ emissions) and therapy (ß- and a) emissions b. Desirable characteristics of theranostics agents c. Clinical examples of imaging/therapeutic pairs, with the characteristics of radionuclides used (half-life, energies, range, and imaging modality): i. 123I-MIBG/ 131I-MIBG (Azedra®) ii. 68Ga/64Cu-DOTATATE/ 177Lu-DOTATATE (Luthatera®) iii. 68Ga-PSMA-11/ 177Lu-PSMA-617 (Pluvicto ®) iv. 99mTc-MDP/223Ra (Xofigo®) 2) Concepts of radiation biology and dosimetry: a. Biological descriptors of uptake pathways and pharmacokinetics b. Types of dosimetry calculation: Tumor, blood and solid organ at risk (OAR) i. MIRD Schema and Voxel Based ii. Generating time activity curves c. Implications on side effects from the therapy 3) Additional factors involved in the choice and application of radionuclide therapies: a. Patient factors: such as clearance rates and baseline function of OAR b. Tumor factors: level of uptake of the therapeutic agent by the tumor, and tumor heterogeneity

First Pass PET Imaging of Various Cardiovascular Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Takashi Norikane, MD, PhD, Kita-gun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Positron emission tomography (PET) is usually used for evaluating metabolic activity of the cells of body tissues. However, adding first pass PET imaging to standard imaging can provide information about vessel morphology and perfusion. The major teaching points of this exhibit are: 1: Knowledge of technique of first pass PET is important for an alternative imaging to conventional angiography for evaluation of vessels. 2: Knowledge of combination first pass and standard PET imaging provides further findings for radiologists to understand the disease condition accurately.

TABLE OF CONTENTS/OUTLINE

Technique List mode dynamic scan in selected region ECG-gated early phase scan Whole body PET angiography using continuous bed motion mode Disease Takayasu arteritis Giant cell arteritis Infectious aortitis Behcet's disease IgG4-related disease Pulmonary arterial venous malformation Pelvic arterial venous malformation Tubulointerstitial nephritis and uveitis Leriche syndrome Carotid artery stenosis Cardiac amyloidosis Constrictive pericarditis

Imaging Features of Atypical Thoracic Metastases From Biochemically Recurrent Prostate Adenocarcinoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Hala Khasawneh, MBBS, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Using a case-based approach we will reinforce the following: 1. Treatment advancements and improved patient survival have led to an increase in the frequency of encountering atypical sites of biochemically recurrent (BCR) prostate cancer (PCa) metastasis 2. Novel PET radiotracers including 11C-choline and 68Ga-PSMA have the potential to detect atypical sites of metastases early in the disease course and often at very low PSA levels 3. Multimodality imaging evaluation of atypical sites of tracer uptake is essential for metastasis detection and characterization 4. Information on the site and burden of disease is required for personalized management of BCR PCa 5. Awareness of atypical sites of metastasis is critical given the essential role of radiologists in guiding patient care

TABLE OF CONTENTS/OUTLINE

1. Brief overview of BCR in PCa 2. Available imaging modalities used in patients with suspected BCR; Conventional versus PET imaging. 3. PET radiotracers used in early detection of BCR PCa: a) Comparison of available PET radiotracers for imaging of BCR PCa. b) Imaging protocol and patient preparation. c) Normal biodistribution of commonly used PET radiotracers. 4. Metastatic pattern in BCR PCa a) Typical versus atypical metastases sites b) Oligo-metastasis versus widespread disease 5. Case-based review of imaging features for a variety of atypical sites of BCR metastasis in the thorax with multimodality correlation: a) The respiratory system; lungs, pleura, and airways b) Supradiaphragmatic lymph nodes c) Breast metastasis d) Atypical bone metastasis and mimickers 6. Discuss relevant differential diagnosis and potential imaging pitfalls 7. Impact of early BCR localization on clinical management

Always Wear Sunscreen: Conventional and Hybrid Imaging of Melanoma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Craig Ferguson, BMBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To describe the variety of imaging investigations to detect disease extent and evaluate their relative merits and limitations (including ultrasound, CT, MRI and 18F-FDG PET/CT)- To define the rationale of sentinel lymph node biopsy and highlight the benefit of SPECT over conventional planar lymphoscintgraphy for sentinel node localization- To discuss the role of imaging in surveillance and response assessment, and associated challenges relating to novel therapies including immunotherapy- To identify disease mimics that the radiologist must recognize to ensure patients are not inappropriately denied treatment- To highlight the role of MRI in assessing CNS disease, including characteristic imaging appearances and common pitfalls

TABLE OF CONTENTS/OUTLINE

Background- Melanoma subtypes (cutaneous and non-cutaneous) including histopathology- Epidemiology, pathogenesis and management- Review of current guidelines relating to imaging workup in melanoma- Lymphoscintigraphy to identify the sentinel node; indications and technique- Role of cross-sectional imaging for initial staging, surveillance and response assessment; focusing on the benefits and limitations of 18F-FDG PET/CT- Top-to-toe review of multimodality imaging throughout a range of organ systems using selected case studies, including atypical presentations, important mimics, and imaging pitfalls

Assessment of Response to Androgen Deprivation Therapy in Patients With Metastatic Castration-Resistant or Hormone-Sensitive Prostate Cancer by Radiolabeled Choline PET/CT: A Pictorial Essay

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Elisabet Vila, (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit will:- Review the concept of castration resistant prostate carcinoma (CRPC) and the use of choline PET/CT for response assessment.- Discuss the role of androgen receptor blockers in CRPC, and their mechanism of action.- Present radiological choline PET/CT CRPC cases and their different responses to treatment.- Assess the overall response to therapy and management in patients with CRPC as well as the utility of choline PET/CT in this scenario.

TABLE OF CONTENTS/OUTLINE

1. Introduction to prostate cancer1.1 Background and epidemiology1.2 Clinical Course1.3 Imaging findings of prostate cancer recurrence1.4 Metastatic Castration Resistant Prostate Carcinoma (mCRPC) 1.4.1 Definition1.4.2 Metastatic spread2. Treatment options2.1 Androgen receptor blockers (enzalutamide, abiraterone)2.2 Chemotherapies (docetaxel)2.3 Actual management3. Role of Choline PET/CT in the evaluation of tumor response3.1 Target and normal distribution of choline3.2 Strengths and weaknesses3.3 Use of choline PET/CT in mCRPC3.4 Pitfalls and artifacts4. Presentation of mCRPC cases at our center and evaluation of the response to treatment

Nuking Dementia: Adding Some Colour to The Dementia Diagnostic Pathway

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Peter Jarvis, FRCR, MBBS, Bournemouth, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Provide an overview of the different molecular imaging techniques, with sample protocols, used in the diagnostic work up of dementia. 2. Appreciate normal images (including typical ageing) and give a strategy to identify the most common dementia sub-types using FDG-PET examples. 3. Overview of the specific role of DaTscan imaging in the diagnosis of Parkinson's disease and Lewy body dementia. 4. Determine which patients would benefit from functional imaging and lay out a suggested diagnostic pathway to be used in conjunction with conventional structural imaging. 5. Explore some of the newer molecular imaging techniques currently in practice and under development.

TABLE OF CONTENTS/OUTLINE

*Aims? *Background and purpose of nuclear imaging? *Molecules overexpressed in dementia subtypes? *Overview of HMPAO SPECT/CT? *Overview of FDG PET/CT? *Comparison of HMPAO and FDG PET? *Statistical parametric mapping? *Important regions for interpretation? *Normal images (FDG PET and HMPAO)? *Normal ageing (FDG PET)? *FDG PET imaging of dementia subtypes? *Alzheimer's disease?(typical) *Mild cognitive impairment? *Logophenic aphasia *Posterior cortical atrophy *Fronto-temporal dementia?(typical) *Behavioral variant FTD *Semantic dementia? *Progressive non-fluent aphasia *Lewy body dementia? *Cautions and pitfalls? *DaTscan?- overview and clinical uses? *Newer PET imaging agents? *Amyloid PET? *Tau PET? *TSPO PET (neuroinflammation)? *When functional imaging should be used / pathway? *Summary? *References?

Practical Overview of I-123 Ioflupane (DaTscan) Imaging for Parkinsonian Syndromes: Clinical Applications Findings and Pitfalls of Interpretation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Awards
Identified for RadioGraphics

Participants
Megan Mercer, MD, Charleston, SC (*Presenter*) Nothing to Disclose

TEACHING POINTS

I-123 Ioflupane (DaTscan) imaging is routinely performed in nuclear medicine departments nationwide. The clinical symptoms of Parkinsonian syndromes are not always specific, and radiologists are frequently called upon to help provide a diagnosis. The goal of this exhibit is to provide a focused guide for radiologists on important aspects of patient preparation, protocoling, troubleshooting, interpretation, and reporting of DaTscan imaging, through both a didactic and case-based approach. Multimodality correlation of DaTscan findings with other molecular (FDG PET-CT) and cross-sectional imaging (CT, MRI) is also incorporated.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Pathophysiology 3. Indications 4. Protocol 5. Patient Preparation 6. Troubleshooting 7. Pitfalls 8. Interpretation 9. Reporting 10. Case examples with multimodality correlation 11. Conclusion.

Musculoskeletal Involvement in Oncological Diseases: Strengths and Weaknesses of 18F-FDG- PET/CT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Patricia Garcia, MD, PhD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To illustrate the spectrum of hematological diseases and oncological pathologies with musculoskeletal involvement in FDG-PET/CT with histological correlation -To discuss strengths and limitations of FDG-PET/CT in the diagnostic and follow up of these diseases

TABLE OF CONTENTS/OUTLINE

FDG-PET/CT is proved to be the best technique for diagnosis and follow up of myeloma and lymphoma. One limitation in these diseases is the diffuse affection of the bone marrow, where there can be false negatives and positives findings. FDG-PET/CT plays also an important role for detection of metastases.FDG uptake alone is not adequate for characterizing primary bone tumors and morphologic evaluation is an important factor in the interpretation of FDG-PET/CT scans. In many cases other imaging studies or biopsy is required for definitive diagnosis.We reviewed the hematological and oncological FDG-PET/CT studies from the last 10 years in two institutions. Regarding the musculoskeletal involvement we divided them in: - Bone lesions: I.e. scapular telangiectatic sarcoma, different patterns of presentation of myeloma, lymphoma, metastases - Soft tissue lesions: I.e. cell T skin lymphoma, cell B lymphoma - Complications: spinal cord compressions and pathological fractures We discuss the actual importance of FDG-PET/CT in each pathology and its limitations.

Neoplastic Neurocristopathies in Nuclear Medicine: Embryology, Pathophysiology, and Theranostics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Edgar Zamora, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Familiarize the reader with neural crest cell (NCC) embryology, pathophysiology of neoplastic neurocristopathies (NCP) and biochemical phenotypes, and the role of nuclear imaging and therapy. The exhibit includes illustrations and cases categorized based on primary NCC lineages involved (i.e., cranial, truncal, vagal, sacral).

TABLE OF CONTENTS/OUTLINE

NCCs arise from unfused neural folds, migrate extensively, and differentiate into specialized tissues in multiple systems. Mutations in crucial genes can lead to various neoplasms and dysgenetic conditions, originally presumed unrelated. Neuroblastomas (sympathoadrenal progenitor cells) result from epigenetic alterations (MYCN overexpression) or mutations in key genes (ALK, PHOX2B), while pheochromocytomas/paragangliomas (chromaffin/ chief cells) are more often familial (SDHx, VHL, RET). Targeted imaging can be performed with 123I-MIBG, and 111In- or 68Ga-SSTR binding agents, the latter also available for differentiated NETs. Theranostic ß- and ? emitting radiopharmaceuticals are useful in select conditions. Familial syndromes such as NF1 and MEN are associated with various NCPs, such as MTC, pancreatic islet cell tumors, and parathyroid adenomas. Radiolabeled SSTR binding agents can be used for pancreatic islet cell tumors, 18F-FDG for MTC, and 99mTc-Sestamibi for parathyroid adenomas. Other conditions resulting from dysgenesis or abnormal migration/differentiation of NCCs include meningioma, melanoma, and neurocutaneous syndromes. Biochemical phenotypes have an important role in radiopharmaceutical selection. Therefore, understanding the pathophysiology of NCPs is essential for diagnosis and management strategy.

PSMA PET/CT: A Pictorial Review of Common Pitfalls in Interpretation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Venkata Kal Byrapogu, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Our studies indicate that uptake of PSMA by PCa bone metastatic lesions tends to be homogeneous and more intense. In contrast, uptake by other pathologies presented here tend to be heterogenous and less intense.

TABLE OF CONTENTS/OUTLINE

Introduction:Prostate cancer (PCa) is the one of the most common cancers affecting men in the United States and worldwide[1]. Advanced PCa presents with bone metastases - most commonly osteoblastic while rarely osteolytic metastases. Accurate and reliable detection of these bone metastases is critical for patient survival as well as for improving patient's quality of life[2].Technique:Prostate-specific membrane antigen (PSMA) is a cell surface glycoprotein that is predominantly expressed in prostate epithelium, proximal tubules of the kidney, jejunal brush border of the small intestine and ganglia of nervous system[3]. Hence, PSMA can be expressed in benign processes of these tissues, PCa, and other cancers. PCa expresses significantly higher (100x - 1000x) PSMA than normal tissues making PSMA an excellent target for nuclear imaging[4]. PSMA PET/CT technique has emerged as a novel receptor-based imaging technique for whole-body detection of PCa bone metastases[5].Pathologic Correlation:It is important for radiologists to be aware of false-positives when evaluating PSMA PET/CT studies. In this study, we present examples of false positive uptake in patients with PCa. For comparison, we also present a typical sclerotic bone lesion of PCa.References:1. Fitzmaurice, C., et al., 2017.2. Jonathan Revels, DO, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching Points 1- Learn the clinical approach and role of radiology in the assessment and management of patients with GI motility disorders. 2- Recognize imaging patterns of normal and abnormal gastric, small bowel, and large bowel motility on nuclear scintigraphy. 3- Learn potential limitations of nuclear medicine examinations for GI motility assessment. 4- Learn the complimentary role nuclear scintigraphy and other radiologic examinations have in evaluation of GI motility disorders.

TABLE OF CONTENTS/OUTLINE

1- Introduction a. Review gastrointestinal motility disorder epidemiology and pathophysiology. b. Review the clinical approach to diagnosis of gastric, small bowel, and large bowel dysmotility, and the role of nuclear scintigraphy in evaluation of these patients. 2- Review protocols for gastrointestinal motility patient preparation and evaluation with nuclear scintigraphy. a. Various approaches to gastric emptying studies, and small bowel and large bowel transit studies. b. Briefly review gastric motility assessment in pre and post-operative setting (gastric bypass, colectomy) and following medical therapy (initiation of prokinetic medication). 3- Review how to evaluate GI motility scintigraphy examinations visually and quantitatively. a. Intragastric meal distribution for gastric emptying i. Fundal -vs- antral dysfunction, rapid gastric emptying. b. Quality control of regions of interest and quantitative assessment. 4- Provide case examples of: a. GI dysmotility on nuclear scintigraphy with fluoroscopic, radiographic, and cross-sectional correlates. b. Incidental findings on nuclear scintigraphy with clinical implications (gastroesophageal reflux, hiatal hernia).

NMMIEE-4

Triaging Frostbite Injuries with Tc99 MDP Multiphase Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Austin Promersberger, Fargo, ND (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Extreme cold exposure/frostbite leads to distal arterial vasoconstriction and ischemia. • Management of frostbite varies widely based on the severity of injury. Treatments range from noninvasive care to catheter directed thrombolytic therapy and amputation. • Patient selection for invasive frostbite management requires timely decision making. • NM multiphase Tc99 MDP scintigraphy provides a noninvasive evaluation demarcating viable perfused tissue from ischemic/infarcted tissue. • MDP imaging can be used to select patients for catheter directed thrombolytic therapy as well as guide amputation planning.

TABLE OF CONTENTS/OUTLINE

1. Review the pathophysiology of frostbite and staging classifications. 2. Illustrate utility of early Tc99 MDP multiphase imaging in guiding thrombolytic therapy. 3. Emphasize the use of delayed Tc99 MDP planar imaging and SPECT/CT for assessing depth and extent of infarcted tissue for surgical debridement and amputation. 4. Pictorially review lessons and caveats learned at a level 1 trauma center during algorithmic implementation of MDP frostbite imaging including sequalae of bandaging, early rewarming, and distal digital marker use to improve diagnostic abilities and patient outcome. 5. Provide a detailed protocol for institutional frostbite imaging implementation.

NMMIEE-5

Spectrum of Vocal Cord FDG Avidity on18F-FDG PET/CT: Presentations Causes and Sites of Nerve Injury

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Reema Goel, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Objectives 1. Describe the course of the vagus and recurrent laryngeal nerves. 2. Identify accurate PET/CT signs of unilateral vocal cord paralysis and avoid mimics and pitfalls. 3. Recognize the role of FDG PET/CT in assessing common and uncommon head and neck as well as mediastinal benign and malignant conditions that may lead to vocal cord paralysis as well as its role in evaluating primary vocal cord tumors

TABLE OF CONTENTS/OUTLINE

Examples of FDG PET/CT imaging highlighting the following benign and malignant causes of vocal cord paralysis : 1. 1. Masses, tumors compressing vagal nerve/its branches at various levels-at base of the skull, neck, thyroid region, and thoracic cavity especially as the recurrent laryngeal nerve (RLN) loops around the aorta at aorticopulmonary window 2. 2. Surgical interventions (especially thyroid surgery)-It would be highlighted that in the lower neck, the course of the right RLN is more lateral and oblique than the left, making it prone to injury particularly secondary to trauma and surgery, most commonly thyroid dissection. However, the length of the left RLN is at times more than double that of the right RLN causing the left RLN to a higher rate of injury from nontraumatic causes, such as neoplastic infiltration. 3. 3. Being secondary to intubation 4. 4. Viral neuritis and idiopathic/paraneoplastic conditions 5. Additionally examples of role of FDG PET in assessing vocal cord tumors at initial diagnosis and post treatment stage/follow up would also be included.

NMMIEE-6

What Do We Know About Emerging Methods for Imaging The Glymphatic System?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Yuichi Morita, Bunkyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The glymphatic system describes the brain perivascular network promoting cerebrospinal and interstitial fluids exchange that facilitates the clearance of solutes and waste from the brain. Dysfunction of the glymphatic system is related to numerous neurological disorders. MRI tracer-based methods have been used to evaluate glymphatic function in humans; however, tracer administration is relatively invasive and limited in its clinical application. Recent studies have showed the potential of structural and diffusion MRI to investigate the glymphatic system non-invasively.The teaching points are:1. To review the current knowledge of the glymphatic system.2. To overview invasive and non-invasive methods for imaging the glymphatic system.3. To introduce clinical applications of glymphatic imaging using MRI.

TABLE OF CONTENTS/OUTLINE

1. The description of the glymphatic system hypothesis.2. Glymphatic imaging methods using tracers (i.e., Gadolinium-based contrast agents and 17O isotope).3. Non-invasive glymphatic imaging methods (i.e., perivascular space volumetry, diffusion tensor image analysis along the perivascular space, free water imaging, etc.).4. Clinical applications of glymphatic imaging methods, including Alzheimer's disease, Parkinson's disease, idiopathic normal pressure hydrocephalus, etc., and the future prospective application.

Keep Calm and Image On: Safely Employing PET/CT In Pediatric Malignancies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Participants
Jaron Hansen, MD, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Learn the oncologic indications for performing PET/CT in pediatric patients2. Recognize the normal biodistribution of 18F-FDG in pediatric patients3. Present case examples which highlight the utility of pediatric PET/CT in oncologic conditions4. Discuss mechanisms for reducing pediatric radiation doses while still obtaining a diagnostic imaging exam

TABLE OF CONTENTS/OUTLINE

1. Pediatric oncologic PET/CT a. Indications for PET/CT in the work up of pediatric cancer patients b. PET radiopharmaceuticalsi. 18F-FDG in cancer staging and treatment response assessment ii. 68Ga-DOTATATE in neuroblastoma and neuroendocrine tumor imaging 2. Oncologic case examples a. Lymphoma i. 18F-FDG PET/CT imaging in staging and treatment response assessment b. Sarcomas i. 18F-FDG PET/CT for staging, treatment response assessment, and PET-guided biopsies c. Neural origin tumors i. 18F-FDG PET/CT to characterize peripheral nerve sheath tumors ii. 68Ga-DOTATATE in neuroblastoma staging d. Malignancies associated with congenital syndromes i. Using 18F-FDG PET/CT to identify and stage malignancy in cancer predisposition syndromes, including Li Fraumeni and Lynch Syndrome 3. Pediatric PET/CT scanning considerations a. Understanding the balance between dose reduction and high-quality imaging, including the pros and cons of anesthesia and radiation in pediatric patients b. Technologies that help reduce dose or scan time for PET/CT scans c. Targeting the right PET/CT protocol for the clinical management decision

NMMIEE-9

Spectrum of PET Emergent Findings Among Various Radiotracers

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NMMI

Awards
Certificate of Merit

Participants
Hiroaki Takahashi, MD, PhD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Unexpected emergent findings are occasionally detected on PET. Since PET scans routinely cover almost the entire body, there is a higher probability of incidental emergent findings than focused imaging. However, anatomical assessment is limited on the portion of these exams that are performed primarily for attenuation correction and colocalization of PET findings. While the appearance of emergent findings on FDG PET has been well-documented, reports on these findings as seen with other newly emerging PET radiotracers are scarce. In this exhibit we will present methods to detect the most common emergent diagnostic challenges radiologists will face on PET, focusing on their different appearance on various radiotracers including FDG, Choline, DOTATATE, Ammonia and PSMA. The purposes of this exhibit are: 1. To review varying appearances of incidental emergent conditions detected with different PET radiotracers. 2. To review appropriate management.

TABLE OF CONTENTS/OUTLINE

1. Overview of emergent findings on PET. 2. Basic mechanism and imaging of various PET radiotracers. 3. Findings of the emergent abdomen, including diverticulitis, cholecystitis/cholangitis, appendicitis, bowel obstruction, pyelonephritis, and pancreatitis. 4. Findings of the emergent chest, including pulmonary embolism, pneumothorax, and infection including COVID-19. 5. Findings of vascular emergencies, including deep venous thrombus, intramural hematoma, and pseudoaneurysm. 6. Findings of neurological emergencies, including intracranial hemorrhage, and large volume brain metastasis/tumor. 7. Findings of spine and musculoskeletal emergencies, including spinal stenosis, osteomyelitis and unstable fracture.

Abstract Archives of the RSNA, 2022

NPMEE

Noninterpretive Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Sub-Events

NPMEE-1 Up the Game for Radiology Education in Medical School: A New Approach Using Virtual Case-based Learning With Resident Mentorship

Participants
Sagar Wagle, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Free online curricula combined with guided mentorship by radiology residents can provide a structured educational experience for a week-long medical student radiology rotation, hosted virtually.- Two examples of online curricula, including LearnAbdominal.com and LearningNeuroradiology.com, offer interactive resources such as search-pattern videos and scrollable DICOM cases. - The radiology rotation consisted of initial resident-student meetings, either in person or online, to discuss search patterns and review introductory cases. This was followed by students completing a self-paced curriculum. The resident remained available if students had questions. - The educational experience has several benefits: the students learn basic radiology skills, establish relationships with radiology residents, and are exposed to radiology as a potential career. The residents reinforce teaching skills, and explore interest in academic radiology. - Online curricula with mentorship is a scalable model that can increase access to radiology education, especially in underserved training programs nationally or internationally.

TABLE OF CONTENTS/OUTLINE

Rotation outline and structure.Curriculum content examples.Role of the radiology resident mentor.Challenges of implementing an online rotation.Outcomes of the rotation.Medical student and resident feedback.Application of this model for underserved training environments.

NPMEE-10 Beyond the Reading Room: Creating an Engaging Radiology Screening Elective Emphasizing Public Health Principles and Healthcare Disparities

Awards
Certificate of Merit

Participants
Alison Gegios, MD, Whitefish Bay, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Engaging medical students in a radiology screening elective highlighting basic principles of screening and contemporary screening guidelines provides exposure to radiology and the role of radiology in public health. 2. Students embrace novel methods of delivering educational content, such as "enduring learning objects" (i.e. online learning modules) and interactive case sets, in addition to more traditional lectures and reading room observation. 3. Students are motivated to synthesize learned material and create educational content through innovative assignments with an emphasis on public health education and analysis of healthcare disparities.

TABLE OF CONTENTS/OUTLINE

(1) How to develop a new course, including designing objectives and key course components: a. Review basics of screening and select most impactful exams to emphasize in the course (e.g., breast, lung, colorectal cancer screening) b. Implement progressive ways of delivering educational content through a flipped classroom model c. Construct novel assessment methods (e.g., infographic presentations) (2) Engagement in and beyond the reading room, including how to create interactive experiences, such as: a. Role-play sessions b. Curated case sets c. Patient experiences in radiology (i.e., image acquisition with technologists, delivering information to patients about next steps) (3) Future goals, including creating an interactive website (4) Analysis of course feedback

NPMEE-11 Challenges and Opportunities in Creating an Interactive Student Focused Radiology Curriculum for Medical Students

Participants
Danielle Cadoret, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Medical school curricula for radiology are not standardized, although some guidelines do exist. As radiology has become more central to the day-to-day practice of clinical medicine, it is critical that this is reflected in how we teach our medical students. If we can produce medical school graduates who are competent and confident in their radiology knowledge base, it will be beneficial both in maintaining the quality of graduates choosing a career in radiology and facilitating communication between radiologists and non-radiologist clinicians going forward. It is the responsibility of the Radiologist to teach these students what we want them to know,

but time is the most precious, limited resource and medical student teaching tends to be the lowest priority for many. However, methods of delivery of education have changed drastically, emphasizing independent active learning, online and in-person. This exhibit will highlight best practices when designing a new medical school radiology curriculum, including high yield core content, teaching modalities used, and interactive delivery strategies tailored to current educational standards. It will also highlight the challenges encountered in this process, and the solutions used to overcome them based on our experience creating a new curriculum at our institution. This exhibit aims to enable fellow radiologists to grow their educational roles expeditiously and in accordance with current best practices in medical education.

TABLE OF CONTENTS/OUTLINE

Current standards of medical school radiology curricula. Evolving learning styles. Key considerations in building a new curriculum. Delivery: Interactive, Student focused Online Models. Challenges solutions

NPMEE-12 Constructing Clinically Relevant, Indication Driven Reports: An Institutional Web-Based Platform for Musculoskeletal Radiography Reference Materials

Awards
Certificate of Merit

Participants
Blake Bartholomew, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• An institutional web-based platform provides quick access to musculoskeletal radiography search patterns and reference materials to optimize report dictation.• Indication and location specific pathology guides with example reports may assist radiology trainees with technical vocabulary development.

TABLE OF CONTENTS/OUTLINE

1. Background: a. Novice residents report difficulty with identifying and describing relevant normal and pathologic findings for a given indication. b. A web-based platform has been created at our institution to serve as a comprehensive, easily accessible tool to help users develop indication specific search patterns and the technical vocabulary to create tailored, clinically relevant musculoskeletal radiograph reports. 2. Utility: a. Trainees develop indication specific search patterns. b. Quick access to high-yield example cases, diagrams, and measurement guides to assist with report dictation. 3. Structure: a. Homepage i. Hyperlinks to pages organized by anatomic location and specific pathology. b. Section content i. Review of indication specific search patterns (i.e. trauma, atraumatic pain, post-operative assessment) • Anatomic diagrams • Measurement guides ii. Overview of common pathologic findings and relevant descriptors iii. Case-based review with example reports iv. External links to high-yield resources 4. User data and feedback 5. Conclusion

NPMEE-13 Optimising Human Factors to Promote the Learning in Radiology

Participants
Rachel Magennis, Manchester, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

• The handling of error or discrepancy within radiology departments can have a very negative impact on individuals and the wider team depending on relationships, environment and culture. • Individuals can feel targeted and unsupported in a process that should be 'safe' and blame free and for the benefit of all reporters. • We have a unique opportunity in radiology to review scan findings from a given time and consider alternate diagnoses, learn from missed opportunities or celebrate the ‘good spots’. • This allows radiologists to engage in a learning process, outlined by the Royal College of Radiologists, called ‘Radiology Events and Learning’ or REAL in the UK.

TABLE OF CONTENTS/OUTLINE

A better understanding of human factors in the wider healthcare setting has started to impact positively on the culture in many trusts. Human factors and their impact on the well being of staff and on the safety of our patients has also influenced radiology error management in recent years.With the movement away from 'Mistakes meeting' and advent of 'Radiology Events and Learning', the terminology has softened and judgement gone. The focus now is all about the learning and this culture shift has enhanced engagement and participation. ‘Good spots’ as well as errors and discrepancies are shared anonymously, in a ‘safe’ environment.With human factors in mind, we have strived to create an environment of psychological safety with anonymous submission of cases and sharing without judgement, for the benefit of all reporters.We highlight how human factors interplay with the process of learning in radiology with reference to the college standards and our own practice.

NPMEE-14 A New (Digital) Era in Medical Journalism: Leveraging Social Media and Other Online Tools to Increase Reach and Engagement

Awards
Identified for RadioGraphics

Participants
Katie S. Traylor, DO, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Social media and other digital tools offer many advantages and opportunities to medical journals with the vision and expertise to leverage them. 2. The purpose of this exhibit is to highlight these advantages from the standpoints of journal editors, authors, and readers, particularly emphasizing ways all stakeholders can benefit

TABLE OF CONTENTS/OUTLINE

A. Background/Introduction. 1. Available tools. a. Pros and cons of each. B. Editor Advantages. 1. Expand audience through global reach. a. Increase diversity. b. Bolster pipelines. c. Identify talented and interested individuals for future journal involvement. *RG Team. d. Tracking metrics. 2. Receive and incorporate reader feedback. 3. Define brand. 4. Altmetrics and article citations. C. Author Advantages. 1. Increased visibility of work. 2. Engage with readers in active discussions. 3. Receive reader feedback to

inform future work. D. Reader Advantages. 1. Ease of access to content for 'on-the-go' consumption. 2. Engage editors and authors in active discussions. 3. Discover opportunities to get involved/volunteer. 4. Low cost (often free). E. How RadioGraphics Does It. 1. Social Media and Digital Innovation Team. a. Article summary tweets. b. Tweetorials. c. Tweet chats. d. Live audio journal discussions. e. #RGphx. 2. Visual abstracts. a. Digital Table of Contents. 3. Podcosts. 4. RadDiscord collaboration.

NPMEE-15 Climate Change and Radiology: What Radiologists Need to Know

Participants
Cameron Nosrat, San Francisco, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The health care contribution to overall greenhouse gas emissions in the U.S. was estimated at 10% in 2013, with radiology responsible for a substantial share of carbon footprint.2. Historically marginalized groups are most vulnerable to impacts of climate change.3. A strong interrelationship exists between radiology and climate change. Current radiology practices produce excessive waste and energy consumption while the changing climate makes it increasingly more difficult for underserved communities to receive the health care and imaging they need.4. Solutions addressing climate change and health equity should focus on promoting sustainable radiology practices through education and research.

TABLE OF CONTENTS/OUTLINE

1. Introduction a. Current climate outlook b. Urgency c. Health care contribution to climate change2. Impact of radiology on climate change a. Current research on environmental costs of radiology b. Energy cost of imaging modalities c. ACR appropriateness and sustainable alternatives including clinical cases d. Education, policy, and advocacy3. Impact of climate change on radiology a. Natural disasters b. Supply chain c. Endemic disease patterns d. Disproportionate burden on underserved communities4. Future directions for institutional initiatives

NPMEE-16 A Color Doppler Picture is Worth a Thousand Words

Awards
Cum Laude

Participants
Sinan Bana, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

As radiologists' workload increases and the amount of time they have to interpret each study decreases, it can become easy to rely on sonographers' worksheets for most of the findings. Over time, sonographers are reviewing their studies to radiologists less and less, and with the increase in teleradiology across the world, many radiologists don't know the sonographers producing the studies or have a convenient way to contact them with questions about their images or findings. When radiologists choose where to spend their limited time interpreting a Doppler study, they often overlook the color Doppler image that accompanies the spectral Doppler waveform. If the radiologist knows the sonographer well and has proven to be strong, they can more easily overlook this portion of the image. However, if a radiologist doesn't know or trust the sonographers performing the studies they are interpreting, this crucial part of study interpretation cannot be ignored. This exhibit will show many examples of how the color Doppler portion of an image accompanied by a spectral Doppler waveform will tell a very different story than the spectral waveform and bring enhanced awareness of how critically important it is not to overlook these color images and rely solely on the spectral waveform or the sonographers' worksheets.

TABLE OF CONTENTS/OUTLINE

1. Review proper technical settings for the gray-scale, color Doppler and spectral Doppler waveform images. 2. Show examples of how the color Doppler images tell a different story than the spectral waveform or the sonographers' worksheet. 3. Provide advice on how to handle issues of inconsistency for high quality patient care.

NPMEE-17 Pre-med Shadowing: Establishing a Week Long Introductory Experience for College Students Interested in Radiology

Participants
Matthew Miller, MD, Sewickley, PA (*Presenter*) Editor, Aquifer Inc

TEACHING POINTS

1. Student interest in a career in radiology will be piqued if opportunities to observe are readily available2. Establish an organized week long radiology shadowing experience for premedical college students.3. Create a comprehensive self-learning curriculum for the shadowers.4. Facilitate a mentorship pipeline though which premedical students and radiologists can collaborate.

TABLE OF CONTENTS/OUTLINE

1. Pre-medical student timelinea. MCAT and application timing2. Purposes for establishing a week long organized shadowing experiencea. Child labor limitationsb. Lack of radiology exposurec. Post-COVID3. Goals for the weeka. Observe the breadth of radiology subspecialties and partake in reading room learning similar to medical student rotatorsi. Breastii. Abdominaliii. Musculoskeletaliv. Chestv. Neurob. Observe specialty "field trips" outside of the reading roomi. X-Ray, Mammogram, CT, MRI, Fluoroc. Partake in organized self-learning curriculumi. Recorded lecturesii. Selected readingsd. Establish a mentorship pipeline with a few radiologists

NPMEE-18 Making Radiology Reports Great Again

Participants
Uffan Zafar, MBBS, Karachi, Pakistan (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the perspectives on reporting styles and fundamentals of concise radiology reporting. Components of the findings and impression sections of radiology reports and underlying concepts.Navigating the use and abuse of perception-related terminology in radiology report. Impact of radiology reports on delivering high quality clinical care.Adapting radiology report to evolving practices

and communication styles in medicine.Exploring the role of artificial intelligence in formulating radiology reports.

TABLE OF CONTENTS/OUTLINE

Background Speaking like a radiologist Improving radiology report Differences findings and impression sectionsKey principles for the findings section Key principles for the impression section Key structural Components of an Impression Radiology report audience and their needs Role of artificial intelligence Summary References Acknowledgements Author information Ethics declaration Rights and permissions Further Reading

NPMEE-19 The Price Is Right...Sometimes: CMS Price Transparency Requirements, Intra-Institutional Inconsistencies in Published Charges, and Imaging Charge Variability

Participants
Matthew Petterson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduce the Centers for Medicare and Medicaid Services hospital price transparency requirements, including the charges which must be made publicly available via chargemasters and consumer-friendly displays.2. Discuss widespread intra-institutional inconsistency between charges for the same examinations published in chargemasters versus consumer-friendly displays. 3. Highlight the marked heterogeneity in total charges for common imaging examinations across prominent U.S. academic medical centers.

TABLE OF CONTENTS/OUTLINE

1. Centers for Medicare and Medicaid Services Price Transparency Rule a. Goals b. Affected institutions c. Required data publication formats i. Chargemasters 1. Required data ii. Consumer-friendly display of shoppable services 1. Required data 2. Mandatory imaging examinations 3. Common consumer-friendly displays d. Penalties2. Intra-institutional inconsistencies between total charges published in chargemasters and consumer-friendly displays a. Rates and magnitudes b. Other commonly incomplete charge data c. Sources d. Implications for institutions e. Implications for patients3. Variability in total charges for C.M.S. mandated imaging examinations a. CT i. CPT 70450, 72193, 74177 b. MRI i. CPT 70553, 72148, 73721 c. US i. CPT 76700, 76805, 76830 d. Radiography i. CPT 72110 e. Mammography i. CPT 77065, 77066, 77067

NPMEE-2 How To Develop The Best Radiology Clerkship?: A Guide for Educators

Participants
Francisco Garrido Cisterna, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Increasing workload and continued specialization of radiology practice are challenge for medical educators planning in-person activities in the reading room of medical students during their elective radiology clerkships. 2. Radiology clerkships require a structure that will enable the proposed educational goals to be met: known learning objectives, available and user friendly consult materials, feedback sessions and assessment. 3. In the reading room, various educational strategies can be applied such as: patient history review from the EMR, involvement in clinical-radiological discussions, creation of a portfolio of interesting cases, selection of topics based on cases encountered for further presentation in the journal club, among others. 4. Radiology residents may spend more time with medical students that with supervisions fellows or staff radiologists, playing a central role in the overall quality of medical student experience in the reading room. Therefore, they must learn and apply a few teaching techniques specifically for this environment.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. What is the current status in the world? 3. The educational challenge in the reading room 4. What elements do you need to build a clerkship? 5. Teaching and learning methods in the reading room and at home 6. The impact of the residents in the radiology clerkship (resident as teachers) 7. Assessment 8. Conclusions

NPMEE-20 MRI Safety of Commonly Used Implants and Devices: What the Radiologist Needs to Know

Awards
Certificate of Merit

Participants
Vivek Pai, MBBS,MD, Toronto, Singapore (*Presenter*) Nothing to Disclose

TEACHING POINTS

Requests for MRIs in patients with medical and/or surgical devices are frequently encountered in practice. The aims of this exhibit are: 1. To review the concepts of static magnetic fields, gradient fields, and RF pulse with regard to MRI safety 2. To review the concept of Specific Absorption Rate (SAR) and B1+rms 3. To review standard MRI safety terminology 4. To review general guidelines with respect to MRI safety in patients with implants and devices 5. To review the specific MRI safety concerns of the most commonly used devices and implants.

TABLE OF CONTENTS/OUTLINE

1. Basic concepts and definitions in MRI safety 2. Review of MRI safety for: a. Deep Brain Stimulators b. Epidural and Peripheral Nerve Catheters c. Spinal Cord Stimulators d. Peripheral Nerve Stimulators e. Cochlear Implants f. Scleral Buckles g. Pacemakers and Defibrillators h. Vascular Stents i. Endoscopic Hemostatic Clips and Video Capsule Endoscopic Recording Devices j. Intrauterine and Fallopian Tube Closure Devices k. Bullets, Shrapnel, and Foreign Metallic Objects.

NPMEE-21HC Fostering Organizational Excellence Through Inclusive Leadership: A Practical Guide for Radiology Leaders

Awards
Identified for RadioGraphics

Participants

Anand Narayan, MD, PhD, Verona, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Increasing the diversity of Radiology departments can drive performance by leveraging the collective experiences of different backgrounds, age groups, and genders.• The potential of diverse teams can only be actualized when team members feel valued, respected, included, confident, and inspired.• Inclusive work cultures promote innovation, productivity, higher quality decision making, and profitability.• Inclusive leadership training can provide radiology leaders with tools to foster healthy, diverse and inclusive environments and teams.

TABLE OF CONTENTS/OUTLINE

1. Rationale for Inclusive Leadershipa. Backgroundb. Impact of Inclusion on Team Performance2. Inclusive Leadershipa. Inclusive versus Exclusive Leadership Stylesi. Transformative Leadershipii. Transactional Leadershipiii. Authoritarian Leadershipiv. Laissez Faire Leadershipv. Democratic Leadershipvi. Servant Leadershipb. Characteristics of Highly Inclusive Leadersi. Cognizanceii. Curiosityiii. Courageiv. Cultural Intelligencev. Commitmentvi. Collaborationc. Unconscious biasesi. Definitionii. Impact on Decision-Making in the Workplaceiii. Strategies for Reducing Unconscious Biases3. Strategies for Radiology Leadersa. Increase Diversityb. Nurture Authentic, Brave Dialoguec. Inclusive Meetingsd. Transparent Processes for Assignments and Promotionse. Foster Community BuildingPlease visit the Learning Center to also view this presentation in hardcopy format.

NPMEE-22 Mapping Our Journey Towards Gender-Affirming Imaging Care

Participants
Kristen L. Dean, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

It is critical for radiology practices to know how to provide a welcoming care environment for gender diverse patients such as transgender patients. We employed a structured patient experience mapping process to identify potential barriers associated with each aspect of the imaging exam. The purpose of this exhibit is: 1. To learn how to provide a safe, affirming, and inclusive environment for transgender patients and their families by understanding the patient journey from their perspective. 2. To describe our 'Gender Diverse Patient Experience' initiative to improve the care journey and support staff in gaining cultural competency.

TABLE OF CONTENTS/OUTLINE

1. Mapping the Journey • Potential Scenarios o Transgender male having a transvaginal US o Transgender female having a RUG/VCUG o Transgender male having a mammogram • Step-by-Step • Actions, Motivations, Questions, Barriers • Staff concerns 2. Framework to Map • Patient Journey template • Documentation 3. Key Findings • Causes of Patient Distress • Information Gap • Semblance of Control 4. Informing Improvements • Patient Workflow Across Journey o Patient preparation information o Welcoming greeting: Chosen name, pronouns o History, intake and control forms (sexual orientation, gender identity, sex assigned at birth) o Patient preferences during exam (changing, conversation, students) o Radiology reports use of pronouns • Physical Environment o Affirming inclusive silent indicators (Healthcare Equality Index, Non- Discrimination policy) o Changing rooms, waiting rooms restrooms o Reflect across online environment touchpoints • Awareness, Education Training o Experiential, safe to make mistakes, multi-pronged o Culturally competent workforce

NPMEE-23 International Medical Graduates: A Primer for Program Directors

Participants
Jose Armando Rodriguez Hernandez, MD, Tegucigalpa, Honduras (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Define International Medical Graduates (IMG)2. Understand composition and historic trends of IMGs in the U.S. medical and radiology workforce3. Discuss the steps IMGs need to take to be eligible to apply to residency positions in the U.S.4. Recognize common misconceptions IMGs face in the interview trail5. Recognize attributes IMGs bring to the U.S. healthcare system

TABLE OF CONTENTS/OUTLINE

1. Define International Medical Graduateso US-citizens IMGo Non-US citizens IMG2. IMG composition and trends in the U.S. medical and radiology workforce3. Steps IMG need to take to apply to a residency position in the U.S.o Medical school requirements (established by the Educational Commission for Foreign Medical Graduates, or ECFMG)o Application for ECFMG certificationo Examination requirementso Medical education credential requirements4. Common misconceptions IMG face in the interview trailo Medical schools unknown to selection committeeso "Gap" years from graduation for non-US IMGs, commonly spent on:Mandatory service at their home countryClinical and research rotations in the U.S.Preparing for USMLE examsApplying for ECGME certificationo English language proficiencyo Understanding of the U.S. medical systemo Difficulty acquiring visas5. Attributes IMG bring to the U.S. healthcare systemo Diverse medical and cultural backgroundso Contribute to peers' cultural competencyo Fluency in multiple languageso Experience working unsupervised as primary care providers

NPMEE-24 Avenues Of Advocacy For Healthcare Disparities In Breast Imaging

Participants
Connie Ge, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Understand how healthcare disparities (HCD) affect morbidity and mortality in breast cancer- Identify 3 domains of HCD advocacy in breast imaging (Patient centeredness, Imaging processes, Healthcare systems)- Examine the literature on efforts to address each of these domains- Apply this knowledge to problem solving in real-life patient vignettes.

TABLE OF CONTENTS/OUTLINE

- Background and objectives- Overview of literature examining HCD in context of breast imaging- Overview of 3 domains of HCD advocacy in breast imaging1. Patient centeredness--Patient education--Patient-centered reporting and guidelines--Cultural competency training and diversification of workforce--Language accessibility2. Imaging processes--R-Scan--ACR Select--Tools to examine data through lens of health equity3. Healthcare systems--Structural barriers to accessing care--Targeted outreach efforts for specific vulnerable populations--Collaboration with local organizations- Patient vignettes with guided brainstorming- Conclusions

NPMEE-25 What Radiologists Need to Know About Workplace Ergonomics

Participants
Tyler Yan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Substantial workstation-related MSK discomfort is experienced by Canadian radiologists• Adjustable furniture is not often available or used• Provision of adjustable equipment is an important component in the creation of accessible and inclusive radiology departments• There is great opportunity to improve the wellbeing and productivity of radiologists and trainees by addressing workstation ergonomics

TABLE OF CONTENTS/OUTLINE

• Why workstation ergonomics are important in radiologyWe use workstations all day (and night)Many workstations are sharedWorkstations are often not fully adjustableMusculoskeletal (MSK) discomfort can affect productivityIncreased knowledge of ergonomics is associated with decreased likelihood of MSK discomfort • Optimal workstation ergonomicsShoulders and arms are relaxedMonitor is at arm's length with top of screen at eye levelWrists are relatively flatElbows at 90degreesFeet flat on floor/footstoolChair with lumbar support• Substantial workstation-related MSK discomfort in radiologistsImpact on productivity Requires symptom management Radiologists have limited ergonomic knowledge • Recommendations to Radiology DepartmentsProvide ergonomics training and ergonomics evaluationProvide adjustable equipment • Recommendations to Radiologists and TraineesAdvocate for inclusive workplaceMake adjustments before using shared workstation (when possible)

NPMEE-26 A Guide to Using YouTube Live for Radiology Education

Participants
Lilly Kauffman, BA, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- YouTube Live is the most popular streaming platform on social media- Livestreaming is a way to reach and interact with a large audience for radiology education- There are several advantages, including interactivity and analytics, that come with YouTube Live- However there are also disadvantages, such as limited streaming abilities within the YouTube platform

TABLE OF CONTENTS/OUTLINE

1. Understanding YouTube Live1a. YouTube Live Statistics2a. How to create a YouTube Live segment2. Our experience3. The pros of using YouTube Live4. The drawbacks of using YouTube Live

NPMEE-27 Next Level Cases: Strategies for Creating Dynamic and Interactive Radiology Presentations

Participants
Lucas Aronson, BS, Madison, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Traditional radiology presentations rely on a few images of cross-sectional studies rather than scrollable images. While this is more efficient for content delivery, this can decrease learner engagement and emphasizes the "classic" appearance of diseases. (2) There are several techniques and tools to boost interaction and integrate scrollable cross-sectional imaging in radiology presentations. These help facilitate a diagnostic simulation environment and provide a stronger bridge to making independent diagnoses. (3) Interactive and scrollable cases permit the teacher to more confidently teach complex pathologies that do not display well in a few-image presentation. (4) Interactive presentations create more flexibility in teaching methods, including flipped-model, group work, and learner-directed exploration of topics. (5) Interactive presentations can reach a broader variety of learners, as individuals can approach the material from their current skill set and are not confined by a few-image presentation of pathology.

TABLE OF CONTENTS/OUTLINE

(1) Limitations of traditional presentations (1a) Use of single images from cross-sectional studies (1b) Reduced interactivity (1c) Selection biased toward "Aunt Minnie" images (1d) Barriers for teaching complex topics (2) How to make presentations more engaging and dynamic (2a) Include scrollable cross-sectional imaging (2b) Utilize links for multiple choice questions (2c) Implement polling software for group engagement (2d) Toggle annotations with links (2e) Zoom into regions of interest with hover-links

NPMEE-3 Immersive Imaging: Structure and Outcomes from a Novel One-year Medical Student Fellowship in Radiology

Participants
Sohum D. Patel, BA, White River Junction, VT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Identify challenges to medical student recruitment/engagement with radiology given the conventional clerkship framework.2. Describe our institution's novel medical student fellowship in radiology.3. Analyze outcome metrics from past fellows, including specialty choice influence, perceived educational utility, and contribution to professional development.4. Summarize resident and faculty perceptions of adding a medical student fellow and its effect on clinical workflow.5. Explore potential future directions of immersive radiology experiences.

TABLE OF CONTENTS/OUTLINE

Introduction- Limitations of current student engagement strategies in radiology- Current state of affairs for radiology recruitmentThe Robert Jeffery Medical Student Fellowship in Radiology1. Fellowship overview - History, philosophy, and structure - Responsibilities and opportunities2. Outcomes: Perspectives from Prior Fellows - Preparedness for rotations, internship, and residency - Perceived importance for residency application - Mentorship, advising, and professional development3. Outcomes: Perspectives from Radiology Residents Faculty - Perceived contribution to workflow and department4. Challenges5. The Road Ahead - Plans for future fellowships - Considerations for implementation at other institutionsConclusion: Student fellowships in radiology provide an incredible opportunity to both students and the department to recruit and train future radiologists.

NPMEE-4 Global Learning Centers: Sustainable and Impactful Radiology Outreach

Participants
Sucari Vlok, MBChB, MMEd, Tygerberg, South Africa (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Evolution in radiology education and outreach • Power of conceptual thinking • Beauty of collaboration and ability to listen

TABLE OF CONTENTS/OUTLINE

• Introduction o Previously the RSNA relied on the International Visiting Program (IVP) for international outreach. o In 2018, the RSNA board re-envisioned the IVP, and the Global Learning Centers (GLC) were birthed. • Planning phase o Stellenbosch University/Tygerberg Hospital was chosen as the inaugural GLC program. A curriculum was derived from perceived greatest areas of need. • Implementation phase o The COVID pandemic struck as the first RSNA team was preparing an on-site visit. It forced the program to pivot to an online curriculum, utilizing the RSNA's considerable back catalog of lecture material from annual meetings. • Online continuing education phase o RSNA Department of Education staff curated online content into course modules. An online classroom and ultrasound facilities for distance-based teaching were installed. • Exit phase o The GLC will be implemented over a three-year period, but relationships and collaboration will hopefully endure long after and ascertain sustainability of the program. • Conclusion o The COVID pandemic forced us all to conceptualize new ways of thinking, planning and learning. o The board of RSNA Radiologists' rich history of visionary thinking transformed and led Radiology from its inception to where we are today.

NPMEE-5 Nothing Humerus About it: Recognizing, Preventing and Treating Radiologist Elbow

Participants
Kathleen MacMillan, PharmD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Lateral epicondylitis is an overuse injury related to wrist extension and is commonly known as tennis elbow.2. Due to wrist positioning during computer-mouse related work, radiologists are at risk of occupational lateral epicondylitis, "radiologist elbow".3. Lateral epicondylitis can usually be diagnosed clinically, but ultrasound or MRI may be helpful to confirm the diagnosis and to determine the severity of tendinopathy or tearing.4. Prevention of lateral epicondylitis centers on reduction of wrist extension. For radiologists this includes supports for the forearm, use of a vertical mouse, and use of voice recognition software where possible.5. Treatment of lateral epicondylitis can include rest, ice, therapeutic ultrasound interventions, physiotherapy, NSAIDs, corticosteroid injections, or surgery.

TABLE OF CONTENTS/OUTLINE

1. Detailed explanation of the anatomy and pathophysiology of lateral epicondylitis in computer-users focusing on specific occupational risks of radiologists.2. Review the symptoms of lateral epicondylitis, clinical diagnostic criteria, and typical diagnostic imaging findings.3. Using a structured literature review, summarize evidence-based recommendations to prevent radiologist elbow. Explain the ergonomic basis of the interventions.4. Provide recommendations to reduce and treat associated symptoms in radiologists.

NPMEE-6 Magnetic Resonance Nail Evaluation With The Use Of Conductive Gel: Technical and Clinical Aspects

Participants
Paula Lucio, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review clinical aspects of MRI nail evaluation. - To sumarize main challenges related to MRI nail evaluation, including patient positioning, image quality and technical fators that undermine the individualization of structures and possible alterations. - To discuss the importance of conductive gel using illustrative and comparative cases. - To discuss other technical factors that impact in imaging quality using illustrative and comparative cases, including the use of the coilLoop Small-Siemens®.

TABLE OF CONTENTS/OUTLINE

1. Clinical indications of nail evaluation of fingers and pododactyls by Magnetic Resonance a. Suspected retronychia b. Suspected ligament injury c. Suspected tumor d. Trauma e. Infectious/inflammatory processes 2. Use on the finger and glove to apply the conductive gel. 3. Positioning for fingers and pododactyls. 4. How the structures and conductive gel appear on T2 images with FAT and T1. 5. Use of the coil Loop Small-Siemens® and image quality. 6. Take home messages.

NPMEE-7 What Radiologists Need to Know About Gender-Inclusive Naming

Participants
Tyler Yan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Transgender individuals experience significant inequalities in radiology• Using gender-inclusive terminology is one of many ways to combat structural stigma• Barriers to gender-inclusive naming include the lack of provider education, departmental equity, diversity, and inclusion (EDI) committees, and public online presence of EDI efforts• Individual and systems level strategies exist to promote transgender inclusivity in radiology.

TABLE OF CONTENTS/OUTLINE

• Why transgender inclusivity is important in radiologyTransgender individuals face numerous inequalities in medicineInequalities faced in radiology departments specificallyDownstream detrimental effects, like suicide risk• Example of inclusive practice: fellowship namingImportance of gender-inclusive naming Current landscape of naming in Canada and the United StatesGender-inclusive naming among continuing medical education (CME) courses• Barriers to gender-inclusive namingCurrent landscape of departmental EDI committees, EDI CME courses• Recommendations to individualsImportance of patient names and pronouns; provider normalizing practice tooProvider self-educationRecognizing unconscious biases• Recommendations to radiology departmentsAdvocate for gender-inclusive naming of fellowships and CME coursesEstablish departmental committees, EDI trainingIncreasing public visibility of EDI efforts

NPMEE-8 Microaggressions With a Macro-Impact: What the Radiologist Needs to Know About Microaggressions

Participants
Sheikh Ahmed, BSc, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

By reviewing the definitions of microaggressions and their impact in radiology, the learner will be able to:1. Define and identify microaggressions and their subtypes 2. Recognize the impact of microaggressions in medicine and radiology 3. Recognize the link between microaggressions and challenges of developing diversity in radiology 4. Employ strategies to combat and address microaggressions

TABLE OF CONTENTS/OUTLINE

1. Introduction - Definitions of Microaggressions 2. Micro-insults - Definitions and Examples 3. Micro-invalidation- Definitions and Examples 4. Micro-assault- Definitions and Examples 5. Microaggressions as a negative determinant of diversity in medicine and radiology - literature examples 6. Gender-based microaggressions as a negative predictor of diversity in radiology and contributor to the "leaky pipe" concept 7. How to combat microaggressions - strategies and applications to training programs and departments

NPMEE-9 A Program Director's Guide to Recruiting for Excellence and Diversity

Participants
Mai A. Elezaby, MD, Madison, WI (*Presenter*) Investigator, Exact Sciences Corporation;Research Grant, Exact Sciences Corporation

TEACHING POINTS

The average percentage of female radiology residents remains at 26-27% despite improvement and equity in medical school applicants. Several reported factors accounting for fewer female applicants to Radiology include perceived lack of patient contact, lack of female role models, paucity of females in leadership positions and hostile work environment. A diverse healthcare team with parity in gender representation provides more opportunities for success and improved patient care. This presentation describes best practices for residency recruitment to achieve excellence and diversity using examples from a Midwestern Academic Radiology Residency program's experience with standardized virtual recruitment strategies.

TABLE OF CONTENTS/OUTLINE

I. Current Radiology Residency Recruitment Data in the U.S. II. Outline of a Standardized Recruitment Process to increase Diversity a. Building a diverse search committee b. Recruiting a pool of highly qualified, diverse candidates c. Strategies to mitigate unconscious bias d. Tenants of holistic review process e. Standardized behavioral questions III. How to leverage virtual interviews to increase Diversity IV. Future proposals for residency interviews and potential pitfalls

Abstract Archives of the RSNA, 2022

NPMEE-1

Up the Game for Radiology Education in Medical School: A New Approach Using Virtual Case-based Learning With Resident Mentorship

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Sagar Wagle, MD, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Free online curricula combined with guided mentorship by radiology residents can provide a structured educational experience for a week-long medical student radiology rotation, hosted virtually.- Two examples of online curricula, including LearnAbdominal.com and LearningNeuroradiology.com, offer interactive resources such as search-pattern videos and scrollable DICOM cases. - The radiology rotation consisted of initial resident-student meetings, either in person or online, to discuss search patterns and review introductory cases. This was followed by students completing a self-paced curriculum. The resident remained available if students had questions. - The educational experience has several benefits: the students learn basic radiology skills, establish relationships with radiology residents, and are exposed to radiology as a potential career. The residents reinforce teaching skills, and explore interest in academic radiology. - Online curricula with mentorship is a scalable model that can increase access to radiology education, especially in underserved training programs nationally or internationally.

TABLE OF CONTENTS/OUTLINE

Rotation outline and structure.Curriculum content examples.Role of the radiology resident mentor.Challenges of implementing an online rotation.Outcomes of the rotation.Medical student and resident feedback.Application of this model for underserved training environments.

Beyond the Reading Room: Creating an Engaging Radiology Screening Elective Emphasizing Public Health Principles and Healthcare Disparities

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Awards
Certificate of Merit

Participants
Alison Gegios, MD, Whitefish Bay, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Engaging medical students in a radiology screening elective highlighting basic principles of screening and contemporary screening guidelines provides exposure to radiology and the role of radiology in public health. 2. Students embrace novel methods of delivering educational content, such as "enduring learning objects" (i.e. online learning modules) and interactive case sets, in addition to more traditional lectures and reading room observation. 3. Students are motivated to synthesize learned material and create educational content through innovative assignments with an emphasis on public health education and analysis of healthcare disparities.

TABLE OF CONTENTS/OUTLINE

(1) How to develop a new course, including designing objectives and key course components: a. Review basics of screening and select most impactful exams to emphasize in the course (e.g., breast, lung, colorectal cancer screening) b. Implement progressive ways of delivering educational content through a flipped classroom model c. Construct novel assessment methods (e.g., infographic presentations) (2) Engagement in and beyond the reading room, including how to create interactive experiences, such as: a. Role-play sessions b. Curated case sets c. Patient experiences in radiology (i.e., image acquisition with technologists, delivering information to patients about next steps) (3) Future goals, including creating an interactive website (4) Analysis of course feedback

Challenges and Opportunities in Creating an Interactive Student Focused Radiology Curriculum for Medical Students

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Danielle Cadoret, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Medical school curricula for radiology are not standardized, although some guidelines do exist. As radiology has become more central to the day-to-day practice of clinical medicine, it is critical that this is reflected in how we teach our medical students. If we can produce medical school graduates who are competent and confident in their radiology knowledge base, it will be beneficial both in maintaining the quality of graduates choosing a career in radiology and facilitating communication between radiologists and non-radiologist clinicians going forward. It is the responsibility of the Radiologist to teach these students what we want them to know, but time is the most precious, limited resource and medical student teaching tends to be the lowest priority for many. However, methods of delivery of education have changed drastically, emphasizing independent active learning, online and in-person. This exhibit will highlight best practices when designing a new medical school radiology curriculum, including high yield core content, teaching modalities used, and interactive delivery strategies tailored to current educational standards. It will also highlight the challenges encountered in this process, and the solutions used to overcome them based on our experience creating a new curriculum at our institution. This exhibit aims to enable fellow radiologists to grow their educational roles expeditiously and in accordance with current best practices in medical education.

TABLE OF CONTENTS/OUTLINE

Current standards of medical school radiology curricula. Evolving learning styles. Key considerations in building a new curriculum. Delivery: Interactive, Student focused Online Models. Challenges solutions

NPMEE-12

Constructing Clinically Relevant, Indication Driven Reports: An Institutional Web-Based Platform for Musculoskeletal Radiography Reference Materials

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Awards
Certificate of Merit

Participants
Blake Bartholomew, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• An institutional web-based platform provides quick access to musculoskeletal radiography search patterns and reference materials to optimize report dictation.• Indication and location specific pathology guides with example reports may assist radiology trainees with technical vocabulary development.

TABLE OF CONTENTS/OUTLINE

1. Background: a. Novice residents report difficulty with identifying and describing relevant normal and pathologic findings for a given indication. b. A web-based platform has been created at our institution to serve as a comprehensive, easily accessible tool to help users develop indication specific search patterns and the technical vocabulary to create tailored, clinically relevant musculoskeletal radiograph reports. 2. Utility: a. Trainees develop indication specific search patterns. b. Quick access to high-yield example cases, diagrams, and measurement guides to assist with report dictation. 3. Structure: a. Homepage i. Hyperlinks to pages organized by anatomic location and specific pathology. b. Section content i. Review of indication specific search patterns (i.e. trauma, atraumatic pain, post-operative assessment) • Anatomic diagrams • Measurement guides ii. Overview of common pathologic findings and relevant descriptors iii. Case-based review with example reports iv. External links to high-yield resources 4. User data and feedback 5. Conclusion

NPMEE-13

Optimising Human Factors to Promote the Learning in Radiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Rachel Magennis, Manchester, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

• The handling of error or discrepancy within radiology departments can have a very negative impact on individuals and the wider team depending on relationships, environment and culture. • Individuals can feel targeted and unsupported in a process that should be 'safe' and blame free and for the benefit of all reporters. • We have a unique opportunity in radiology to review scan findings from a given time and consider alternate diagnoses, learn from missed opportunities or celebrate the 'good spots'. • This allows radiologists to engage in a learning process, outlined by the Royal College of Radiologists, called 'Radiology Events and Learning' or REAL in the UK.

TABLE OF CONTENTS/OUTLINE

A better understanding of human factors in the wider healthcare setting has started to impact positively on the culture in many trusts. Human factors and their impact on the well being of staff and on the safety of our patients has also influenced radiology error management in recent years.With the movement away from 'Mistakes meeting' and advent of 'Radiology Events and Learning', the terminology has softened and judgement gone. The focus now is all about the learning and this culture shift has enhanced engagement and participation. 'Good spots' as well as errors and discrepancies are shared anonymously, in a 'safe' environment.With human factors in mind, we have strived to create an environment of psychological safety with anonymous submission of cases and sharing without judgement, for the benefit of all reporters.We highlight how human factors interplay with the process of learning in radiology with reference to the college standards and our own practice.

A New (Digital) Era in Medical Journalism: Leveraging Social Media and Other Online Tools to Increase Reach and Engagement

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Awards
Identified for RadioGraphics

Participants
Katie S. Traylor, DO, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Social media and other digital tools offer many advantages and opportunities to medical journals with the vision and expertise to leverage them. 2. The purpose of this exhibit is to highlight these advantages from the standpoints of journal editors, authors, and readers, particularly emphasizing ways all stakeholders can benefit

TABLE OF CONTENTS/OUTLINE

A. Background/Introduction. 1. Available tools. a. Pros and cons of each. B. Editor Advantages. 1. Expand audience through global reach. a. Increase diversity. b. Bolster pipelines. c. Identify talented and interested individuals for future journal involvement. *RG Team. d. Tracking metrics. 2. Receive and incorporate reader feedback. 3. Define brand. 4. Altmetrics and article citations. C. Author Advantages. 1. Increased visibility of work. 2. Engage with readers in active discussions. 3. Receive reader feedback to inform future work. D. Reader Advantages. 1. Ease of access to content for 'on-the-go' consumption. 2. Engage editors and authors in active discussions. 3. Discover opportunities to get involved/volunteer. 4. Low cost (often free). E. How RadioGraphics Does It. 1. Social Media and Digital Innovation Team. a. Article summary tweets. b. Tweetorials. c. Tweet chats. d. Live audio journal discussions. e. #RGphx. 2. Visual abstracts. a. Digital Table of Contents. 3. Podcosts. 4. RadDiscord collaboration.

Climate Change and Radiology: What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Cameron Nosrat, San Francisco, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The health care contribution to overall greenhouse gas emissions in the U.S. was estimated at 10% in 2013, with radiology responsible for a substantial share of carbon footprint.2. Historically marginalized groups are most vulnerable to impacts of climate change.3. A strong interrelationship exists between radiology and climate change. Current radiology practices produce excessive waste and energy consumption while the changing climate makes it increasingly more difficult for underserved communities to receive the health care and imaging they need.4. Solutions addressing climate change and health equity should focus on promoting sustainable radiology practices through education and research.

TABLE OF CONTENTS/OUTLINE

1. Introduction a. Current climate outlook b. Urgency c. Health care contribution to climate change2. Impact of radiology on climate change a. Current research on environmental costs of radiology b. Energy cost of imaging modalities c. ACR appropriateness and sustainable alternatives including clinical cases d. Education, policy, and advocacy3. Impact of climate change on radiology a. Natural disasters b. Supply chain c. Endemic disease patterns d. Disproportionate burden on underserved communities4. Future directions for institutional initiatives

A Color Doppler Picture is Worth a Thousand Words

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Awards
Cum Laude

Participants
Sinan Bana, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

As radiologists' workload increases and the amount of time they have to interpret each study decreases, it can become easy to rely on sonographers' worksheets for most of the findings. Over time, sonographers are reviewing their studies to radiologists less and less, and with the increase in teleradiology across the world, many radiologists don't know the sonographers producing the studies or have a convenient way to contact them with questions about their images or findings. When radiologists choose where to spend their limited time interpreting a Doppler study, they often overlook the color Doppler image that accompanies the spectral Doppler waveform. If the radiologist knows the sonographer well and has proven to be strong, they can more easily overlook this portion of the image. However, if a radiologist doesn't know or trust the sonographers performing the studies they are interpreting, this crucial part of study interpretation cannot be ignored. This exhibit will show many examples of how the color Doppler portion of an image accompanied by a spectral Doppler waveform will tell a very different story than the spectral waveform and bring enhanced awareness of how critically important it is not to overlook these color images and rely solely on the spectral waveform or the sonographers' worksheets.

TABLE OF CONTENTS/OUTLINE

1. Review proper technical settings for the gray-scale, color Doppler and spectral Doppler waveform images. 2. Show examples of how the color Doppler images tell a different story than the spectral waveform or the sonographers' worksheet. 3. Provide advice on how to handle issues of inconsistency for high quality patient care.

Pre-med Shadowing: Establishing a Week Long Introductory Experience for College Students Interested in Radiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Matthew Miller, MD, Sewickley, PA (*Presenter*) Editor, Aquifer Inc

TEACHING POINTS

1. Student interest in a career in radiology will be piqued if opportunities to observe are readily available2. Establish an organized week long radiology shadowing experience for premedical college students.3. Create a comprehensive self-learning curriculum for the shadowers.4. Facilitate a mentorship pipeline though which premedical students and radiologists can collaborate.

TABLE OF CONTENTS/OUTLINE

1. Pre-medical student timelinea. MCAT and application timing2. Purposes for establishing a week long organized shadowing experiencea. Child labor limitationsb. Lack of radiology exposurec. Post-COVID3. Goals for the weeka. Observe the breadth of radiology subspecialties and partake in reading room learning similar to medical student rotatorsi. Breastii. Abdominaliii. Musculoskeletaliv. Chestv. Neurob. Observe specialty "field trips" outside of the reading roomi. X-Ray, Mammogram, CT, MRI, Fluoroc. Partake in organized self-learning curriculumi. Recorded lecturesii. Selected readingsd. Establish a mentorship pipeline with a few radiologists

The Price Is Right...Sometimes: CMS Price Transparency Requirements, Intra-Institutional Inconsistencies in Published Charges, and Imaging Charge Variability

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Matthew Petterson, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduce the Centers for Medicare and Medicaid Services hospital price transparency requirements, including the charges which must be made publicly available via chargemasters and consumer-friendly displays.2. Discuss widespread intra-institutional inconsistency between charges for the same examinations published in chargemasters versus consumer-friendly displays. 3. Highlight the marked heterogeneity in total charges for common imaging examinations across prominent U.S. academic medical centers.

TABLE OF CONTENTS/OUTLINE

1. Centers for Medicare and Medicaid Services Price Transparency Rule a. Goals b. Affected institutions c. Required data publication formats i. Chargemasters 1. Required data ii. Consumer-friendly display of shoppable services 1. Required data 2. Mandatory imaging examinations 3. Common consumer-friendly displays d. Penalties2. Intra-institutional inconsistencies between total charges published in chargemasters and consumer-friendly displays a. Rates and magnitudes b. Other commonly incomplete charge data c. Sources d. Implications for institutions e. Implications for patients3. Variability in total charges for C.M.S. mandated imaging examinations a. CT i. CPT 70450, 72193, 74177 b. MRI i. CPT 70553, 72148, 73721 c. US i. CPT 76700, 76805, 76830 d. Radiography i. CPT 72110 e. Mammography i. CPT 77065, 77066, 77067

How To Develop The Best Radiology Clerkship?: A Guide for Educators

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Francisco Garrido Cisterna, MD, Santiago, Chile (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Increasing workload and continued specialization of radiology practice are challenge for medical educators planning in-person activities in the reading room of medical students during their elective radiology clerkships. 2. Radiology clerkships require a structure that will enable the proposed educational goals to be met: known learning objectives, available and user friendly consult materials, feedback sessions and assessment. 3. In the reading room, various educational strategies can be applied such as: patient history review from the EMR, involvement in clinical-radiological discussions, creation of a portfolio of interesting cases, selection of topics based on cases encountered for further presentation in the journal club, among others. 4. Radiology residents may spend more time with medical students that with supervisions fellows or staff radiologists, playing a central role in the overall quality of medical student experience in the reading room. Therefore, they must learn and apply a few teaching techniques specifically for this environment.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. What is the current status in the world? 3. The educational challenge in the reading room 4. What elements do you need to build a clerkship? 5. Teaching and learning methods in the reading room and at home 6. The impact of the residents in the radiology clerkship (resident as teachers) 7. Assessment 8. Conclusions

MRI Safety of Commonly Used Implants and Devices: What the Radiologist Needs to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Awards
Certificate of Merit

Participants
Vivek Pai, MBBS,MD, Toronto, Singapore (*Presenter*) Nothing to Disclose

TEACHING POINTS

Requests for MRIs in patients with medical and/or surgical devices are frequently encountered in practice. The aims of this exhibit are: 1. To review the concepts of static magnetic fields, gradient fields, and RF pulse with regard to MRI safety 2. To review the concept of Specific Absorption Rate (SAR) and B1+rms 3. To review standard MRI safety terminology 4. To review general guidelines with respect to MRI safety in patients with implants and devices 5. To review the specific MRI safety concerns of the most commonly used devices and implants.

TABLE OF CONTENTS/OUTLINE

1. Basic concepts and definitions in MRI safety 2. Review of MRI safety for: a. Deep Brain Stimulators b. Epidural and Peripheral Nerve Catheters c. Spinal Cord Stimulators d. Peripheral Nerve Stimulators e. Cochlear Implants f. Scleral Buckles g. Pacemakers and Defibrillators h. Vascular Stents i. Endoscopic Hemostatic Clips and Video Capsule Endoscopic Recording Devices j. Intrauterine and Fallopian Tube Closure Devices k. Bullets, Shrapnel, and Foreign Metallic Objects.

Fostering Organizational Excellence Through Inclusive Leadership: A Practical Guide for Radiology Leaders

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Awards
Identified for RadioGraphics

Participants
Anand Narayan, MD, PhD, Verona, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Increasing the diversity of Radiology departments can drive performance by leveraging the collective experiences of different backgrounds, age groups, and genders.• The potential of diverse teams can only be actualized when team members feel valued, respected, included, confident, and inspired.• Inclusive work cultures promote innovation, productivity, higher quality decision making, and profitability.• Inclusive leadership training can provide radiology leaders with tools to foster healthy, diverse and inclusive environments and teams.

TABLE OF CONTENTS/OUTLINE

1. Rationale for Inclusive Leadershipa. Backgroundb. Impact of Inclusion on Team Performance2. Inclusive Leadershipa. Inclusive versus Exclusive Leadership Stylesi. Transformative Leadershipii. Transactional Leadershipiii. Authoritarian Leadershipiv. Laissez Faire Leadershipv. Democratic Leadershipvi. Servant Leadershipb. Characteristics of Highly Inclusive Leadersi. Cognizanceii. Curiosityiii. Courageiv. Cultural Intelligencev. Commitmentvi. Collaborationc. Unconscious biasesi. Definitionii. Impact on Decision-Making in the Workplaceiii. Strategies for Reducing Unconscious Biases3. Strategies for Radiology Leadersa. Increase Diversityb. Nurture Authentic, Brave Dialoguec. Inclusive Meetingsd. Transparent Processes for Assignments and Promotionse. Foster Community BuildingPlease visit the Learning Center to also view this presentation in hardcopy format.

NPMEE-22

Mapping Our Journey Towards Gender-Affirming Imaging Care

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Kristen L. Dean, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

It is critical for radiology practices to know how to provide a welcoming care environment for gender diverse patients such as transgender patients. We employed a structured patient experience mapping process to identify potential barriers associated with each aspect of the imaging exam. The purpose of this exhibit is: 1. To learn how to provide a safe, affirming, and inclusive environment for transgender patients and their families by understanding the patient journey from their perspective. 2. To describe our 'Gender Diverse Patient Experience' initiative to improve the care journey and support staff in gaining cultural competency.

TABLE OF CONTENTS/OUTLINE

1. Mapping the Journey • Potential Scenarios o Transgender male having a transvaginal US o Transgender female having a RUG/VCUG o Transgender male having a mammogram • Step-by-Step • Actions, Motivations, Questions, Barriers • Staff concerns 2. Framework to Map • Patient Journey template • Documentation 3. Key Findings • Causes of Patient Distress • Information Gap • Semblance of Control 4. Informing Improvements • Patient Workflow Across Journey o Patient preparation information o Welcoming greeting: Chosen name, pronouns o History, intake and control forms (sexual orientation, gender identity, sex assigned at birth) o Patient preferences during exam (changing, conversation, students) o Radiology reports use of pronouns • Physical Environment o Affirming inclusive silent indicators (Healthcare Equality Index, Non- Discrimination policy) o Changing rooms, waiting rooms restrooms o Reflect across online environment touchpoints • Awareness, Education Training o Experiential, safe to make mistakes, multi-pronged o Culturally competent workforce

International Medical Graduates: A Primer for Program Directors

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Jose Armando Rodriguez Hernandez, MD, Tegucigalpa, Honduras (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Define International Medical Graduates (IMG)2. Understand composition and historic trends of IMGs in the U.S. medical and radiology workforce3. Discuss the steps IMGs need to take to be eligible to apply to residency positions in the U.S.4. Recognize common misconceptions IMGs face in the interview trail5. Recognize attributes IMGs bring to the U.S. healthcare system

TABLE OF CONTENTS/OUTLINE

1. Define International Medical Graduateso US-citizens IMGo Non-US citizens IMG2. IMG composition and trends in the U.S. medical and radiology workforce3. Steps IMG need to take to apply to a residency position in the U.S.o Medical school requirements (established by the Educational Commission for Foreign Medical Graduates, or ECFMG)o Application for ECFMG certificationo Examination requirementso Medical education credential requirements4. Common misconceptions IMG face in the interview trailo Medical schools unknown to selection committeeso “Gap” years from graduation for non-US IMGs, commonly spent on:Mandatory service at their home countryClinical and research rotations in the U.S.Preparing for USMLE examsApplying for ECGME certificationo English language proficiencyo Understanding of the U.S. medical systemo Difficulty acquiring visas5. Attributes IMG bring to the U.S. healthcare systemo Diverse medical and cultural backgroundso Contribute to peers’ cultural competencyo Fluency in multiple languageso Experience working unsupervised as primary care providers

Avenues Of Advocacy For Healthcare Disparities In Breast Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Connie Ge, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Understand how healthcare disparities (HCD) affect morbidity and mortality in breast cancer- Identify 3 domains of HCD advocacy in breast imaging (Patient centeredness, Imaging processes, Healthcare systems)- Examine the literature on efforts to address each of these domains- Apply this knowledge to problem solving in real-life patient vignettes.

TABLE OF CONTENTS/OUTLINE

- Background and objectives- Overview of literature examining HCD in context of breast imaging- Overview of 3 domains of HCD advocacy in breast imaging1. Patient centeredness--Patient education--Patient-centered reporting and guidelines--Cultural competency training and diversification of workforce--Language accessibility2. Imaging processes--R-Scan--ACR Select--Tools to examine data through lens of health equity3. Healthcare systems--Structural barriers to accessing care--Targeted outreach efforts for specific vulnerable populations--Collaboration with local organizations- Patient vignettes with guided brainstorming- Conclusions

What Radiologists Need to Know About Workplace Ergonomics

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Tyler Yan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Substantial workstation-related MSK discomfort is experienced by Canadian radiologists• Adjustable furniture is not often available or used• Provision of adjustable equipment is an important component in the creation of accessible and inclusive radiology departments• There is great opportunity to improve the wellbeing and productivity of radiologists and trainees by addressing workstation ergonomics

TABLE OF CONTENTS/OUTLINE

• Why workstation ergonomics are important in radiologyWe use workstations all day (and night)Many workstations are sharedWorkstations are often not fully adjustableMusculoskeletal (MSK) discomfort can affect productivityIncreased knowledge of ergonomics is associated with decreased likelihood of MSK discomfort • Optimal workstation ergonomicsShoulders and arms are relaxedMonitor is at arm's length with top of screen at eye levelWrists are relatively flatElbows at 90degreesFeet flat on floor/footstoolChair with lumbar support• Substantial workstation-related MSK discomfort in radiologistsImpact on productivity Requires symptom management Radiologists have limited ergonomic knowledge • Recommendations to Radiology DepartmentsProvide ergonomics training and ergonomics evaluationProvide adjustable equipment • Recommendations to Radiologists and TraineesAdvocate for inclusive workplaceMake adjustments before using shared workstation (when possible)

A Guide to Using YouTube Live for Radiology Education

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Lilly Kauffman, BA, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- YouTube Live is the most popular streaming platform on social media- Livestreaming is a way to reach and interact with a large audience for radiology education- There are several advantages, including interactivity and analytics, that come with YouTube Live- However there are also disadvantages, such as limited streaming abilities within the YouTube platform

TABLE OF CONTENTS/OUTLINE

1. Understanding YouTube Live1a. YouTube Live Statistics2a. How to create a YouTube Live segment2. Our experience3. The pros of using YouTube Live4. The drawbacks of using YouTube Live

Next Level Cases: Strategies for Creating Dynamic and Interactive Radiology Presentations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Lucas Aronson, BS, Madison, WI (*Presenter*) Nothing to Disclose

TEACHING POINTS

(1) Traditional radiology presentations rely on a few images of cross-sectional studies rather than scrollable images. While this is more efficient for content delivery, this can decrease learner engagement and emphasizes the "classic" appearance of diseases. (2) There are several techniques and tools to boost interaction and integrate scrollable cross-sectional imaging in radiology presentations. These help facilitate a diagnostic simulation environment and provide a stronger bridge to making independent diagnoses. (3) Interactive and scrollable cases permit the teacher to more confidently teach complex pathologies that do not display well in a few-image presentation. (4) Interactive presentations create more flexibility in teaching methods, including flipped-model, group work, and learner-directed exploration of topics. (5) Interactive presentations can reach a broader variety of learners, as individuals can approach the material from their current skill set and are not confined by a few-image presentation of pathology.

TABLE OF CONTENTS/OUTLINE

(1) Limitations of traditional presentations (1a) Use of single images from cross-sectional studies (1b) Reduced interactivity (1c) Selection biased toward "Aunt Minnie" images (1d) Barriers for teaching complex topics (2) How to make presentations more engaging and dynamic (2a) Include scrollable cross-sectional imaging (2b) Utilize links for multiple choice questions (2c) Implement polling software for group engagement (2d) Toggle annotations with links (2e) Zoom into regions of interest with hover-links

Immersive Imaging: Structure and Outcomes from a Novel One-year Medical Student Fellowship in Radiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Sohum D. Patel, BA, White River Junction, VT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Identify challenges to medical student recruitment/engagement with radiology given the conventional clerkship framework.2. Describe our institution’s novel medical student fellowship in radiology.3. Analyze outcome metrics from past fellows, including specialty choice influence, perceived educational utility, and contribution to professional development.4. Summarize resident and faculty perceptions of adding a medical student fellow and its effect on clinical workflow.5. Explore potential future directions of immersive radiology experiences.

TABLE OF CONTENTS/OUTLINE

Introduction- Limitations of current student engagement strategies in radiology- Current state of affairs for radiology recruitmentThe Robert Jeffery Medical Student Fellowship in Radiology1. Fellowship overview - History, philosophy, and structure - Responsibilities and opportunities2. Outcomes: Perspectives from Prior Fellows - Preparedness for rotations, internship, and residency - Perceived importance for residency application - Mentorship, advising, and professional development3. Outcomes: Perspectives from Radiology Residents Faculty - Perceived contribution to workflow and department4. Challenges5. The Road Ahead - Plans for future fellowships - Considerations for implementation at other institutionsConclusion: Student fellowships in radiology provide an incredible opportunity to both students and the department to recruit and train future radiologists.

Global Learning Centers: Sustainable and Impactful Radiology Outreach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Sucari Vlok, MBChB, MMEd, Tygerberg, South Africa (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Evolution in radiology education and outreach • Power of conceptual thinking • Beauty of collaboration and ability to listen

TABLE OF CONTENTS/OUTLINE

• Introduction o Previously the RSNA relied on the International Visiting Program (IVP) for international outreach. o In 2018, the RSNA board re-envisioned the IVP, and the Global Learning Centers (GLC) were birthed. • Planning phase o Stellenbosch University/Tygerberg Hospital was chosen as the inaugural GLC program. A curriculum was derived from perceived greatest areas of need. • Implementation phase o The COVID pandemic struck as the first RSNA team was preparing an on-site visit. It forced the program to pivot to an online curriculum, utilizing the RSNA's considerable back catalog of lecture material from annual meetings. • Online continuing education phase o RSNA Department of Education staff curated online content into course modules. An online classroom and ultrasound facilities for distance-based teaching were installed. • Exit phase o The GLC will be implemented over a three-year period, but relationships and collaboration will hopefully endure long after and ascertain sustainability of the program. • Conclusion o The COVID pandemic forced us all to conceptualize new ways of thinking, planning and learning. o The board of RSNA Radiologists' rich history of visionary thinking transformed and led Radiology from its inception to where we are today.

Nothing Humerus About it: Recognizing, Preventing and Treating Radiologist Elbow

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Kathleen MacMillan, PharmD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Lateral epicondylitis is an overuse injury related to wrist extension and is commonly known as tennis elbow.2. Due to wrist positioning during computer-mouse related work, radiologists are at risk of occupational lateral epicondylitis, "radiologist elbow".3. Lateral epicondylitis can usually be diagnosed clinically, but ultrasound or MRI may be helpful to confirm the diagnosis and to determine the severity of tendinopathy or tearing.4. Prevention of lateral epicondylitis centers on reduction of wrist extension. For radiologists this includes supports for the forearm, use of a vertical mouse, and use of voice recognition software where possible.5. Treatment of lateral epicondylitis can include rest, ice, therapeutic ultrasound interventions, physiotherapy, NSAIDs, corticosteroid injections, or surgery.

TABLE OF CONTENTS/OUTLINE

1. Detailed explanation of the anatomy and pathophysiology of lateral epicondylitis in computer-users focusing on specific occupational risks of radiologists.2. Review the symptoms of lateral epicondylitis, clinical diagnostic criteria, and typical diagnostic imaging findings.3. Using a structured literature review, summarize evidence-based recommendations to prevent radiologist elbow. Explain the ergonomic basis of the interventions.4. Provide recommendations to reduce and treat associated symptoms in radiologists.

Magnetic Resonance Nail Evaluation With The Use Of Conductive Gel: Technical and Clinical Aspects

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Paula Lucio, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review clinical aspects of MRI nail evaluation. - To sumarize main challenges related to MRI nail evaluation, including patient positioning, image quality and technical fators that undermine the individualization of structures and possible alterations. - To discuss the importance of conductive gel using illustrative and comparative cases. - To discuss other technical factors that impact in imaging quality using illustrative and comparative cases, including the use of the coilLoop Small-Siemens®.

TABLE OF CONTENTS/OUTLINE

1. Clinical indications of nail evaluation of fingers and pododactyls by Magnetic Resonance a. Suspected retronychia b. Suspected ligament injury c. Suspected tumor d. Trauma e. Infectious/inflammatory processes 2. Use on the finger and glove to apply the conductive gel. 3. Positioning for fingers and pododactyls. 4. How the structures and conductive gel appear on T2 images with FAT and T1. 5. Use of the coil Loop Small-Siemens® and image quality. 6. Take home messages.

What Radiologists Need to Know About Gender-Inclusive Naming

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Tyler Yan, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Transgender individuals experience significant inequalities in radiology• Using gender-inclusive terminology is one of many ways to combat structural stigma• Barriers to gender-inclusive naming include the lack of provider education, departmental equity, diversity, and inclusion (EDI) committees, and public online presence of EDI efforts• Individual and systems level strategies exist to promote transgender inclusivity in radiology.

TABLE OF CONTENTS/OUTLINE

• Why transgender inclusivity is important in radiologyTransgender individuals face numerous inequalities in medicineInequalities faced in radiology departments specificallyDownstream detrimental effects, like suicide risk• Example of inclusive practice: fellowship namingImportance of gender-inclusive naming Current landscape of naming in Canada and the United StatesGender-inclusive naming among continuing medical education (CME) courses• Barriers to gender-inclusive namingCurrent landscape of departmental EDI committees, EDI CME courses• Recommendations to individualsImportance of patient names and pronouns; provider normalizing practice tooProvider self-educationRecognizing unconscious biases• Recommendations to radiology departmentsAdvocate for gender-inclusive naming of fellowships and CME coursesEstablish departmental committees, EDI trainingIncreasing public visibility of EDI efforts

Microaggressions With a Macro-Impact: What the Radiologist Needs to Know About Microaggressions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Sheikh Ahmed, BSc, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

By reviewing the definitions of microaggressions and their impact in radiology, the learner will be able to:1. Define and identify microaggressions and their subtypes 2. Recognize the impact of microaggressions in medicine and radiology 3. Recognize the link between microaggressions and challenges of developing diversity in radiology 4. Employ strategies to combat and address microaggressions

TABLE OF CONTENTS/OUTLINE

1. Introduction - Definitions of Microaggressions 2. Micro-insults - Definitions and Examples 3. Micro-invalidation- Definitions and Examples 4. Micro-assault- Definitions and Examples 5. Microaggressions as a negative determinant of diversity in medicine and radiology - literature examples 6. Gender-based microaggressions as a negative predictor of diversity in radiology and contributor to the "leaky pipe" concept 7. How to combat microaggressions - strategies and applications to training programs and departments

A Program Director's Guide to Recruiting for Excellence and Diversity

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NPM

Participants
Mai A. Elezaby, MD, Madison, WI (*Presenter*) Investigator, Exact Sciences Corporation;Research Grant, Exact Sciences Corporation

TEACHING POINTS

The average percentage of female radiology residents remains at 26-27% despite improvement and equity in medical school applicants. Several reported factors accounting for fewer female applicants to Radiology include perceived lack of patient contact, lack of female role models, paucity of females in leadership positions and hostile work environment. A diverse healthcare team with parity in gender representation provides more opportunities for success and improved patient care. This presentation describes best practices for residency recruitment to achieve excellence and diversity using examples from a Midwestern Academic Radiology Residency program's experience with standardized virtual recruitment strategies.

TABLE OF CONTENTS/OUTLINE

I. Current Radiology Residency Recruitment Data in the U.S. II. Outline of a Standardized Recruitment Process to increase Diversity a. Building a diverse search committee b. Recruiting a pool of highly qualified, diverse candidates c. Strategies to mitigate unconscious bias d. Tenants of holistic review process e. Standardized behavioral questions III. How to leverage virtual interviews to increase Diversity IV. Future proposals for residency interviews and potential pitfalls

Neuroradiology Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Sub-Events

NREE-1 Cranial Nerves Cavernoma: A Rare Presentation of an Usual Lesion

Awards
Cum Laude

Participants
Danielly Santos SR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Through this pictorial essay a review will be made based on cases and original drawings about atypical location of Cavernous Malformations (MC's). The purposes of this exhibit are:- To review the normal anatomy of cranial nerves using schematic illustrations and imaging MRI.- To discuss imaging features of cavernous malformations (CM's) and their classification.- To display a compendium of cases of CM's involving the origin and path of cranial nerves.- To show the examination protocols and the best MRI sequence for assessing these cases.

TABLE OF CONTENTS/OUTLINE

Cavernous angiomas or malformations are angiographically occult vascular malformations found in approximately 0.4%-0.9% of the population, and they account for 10-20% of all cerebrovascular malformations. Their location is variable, with 70-80% having a supratentorial origin, followed by infratentorial location (15%) within the spinal cord (5%). Isolated cranial nerves CMs are extremely rare, and there are very few reports. Although rare, it poses a significant threat to nerve functions. Due to the limited number of cases and scarce evidence, no definite recommendation is available on the indications of surgery and treatment. However, it seems essential to treat patients with progressive neurological deficits.MRI imaging is crucial for the evaluation of CMs. It can be safely stated that the CISS/FIESTA sequence should be considered as a tool for evaluating the CM origin and nerve continuity and planning a surgical approach.

NREE-10 Ocular Trauma: There is More Than Meets the Eye

Participants
Atefeh Zeinoddini, MD, St. Clair Shores, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the relevant ocular anatomy.Identify the common post traumatic ocular injuries.Discuss potential pitfalls and complications of traumatic ocular injuries.List imaging findings that require immediate (surgical) intervention.

TABLE OF CONTENTS/OUTLINE

Relevant ocular anatomy.Ocular Trauma Score Points.Types of Detachments.Types of globe rupture, ocular foreign body (FB) and their potential pitfalls.Complications of ocular trauma.

NREE-100 Bilateral Thalamic Lesions Report: Imaging Statistics and Facts

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the spectrum of bilateral thalamic lesions on MRI. To demonstrate that the MRI assessment of bilateral thalamic lesions can be simplified through a practical approach, listing the most valuable key imaging points. To identify potential imaging pitfalls, make possible the implementation of precise therapeutic measures, and avoid potentially harmful biopsies.

TABLE OF CONTENTS/OUTLINE

1. Anatomy of the thalamic region. 2. Main neoplasms presenting with bilateral involvement of the thalamus, including astrocytomas and lymphomas.3. Inflammatory, infectious, and demyelinating lesions that can manifest with bilateral thalamic involvement, including West Nile and Mycoplasma encephalitis. 4. Vascular causes: deep venous thrombosis, arterial infarction, and hypoxic-ischemic encephalopathy. 5. Toxic and metabolic causes, including Wernicke's encephalopathy, Fahr disease, and Leigh disease. 6. Clues for a practical imaging assessment and the avoidance of pitfalls.

NREE-101 Case Based Review of Meningeal Disorders

Participants
Etsushi Iida, MD, Ube, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review normal anatomy of the meninges and imaging techniques for evaluation of meningeal pathologies To be familiar with imaging diagnosis of meningeal diseases with case based review

TABLE OF CONTENTS/OUTLINE

1. Anatomy of meninges and extra-axial spaces 2. Imaging techniques for detection of meningeal abnormality 3. Representative abnormal imaging findings on various sequences including FLAIR, DWI, SWI, ASL-PWI, and contrast enhanced FLAIR and T1WI 4. List of Case based review l Case1 tubercular meningitis l Case2 sarcoidosis l Case3 intracranial hypotension l Case4 dural AVF l Case5 Sturge Weber syndrome l Case6 MOG related disease

NREE-102 Shedding light on the Substantia Nigra: Anatomy, Function, Imaging Technique and Pathophysiology.

Participants
Guillaume Curaudeau, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Anatomic features of the substantia nigra beget predictable imaging presentations of common and uncommon pathologies.Multi-modality and multi-sequence approach, including conventional T1 and T2-weighted images, DWI, SWI, and perfusion imaging are necessary to segregate different etiologies that affect the substantia nigra. The spectrum in imaging is reinforced via case based learning.Whereas DAT-SPECT scans have traditionally been used to evaluate Parkinsonian pathologies, improved high-resolution volumetric and susceptibility-weighted imaging are being leveraged for both Parkinsonian and non-Parkinsonian evaluation of etiologies affecting the substantia nigra. Understanding the difference between Wallerian and transneuronal degeneration Cellular idiosyncrasies of the nigrostriatial pathways including dense aquaporin-4 and elevated GABA receptor concentrations, as well as increased axonal aborization, contribute to higher metabolic burden and therefore lower threshold for development of oxidative stress.Genetic predispositions, some of which are newly characterized, foster accelerated pathways for nigrostriatal injury, and increased bionergetic burden.

TABLE OF CONTENTS/OUTLINE

Anatomy and Cellular underpinningsFunctionImaging techniquesCasesSummary and implications for clinical practice

NREE-103 Immunodeficiency-associated Primary CNS Lymphoma in Non-AIDS Patients - Clinico-Radiological Update

Participants
Francis Astrid Garay Buitron, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Presurgical suspicion of CNS lymphoma is crucial for initial patient management: corticoids avoidance prior to biopsy.-Imaging features of CNS lymphoma are T2 hypointensity, homogeneous enhancement, and restricted diffusion, without hemorrhage. These features refer to diffuse large B-cell lymphoma of the CNS (Epstein-Barr virus-negative, immunocompetent hosts).-Immunodeficiency-associated CNS lymphoma (diffuse large B-cell, Epstein-Barr virus-positive) does not fulfill these imaging criteria and it appears ring-enhancing with necrosis and hemorrhage; mimicking glioblastoma or metastasis.-It has been mainly associated with AIDS, which incidence is decreasing; while other causes of immunocompromise are increasing.-MRI interpretations usually misdiagnose this entity as glioblastoma or metastasis, and it is not uncommon that patients undergo avoidable surgical resection.-We noted a TSE-T2 hypointensity of the central non-enhancing component in these tumors, which may provide an easily-recognizable clue. Also, DSC-PWI (low CBV and high percentage of signal recovery) could be very useful.-In this presentation, clinical and radiological features of patients with non-AIDS DLBC EBV-positive CNS lymphoma are described with emphasis on 'imaging pearls'.-Radiologists must be aware of any cause of immunocompromise when facing a ring-enhancing tumor and know the imaging pearls for immunodeficiency-associated CNS lymphoma.

TABLE OF CONTENTS/OUTLINE

-CNS lymphomas WHO classification-Epidemiology-Clinico-radiological features of immunodeficiency-associated CNS lymphoma: clinical experience literature review-Differential diagnosis-Key-imaging features-Conclusions

NREE-104 Do Not Touch Lesions in Neuroradiology

Awards
Certificate of Merit

Participants
Joshua Litchman, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Define the concept of a Do Not Touch lesion in radiologyIdentify and describe representative Do Not Touch lesions in the brain, head and neck, and spineCompare and contrast these Do Not Touch lesions with their radiologic mimics on the basis of their respective clinical and imaging features

TABLE OF CONTENTS/OUTLINE

NREE-105 Imaging Features of CNS Neuroblastoma with FOXR2 Activation

Participants
Lohith Kini, MD, PhD, (*Presenter*) Consultant, Blackfynn Inc

TEACHING POINTS

Primitive neuroectodermal tumors of the central nervous system (CNS-PNETs) are a heterogeneous group of highly aggressive, poorly differentiated embryonal tumors occurring predominantly in young children. With the discovery and advances in molecular and genetic diagnostics led to a reclassification of CNS embryonal tumors in the most recent 2021 WHO Classification of CNS Tumors. The varied molecular and genetic alterations, as well as distinct histopathological and imaging features, described in this new taxonomy could inform future targeted clinical decision-making and reduce diagnostic challenge due to a lack of defining molecular markers. Using gene methylation profiling, CNS neuroblastoma with FOXR2 activation (CNS NB-FOXR2) has been identified as a distinct subtype. This educational exhibit will discuss the key radiographic and molecular features of CNS NB-FOXR2, as well as similar entities on the radiologic differential diagnoses.

TABLE OF CONTENTS/OUTLINE

I. Overview of CNS neuroblastoma with FOXR2 activation (CNS NB-FOXR2). II. Characteristic imaging features and molecular classification of CNS NB-FOXR2. III. Radiologic differences between CNS NB-FOXR2 and other embryonic tumorsa. Medulloblastomab. CNS tumor with BCOR internal tandem duplication IV. Summary and Quiza. Summary of key radiologic findings of CNS NB-FOXR2.b. Quiz: apply this new knowledge to a few example cases to improve diagnostic precision.

NREE-106 Circumscribed Astrocytic Gliomas: Key Findings You Need to Know

Participants
Seulkee Kim, MD, PhD, Gwangju, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the major changes of the fifth edition of the WHO Classification of Tumors of the CNS (WHO CNS5)2. To review the key radiologic and clinical findings of circumscribed astrocytic gliomas.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. The major changes in the WHO CNS5 of circumscribed astrocytic gliomas3. Diagnostic key radiologic and clinical findings: case-based review1) Pilocytic astrocytoma2) Pleomorphic xanthoastrocytoma3) Subependymal giant cell astrocytoma4) Chordoid glioma5) Astroblastoma4. Differential diagnosis1) Ganglioglioma2) Dysembryoplastic neuroepithelial tumor5. Summary

NREE-107 The Lymphoma Game Show: Imaging Review of Primary CNS Lymphoma and Its Differential Diagnoses

Participants
Karla Jonguitud, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit isReview the most common imaging manifestations of primary CNS lymphoma.To know the purpose of radiological imaging of primary CNS lymphoma.Explain the most common manifestations encountered with neuroimaging (CT, MRI, MR spectroscopy and MR perfusion) and assess their role in the initial diagnosis and monitoring of primary CNS lymphoma.Discuss imaging findings of differential diagnosis of primary CNS lymphoma with a "choose your answer" game.

TABLE OF CONTENTS/OUTLINE

General features of primary CNS lymphoma.Clinical presentation in primary CNS lymphoma.Diagnostic procedures in primary CNS lymphoma.Purpose of radiological imaging in primary CNS lymphoma.Imaging diagnostic clues in primary CNS lymphoma.Imaging CT findings in primary CNS lymphoma.Imaging MR findings in primary CNS lymphoma.Game: Differential diagnosis of primary CNS lymphoma.Toxoplasmosis.Glioblastoma.Abscess.Progressive multifocal leukoencephalopathy.Demyelination.Metastases.Neurosarcoidosis.Diagnostic considerations and pearls in primary CNS lymphoma.Conclusions.

NREE-108 Imaging Features of Primary Intracranial Sarcoma with DICER1 Mutation

Participants
Lohith Kini, MD, PhD, (*Presenter*) Consultant, Blackfynn Inc

TEACHING POINTS

A broad spectrum of primary intracranial sarcoma subtypes is now recognized, presumably arising from mesenchymal progenitor cells within the meningeal covering of the brain and along perivascular spaces. Building on the key advancements in radiographic and genetic and molecular diagnostics including DNA methylation profiling, primary intracranial sarcoma with DICER1 mutation (PISD) can now be characterized as a distinct tumor entity, newly defined by the 2021 WHO Classification of CNS Tumors. The significant histological variability of PISD makes diagnosis challenging, but DNA methylation profiling and gene panel sequencing have elucidated it as a homogenous entity. This educational exhibit will highlight the important and distinct radiographic and molecular features of PISD in contrast to other intracranial mesenchymal, non-meningothelial tumors such as rhabdomyosarcoma, CIC-rearranged sarcoma and solitary fibrous tumors.

TABLE OF CONTENTS/OUTLINE

I. Overview of primary intracranial sarcoma with DICER1 mutation (PISD). II. Characteristic imaging features and molecular classification of PISD. III. Radiologic differences between PISD and other intracranial mesenchymal, non-meningothelial tumors a. Rhabdomyosarcoma b. CIC-rearranged sarcoma c. Solitary fibrous tumors IV. Summary and Quiz a. Summary of key radiologic findings of PISD. b. Quiz: apply this new knowledge to a few example cases to improve diagnostic precision.

NREE-109 Hypothalamic-pituitary Region and the Neighborhood

Participants
Eduardo Valadares, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the embryology, anatomy and physiology of hypothalamic-pituitary axis and anatomy of structures around the sella turcicaExhibit the normal appearance of pituitary gland and hypothalamus in CT and MRI imaging.Summarize the main anatomy variants, congenital anomalies, neoplasms, inflammatory diseases, tumor-like lesions and other disorders of hypothalamic-pituitary axis and neighborhood

TABLE OF CONTENTS/OUTLINE

Introduction Embriology, anatomy and physiology of hypothalamic-pituitary axisNormal CT and MRI appearanceMain anatomy variantsPituitary hyperplasiaEmpty sellaCongenital anomalies• Pituitary anomalies• Hypothalamic hamartoma• Rathke Cleft cystNeoplasms• Pituitary adenomas• Craniopharyngioma• Lymphoma• Germinoma• Meningioma• Histiocytosis• Astrocytoma• Teratoma• Lipoma• MetastasisInflammatory diseases• Hypophysitis• Infectious processesTumor-like lesions and other disorders• Pituitary apoplexy• Hypothalamic hamartoma• Aneurysm• Wernicke disease• Wyburn-Mason syndrome• Neuromyelitis optica (NMO)Take-home messages/Conclusions

NREE-11 Brain Arteriovenous Malformations (AVMs): A Practical Approach

Participants
Danielly Santos SR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To make the correct diagnosis, distinguishing brain AVMs from other intracranial vascular malformations and identify any complications at the time of presentation that may require immediate management;To stratify the risk of future complications, especially hemorrhage, perilesional hypoxemia or venous congestion, and thereby, establishing the appropriateness of conservative management or treatment;If AVM treatment is indicated, to choose the most effective modality for treatment with the lowest risk of adverse events;To follow the AVM over time, monitoring responses to treatment or ensuring stability with conservative management.

TABLE OF CONTENTS/OUTLINE

A AVM is a nidus of abnormal blood vessels connecting arteries and veins in the brain parenchyma through a shunt, primarily composed of enlarged feeding arteries through which arteriovenous shunting occurs with draining veins. Brain AVMs are rare lesions and most occur sporadically, although there are known associations with syndromes, such as hereditary hemorrhagic telangiectasia and cerebrofacial arteriovenous metameric syndrome. When imaging AVMs, it is important to first identify features suggesting elevated risk of hemorrhage or other morbidity, such as perinidal hypoxemia, and secondly, to inform the choice of treatment or observation that provides the best balance of risk and benefit to the individual patient. Longitudinal imaging surveillance, either with conservative management or after treatment, enables monitoring for resolution of the AVM or the development of adverse findings that may necessitate a change in management.

NREE-110 Post-treatment Imaging Findings of Brain Metastases

Participants
Neudy Junior, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: Illustrate typical and atypical post-treatment findings of brain metastases, including stereotactic radiotherapy, surgery resection, whole-brain irradiation, and immunotherapy. Describe characteristic imaging findings with sample cases from our institution's database. Highlight key imaging points and differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Introduction. Epidemiology. Brain metastasis's location. Treatment options and complications. Series of cases of post-treatment imaging findings, complications, differential diagnosis and pitfalls. Conclusion.

NREE-111 Signs or Sins of Stroke in the Young Population: The Unforgivable Vascular Imaging Mystery

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate that other vasculopathies besides atherosclerosis can cause ischemic stroke in young patients. To review the inflammatory, metabolic, coagulopathic, and genetic vasculopathies. To illustrate the imaging pearls of reversible cerebral vasoconstriction syndrome, carotid and vertebral dissection, carotid web, moyamoya, vasculitis, CADASIL, and drug abuse. To review these fewer common causes of stroke, sometimes misdiagnosed, and encourage the radiologist to go deeper into investigating these diseases.

TABLE OF CONTENTS/OUTLINE

1. Background of non-atherosclerotic vasculopathy causing ischemic stroke in young people. 2. Terminology, etiology, and pathology. 3. How CT and MRI angiography can help in differential diagnoses. 4. Vessel Wall MRI. 5. Carotid and vertebral dissection. 6. Carotid web. 7. Moya-Moya syndrome. 8. RCVS. 9. CADASIL. 10. Vasculitis. 11. Flowchart of imaging assessment. 12. Summary and Take-home messages.

NREE-112 Recanalization Therapy is a Matter of Mismatch

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the most beneficial practices in the ischemic stroke imaging assessment, emphasizing perfusion-diffusion evaluation of ischemic penumbra and FLAIR-diffusion mismatch. To show the importance of perfusion-diffusion mismatch evaluation in ischemic strokes with more than 6 hours of evolution. To explain the importance of FLAIR-diffusion mismatch evaluation in ischemic strokes with unknown onset time. To re-examine the current AHA/ASA Guidelines for the Early Management of Patients with Acute Ischemic Stroke Update.

TABLE OF CONTENTS/OUTLINE

1. Brief pathophysiological considerations of ischemic penumbra. 2. Flowchart of the objectives traced by the radiologist: critical objectives for stroke management. 3. Potentially salvageable brain: definition of ischemic penumbra through CT perfusion. 4. Potentially salvageable brain: definition of ischemic penumbra through MR perfusion-diffusion mismatch. 5. Strokes with unknown onset time: the importance of FLAIR-diffusion mismatch for clinical management. 7. Take-home messages.

NREE-113 Dose Size Matter? Going Beyond Large Vessels in Stroke Imaging

Participants
Humza Haque, MD, Newark, NJ (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To appreciate the importance of more distal vasculature when a patient presents with clinical appreciable stroke symptoms- High clinical suspicion, such as with a high NIH Stroke Scale, without occlusion of a large vessel (ICA, M1, basilar), should prompt careful inspection of more distal vasculature Latest research trends have shown success with intervention upon smaller vessels, making the radiologist's role for detection vital [1]2. To understand the utility of CT perfusion to guide identification of smaller vessel occlusion.- CT perfusion increases sensitivity and specificity of the detection of an occluded vessel [2]3. To gain insight on pearls and pitfalls regarding vascular anatomy, CT technique, and to avoid common errors when faced with stroke imagingSaver et al. (2020) Stroke 51:2872.Amukotuwa et al. (2021) Stroke 52:3308.

TABLE OF CONTENTS/OUTLINE

Define commonly used terms and abbreviations in the world of stroke and its imaging, including medium vessel occlusions (M2/3 middle cerebral artery, A2/3 anterior cerebral artery, and P2/3 posterior cerebral artery segments) [3]Review literature regarding large and more distal vessel occlusionCases and teaching points of medium vessel occlusions involving the ACA, MCA, and PCA with pertinent clinical information, non-contrast CT head, CT angiogram, CT perfusion, and MRI.Conclusion3. Ospel et al. (2020) Stroke 51:2817

NREE-114 2022: a Stroke Flowchart Odyssey in the Emergency Room

Participants
Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the current flowchart protocol for assessing acute ischemic stroke in the emergency room. To clarify the better protocol selection indications, including CT, CT angiography, and MRI. To explain the advantages of employing MRI for acute stroke evaluation. To demonstrate the optimal therapeutic implementation, including intravenous thrombolysis and mechanic thrombectomy.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Current flowchart protocol. 3. Clinical perspective and relevance of determining the correct stroke diagnosis, considering stroke mimics, and excluding hemorrhage. 4. Imaging perspective: CT, CT angiography, and MRI - advantages and disadvantages. 5. Critical Objectives Outlined by the Radiologist for Initial Conduct. 6. Tissue Viability: Definition of Ischemic Penumbra through CT and MRI Perfusion. 7. Update in the therapeutic assessment of stroke. 8. Take-Home messages.

NREE-115 Arachnoid Cysts: Not Always Benign

Participants
Glauber Siqueira I, MD,ARRT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:The objective of this iconographic essay is to highlight the main imaging aspects of computed tomography (CT) and magnetic resonance imaging (MRI) of complications related to arachnoid cysts through illustrative cases.Among the main findings, that stand out, are rupture with the formation of extra-axial collections such as subdural hygroma or hematoma, intracystic hemorrhage, herniations, and hydrocephalus.It is crucial that radiologists become familiar with the main diagnostic aspects in cross-sectional imaging of this frequent cause that is not always devoid of clinical significance.

TABLE OF CONTENTS/OUTLINE

Anatomical considerations: location, anatomical variants and its implications. Cystic characteristics on CT and MRI. Adjacent structures: brain, bone, vessel and nerves. Atypical imaging appearance: red flags on differential diagnosis Arachnoid cysts post-operative imaging.

NREE-116 Clues to Suspect Dural Arteriovenous Fistulas at Cross-sectional Imaging: Case-based Quiz and Review with Angiographic Correlation

Participants
Carlota Garcia de Andoin Sojo, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Even if arteriography is the gold standard radiological technique to confirm the presence of dural arteriovenous fistulas, some CT and MRI direct and indirect findings can suggest the diagnosis if seen.

TABLE OF CONTENTS/OUTLINE

ObjectivesTo describe different radiological signs that suggest the presence of dural arteriovenous fistulas in cross-sectional image modalities (CT and MRI).To show the correlation between the signs described before and the angiographic findings.MethodsA CT and MRI illustrated quiz with cases from our institution has been made to introduce the revision of each sign that suggests the presence of dural arteriovenous fistulas in non-invasive radiological tests.Direct signs: high signal of venous structures seen on time of flight (TOF) angiography MRI sequence; early enhancement of venous structures on contrast-enhanced angio-CT or MRI. Indirect signs: congestive parenchymatous or spinal oedema with variable hemorrhagic foci on MRI; intracranial intraparenchymal, subarachnoid or subdural haemorrhages; cerebral venous sinus thrombosis; prominent vascular structures in absence of nidus; area of increased blood flow in neuroperfusion studies; proptosis and orbital oedema; abnormally enlarged dural vascular channels in the skull. Conclusion:The knowledge of these findings in cross-sectional image modalities is useful for approaching the diagnosis and before performing an invasive test.

NREE-117 Reversible Cerebral Vasoconstriction Syndrome Learning Methods - How to Tighten the Mind

Awards
Certificate of Merit

Participants
Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the imaging assessment of reversible cerebral vasoconstriction syndrome (RCVS). To describe the terminology, etiology, and physiopathology of RCVS. To explain the complications, disease associations, and treatment options involved in the RCVS.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. MRI and CT angiography imaging protocol. 3. Physiopathology and related disorders. 4. Imaging assessment of RCVS and associations, like Posterior reversible encephalopathy syndrome and cortical subarachnoid hemorrhage. 5. Differential diagnoses. 6. Digital subtraction angiography assessment with emphasis on therapeutics. 7. Flowchart for assessment of RCVS. 8. Take-Home messages.

NREE-118 Arterial Wall Irregularities in Cerebral Vessels: Radiological Findings of Cerebral Vasculopathy

Participants
Mariano Lozano Gomez, MD, Almeria, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To recognize imaging appearances of various forms of cerebral vasculopathy at CT, MRI and Digital Substraction Angiography (DSA)- To describe key aspects to distinguish some types of cerebral nervous system (CNS) vasculopathy.- To discuss the correlation of clinical presentation and laboratory test results with imaging findings to aid the diagnosis of cerebral vasculopathy.

TABLE OF CONTENTS/OUTLINE

- Introduction.- Cerebral vascular anatomy: - Circle of Willis. - Vertebrobasilar circulation.- Analysis of CNS vasculopathies: - Description. - Clinical presentation. - Radiological features (CT, MRI, DSA).- Conclussion. - Take-home points.

NREE-119 CT Myelography: From Technical Aspects to Imaging Evaluation

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Irline Cordeiro de Macedo Pontes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although MRI has increased in importance, CT myelography still has a key role in delineating the spinal anatomy, especially to demonstrate dural sac and its contents pathologies. Therefore the radiologists must be aware of the main indications and the principles of the exam technique. The aim of this exhibit is to:1. Detail the technique from lumbar and C1-C2 punctures.2. Demonstrate the differences between the acquisition techniques from CT myelography.3. Describe the differences between the contrast agents and the most suitable choice for the procedure.4. Display and illustrate the needles available for lumbar puncture and the best selection for each case. 5. Exhibit forms of prevention of post-dural puncture headache. 6. Demonstrate imaging findings from erroneous contrast administration.7. Illustrate the main indications from CT myelography with imaging findings.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION2. THE TECHNICAL ASPECTS FROM CT MYELOGRAPHY a. Lumbar and cervical punctures b. Acquisition techniques c. Contrast selectioni. Ionicii. Nonionic d. Needles selectioni. Conventional typeii. Pencil-point type e. Erroneous contrast administration: imaging findings.f. Post-dural puncture headache3. MAIN INDICATIONS AND IMAGING FINDINGS a. Main indications b. Imaging findings from pathologiesi. Radiation planning treatmentii. Spontaneous intracranial hypotensioniii. MRI contraindicationsiv. Older uses/ indications

NREE-12 Pearls and Pitfalls of Diagnosing Spinal Cord Abnormalities: Emphasis on Patterns in T2-, Postcontrast T1- and Diffusion-Weighted Images

Awards
Certificate of Merit

Participants
Mariko Kurokawa, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this review is to summarize the clinical and imaging features of spinal cord disorders with focus on the distribution and enhancement patterns and diffusion-weighted images (DWI).AbstractTeaching Points:• Understand the anatomy of the spinal cord and surrounding structures in correlation with symptomatology and pathophysiologic mechanisms• Describe the pattern and distribution on axial and sagittal T2, postcontrast T1, and DWI in the spinal cord and surrounding structures, and discuss the appropriate imaging techniques and pitfalls.• Summarize typical and atypical imaging features of various common and uncommon diseases

TABLE OF CONTENTS/OUTLINE

1. Spinal imaging techniques:MR protocols including single or multi-shot EPI and non-EPI DWI; pitfalls and artifacts2. Anatomy of the spine and spinal cordAscending tracts, descending tracts, and arterial territory3. Axial imagesWhite matter or gray matter (anterior, lateral, and posterior segments)4. Sagittal imagesLong cord lesion or short cord lesion5. Enhancement patternRim or ring enhancement, single nodular enhancement, multiple nodular enhancement, and patchy enhancement, pial or dural enhancement6. Diffusion pattern7. CasesSpinal cord infarction/ischemia, dural AVF, neurosarcoidosis, transverse myelitis, viral myelitis, demyelinating diseases, compressive myelopathy, subacute combined degeneration, traumatic cord

injury, spinal cord injury without radiographic abnormality (SCIWORA), and benign and malignant spinal tumors8. Systemic diseases with spinal cord abnormalities9. Summary

NREE-120 Correlation of Magnetic Resonance Imaging with Neuroinflammatory and Neuroimmune Responses in Acute, Subacute and Chronic Phases of Traumatic Spinal Cord Injury

Participants
Mabel Torres - Llacsa, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Describe the normal appearance of spinal cord in adult and after traumatic SCI.2- Distribution of aldynoglia cell subpopulations in the adult CNS 3- Recognize the radiological appearance of the spinal cord in the acute, subacute and chronic phases after a traumatic spinal cord injury

TABLE OF CONTENTS/OUTLINE

1- Describe the inflammatory process that occurs in the spinal cord after a traumatic injury to the spinal cord. 2- Relationship of the radiological uptakes by magnetic resonance with the inflammatory phases that occur after a traumatic SCI. 3- Discuss the possible use of aldynoglia cells as cell therapy in traumatic spinal cord injury due to its ability to facilitate axonal re-growth re-myelination. 3.1- Cure by stimulation of resident aldynoglia cells near lesion area in SCI. 3.2- Injection of autologous aldynoglia cells grown ex vivo.

NREE-121 Sick Spine - A Review Of Differential Diagnosis Of Intramedullary Lesions On MRI

Participants
Pedro Gama Carpentieri Primo, MD, Rio De Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Summarize the main strategy of the differential diagnosis for intramedullary signal alterationsExplore the differential diagnosis of intramedullary pathology with focus on unusual and rare casesCharacterize the imaging aspects of the main lesions

TABLE OF CONTENTS/OUTLINE

Differential of intramedullary lesions based on MRI signal findings T1 hyperintense/hypointense T2 hyperintense/hypointenseAnatomical distribution findings Ventral cordDorsal cordCentral cordImportant differential diagnosis and its imaging featuresAngiomyolipomaCavernomatous malformationEmbryonal tumor with multilayered rosettesHemangioblastomaSyringocephalusMedullary congestionMedullary tuberculosis Neuromyelitis optica spectrum Transverse myelitis post-COVID vaccination Leukemic infiltration Syphilis myelitis Intramedullary metastasis Medullary cone ependymoma Acute disseminated encephalomyelitisSystemic lupus erythematosus related myelitis Multiple sclerosisMedullary schistosomiasis

NREE-122 Spinal Epidural Lesions: A Case-Based Review

Participants
Izaely Prates, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1 - TEACHING POINTS- Review the normal anatomy of the epidural space and its relationship to adjacent structures- to illustrate a variety of rare cases in order to avoid misinterpretations and pitfalls;- propose an interpretation algorithm to try to reduce the number of differential diagnoses to help the referring physician.

TABLE OF CONTENTS/OUTLINE

2 - TABLE OF CONTENTS/OUTLINEINTRODUCTION.RELEVANT IMAGING ANATOMY.SPINAL EPIDURAL LESIONS: Clinical cases illustrating the spectrum of common and uncommon spinal epidural space findings in CT and MRI).Primary neoplasms of epidural space;Neoplasms that invade the epidural space;Hematomas;Infection and collections;Other lesions.A STEP-BY-STEP ALGORITHM TO APPROACH SPINAL EPIDURAL LESIONS.TAKE-HOME MESSAGESREFERENCES

NREE-123 Diffusion for Clearing Confusion: Role of the Diffusion-weighted Imaging in the Spine and Spinal Cord

Participants
Melih Akyuz, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS: 1. Diffusion-weighted imaging (DWI) in the spine is relatively new, yet has been a reliable imaging method for the characterization of a variety of disease entities 2. DWI provides information on the tissue microstructure depending on the alterations of the water-proton mobility. The efficacy of this technique has been proven in the evaluation of the abnormalities of not only the brain but also the spinal cord and spine 3. Previous studies have shown that DWI might be useful in the evaluation of vertebral fractures, degenerative changes of the spine, infection, infarction of the spinal cord, neoplasms, and various inflammatory conditions involving the spine and spinal cord

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS OUTLINE: 1. Describing different techniques of diffusion-weighted imaging in the spine2. Discuss various abnormalities involving the spine spinal cord their clinical manifestations3. Briefly discuss the sources and mechanisms of actions of different disease entities involving the spine4. Case-based imaging review of the abnormalities of the spine spinal cord with distinctive imaging findings emphasis on the use of the DWI in each entity

NREE-124 Magnetic Resonance Imaging Findings in Infectious and Granulomatous Spinal Cord Lesions

Participants
Alice Abreu Mota, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Magnetic Resonance findings, associated with clinical and laboratorial exams, may help differentiate the specific etiology for infectious and granulomatous medulla and spinal cord pathologies. • Linear and nodular enhancement pattern with an “arborized” appearance is typical in neuroschistosomiasis. • The tuberculosis infection may lead to many complications like meningitis, radiculomyelitis, tuberculoma, myelitis, syringomyelia and spinal abscess. • Sarcoidosis lesions are frequently multiple and centrally located. • Toxoplasmosis is often indistinguishable from tuberculoma. • Abnormalities are mainly found in the dorsal columns in HTLV-1 and usually involve the posterior and lateral region of the cord in HIV. • In Varicella Zoster the T2 hyperintensity is in the lateral portion. • Myeloradiculopathy, myeloradiculitis, myelitis, myeloneuropathy, Guillain-Barre syndrome, have been reported in arboviruses.

TABLE OF CONTENTS/OUTLINE

Viral Myelitis • Varicella Zoster • Arboviruses (Chikungunya) • Citomegalovirus • HIV • HTLV-1 Others Infectious diseases • Tuberculosis • Neuroschistosomiasis • Neurotoxoplasmosis Non-infectious granulomatous disease • Sarcoidosis

NREE-125 Non-traumatic Spine Emergencies -A Primer for the On-Call Radiology Resident

Participants

Emily Convery, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although trauma remains a common indication for emergency room clinician to order spine imaging study, there are several atraumatic causes that warrant emergent spine imaging. This differential includes acute disc herniations with compressive myelopathy, pyogenic osteomyelitis with epidural abscess, and acute inflammatory process such as Guillain Barre syndrome or demyelinating disease, as well as direct or leptomeningeal spread of metastatic disease and vascular pathologies. Having familiarity with typical clinical manifestations and emergent management of such disease process can aid the radiologist with obtaining the proper spinal level of imaging with appropriate imaging modality and if need be recommend further imaging outside the neural axis.

TABLE OF CONTENTS/OUTLINE

1) Overview of spinal anatomy imaging search pattern 2) Signs and symptoms of myelopathy 3) Degenerative disease 4) Infectious and inflammatory diseases 5) Malignant compressive pathology 6) Vascular pathology 7) Treatment/management options

NREE-126 Diffusion Kurtosis Imaging (DKI) in Neuroradiology: Technique and Clinical Applications

Participants
Silvia Lanzarote Vargas, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

DKI is a diffusion technique based on the use of very high values ??(b=2000 s/mm2) and on the complex tissue structural technique with interesting applications in neuroradiology, mainly in the diagnosis and follow-up of gliomas.

TABLE OF CONTENTS/OUTLINE

Kurtosis is a statistical measure that determines the degree of concentration that the values ??of a variable present around the central zone of the frequency distribution. Diffusion imaging (DWI) with low b values ??assumes that the movement of water molecules after the application of the gradients of the diffusion sequence is the same in any direction in space and follows a Gaussian distribution. In biological tissues the movement of water molecules varies from the Gaussian distribution. This degree of deviation is related to tissue structural complexity and barriers to the free diffusion of water and it can be calculated using DKI. This presentation will explain in a simple way what are the technical requirements necessary to obtain the DKI as well as the parameters that can be calculated, such as the kurtosis coefficient (K). It is intended to provide information that may be useful in routine clinical practice, illustrating representative cases. Examples of the different applications of DKI in the diagnosis and monitoring of different pathologies will be given. In brain tumors, it can be useful to differentiate high-grade and low-grade gliomas, as well as to distinguish between recurrence of high-grade gliomas and pseudoprogression or radionecrosis and gliomas from other tumors such as primary CNS lymphomas. We will also show the usefullness of DKI in the diagnosis of head and neck tumors as well as in neurodegenerative diseases.

NREE-127 Cavernous Sinus Hyperintense on Magnetic Resonance Angiography - Can You Differentiate Dural Arteriovenous Fistula from Cerebral Venous Reflux?

Participants
Keizo Tanitame, MD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnostic radiologists often encounter cavernous sinus hyperintense on three-dimensional time-of-flight magnetic resonance angiography (MRA). Even if detailed evaluation of the source images of MRA is performed, differentiation between dural arteriovenous fistula (DAVF) and cerebral venous reflux (CVR) is occasionally difficult. Cerebral digital subtraction angiography (DSA) is useful for differentiating them, but it is invasive and has a small risk of cerebral embolisms. CVR is observed mostly on the left side, and considered to be retrograde venous flow due to compression of the left brachiocephalic vein between the sternum and aortic arch or branches. We demonstrate several cases with diagnostic difficulty and focus the cause of retrograde venous flow in left cavernous sinus and some techniques suppressing the CVR on MRA.

TABLE OF CONTENTS/OUTLINE

1. Representative MRA and DSA images of cavernous sinus DAVF - Small arteriovenous shunts near the cavernous sinus 2. Representative MRA and DSA images of upward venous reflux in the cavernous sinus - Retrograde venous flow of the cavernous sinus and other venous sinuses 3. The cause of retrograde venous flow in the left cavernous sinus - Images and schematic illustration of left brachiocephalic vein compression 4. Suppression techniques against intracranial retrograde venous flow - The usefulness of MRA scanning in the supine position with shoulder pillows and small breathing

NREE-128 Probing Metabolism: The Role of Proton MR Spectroscopy in Neurometabolic Diseases

Participants
Milena Krieck Farche, MD, Campinas, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Describe the basic principles of magnetic resonance spectroscopy (MRS), with an emphasis on protocol acquisition and optimal technique in a variety of neurometabolic conditions. 2- Illustrate the normal spectra and main abnormal patterns of brain metabolites, integrating the spectroscopy information with the analysis of conventional MRI sequences.3- To review the main neurometabolic diseases in which spectroscopy can aid in establishing the correct diagnosis, presenting radiological tips for each clinical context.

TABLE OF CONTENTS/OUTLINE

1 - Introduction2 - Principles of Proton MR spectroscopy A) Choosing the localization techniqueB) Choosing the echo-time (TE)C) Deciding between single-voxel vs multi-voxelD) Choosing the voxel location3 - Normal spectra and main abnormal patterns of brain metabolites, including potential pitfalls and normal variants.4 - Role of spectroscopy in the diagnosis of specific neurometabolic diseases with a series of illustrative cases5 - A spectroscopy-based approach to narrow the differential diagnosis in certain clinico-radiological scenarios (leukodystrophies, mitochondrial diseases, etc.)6 - Conclusion

NREE-129 Abnormalities Associated with Cerebral Cortical (AACs) on MRI

Participants
Zhiqiang Zhang, MD,PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Abnormalities associated with cerebral cortical (AACs) present specific anatomic, pathological, clinical and radiological features, but have less been addressed. we proposed a diagnostic framework by categorizing AACs into focal, regional and diffuse types according to the shape on MRI.In summary. AACs cover a variety of pathologies, show radiological gyrus-thickness sign in focal AASs, outline-sketched sign in regional AACs and flower-mimic sign in diffuse AACs, and are well demonstrated with IR-based T1WI, SWI and DWI on MRI.

TABLE OF CONTENTS/OUTLINE

Regional AACs, mainly include diseases of MCD of FCD-I and tumors of long-term epilepsy. Diseases mainly present symptoms of seizures, and are well demonstrated as focal gyrus thickness on IR based T1WI.Regional AACs, lesions are within a lobe at a hemisphere, pathologically diversified into (1) MCDs of polymicrogyria, (2) VDs of cortical laminar necrosis, Isolated cortical venous thrombosis and meningioangiomatosis. (3) tumors of gliomas and MVNT. (4) Brain injury of status epilepticus and (5) CNS infections/inflammation. The diseases feature with consciousness disorders and are well

demonstrated on SWI or DWI with outline-sketched sign of gyrus.Diffuse AACs, are mostly bilaterally distributed and cover widely cortical areas, include more pathological types of (1) VD of HIE and SSCNS. (2) Tumor of DLGNT. (3) Metabolic of MELAS, hypoglycemic and hyperammonia encephalopathy; (4) CJD (5) NIID and (7) Toxicosis of mercury and benzene. Diseases feature with cognitive impairments, are pathologically associated with energy metabolic abnormality in cortex, and presented with regular geometric/vivid flower-mimic shapes on DWI and FLAIR.

NREE-13 Spinal Vascular Lesions: What to Know, and How it Should be Reported

Participants
Thiago Martins Fernandes Vilela, Mogi das Cruzes, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the normal anatomy of the spinal cord, the modified classification of spinal vascular lesions (by Spletz), a more practical classification based on the vascular anatomy of the spinal cord and the inborn or acquired nature of the lesion (Bicentre group).- To review the pathophysiological mechanisms and their clinical correlations.- To present and review some of the metameric and myelomeric syndromes.- To point out what information is expected beyond the diagnosis in each of the cases presented.- To propose a structured report.- To review post-operative image findings and complications of the most used procedures and techniques.

TABLE OF CONTENTS/OUTLINE

-- Introduction - Anatomy - Classifications - Pathophysiological mechanisms and their clinical correlations - MRI and digital angiography techniques -- Description of the imagine features, pointing out the most important information that is to be provided. -- Review of the post-operative image findings and complications of the most used procedures and techniques. -- Proposal of a structured report. -- Conclusion

NREE-130 Neurosyphilis: Findings From a Reemerging Disease

Participants
Pedro Henrique Andrade, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the syphilis natural history. 2. To review the CNS syphilis involvement. 3. To illustrate imaging findings related to neurosyphilis.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Pathogenesis and natural course of untreated syphilis a.Primary syphilis b.Secondary syphilis c.Tertiary syphilis3. CNS involvement in syphilis a.meningitis b.meningovascular syphilis c.parenchymal neurosyphilis d.syphilitic dementia (general paresis) e.otologic syphilis f.ocular syphilis g.tabes dorsalis h.congenital neurosyphilis4. Imaging in syphilis neurological manifestations and differential diagnosis 5. Conclusion 6. Take-home messages 7. References

NREE-131 Inborn Errors of Metabolism: A Step by Step Clinico-radiological Approach

Participants
Gabriela Bandeira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1-To review the classification of inborn errors of metabolism.2- To review the pathophysiology basic principles of the inborn errors of metabolism.3-To illustrate imaging findings related to genetically determined metabolic disorders.

TABLE OF CONTENTS/OUTLINE

1 - Introduction2 - Classification of inborn errors of metabolismDisorders of intermediary metabolism : aminoacidopathies, organic acidurias, latic acidemias, hyperammonemia and disorders of the urea cycle, disorders of fatty acid oxidation. Disorders of the biosynthesis and breakdown of complex molecules: purine and pyrimidine metabolism, lipoprotein metabolism, lysosomal storage disorders, peroxisomal disorders, porphyrias.Mitochondrial disorders: mitochondrial encephalomyopathy, lactic acidosis and stroke-like episodes (MELAS), Kearns-Sayre syndrome, MERRF (myoclonus epilepsy with ragged red fibers). Neurotransmitter defects and related disorders: disorders of glycine and serine metabolism.Disorders of mineral metabolism: Menkes disease, Wilson disease, others.3- General and specific clinical features of inborn errors of metabolism4 - Clinico-radiological approach to inborn errors of metabolism with illustrative cases5- Take home message6 - Conclusion7 - References

NREE-132 Molecular and Genetic Features of Adult Diffuse Gliomas: Essential Updates from WHO 2021 CNS Tumor Classification

Participants
Ilan Benador, MD,PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diffuse adult gliomas have been previously organized into 15 separate entities primarily based on histological features. WHO CNS tumor classification 2021 has reorganized diffuse gliomas into only three subtypes based on molecular and genetic characteristics that better correlate with prognosis and treatment response: 1) astrocytoma, IDH-mutant, 2) oligodendroglioma, IDH-mutant, and 1p19q-codeleted, 3) glioblastoma, IDH-wildtype. Additionally, the following entities have been retired from the tumor nomenclature in the classification scheme: glioblastoma, IDH-mutant, astrocytoma, IDH-wildtype, and oligoastroglioma. This educational exhibit will highlight the key advancements in radiographic and molecular diagnosis of diffuse gliomas.

TABLE OF CONTENTS/OUTLINE

I. Overview of WHO 2021 CNS Tumor Classification of adult-type diffuse gliomas. II. Characteristic imaging features and molecular classification of adult-type gliomas. A) Astrocytoma, IDH mutant: ATRX mutation, CDKN2A/B deletion. B) Oligodendroglioma, IDH-mutant: 1p19q co-deleted, TERT promoter mutation. C) GBM, IDH-wildtype: TERT promoter mutation, EGFR amplification, Trisomy 7 Monosomy 10. III. Summary of key molecular signatures of each subtype. IV. Quiz: apply this new knowledge to a few example cases to improve diagnostic precision.

NREE-133 Distinguishing Mimics from the Great Mimicker: CNS Lymphoma in Immunocompromised Hosts

Participants
Nima Omid-Fard, MD, BSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• In the immunocompromised setting, there are distinct radiologic findings of CNS lymphoma, including necrotic ring-enhancing lesions, increased propensity for intralesional hemorrhage, and multiplicity.• In this clinical context, advanced imaging with MR perfusion, spectroscopy and diffusion-weighted imaging can be used to increase accuracy in the diagnosis of lymphoma over mimics such as GBM, metastases or infection.• This knowledge is particularly relevant to radiologists as the incidence of immunodeficiency-related CNS lymphoma may be increasing.

TABLE OF CONTENTS/OUTLINE

• Briefly review typical imaging findings of primary and secondary CNS lymphoma • Discuss the potential for rare and atypical presentations of CNS lymphoma • A greater emphasis will then be placed on the unique imaging findings in immunodeficiency-associated CNS lymphoma, reviewing advanced imaging techniques including MR spectroscopy, diffusion, and MR perfusion. • Side-by-side multisequence comparison of immunocompromised vs immunocompetent CNS lymphoma • Side-by-side multisequence comparison of immunocompromised CNS lymphoma vs glioblastoma • Side-by-side multisequence comparison of immunocompromised CNS lymphoma vs metastasis • Side-by-side multisequence comparison of immunocompromised CNS

lymphoma vs infection (toxoplasmosis)

NREE-134 The B - T Guide of Lymphomas

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate the typical MRI patterns and the classification of central nervous system (CNS) lymphomas. To explain the difference between intra-axial and extra-axial primary CNS lymphoma. To illustrate the importance of MRI in the trivial and atypical features of CNS lymphomas. To depict the importance of MRI in the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Diffuse large B-cell lymphoma and high-grade Burkitt-like B-cell lymphoma. 3. Low-grade T-cell lymphoma. 4. Lymphomas in the immunocompromised patient: AIDS-related diffuse large B-cell lymphoma. 5 EBV-positive diffuse large B-cell lymphoma, NOS. 6. Lymphomatoid granulomatosis. 7. Primary CNS posttransplant lymphoproliferative disorder. 8. Intravascular lymphoma. 9. MALT lymphoma of the dura. 10. Typical features, including hypercellularity and moderate to low perfusion. 11. Imaging assessment of the atypical imaging patterns of CNS lymphomas, including spontaneous remission and relapsing presentation, and corticospinal tract infiltration. 12. Differential diagnoses: meningioma, sarcoidosis, non-Langerhans cell histiocytosis, and IgG4-related disease. 13. Flowchart of evaluation. 14. Take-Home messages.

NREE-135 Unraveling Lesions of Chiasmatic-Hypotalamic Region: A Case Based Approach

Awards
Certificate of Merit

Participants
Virginia Simonini, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The hypothalamus is a midline structure located below the thalamus, and together with the epithalamus and subthalamus, they constitute the diencephalon and its main function is homeostasis. - The optic chiasm is also a midline structure located anteriorly to the hypothalamus and is the point where both optic nerves meet and continue posteriorly as the optic tracts. - The hypothalamic-chiasmatic region can be affected by many diseases from multiple etiologies, such as neoplastic, developmental abnormalities and inflammatory/granulomatous, and the aim of this study is to didactically illustrate such cases. - Many important structures surround the hypothalamic-chiasmatic region, such as mamillary bodies (MB), pituitary stalk (PS), neuro and adenohypophysis, and can also be affected by those diseases. - Computed tomography (CT) is a limited method for the hypothalamic-chiasmatic region evaluation, since it has low contrast between structures. Hence, the imaging modality of choice for examination of this area is magnetic resonance imaging (MRI), specially midline sagittal slices.

TABLE OF CONTENTS/OUTLINE

- Illustrate normal hypothalamic-chiasmatic region anatomy. - Expose didactic cases of hypothalamic-chiasmatic region lesions, from many etiologies and how to evaluate trough imaging, illustrating described findings to consolidate the acquired knowledge. - Bibliographical references.

NREE-136 Retinobasltoma: A Giant for the Little Ones

Participants
Karolina Cancela, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibition are: review the anatomy of the eyeball, including its main anatomical limits and the structures that compose it. Review vascularization characteristics and normal MR imaging findings. Correlated clinical syndromes. Discuss and illustrate the main imaging patterns of retinoblastoma. Detail the lesions according to their topography, whether unilateral, bilateral or even trilateral, configuring pineoblastoma.Describe diagnostic scenarios through illustrative cases, focusing on typical imaging patterns, unexpected tumor findings, dissemination patterns and imaging aspects of complications and post-treatment.

TABLE OF CONTENTS/OUTLINE

Retinoblastoma with its imaging patterns on MRI sequences; unilateral, bilateral or trilateral; structures involved: intra-orbital and/or extra-orbital; unexpected findings: other tumors as main differential diagnoses; post-treatment evaluation and complications; final considerations.

NREE-137 Imaging of Common and Uncommon Post-treatment Related Complications in the Brain and Spinal Cord

Participants
David Michaels, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Present cases which highlight both common and uncommon complications related to neurological treatment • Identify specific imaging findings to look for when presented with post-treatment cases • Give a brief summary of the natural time course of the above mentioned complications and how they will evolve over time on follow up imaging studies

TABLE OF CONTENTS/OUTLINE

Complications from treatment, whether related to medical, surgical, or radiation treatments, are important for the neuroradiologist to recognize and diagnose. Often, recognition of such complications is crucial, as it can change future care of the patient. This education exhibit will present cases which illustrate both common and uncommon complications related to neurological treatment. We will provide a succinct overview of patient history, followed by a comprehensive interpretation of pertinent imaging studies. Our institution functions as a large tertiary care referral center for the region, which translates into both rare complications of common treatments, and common complications of rare treatments. Finally, we will end each case with a brief comment on the prognosis of each complication, and what to look for on future imaging studies. Cases include acute toxic leukoencephalopathy from both immunosuppressive and chemotherapeutic agents, radiation-induced leukoencephalopathy and meningioma formation, and postsurgical complications to include Teflon granuloma and remote cerebellar hemorrhage, among others.

NREE-138CS Development and Clinical Translation of a Neuro-analysis Pipeline for Automatic Quantitative Analysis Using the Kaapana Platform

Participants
Vikas Bommineni, Orlando, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Quantitative measures, such as brain atrophy patterns related to neurodegenerative diseases, may provide complementary information to radiologists. However, translation of quantitative biomarkers to clinical practice has been limited. Recent advances in image analysis allow automated and rapid processing of medical image data, while new statistical methods enable collection of large harmonized reference datasets to perform comparative analyses of individual measures. We present a workflow on Kaapana, an open-source framework for medical data analysis, for translating laboratory-validated, quantitative measures into next-generation, precise biomarkers towards personalized diagnostics. The pipeline includes pretrained deep

learning(DL) models for segmentation of brain anatomy, data harmonization to a cognitively normal reference population, and calculation of machine-learning based individualized summary scores that quantify neurodegeneration and brain aging. The pipeline inputs DICOM scans directly from scanners or Picture Archival and Communications Systems (PACS) and generates segmentation maps and a patient-specific summary report to visualize measures in comparison to expected distributions based on reference populations. Outputs are converted to DICOM for archival on PACS.

TABLE OF CONTENTS/OUTLINE

1) Introduction2) Neurodegeneration biomarkers3) Neuro-analysis pipeline:a) Pre-processing: Nifti conversion, skull stripping tissue segmentationb) Analysis: Data harmonization extraction of quantitative biomarkersc) Generation of summary reportd) DICOM output4) Workflow: Push data to Kaapana, trigger pipeline, QC results and push to PACS5) Future enhancements

NREE-139 Improving Automated Substantia Nigra Segmentation Accuracy Using a Novel Test-time Normalization Method

Participants
Tao Hu, MSc, Nagoya, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To understand the feasibility and benefits of substantia nigra (SN) segmentation using T2-weighted magnetic resonance imaging (MRI).2. To understand how the proposed test-time normalization (TTN) can be used for improving segmentation accuracy.3. To understand the the potential applications of the segmentation results and estimated uncertainty maps in clinical scenarios.

TABLE OF CONTENTS/OUTLINE

1. Review of automated SN segmentation using MRI- Relationship between SN and progression of Parkinson Disease (PD)- Difficulties of automated SN segmentation from MRI- Conventional methods for automated SN segmentation2. Automated SN segmentation with the proposed TTN- Review of test-time augumentations in segmentation tasks- Detailed explanations of the proposed TTN- Algorithm of the proposed TTN and its application in segmentation- Review of losses for tiny structure segmentation- Combination of the proposed TTN and investigated losses in segmentation- Segmentation results with and without TTN- Benefits of the proposed TTN3. Potential applications of automated SN segmentation- SN volume and asymmetric metric estimation using segmentation results- Indicating vague boundaries of SN using uncertainty maps- longitudinal SN inspection using automated segmentation results

NREE-14 Lumbar Spine MR Examination (2 Minutes, 30 seconds) Faster than Instant Noodles Using GRAPPA and Deep Learning Reconstruction with High Acceleration Factor

Participants
Takeshi Hasuda, RT, Ueda-Shi, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibition was approved by our Medical Ethics Committee. One of the disadvantages of MRI examinations is the relatively long time required to acquire MR images. In MRI examinations of the spine, there are cases in which the examination needs to be performed quickly due to trauma, or patients with hernias or other pain that make it impossible to perform the examination in the same position for long periods of time due to rounded backs. In recent years, reconstruction technology using Deep Learning has been attracting attention, and high-speed and high-resolution MRI have been attracting attention. This education focused on Deep Resolve (DR), a Deep Learning Reconstruction (DLR) method, to understand the characteristics of DR and to optimize the imaging protocol. The teaching points of this exhibition are to (1) understand the outline of DR by validation using phantoms and to examine the optimal conditions in combination with parallel imaging (GRRAPPA), (2) practice the validation results in clinical practice and to analyze problems, and (3) optimize the parameters of Spine's imaging conditions based on the results and demonstrate scan times faster than instant noodles.

TABLE OF CONTENTS/OUTLINE

1. overview 2. understanding the characteristics of DR (Deep Resolve) 3. phantom verification 4. trial and error in actual clinical practice 5. MR images (comparison of original and optimized images) Faster than instant noodles

NREE-140 Synthetic MRI Evaluation of Sella Pathologies

Participants
Ranliang Hu, MD, (*Presenter*) Stockholder, Moderna, Inc;Stockholder, Pfizer Inc

TEACHING POINTS

Synthetic MRI is an emerging technique for clinical imaging, able to generate multiple contrast weighted images and parametric maps based on a single acquisition using multiple delay and and echo times. While Synthetic MRI has become available from multiple vendors and recent studies have shown it to produce comparable image quality to that of conventional brain MRI, it is still underutilized in part due to lack of experience among radiologists with the technique and post-processing. The sella region is complex for neuroradiologic evaluation due its small anatomy, subtle pathologies, complex tissue/enhancement characteristics. Technical developments in 3D synthetic MRI with higher spatial resolution has made sella imaging feasible, with ability to perform qualitative and quantitative tissue characterization. This education exhibit will review recent developments in Synthetic MRI for neuroimaging and through case examples demonstrate its role in the evaluation of pathologies in the sella region.

TABLE OF CONTENTS/OUTLINE

1. Background: a. Brief review of current literature2. Technical Overview: a. Acquisition b. Post-processing3. Case Review: a. Pituitary hyperplasia b. Rathke’s cleft cyst c. Epidermoid cyst d. Pituitary adenoma e. Post-treatment adenoma f. Meningioma g. Craniopharyngioma4. Summary: a. Key points for qualitative interpretation b. Quantitative differences between pathologies c. Challenges and limitations

NREE-141 Trigeminal, Facial, Hypoglossal and Greater Occipital Nerves: Had You Seen Them Like This Before?

Participants
Marta Barrios Lopez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To summarize the most important anatomical relationships of the extracranial segments of the main cranial nerves (including the trigeminal, facial and hypoglossal nerves). We will also include those of the greater occipital nerve, the thickest cutaneous nerve in the human body. -To demonstrate the ability of 3D CRANI, an innovative MRI sequence, to help visualize these branches.

TABLE OF CONTENTS/OUTLINE

-INTRODUCTION- THE 3D CRANI SEQUENCE: a relatively new MRI technique that combines a STIR TSE black-blood sequence, a motion-sensitized driven equilibrium (MSDE) pulse and a pseudo steady-state (PSS) sweep.- TRIGEMINAL NERVE: introduction and origin. Extracranial segment.- Ophthalmic nerve. Maxillary nerve. Mandibular nerve: main anatomical relationships and branches. Useful details and their correlation with the clinic. - FACIAL NERVE: introduction and origin. Extracranial segment. Main extracranial branches and their relationship to the parotid gland. - HYPOGLOSSAL NERVE: introduction and origin. Main anatomical relationships in the neck.- GREATER OCCIPITAL NERVE: introduction, importance, anatomical landmarks. -CONCLUSIONS: 3D CRANI is useful to visualize the extraforaminal segments of the major cranial nerves.

NREE-142 Perfusion Imaging: The Cerebral Path to the Final Diagnose

Participants

Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To depict the perfusion imaging applications to assess neoplastic, ischemic, post-ictal, and infectious diseases. To clarify the physics and how to interpret the brain perfusion maps. To elucidate the advantages and disadvantages of utilizing perfusion compared to the permeability.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Imaging protocol and physics. 3. Advantages and disadvantages of perfusion versus permeability. 4. Applications in CNS tumors. 5. Perfusion and the therapeutic and molecular diagnosis implications in neoplastic disease. 6. Applications in stroke. 7. The therapeutic implications of the perfusion in ischemia. 8. Differential diagnosis, including infectious diseases and post-ictal changes. 9. Flowchart for assessment of brain diseases with perfusion. 10. Take-Home messages.

NREE-143 Mismatch of Arterial Spin Labeling (ASL) Compared to MR Dynamic Susceptibility Contrast Perfusion Weighted Imaging (DSC-PWI) in the Central Nervous System Diseases

Participants
Xiang Liu, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

MR dynamic susceptibility contrast perfusion weighted imaging (DSC-PWI) is the most commonly used perfusion imaging technique in the central nervous system (CNS) diseases, including brain tumors. MR arterial spin labeling (ASL) is a novel noninvasive MR sequence to quantify tissue blood flow. Most published studies showed that the relative cerebral blood volume (rCBV) derived from DSC-PWI and cerebral blood flow (CBF) of ASL. Based on our experience of more than 950 patients who had concurrent ASL and DSCPWI examinations, the purpose of this Education Exhibit is to present following teaching points of mismatch between ASL and DSCPWI in the evaluation of hemodynamic changes in the CNS diseases. 1. Learning the principle of DSC-PWI; 2. Learning the principle of ASL; 3. Learning advantages and limitations of DSC-PWI and ASL in the CNS diseases;

TABLE OF CONTENTS/OUTLINE

1. Introduction of the principle of DSC-PWI; 2. Introduction of the principle of ASL; 3. Sample cases comparing between DSC-PWI and ASL in glioma, brain metastasis, meningioma, vascular malformation, and MELAS, etc ; 4. Summary of advantages and limitations of DSC-PWI and ASL in the CNS diseases;

NREE-15 How Diffusion Tensor Imaging Enables Direct Targeting for Focused Ultrasound Surgery

Participants
Hiroki Hori, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to summarize how to implement diffusion tensor imaging (DTI) as a direct targeting method in transcranial MR-guided focused ultrasound surgery (TcMRgFUS). Although the atlas-based targeting method of indirect measuring the ventral intermediate nucleus (VIM) of the thalamus from the posterior commissure (PC) was widely used, it may not be precise, as the locations of the VIM, ventral caudal nucleus (Vc) and pyramidal tract (PT) etc., may vary in each subject based on our pilot study. Especially in the case of atrophic brain, it is difficult to measure the precise location of the VIM using the conventional indirect targeting method, hence a direct targeting strategy is more desired. DTI enables visualization and characterization of fibrous structures in the brain, and tractography-based direct targeting may become the method of choice for surgical targeting as it is capable of providing patient-specific coordinates. DSI studio is an open source, high spec image processing software tool that facilitates DTI data analysis. DSI studio assisted tractography-based direct targeting offers a practical and flexible approach to improve treatment efficacy and safety profiles after TcMRgFUS treatments.

TABLE OF CONTENTS/OUTLINE

1. What is TcMRgFUS a. Overview b. Traditional method of assessment c. Ablating location2. How to visualize each fiber a. Visualize VIM b. Visualize Vc c. Visualize PT3. Location of the nucleus and ablation outcome a. Mild adverse event b. Severe adverse event c. Recurrence and mild adverse event d. Perfect treatment4. Future outlook

NREE-16 The Role of APTw with fMRI, and DTI in Preoperative Planning

Participants
Sevcan Turk, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Highlight the role of amide proton transfer weighted (APTw) imaging for preoperative planning of the brain tumors; grading, genetic mutations, peritumoral invasion, and white matter tumor infiltration• Discuss the potential of using APTw imaging in assessing treatment response and discrimination of true tumor progression from pseudoprogression• APTw high signals: hypercellular components of the tumor, extracellular tumor matrix, hematoma, necrosis.• Discuss the pros and cons, artifacts in interpreting APTw, fMRI, DTI, PWI

TABLE OF CONTENTS/OUTLINE

• Overview of imaging characteristics of brain tumors with emphasis on APTw in conjunction with fMRI, DTI, and PWI for preoperative planning.• Demonstrate cases of tumor progression versus treatment effects, peritumoral invasion, and genetic mutation and grade correlation APT, PWI, DWI parameters with the role of fMRI and DTI.• Differences of pediatric tumors on advanced imaging, the added value of APTw imaging• Necrosis, hemorrhage, calcification, and extracellular matrix effects on the signal intensity in APT, fMRI, DTI, and perfusion-weighted imaging. Pitfalls and accuracy of each advanced imaging method.

NREE-17 Neuronal and Mixed Glioneuronal Tumors: Image Correlation X Molecular Profile

Participants
Milena Ouchar Sabino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the main imaging findings of neuronal and mixed glioneuronal tumors with cases from three hospitals imaging departments. - To correlate some of the neuronal and mixed glioneuronal tumors to specific altered molecular profiles.

TABLE OF CONTENTS/OUTLINE

- A brief discussion of the new WHO 2021 CNS tumors classification, focusing on neuronal and mixed glioneuronal tumors.- The most frequently altered molecular pathways.- Correlation of neuronal and mixed glioneuronal tumors according to their most frequent location and clinical presentation.- A review of the main imaging features - cases of neuronal and mixed glioneuronal tumors and their associated altered molecular profiles: gangliogliomas, desmoplastic infantile ganglioglioma/astrocytoma, papillary glioneuronal tumor, DNET, rosette-forming glioneuronal tumor, multinodular and vacuolating neuronal tumor, diffuse leptomeningeal glioneuronal tumor, central neurocytoma, extraventricular neurocytoma, dysplastic cerebellar gangliocytoma (Lhermitte-Duclos), myxoid glioneuronal tumor.- An approach to neuronal and mixed glioneuronal tumors according to their imaging appearance (solid or cystic-solid and pseudocystic).

NREE-18 Diffuse Gliomas Genomics: What Radiology Residents Need to Know

Participants
Yu Bin Lee, MD, Gwang Ju, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Two review the major changes of the fifth edition of the WHO Classification of Tumors of the CNS (WHO CNS5).2. Two review the clinical implications and related imaging findings of the representative genetic mutations associated with diffuse gliomas.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. The major changes of the WHO CNS53. Clinical implications and imaging evaluation of tumor genomics1) Adult-type diffuse gliomas- Isocitrate dyhdrogenase (IDH) mutation- 1p/19q codeletion- O-6-Methylguanine-DNA-Methyltransferase (MGMT)- ATRX loss- TP53 mutation- TERT promotor mutation- EGFR amplification2) Pediatric-type diffuse low-grade gliomas- BRAF mutation in MAPK pathway3) Pediatric-type diffuse high-grade gliomas- H3 K27-altered- H3 G34-mutant4. AI approaches in radiogenomics5. Summary

NREE-19 Update on Radiophenotypes of Central Nervous System Tumors After 5th Edition WHO Classification 2021

Participants
Taina Estruzani, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize high specificity imaging phenotypes of CNS Tumors. Discuss modifications of taxonomy. Characterize pediatric and adult CNS tumors. Differentiate between high-grade and low-grade gliomas. Correlate imaging and molecular features.

TABLE OF CONTENTS/OUTLINE

Imaging phenotypes of CNS Tumors. Gliomas imaging classification. Pediatric-type diffuse low-grade gliomas. Pediatric-type diffuse high-grade gliomas. Adult-type diffuse gliomas. Some new types of tumors according to molecular biomarkers. Modifications of new CNS tumors taxonomy. Differential diagnosis of CNS tumors.

NREE-2 Photon-Counting CT Applications in Neuroradiology

Awards
Certificate of Merit

Participants
Fides Schwartz, MD, Durham, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

Photon-counting computed tomography (PCCT) is a new CT technology. PCCT uses energy-resolving detectors, instead of integrating the entire x-ray signal (energy integrating detectors: EID), enabling spectral acquisitions without the need of specialized acquisition strategies (e.g., dual-source). PCCT records photons in different energy bins, starting at a minimum energy threshold, so electronic noise can be avoided altogether. PCCT detectors use a two-step conversion (x-rays to electrical signal), rather than the 3-step conversion EID (x-rays to light to electrical signal), and inherently have higher spatial resolution as no septa (to separate voxels) are needed. This project is geared toward introducing the emerging technology of PCCT to the RSNA neuroradiology imaging community. The details of this technology will be explained using diagrams of the physics principles, and examples of standard EID vs PCCT patient scans to demonstrate the performance of the new scanner system.

TABLE OF CONTENTS/OUTLINE

1. PCCT - Detectors a. Comparison of energy-integrating vs photon-counting detectors b. How is higher spatial resolution of PCCT achieved? 2. PCCT - Photon Binning a. How does photon binning work? b. How are energy thresholds defined? c. How do thresholds help with electronic noise? 3. PCCT - Spectral Data a. How is it always available? b. What can it be used for? 4. Clinical examples a. Temporal Bone - superior spatial resolution b. Brain without contrast - higher image contrast c. CTA - improved contrast conspicuity d. Myelograms - material decomposition capabilities

NREE-20 Retinoblastoma Management: Emphasis on RB-RECIST Criteria with MRI Correlation after Intra-arterial Treatment

Participants
Sevcan Turk, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Highlight the role of MRI and diffusion-weighted imaging in the evaluation of retinoblastoma treatment response.• Discuss the ultrasound and MRI correlation of the different treatment response types of retinoblastoma.• Discuss the pearls and pitfalls in interpreting ultrasound and MRI.

TABLE OF CONTENTS/OUTLINE

• Clinical presentation, genetics, and epidemiology from the ophthalmologist field of view: evaluation of retinoblastoma with orbital US, CT, and MRI.• Retinoblastoma classification: what radiologists need to know.• When Intra-arterial treatment is indicated and how we do it.• Overview of imaging characteristics of retinoblastoma after intraarterial treatment with emphasis on ultrasound- MRI correlation of the RB-RECIST criteria assessment.• Discuss type 0-IV tumor regression patterns with MRI correlate.• Discuss the role of diffusion-weighted imaging in the discrimination of treatment effect and tumor progression.• DCE and DSC perfusion, SWI value in treatment response assessment.• The role of MRI in the evaluation of extraocular extension, optic nerve invasion, post-treatment complications, and intracranial abnormalities.• Surveillance: radiation field, secondary tumors, and beyond the optic nerve.

NREE-21 CSF Circulation and Glymphatic System of the Spinal Cord

Participants
Shotaro Naganawa, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review CSF circulation in the spinal cord2. To review glymphatic system of the spinal cord3. To explore spinal cord diseases related to CSF circulation and glymphatic system in the spinal cord

TABLE OF CONTENTS/OUTLINE

CSF circulation in the spineGlymphatic-lymphatic fluid transport system of the spinal cordSpinal cord diseases related to CSF production, absorption, and loss (leakage)-CSF leakage and CSF venous fistulas -Hypersecretion of CSF after subarachnoid hemorrhageSpinal cord diseases related to CSF flow abnormality-Chiari malformation-Spinal canal stenosis-Amyotrophic lateral sclerosis (ALS)-Spinal web, spinal cord herniation Spinal cord diseases related to glymphatic system-Iatrogenic intrathecal Gd administration -Spinal neurosarcoidosis-Neuromyelitis optica-Presyrinx stateDrug delivery and glymphatic system-Spinal muscular atrophy -ALS and other neurodegenerative diseases

NREE-22 Deep Brain Stimulation (DBS) - Pre and Post Operative Imaging, From Adequate Nucleus and Fiber Tract Localization to Electrode Misplacement

Awards
Cum Laude

Participants
Leandro Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

This panel aims to guide a good quality exam acquisition for Deep Brain Stimulator (DBS) study, in both pre and post operative evaluations. It will be shown how to accurately localize the targets for DBS implantation in different scenarios, such as Parkinson Disease (PD), tremors, dystonias and obsessive-compulsive disorder (OCD), with images acquired on CT and MRI, these from 1,5T, 3T and 7T, correlating the electrode targets in each case with the anatomy and histology.To showcase the MRI and CT imaging protocols, with advanced sequences that are useful for evaluation, such as diffusion tensor imaging (DTI) and functional brain MRI, for each scenario (pre e post operative), its uses and limitations. Post operative protocol and images to assert possible structural reasons for clinical failure of the DBS procedure and electrode misplacement.

TABLE OF CONTENTS/OUTLINE

1 - pre operative study: 1.1 - indications, physiology of action, and scientifically proven improvement1.1.1 - PD, tremor and dystonias1.1.2 - OCD1.2 - anatomy of the targets:1.2.1 - histology1.2.2 - MRI 1,5T, 3T and 7T 1.3. - acquisition protocol:1.3.1 - CT1.3.2 - structural MRI: IR, T2, FGATIR, DP1.3.3 - functional MRI: DTI, fMRI2 - post operative study2.1 - acquisition protocol:2.1.1 - CT2.1.2 - MRI2.2 - imaging evaluation2.2.1 - electrode positioning2.2.2 - other possible structural causes of failure

NREE-23 Beyond Five Millimeters Below the Foramen Magnum: Exploring the Depths of the Chiari 1 Deformity

Participants
James Loftus, MD, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Define the proper nomenclature and terminology of the Chiari 1 and related deformities including 0/0.5 and 1.5 and how they differ in pathogenesis and embryology from the other subtypes (Don't call it a malformation!). 2. Detail the imaging evaluation of the Chiari 1 and related deformities including conventional and phase contrast magnetic resonance imaging. 3. Review surgical techniques and post-surgical imaging of the Chiari 1 and related deformities including expected findings and complications.

TABLE OF CONTENTS/OUTLINE

I. Review of the pathogenesis, embryology, nomenclature, and proper terminology surrounding the Chiari 1 and related deformities. a. Subtypes of the Chiari deformities (0-1.5) and malformations (2-5) and their pathologic and embryologic basis. b. Further description of the anatomic changes in Chiari 0/0.5, 1, and 1.5 compared to normal patients. II. Imaging evaluation of the Chiari 0/0.5, 1, and 1.5 deformities. a. Conventional brain and cervical spine MRI. i. Proper measurement of tonsillar herniation and controversies. ii. Clues to abnormal CSF flow dynamics on conventional MRI sequences (No phase contrast, no problem!). b. Phase contrast MRI (PC-MRI). i. Evaluating the re-phased image, magnitude image, and phase image. ii. Brief note on quantitative PC-MRI. III. Surgical techniques and post-surgical imaging and complications. a. Surgical techniques and expected post-surgical imaging findings including evaluation of the adequacy of decompression on PC-MRI. b. Post-surgical complications the radiologist must recognize.

NREE-24 Transfontanellar Ultrasound Beyond Hemorrhages In Infants

Participants
Pedro Da Silva, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Transfontanellar ultrasound (TFUS) has been increasingly used as a diagnostic and screening tool in pediatrics, even as a first-line imaging technique, due to its advantages over other imaging methods, especially for critical ill newborns, often unable to perform the other ones. In addition, ultrasound (US) is possible to be repeated whenever necessary, without harm to the patient. In this context, grey-scale, color and spectral Doppler assessment with TFUS plays an important role in the evaluation and screening of findings beyond hemorrhages in infants, including ventriculomegaly, cerebral ischemia and its progression, as well as cerebral blood flow patterns and complications related to the use of Extracorporeal Membrane Oxygenation (ECMO) in seriously ill children. Assessment of ventricular measurements in infants allows for rapid diagnoses, monitoring of ventricular dilatations in children who need several exams, and suggests early interventions, avoiding unnecessary and expensive additional imaging methods. Several US measurements of ventricular dimensions have been proposed and increasingly used in control and clinical or surgical decisions. Furthermore, due to the great impact on morbidity and mortality of hypoxic-ischemic encephalopathy in the neonatal population, the TFUS also plays an important role in the characterization and progression of ischemic lesions and their variations, such as ischemic lesion with hemorrhagic transformation.

TABLE OF CONTENTS/OUTLINE

· Review and discuss the advantages of transfontanellar ultrasound as an imaging method in infants· Discuss and understand ultrasound imaging and its sensitivity and specificity of intracranial findings beyond hemorrhages

NREE-25 Craniosynostosis and Craniofacial Malformations: A Radiological and Surgical Perspective

Participants
Jameson Da Silva, MD, Teresina, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss important anatomical features of craniosynostosis which have surgical implications and should be included in imaging reports.Consider the role of CT, especially with 3D reconstruction, in preoperative planning. Briefly describe main strategies of surgical approaches for craniosynostosis, with technique considerations relevant for the imaging specialist.

TABLE OF CONTENTS/OUTLINE

Summary- Introduction.- Relevant Anatomy.- Craniosynostosis classification and types.- Craniofacial malformations associated.- Imaging technique and protocol (Radiography, CT, conventional MRI and MRI angiography).- Imaging of normal and pathologic sutures.- Craniosynostosis clinical syndromes associated.- Postoperative follow-up imaging.- The different surgical options available for the treatment of different types of craniosynostosis.- Conclusions.- References.

NREE-26 One Side at a Time - Unilateral or Asymmetric Centroencephalic Lesions

Awards
Certificate of Merit

Participants
Samya Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Centroencephalic abnormalities can be detected on neuroimaging in a wide variety of pathological conditions. Bilateral and symmetrical alterations are well established in the literature, however, when we look at unilateral conditions, there is a gap in the systematization of the approach. Unilateral or asymmetric centroencephalic lesions will be addressed by an algorithm developed according to typical imaging patterns, such as diffusion restriction, SWI, expansive lesions and T1 contrast enhancement. The purpose of this exhibition is to:- Review anatomy and imaging aspects of the basal ganglia and thalamus;- List normal variations, common benign findings and main diseases that present by unilateral or asymmetric centrencephalic involvement;- Review of the main pathologies on a cased-based approach;- Organize the radiologic reasoning with an algorithm.

TABLE OF CONTENTS/OUTLINE

1. ANATOMY AND IMAGING- Basal ganglia and thalamus- Imaging techniques 2. DIFFERENTIAL DIAGNOSIS OF UNILATERAL/ASYMMETRIC CENTRENCEPHALIC LESIONS- Normal variants- Restricted diffusion- SWI- Volumetric alterations: enlargement and atrophy- T1 alteration: hypersignal, contrast enhancement and morphologic change.

NREE-27 Pediatric Neurodegenerative Diseases: Pathophysiology and Neuroimaging Features

Awards
Certificate of Merit

Participants
Ryo Kurokawa, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this review is to1. Understand the concept of pediatric neurodegenerative disorders (pedND)2. Demonstrate the brain imaging findings of pedND3. Show how clinical features can contribute to the diagnosis of pedND

TABLE OF CONTENTS/OUTLINE

1. Overview and definition of pedND2. Triplet Repeat Disease: Huntington disease (HD), Myotonic dystrophy type 1 (DM1), Spinocerebellar ataxia (SCA) type 1, SCA2, SCA3/Machado-Joseph disease (MJD), SCA7, SCA17, Fragile X syndrome (FXS), Friedreich's ataxia (FRDA)3. Autosomal Dominant: HD, DM1, SCA1, SCA2, SCA3/MJD, SCA7, SCA174. Autosomal Recessive: FRDA, Ataxia with Oculomotor Apraxia type 1 (AOA1), AOA2, Autosomal recessive spastic ataxia of Charlevoix-Saguenay (ARSACS), Ataxia telangiectasia (AT), Marinesco-Sjogren syndrome (MSS), Ataxia with vitamin E syndrome (AVED), Progressive myoclonus epilepsy type 1 (EPM1), Chorea-acanthocytosis (CHAC)5. X-linked: FXS, X-linked Charcot-Marie-Tooth disease (CMTX1)6. Cerebellar ataxia in pedND7. Diseases associated with secondary neurodegeneration: Amino acid metabolism disorders, Urea cycle disorders, Carbohydrate metabolism disorders, Mitochondrial disorders, Lysosomal storage disease, Peroxisomal disorders, Metal metabolism disorders Summary1. PedND have diverse pathomechanisms.2. Some pedNDs have pathognomonic radiological features that can help in differentiation.3. Clinical features can help diagnose pedNDs, especially when radiological findings are similar to others.

NREE-28 Neuroimaging of Hypophysitis: Anatomy, Etiology, Pathology, and Imaging Mimics

Participants
Ryo Kurokawa, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:1. To review the embryology and anatomy of the pituitary gland2. To summarize the various etiologies and pathologies of hypophysitis and the mimics3. To demonstrate how neuroimaging contributes to the diagnosis of hypophysitis

TABLE OF CONTENTS/OUTLINE

Outline1. The embryology and anatomy of the pituitary gland 2. Etiology, epidemiology, pathology and clinical features of hypophysitis 3. Neuroimaging findings in hypophysitis- Lymphocytic hypophysitis- Granulomatous hypophysitis (primary or secondary: Crohn D, sarcoidosis, , GPA, tuberculosis, fungal infection)- Plasmacytic/immunoglobulin G4-related hypophysitis- Xanthomatous hypophysitis- Necrotizing hypophysitis- Immune checkpoint inhibitor-related pituitary adverse effects: isolated adrenocorticotropic hormone deficiency, hypophysitis- Anti-pituitary-specific transcriptional factor (PIT)-1 antibody-related hypophysitis- Differential diagnosis: pituitary adenoma, pituicytoma, pituitary blastoma craniopharyngioma, metastasis, lymphoma, histiocytosis, germ cell tumor, abscess

NREE-29 Diversity of Hyperammonemia-associated CNS Abnormalities: Pathophysiology and Neuroimaging Features

Participants
Ryo Kurokawa, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibit is to1.Review the various causes and mechanisms of hyperammonemia2.Demonstrate the imaging characteristics associated with the causes of hyperammonemia3.Show how clinical features can contribute to a diagnosis

TABLE OF CONTENTS/OUTLINE

Content organization1. Introduction-Mechanisms of hyperammonemia-Mechanisms of hyperammonemic encephalopathy 2. High ammonia production-Infection: Urease-producing bacteria (Proteus, E-coli, Klebsiella)-Increased protein load: Gastrointestinal bleeding, Total parenteral nutrition-Elevated catabolism: Exercise, Seizure/ Eclampsia, Trauma/Burn 3. Portosystemic shunt-Cirrhosis-Neoplasm-Congenital: Congenital portosystemic shunt syndrome, Noonan syndrome-Transjugular intrahepatic portosystemic shunt (TIPS) 4. Metabolic disorders-Congenital: Urea cycle disorders, Organic acidemias, Fatty acid oxidation disorders, Mitochondrial diseases-Drugs: Valproic acid, Acetaminophen, Carbamazepine, 5-Fluorouracil (5-FU), etc. 5. Decreased urine excretion-Renal failure-Urinary retention 6. MiscellaneousMultiple myeloma 7. Summary1. Various etiologies cause hyperammonemia and its associated CNS manifestations2. Knowledge of neuroimaging features and clinical findings helps in diagnosis and appropriate management

NREE-3 Clinical Applications of MR Spectroscopy in the Era of Molecular and Genetic Diagnosis and Treatment

Awards
Magna Cum Laude

Participants
Mariko Kurokawa, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understand the basic principle of MRS: the methodology to acquire the spectrum of chemical shifts• Describe main pathologies related to common metabolites found in MRS as well as novel genetic markers such as SDHB mutation and IDH mutation• Identify the common and uncommon MRS findings, especially focusing on metabolic diseases and their differential diagnoses.

TABLE OF CONTENTS/OUTLINE

1. IntroductionPhysics and methodology2. Pathologies related to common and uncommon metabolitesN-acetyl aspartyl glutamate (NAA), Creatine, Choline, Myo-inositol, Gamma-aminobutyric acid (GABA), Glutamine/glutamate, Lipid, Lactate, Taurine, Glycine, Alanine, Succinate, and 2-HG3. Metabolic diseasesMitochondrial diseases, arginase deficiency, Salla disease, Sandhoff disease, nonketotic hyperglycinemia, Phenylketonuria, Canavan disease, Creatine transporter deficiency, and maple syrup urine disease4. Hypoxic ischemic encephalopathy5. Demyelination diseases (multiple sclerosis, acute disseminated encephalomyelopathy)6. Tumors (low-grade gliomas, high-grade gliomas, medulloblastomas, and other malignant tumors)7. Genetic diseasesVanishing white matter disease, Alexander disease, Adrenoleukodystrophy8. Summary

NREE-30 An Unusual Relation: A Walk to Remember, Neurological Manifestations of Inflammatory Bowel Disease, An Underdiagnosed Pathology

Participants
Angela Sosa, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

After reviewing this exhibit, you will be able to: Describe the neurological disorders associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. Understand the mechanisms involved in the pathophysiology of these manifestations. Recognize the most common imaging findings in central and peripheral nervous system manifestations of patients with inflammatory bowel diseases.

TABLE OF CONTENTS/OUTLINE

1. Neurological complications of inflammatory bowel diseases 1.1 Epidemiology 1.2 Pathophysiology 2. Imaging findings of central and peripheral nervous system manifestations of inflammatory bowel diseases. 2.1 Cerebrovascular: Stroke, vasculitis, and Cerebral venous thrombosis.2.2. Demyelinating2.3. Asymptomatic white matter lesions2.4. Peripheral neuropathy2.5. Toxic treatment-related3. Other central nervous systemsComplications.3.1. Dementia3.2. Headaches3.3 Encephalopathy

NREE-31 Imaging of Cranial Nerve Disorders in Pediatric and Adult Patients

Participants
Minako Azuma, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. In pediatric and adult patients, a wide variety of diseases are related to cranial nerves, including tumors, inflammations, vascular, and so on. 2. It is necessary for radiologists to know typical and atypical radiological findings of cranial nerve disorders. 3. Radiologists have to select the best imaging modality and protocol for the detection of lesions.

TABLE OF CONTENTS/OUTLINE

1. Anatomy of cranial nerves (1) Locations, structure, and function (2) Foramina related to cranial nerves 2. Techniques for the imaging of cranial nerve disorders (1) CT (2) MRI 3. Cranial nerve disorders (1) Tumor Schwannoma Optic nerve sheath meningioma Optic nerve glioma Olfactory neuroblastoma AT/RT(atypical teratoid/rhabdoid tumor) Malignant lymphoma Leukemia Metastasis / Dissemination (2) Inflammation Optic neuritis Neuromyelitis optica spectrum disorder (NMOSD) Myelin oligodendrocyte glycoprotein (MOG) antibody-associated disease Multiple sclerosis IgG4 related disease Tolosa-Hunt syndrome Bell’s palsy Sarcoidosis HTLV-1 Cerebrotendinous Xanthomatosis (3) Hemorrhage Superficial siderosis (4) Secondary compressive disorders a) Orbital and sellar-suprasellar mass b) Neurovascular compression and aneurysm c) Thyroid orbitopathy (5) Toxic neuropathy (6) Congenital (7) Vascular Carotid-cavernous fistula Dural arteriovenous fistula Dural sinus thrombosis Acute cerebral infarction 4. Take home points 5. References

NREE-33 Top 7 Must Know Movement Disorders: Imaging with Clinical Videography Correlation

Participants
Leslie Starkey, MD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnosis of movement disorders is challenging due to the varied clinical manifestations and heterogeneity, so the integration of imaging and clinical features plays an extremely important role.We have selected seven important movement disorders and provide multidisciplinary learning by introducing their imaging and clinical manifestations through a series of unknown cases followed by a clinical discussion including videos.In addition to important imaging manifestations, in collaboration with a neurologist, we present the typical diagnostic criteria and clinical examination findings that would be useful for radiologists to understand, such as the ataxia findings in spinocerebellar ataxia.

TABLE OF CONTENTS/OUTLINE

1. Amyotrophic lateral sclerosis imaging findings, followed by clinical pearls with video demonstration.2. Multiple system atrophy imaging findings, followed by clinical pearls with video demonstration.3. Spinocerebellar ataxia imaging findings, followed by clinical pearls with video demonstration.4. Huntington disease imaging findings, followed by clinical pearls with video demonstration.5. Fahr disease imaging findings, followed by clinical pearls with video demonstration.6. Creutzfeldt-Jakob disease imaging findings, followed by clinical pearls with video demonstration.7. Wilson disease imaging findings, followed by clinical pearls with video demonstration.

NREE-34 Visual Summary of the 2021 WHO Central Nervous System Tumor Classification

Awards
Certificate of Merit

Participants
Neiladri Khan, DO, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The 2021 WHO Classification of Tumors of the Central Nervous System (CNS) is the fifth edition of the classification system, and it succeeds the fourth edition released in 2016.The 2021 classification incorporates changes in diagnostic principles, with a particular emphasis on the molecular profiling of tumors.A description of the new diagnostic principles, along with visual examples and graphics demonstrating their significance. We include two peculiar cases of IDH wild-type gliomas from our home institution which benefit from the new classification system.In addition to changes in diagnostic principles, several tumor-specific changes were also made. There are now also several entirely new tumor entities.The new concept of layered pathological reporting, and the impact of this new system on radiologists.

TABLE OF CONTENTS/OUTLINE

Title page - Disclosures - Introduction to the WHO classification system - Objectives - Brief overview of what is new in the 2021 update - Radiological and pathological visual examples of changes made to the diagnostic principles - IDH wild-type glioma, home institution interesting case 1 - IDH wild-type glioma, home institution interesting case 2 - Graphic rendition of changes made to specific tumor types - Introducing and explaining the concept of integrated diagnoses and layered reports, and what these changes mean for the radiologist - Conclusion - Biography

NREE-35 Genetics and Epigenetics of Brain Tumors for Radiologists

Awards
Certificate of Merit

Participants
Gabriela Bandeira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- To review the oncogenesis of primary brain tumors.2- To understand the main molecular pathways involved in primary brain tumors.3- To integrate the oncogenesis knowledge with the new molecular parameters from the 5th edition of the WHO Classification of Tumors of the Central Nervous System (WHO CNS5).4- To review the phenotypic and the genotypic key features of some primary brain tumors (radiogenomics).

TABLE OF CONTENTS/OUTLINE

1- Introduction2- Oncogenesis in CNSFundamental ConceptsCell CycleLigands and ReceptorsCyclin-Dependent Kinases (CDKs)Cellular Signaling Pathways involved in brain tumorsEpigenetics : Histone modifications, DNA Methylation4- New molecular parameters from the 5th edition of the WHO Classification of Tumors of the Central Nervous System (WHO CNS5).5- Illustrative cases of primary brain tumors with confirmed genetic and epigenetic profiles.6- Take-home messages7- Conclusion8- References

NREE-36 Intracranial Cystic-appearing Images More than a Simple Find

Participants
Eugenio Cézar Rocha Santos Filho, SAO PAULO, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:To show different types of diseases that have cystic presentation. To demonstrate sites that are typically affected by each disease To help expand the differential diagnoses through the distinct imaging patterns of cystic lesions by a pictorial essay.

TABLE OF CONTENTS/OUTLINE

Overview of all pathologies and their division by etiologyCongenital:Arachnoid cyst: different locations and sizesEctodermal Inclusion CystsDermoid cystEpidermoid cystWhite epidermoide cystNeuroglial cystBlake pouch cystRathke's cleft cyst Corpus callosum agenesis and interhemispheric cystChoroid plexus cystChoroidal fissure cystColloid cysts of the third ventriclePineal cystsPerivascular spaces and its associationInfectious:Viral:CytomegalovirusBacterial:NeurosyphilisNeurotuberculosisAbscessProtozoaNeurotoxoplasmosisParasiticNeurocysticercosisChagas diseaseFungiAspergillosisNeurocryptococcosisNeoplastic:Intra-axial:Multinodular and vacuolating neuronal tumorDysembryoplastic neuroepithelial tumors (DNET)Primitive neuroectodermal tumors (PNET)Multinodular and vacuolating neuronal tumorCentral neurocytomaEpendymomaHemangioblastomaGliomasGangliogliomaMedulloblastomaMetastasis Extra-axial:MeningiomaSchwannomaMacroadenomaCraniopharyngiomaHemangiomaGerminomas Pineal tumorsDemyelinating:Demyelinating pseudotumorBalo diseaseOthersCobblestone malformationHypomelanosis of ItoMegalencephalic leukoencephalopathy with subcortical cystsPorencephalic cyst

NREE-37 Posterior Circulation Stroke: How Much Do You Know About It?

Participants
Celia Alonso, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The objective of this educational exhibit is to shine a light on the acute management of vertebrobasilar stroke. Therefore, after reading it, the reader will: -Comprehend the epidemiology of vertebrobasilar strokes, their clinical presentation and etiology depending on the affected anatomical territory. -Learn the indications and limitations of imaging techniques in posterior circulation strokes, as well as their most frequent imaging features. -Know how to apply the two most important imaging prognostic scores in large vessel occlusions: pc-ASPECTS and BATMAN.

TABLE OF CONTENTS/OUTLINE

-Introduction. -Clinical considerations: its symptoms are frequently non-focal, overlap with those of anterior circulation strokes and simulate other neurological conditions ('stroke chameleons'), which usually leads to delayed diagnosis. -Etiology of posterior circulation strokes: ASCOD and topographic classification. -Vertebrobasilar anatomy, relevant variants shown with images. -Imaging techniques: indications, limitations and semiology. Imaging prognostic scores in large vessel occlusions: pc-ASPECTS and BATMAN. Its application will be shown using real cases. -All possible clinical scenarios (small, medium-sized and large vessel disease) will be shown with real cases studied with multimodal CT and/or brain MRI from our institution. -Treatment considerations. -Conclusion.

NREE-38 Imaging Cerebrospinal Fluid Hypotension: Cerebrospinal Fluid Fistula Hyper-knowledge

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the most common symptoms related to cerebrospinal fluid (CSF) hypotension. To demonstrate the imaging aspects of spontaneous intracranial hypotension, a well-recognized entity. To explain that depicting the CSF leak location is the radiologist´s goal, allowing effective treatment. To show that CSF leak imaging can be challenging and often misdiagnosed, leading to severe CSF hypotension.

TABLE OF CONTENTS/OUTLINE

1. Revision of epidemiology and clinical presentation, including headache, rhinorrhea, and severe CSF hypotension. 2. Etiologies of intracranial hypotension and CSF leaks, including surgery and trauma. 3. Imaging strategies and findings of CSF leaks, including MRI and CT myelography assessment. 4. MRI vs. CT cisternography in the assessment of CSF fistulas. 5. CT myelography in the assessment of spinal CSF fistulas. 4. Differential diagnosis of CSF hypotension. 5. Treatment options: epidural blood patches and surgery. 6. Take-home messages.

NREE-39 Ultrahigh-resolution CTA of the Brain as a Tool for Pre- and Postoperative Imaging

Participants
Miho Gomyo, Miraka, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn the basic principles and characteristics of ultrahigh-resolution CT. 2. To learn the kinds of image denoising reconstruction processing and understand their characteristics. 3. To learn the clinical importance of small arteries such as cortical arteries and perforators depicted by ultrahigh-resolution brain CTA.

TABLE OF CONTENTS/OUTLINE

1. Basic principles and characteristics 2. Image denoising reconstruction processing: FBP (filtered back-projection), hybrid IR (iterative reconstruction), full IR and deep learning reconstruction 3. Imaging anatomy and clinical importance the following arteries: cortical arteries, branches of main arteries and perforating arteries 4. Clinical application to preoperative and postoperative images: aneurysm, infectious aneurysm, dissecting aneurysm, arteriovenous malformation, moyamoya disease, arterial stenosis, temporal arteritis, superficial temporal artery-middle cerebral artery bypass and brain tumor

NREE-4 Dural and Leptomeningeal Diseases: Anatomy, Etiology, and Neuroimaging

Awards
Identified for RadioGraphics

Participants
Ryo Kurokawa, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

This review summarizes the clinical and radiological findings of dural and leptomeningeal diseases caused by various etiologies.

TABLE OF CONTENTS/OUTLINE

OutlineI. Overview of dural and leptomeningeal diseasesAnatomyEtiologyRecommended workupsII. Content-Idiopathic-Infection: tuberculosis, syphilis, fungi, Lyme disease, HTLV-1, Q feverAutoimmune: ANCA-related vasculitis, PCNSV, sarcoidosis, systemic lupus erythematosus, rheumatoid arthritis, Behçet’s disease, Sjogren’s disease, Vogt-Koyanagi-Harada disease, inflammatory bowel disease, SAPHO syndromeLymphoproliferative: POEMS syndrome and lymphomaNeoplasm: metastasis (breast cancer, lung cancer, melanoma, gliomatosis), leukemia, medulloblastoma, multiple myeloma, meningioma-Histiocytosis: Erdheim-Chester disease, Rosai-Dorfman disease, Langerhans cell histiocytosis, juvenile xanthogranulomaIntracranial

hypotension: lumbar puncture, CSF leak, CSF shunting, craniotomyMiscellaneous: Multiple sclerosis, amyloidosis, and neurocutaneous melanosis III. Summary1. Various entities cause the development of dural and leptomeningeal diseases.2. Clinical and radiological findings can help in the diagnosis of the etiology.3. Appropriate workup can lead to timely diagnosis and management.

NREE-41 Don't Tense About It: MRI Findings of Idiopatic Intracranial Hypertension and Intracranial Hypotension

Participants
Ana Paula Fonseca, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

This review focuses on the imaging of idiopathic intracranial hypertension and spontaneous intracranial hypotension. Both have salient imaging findings that are important to recognize to help prevent their misdiagnosis from other neurological disorders.This panel aims to: Review the pathophysiology of these two important intracranial pressure disordersDiscuss and illustrate their imaging patternsDescribe through illustrative cases the scenarios for diagnosis, typical imaging patterns, unexpected findings and red flags that aid the diagnosis

TABLE OF CONTENTS/OUTLINE

Pathophysiology of these two ICP disorders: Idiopathic intracranial hypertension and spontaneous intracranial hypotension Definition The Monro-Kellie doctrine Main causes Clinical syndrome Imaging findings Spontaneous intracranial hypotension Brain swelling Distension of the venous sinuses Bilateral subdural collections Dural thickening and enhancement Enlarged pituitary Flattened pons Inferior displacement of the third ventricle Sagging brain Idiopathic intracranial hypertension Partially empty sella turcica Distension of the optic nerve sheath CSF space Increased vertical tortuosity of the optic nerve Flattening of the posterior sclera/ intraocular protrusion of the optic nerve head Cerebellar tonsilla ectopia Meningoceles Hypoplastic and/or stenosis of the venous sinusProeminence of the occipital emissary vein Associated Conditions Superficial Siderosis Ventral Epidural Collection Venous Sinus Thrombosis Pituitary Apoplexy Mimickers Chiari Type I Malformation Subdural Fluid Collections or HematomasOther Conditions with Dural Thickening Red flags and diagnostic tips Diagnostic ApproachFinal remarks

NREE-42 Quantitative Susceptibility Mapping: Overview and Applications

Participants
Alexey Dimov, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Quantitative susceptibility mapping (QSM) is an automated technique that post-processes three-dimensional (3D) gradient echo phase images to depict local tissue magnetic properties, which are blurred in conventional MRI sequences, such as T2w, T2*w and phase images.QSM makes use of the already acquired phase data, does not add scan time, and can be easily integrated into the clinical workflow.QSM provides superb contrast-to-noise ratio (CNR) for depicting deep gray nuclei that are rich with iron, which is useful for precise guidance of deep brain stimulation.QSM provides high fidelity and quantitative measurements of iron in proinflammatory activated microglia in neuroinflammatory disorders, such as in multiple sclerosis, Parkinson's disease, Alzheimer's disease.QSM allows unambiguous differentiation of diamagnetic calcification from paramagnetic iron such as in microbleeds.

TABLE OF CONTENTS/OUTLINE

1. Revision of the basic physics of tissue magnetism, gradient echo data, and phase post-processing for QSM2. Description of how QSM can be used to measure iron overloading in neurodegenerative diseases, such as Parkinson's disease.3. Overview of how QSM can be used to define deep brain stimulation targets.4. Synopsis of how QSM can be used to eliminate gadolinium injection in MRI monitoring of multiple sclerosis (MS) patients and to adjust therapy to measure chronic lesion activity for improved patient care.5. Summary of how QSM processing of phase plus quantitative blood oxygenation level dependent (qBOLD) modeling of magnitude can enable oxygen extraction fraction (OEF) mapping from the widely available multiecho gradient echo data without vascular challenge.

NREE-43 Applications of MR Bone Imaging to Vertebral Lesions

Participants
Kazuhiro Tsuchiya, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn basic concepts and technical aspects of bone imaging like CT by MRI.2. To know how MR bone images depict the normal vertebra and adjacent structures compared with CT.3. To know the differences, especially the advantages, of MR bone images from CT and conventional MR images in miscellaneous vertebral lesions.

TABLE OF CONTENTS/OUTLINE

1. Basic issues of MR bone imaging including currently employed scanning sequences and postprocessing methods.2. Characteristics of MR bone images of the normal vertebra, placing emphasis on the difference from conventional MR images as well as CT.3. Presentation of clinical cases with discussion of implications. Cases will cover spine degeneration (Modic changes), neoplastic lesions including primary and metastatic vertebral tumors, inflammatory changes such as spondylitis, vertebral fractures, and so on.4. Additional discussion including current limitations as well as future directions of this technique.

NREE-44 Synthetic MRI, STAGE, and MR Acceleration through Deep-Learning: A Comparison of Time-Efficient MR Techniques in Neuroimaging

Awards
Certificate of Merit

Participants
Marc Von Reppert, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To provide a structured overview of main approaches to shortening neuroimaging protocols.2. To review recent developments in the field: STAGE, synthetic MRI and Deep Learning-based image enhancement.3. To provide an understanding of current applications and perspectives for clinical use.4. To highlight current shortcomings of these techniques and potential remedies.

TABLE OF CONTENTS/OUTLINE

Background: Highlighting the need for Time-Efficient MRI // Overview of Rapid Imaging Techniques // Synthetic MRI: Acquisition // Comparison of IRTrueFISP, MPME and QRAPMASTER // Application in MS and CNS Tumors // Summary // STAGE: Acquisition // AI-based Automated Microbleed Detection // STAGE for different clinical applications // Summary // DL-based Reconstruction: Introduction and Workflow // Example Case // Introduction of Uncertainty Estimation in Image Enhancement // Outlook // Take Home Points

NREE-45 Implementing Perfusion Protocols for Tumor Differentiation and Analysis of Post-Treatment Changes into Busy Clinical Practice

Participants
Christopher Atkins, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the fundamentals of MR perfusion and applications in Neuro-Oncology2. To review protocol considerations for clinical applications concerning image acquisition, processing, and analysis.3. To review the current developments in standardization efforts for perfusion imaging.

TABLE OF CONTENTS/OUTLINE

I. Review the fundamentals of perfusion imaging including explaining techniques of dynamic susceptibility contrast MRI, dynamic contrast enhanced MRI, and arterial spin labelling as well as highlighting their strengths and pitfalls.II. Review various clinical applications of MR perfusion including differentiation of tumor recurrence from radiation necrosis, distinction of different tumors, and differentiation of cerebral tumor entities using clinical examples.III. Review protocol considerations for each technique including technical requirements and choice of labeling approach.IV. Review the current standardization efforts for MR perfusion protocols.

NREE-46 Reversible Restricted Diffusion Lesions in Excitotoxic Brain Injury and Acute Ischemic Stroke

Participants
Yun Young Lee, Gwangju, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the etiologies of excitotoxic brain injury and its pathomechanisms.2. To review the reversible diffusion weighted imaging lesions in acute ischemic stroke and its clinical implications.

TABLE OF CONTENTS/OUTLINE

1. Introduction- The importance of diffusion weighted imaging (DWI) in the neuroimaging area and the basic mechanisms of diffusion restriction.- Representative etiologies of diffusion restriction2. Reversible restricted diffusion lesions in excitotoxic brain injury- Review the pathomechanisms of excitotoxic brain injury- Possible explanations for reversible diffusion restriction in excitotoxic brain injury- Case based review: toxic, metabolic, trauma, seizure, infection3. Reversible restricted diffusion lesions in acute ischemic stroke- A systematic review the literature for reversible restricted diffusion lesions in acute ischemic stroke- Clinical implications of reversible diffusion restriction in acute ischemic stroke and plausible mechanisms- Permanent reversible diffusion restriction- Transient reversible diffusion restriction4. Summary

NREE-47 Multi-modality Imaging of Skull Base Tumors and Tumor-like Lesions

Participants
Justin Caskey, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Basic skull base anatomy and anatomic landmarks relevant to the evaluation of skull base tumors and tumor-like lesions.2. Common skull base tumors and tumor-like lesions.3. Practical benefit of multi-modality imaging evaluation of skull base tumors and tumor-like lesions.Skull base pathology represents an often-challenging topic in neuroradiology. Anatomically, the skull base is a complex space formed by the ethmoid, sphenoid, occipital and paired frontal and temporal bones. Contained within and traversing through the skull base are critical neurovascular structures which must be carefully considered at radiologic evaluation. In many cases, multi-modality imaging, including perfusion weighted imaging, diffusion weighted imaging, and positron emission tomography, can provide a useful adjunct to standard neuroimaging techniques (CT, MRI) in evaluation of skull base pathology.

TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Review of basic skull base anatomyIII. Brief overview of diffusion and perfusion imaging and positron emission tomographyIV. Case based examples of multi-modality imaging of skull base pathologya. Bone metastases from various primary sites, lymphoma, rhabdomyosarcomab. Primary bone tumor, chordoma, chondrosarcoma, giant cell tumorc. Skull base invasion from carcinoma, pituitary adenoma, meningiomad. Inflammatory pseudotumore. Bacterial and fungal osteomyelitisf. Benign tumor-like lesions, cholesterol granuloma, cholesteatoma, notochord origin lesion

NREE-48HC Imaging features of Diffuse Pediatric-type High-grade Glioma, H3-/IDH-wildtype, and Diffuse Hemispheric Glioma, H3 G34-Mutant

Participants
Andrew Chang, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diffuse pediatric high-grade gliomas (pHGG) are a heterogeneous group of brain tumors comprising 3-15% of all pediatric CNS tumors. In the 2021 WHO Classification of tumors of the CNS, two new subtypes of pHGG have been added to reflect the unique molecular features underlying each tumor: (1) diffuse pediatric-type high-grade glioma, H3-wildtype and IDH-wildtype (DPHGG H3/IDH-wt), and (2) diffuse hemispheric glioma, H3 G34-mutant (DHG H3G34M). This educational exhibit highlights the key MR imaging features of the two new tumor subtypes with emphasis on unique feature of each subtype that may aid in differential diagnosis.DPHGG H3/IDH-wt and DHG H3G34M demonstrate similar MRI features to other pHGGs, with low T2, high T2, and high FLAIR signal intensities, restricted diffusion, and variable enhancement pattern. Distinct features of DPHGG H3/IDH-wt include its propensity for frank intratumoral hemorrhage resulting in extensive edema, mass-effect, and hydrocephalus. In contrast, DHG H3G34M rarely develops hemorrhage and instead demonstrates cyst-and-nodule morphology with minimal surrounding edema or mass-effect.

TABLE OF CONTENTS/OUTLINE

[I] Overview of 2021 WHO Classification of diffuse pediatric-type high-grade gliomas. [II] Summary of key molecular genetic classification schemes. [III] Characteristic MRI features of diffuse pediatric-type high-grade gliomas (a) DPHGG H3/IDH-wt (b) DHG H3G34MPlease visit the Learning Center to also view this presentation in hardcopy format.

NREE-5 Multimodality Imaging of Typical and Atypical Pilocytic Astrocytomas with Pathological Correlations

Participants
Toshio Moritani, MD,PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To demonstrate imaging findings of typical and atypical pilocytic astrocytomas using multimodal imaging including CT, MRI, diffusion, perfusion (DSC and DCE), APTw, MR spectroscopy and PET. -To learn genetic and oncogenic pathways of tumor development of pilocytic astrocytoma with or without NF1 -To discuss the pathological correlation

TABLE OF CONTENTS/OUTLINE

-Genetic and oncogenic pathways: tumor development of pilocytic astrocytomas with or without NF1-Pathology: microcystic change, myxoid degeneration, Rosenthal fiber, pilocytic variants such as diffuse variant or pilomyxoid astrocytoma -Multimodal Imaging and imaging techniques: CT, MRI, diffusion, perfusion (DSC and DCE), APTw, MR spectroscopy and PET Classically high ADC values, while high grade gliomas and embryonal tumors show lower ADC. Relatively wide range of ADC values in PAs. Classically low rCBV and rCBF and high K2 on DSC, and low VP, high VE, and partially high Ktrans on DCEIncreased choline and lactate peak on MRS which can be a pitfall of the diagnosis. APT maps often show high values for PA even this is low grade tumor. -Case presentations:Typical findings: Well-defined infratentorial cystic lesion with enhancing mural nodule and supratentorial enhancing mass, with facilitated diffusion, high ADC value, typical perfusion pattern, increased APTw Atypical findings: unusual locations, non-enhancing, exophytic, hemorrhagic, multicenteric/dissemination, relatively low ADC value, atypical perfusion pattern. Pediatric versus adult cases NF1 versus non NF1 Differential diagnosis

NREE-50 Pictorial Depiction of a Lexicon Based Approach to BT-RADS

Participants
Ankush Jajodia, MD, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Background: Imaging evaluation of brain tumor patients is challenging since imaging findings of tumor development and treatment-related alterations overlap significantly. The accurate interpretation of these tumors causes significant inter-observer variability going to tumor heterogeneity, especially in complex circumstances. Imaging evaluation of brain tumors with MRI plays a crucial role in managing these patients, who face poor survival [median 15 months]. A structured reporting system (BT-RADS) aims to increase uniformity among radiologists. The need for a structured glioma surveillance reporting system with a standardized management-based suggestion, which has the potential to improve clinical interpretation and facilitate more effective patient communication, has already been voiced. There has been a dearth of lexicon depiction and illustration in the literature review. Clinical relevance:A standardized reporting system with the BT-RADS is encouraged using the various sequence-based lexicon. The published lexicon and report template will improve the completeness and accuracy of generated reports.

TABLE OF CONTENTS/OUTLINE

Characterize lexicon on MRI using BT-RADS Review case examples using the BT-RADS descriptive parameters.

NREE-51 Stepwise Application of RANO Criteria on Follow-up Imaging and Treatment of Gliomas: A Guide for Residents

Awards
Certificate of Merit

Participants
Thurl Hugh Cledera, MD, Taguig, Philippines (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gliomas are the most common intra-axial tumor of the central nervous system, among which the most common type is glioblastoma, which incidentally is a highly aggressive tumor. Imaging plays a pivotal role in the management of glioblastomas; hence guidelines have been developed to facilitate the interpretation of studies from pre-treatment studies down to post-surgical and post-radiation changes, one of which is known as the Response Assessment in Neuro-Oncology (RANO) Criteria. The criteria are broken down to complete response, partial response, stable disease, and progressive disease must be applied to all post-treatment glioma cases to guide therapy. Pseudoprogression and pseudoresponse are necessary to distinguish from the standard response criteria as they will have an effect on the treatment and follow-up of patients.

TABLE OF CONTENTS/OUTLINE

1. Introduction and Background 2. Step 1: Confirm Patient History and Treatment 3. Step 2: Know the Natural Course and Management of Glioblastoma 4. Step 3: Identifying Lesions 5. Step 4: Identifying Response Criteria a. Complete Response b. Partial Response c. Stable Disease d. Progressive Disease 6. Step 5: Check for Imaging Pitfalls a. Pseudoprogression (Post-surgical, Post-radiation, Post-chemotherapy) b. Pseudoresponse (VEGF Therapy)

NREE-52 Uncertainty Estimation in Auto-Segmentation and Image Reconstruction Tasks

Awards
Certificate of Merit

Participants
Marc Von Reppert, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To provide a structured overview of the concept of uncertainty estimation (UE) in the context of Machine Learning and Deep Learning.2. To summarize and review different approaches to measuring uncertainty.3. To provide a perspective on current applications of UE in the literature of neuroimaging in tasks like segmentation and image enhancement.4. To highlight sources of uncertainty in neuroimaging and provide an outlook on potential developments in the field.

TABLE OF CONTENTS/OUTLINE

1. Principles of Uncertainty Estimation: // Background: Understanding Uncertainty // Background: Machine Learning and Deep Learning // Types of Uncertainty // Methods of Measuring Uncertainty2. Application of Uncertainty Estimation in Neuroimaging: // Summary of Current Neuroimaging Applications // Brain Anatomical Segmentation // Brain Tumor Segmentation // Image Super-Resolution and Denoising // Collection of Publications3. Take Home Points

NREE-53 Diffusion Weighted Imaging in the Spine: A Magic Key

Awards
Certificate of Merit

Participants
Mahmoud Shalaby, MD, Lansdowne, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Illustrate the role of diffusion weighted imaging (DWI) in spine infectious, neoplastic, and inflammatory disease2- Demonstrate the role of DWI in spine trauma and degenerative disease3- Emphasize the role of DWI in spinal cord ischemia4- Highlight the challenges of spine DWI acquisition5- Discuss technical tips and considerations for protocol optimization for 1.5T and 3T MRI

TABLE OF CONTENTS/OUTLINE

- Clinical applications of DWI in common spinal pathologies:o Infectious and inflammatory diseaseo Primary and metastatic spine tumorso Degenerative diseaseo Traumao Spinal cord ischemiao Compression fractureso Demyelinating disease- Challenges of spine DWI acquisition- Protocol optimization with practical tips to improve spine DWI for 1.5T and 3T MRI

NREE-54 Amide Proton Transfer Weighted Imaging (APTwi) in Brain Tumors: A Pictorial Review

Awards
Magna Cum Laude

Participants
Guillaume Hamon, MD, Rennes, France (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aims of this exhibit are:1. To describe the basic theory and advantages of the APTwi technique2. To illustrate brain tumors and differential's features in APTwi3. To highlight and discuss potential pitfalls in APTwi4. To review the current clinical applications of APTwi in neuro-oncology

TABLE OF CONTENTS/OUTLINE

I. Understanding the APTwi technique1. Introduction to the Chemical Exchange Saturation Transfer (CEST) technique2. Basic physical principles of the amide-CEST contrast, so-called APTwi3. Technical consideration and limitations4. Image analysisII. Brain tumors, tumor mimics pitfalls in APTwi: an image-based approach1. Why to image amide protons in brain tumors?2. Primary and secondary brain tumors3. Tumor mimics4. Potential pitfalls in technique and image interpretationIII. Clinical applications of APTwi in neuro-oncology1. Main current published clinical applications of APTwi to image brain tumors2. Ongoing research and potential perspectives

NREE-55 Imaging Abnormalities Associated With Pediatric Pituitary Disorders

Participants
Yun Song Choo, MBBS, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The pituitary gland occupies a small footprint in terms of volume within the cranium, but pathologies arising from or involving it can have profound and long-lasting effects on the growth and development of the pediatric patient. It is hence important to appreciate the range of abnormalities in the pituitary gland and sellar region arising from both congenital and acquired pathologies that may be seen on neuroimaging studies. In this education exhibit, we revisit the development of the pituitary gland and share approaches to pediatric pituitary abnormalities on imaging with illustrative cases. Some of the major teaching points are: • MRI is the modality of choice to investigate suspected pituitary abnormalities in the pediatric patient. • The anterior and posterior pituitary gland have different embryological origins. • On top of masses that involve the sella and suprasellar region, the radiologist should be aware of mass-like lesions and mimics that have previously resulted in unnecessary surgical intervention.

TABLE OF CONTENTS/OUTLINE

• Pituitary Gland Development and Anatomy • Imaging the Pediatric Pituitary Gland • Abnormalities of Size and Number • Abnormalities of the Posterior Pituitary • Pituitary Stalk Thickening • Masses and Mass-like Lesions

NREE-56 Checklist Based Approach to Interpret Pediatric Brain MRI Studies

Awards
Certificate of Merit

Participants
Anvita Pauranik, MD, FRCPC, VANCOUVER, BC (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To develop a checklist-based methodical approach while interpreting pediatric brain MRI studies by knowing what to look for on different MR imaging planes and sequences, driven by the clinical question. 2. To understand the spectrum of age-related changes in a developing brain.3. To differentiate subtle pathology from normal variants using various case examples.

TABLE OF CONTENTS/OUTLINE

1. Midline sagittal brain. A. Commissures- size, shape, dysmorphisms. B. Sellar and Suprasellar region- Anterior/posterior pituitary gland, Infundibulum, Optic Chiasm, Floor of Third ventricle. Pineal gland C. Posterior fossa- Brainstem, Vermis and Cerebellar tonsils D. CSF Spaces- Cisterns, Aqueduct, Retrocerebellar space. E. Skull base including craniocervical junction, Scalp 2. Brain parenchyma-assessment on T1/T2/DWI/SWI. Age related changes, terminal zones of myelination versus white matter injury, subtle findings in altered sensorium- basal ganglia/ brainstem lesions.3 Ventricles- focal dilatation in PVHI, puckering in PVL, extra axial CSF spaces- prominence, collections, asymmetry, BESSI, cisterns- utility of Sagittal CISS 4. Flow Voids. 5. Extracranial - orbits, mastoids, paranasal sinuses.2. Checklist for focal seizure evaluation A. Midline- Hypothalamic Hamartoma versus inter-hypothalamic adhesion B.Cortical ribbon-blind spots C. Focal cortical Dysplasias-search patterns- Asymmetry in Grey-White matter signal, Sulcation. D. Mesial temporal lobe- early hippocampal sclerosis, dual lesions, temporo-polar changes, skull base defects3. Checklist for Neonatal brain MRI PLIC, Deep gray nuclei, Peri-Rolandic cortex, T1 bright punctate white matter lesions. Normal anisotropy on DWI.

NREE-57 Mind-Bending Cerebellar Anatomy Techniques

Participants
Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate the anatomy of the cerebellum by illustrations and imaging, with phylogenetic and functional considerations. To correlate the most frequent diseases with anatomic regions. To depict the importance of precise localization of the disease according to the anatomical point of the cerebellum.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Imaging protocol. 3. Embryonic development. 4. Cerebellum anatomy. 5. Cerebellar functional anatomy. 6. Phylogenetic considerations of the cerebellar segments. 7. Cerebellar connections and function. 8. Cerebellum vascular anatomy. 9. Clinical perspective: symptoms and diseases - including neoplastic, inflammatory, infections, congenital and degenerative. 10. Flowchart for imaging assessment of cerebellar anatomic regions. 11. Take-Home messages.

NREE-58 Anatomy and Functionality: Solidifying the Sulci, Gyri, and Brain Segmentation

Participants
Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the anatomy of the sulci, gyri, and brain segmentation with MRI imaging and illustrations. To correlate the anatomic segments with their functionality. To demonstrate the significance of accurate localization of the disease according to the anatomical locations, considering the clinical perspective.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Imaging protocol. 3. Sulci, gyri, and brain segmentation anatomy based on MRI imaging and illustrations. 4. Anatomic region and functionality. 5. Clinical perspective: brain diseases and their correlation with anatomy and neurological deficits. 6. Take-Home messages.

NREE-59 Need-to-know Neuroimaging with Clinical Correlation: Parkinson's Disease and Related Movement Disorders

Participants
Leslie Starkey, MD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although Parkinson’s disease is a relatively common movement disorder (MD), the onset is insidious and diagnosis challenging due to the varied clinical manifestations and heterogeneity, so the integration of imaging and clinical features plays an extremely important role.Other MD can simulate Parkinson’s disease, including progressive supranuclear palsy, essential tremor, corticobasal degeneration, and carbon monoxide poisoning, among others.One area neuroradiologists may have interest but little opportunity for learning is the clinical side, e.g. classic neurological findings in MD.In this presentation, we teach imaging and clinical manifestations. Imaging is presented as cases followed by the neurologist's perspective, including diagnostic criteria and videos of findings useful for radiologists to know, such as the eye findings in supranuclear palsy.

TABLE OF CONTENTS/OUTLINE

General topics: 1) Parkinson's disease 2) PSP 3) Corticobasal degeneration 4) CO poisoning.Radiology cases and videos of neurologic findings include:•DAT scan, Nigrosome-1 and the absent swallow tail sign, classic and spectrum.•Clinical videos: motor features: fascial masking, bradykinesia, rest tremors, and gate.•Scans without Evidence of Dopamine Deficit (SWEDDS).•Differential: dopa responsive dystonia, paroxysmal kinesigenic dykinesia, juvenile Huntington disease.•Deep brain stimulators, locations: VIM, GPi, STN.•Clinical videos: off meds, on meds, on meds and on DBS.•PSP: hummingbird sign.•Clinical videos: blink rate, eye movements, freezing speech, gait.•Corticobasal degeneration: asymmetric atrophy.•CO poisoning: globus pallidus lesions.•Clinical videos: gait freezing.

NREE-6 Neuroradiological Aspects of Congenital Infections and Mimics

Awards
Certificate of Merit

Participants
Luiz Uchoa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review imaging findings of congenital infection according to clinical suspicion. Identify the neurologic imaging findings of congenital infection and mimics with CT and MR images. A practical approach to interpreting these conditions systematizing the evaluation based on main neurologic imaging findings and clinical features.

TABLE OF CONTENTS/OUTLINE

Introduction. Congenital Disease: Genetical x Disruptive. Visual Systematization of congenital infection and mimics. Congenital Infections and neurologic imaging findings. Main mimics of congenital infections. Take home messages.

NREE-60 Moving to Diagnosis: Neuroimaging Systematic Approach to Neurometabolic Diseases Manifested as Movement Disorders

Participants
Andres Abad, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To propose a neuroimaging systematic approach for the patients with movements disorders and suspicion of inborn error of metabolism etiology. To review the different neuroimaging presentation of the main inborn error of metabolism associated with movement disorders. To enrich the radiologist role into the diagnosis process of inborn error of metabolism To familiarize the radiologist with the neuroimaging findings present in uncommon congenital diseases that can produce movements disorders.

TABLE OF CONTENTS/OUTLINE

Introduction. Movements disorders classification. Inborn errors of metabolism associated with each movement disorder. Cases and images of neurometabolic diseases associated with chorea. Cases and images of neurometabolic diseases associated with dystonia. Cases and images of neurometabolic diseases associated with myoclonus. Cases and images of neurometabolic diseases associated with tremor. Cases and images of neurometabolic diseases associated with parkinsonism. Conclusion.

NREE-61 "Live and in Color": Imaging of Neurovascular Devices

Participants
Camila Barbosa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Illustrate the most common intracranial and cervical neurointerventional and neurosurgical devices, such as clips, coils, stents and intrasaccular flow disruptors, used for treatment of neurovascular conditions as intracranial aneurysms, arterial stenosis and vascular malformations.Understand the clinical indication of each dispositive.Present cases treated with neurovascular devices, recognizing the importance of the radiologist familiarity with the dispositives in order to proper evaluate post-operative images.Understand the best imaging method on the post-operative evaluation for each dispositive.Review the possible limitations of imaging methods for the follow-up and diagnosis of complications.

TABLE OF CONTENTS/OUTLINE

Illustrated neurovascular devices. Algorithms for the post-treatment follow up. Case-based didactics: sample cases to demonstrate the devices, its appearance on different imaging methods and clinical use. Case-based post treatment discussion of complications.

NREE-62 Far Beyond Atheromatosis: Unusual Findings of Carotid Duplex Scan

Awards
Certificate of Merit

Participants
Iza Vieira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: 1.Comprehend the normal anatomy of the common carotid artery (CCA), internal carotid artery (ICA) and external carotid artery (ECA) on B-mode ultrasound; 2.Recognize anatomy variations and uncommon findings on B-mode ultrasound and duplex scan, with the correlation of CT-angiography (CTA) when necessary;3.Correlate imaging findings with clinical presentation;4.Recognize complications and possible outcomes;5. Brief review of management options.

TABLE OF CONTENTS/OUTLINE

- Normal anatomy of the extracranial carotid system on ultrasound;- Anatomy variations of the extracranial carotid system; - Carotid kinking;- Carotid aneurysms;- Endoleak following endovascular aneurysm repair;- Carotid artery pseudoaneurysm;- Carotid dissection;- Carotid web;- Carotid-jugular arteriovenous fistula;- Occlusion of the CCA and internalization of the ECA;- Takayasu arteritis;- Carotidynia; -Complications and outcomes.

NREE-63 A Checklist Approach to Interpreting Cerebral Digital Subtraction Angiography

Awards
Certificate of Merit

Participants
Charlotte Chung, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

As diagnostic and interventional neuroradiology become increasingly siloed, most diagnostic neuroradiologists no longer perform catheter-based neuroangiography. However, basic understanding of cerebral digital subtraction angiography (DSA), the gold standard for diagnosis of cerebrovascular pathologies, remains crucial for accurate interpretation of noninvasive brain CT and MR angiogram. This exhibit introduces the art of interpreting 2-

dimensional (2D) cerebral DSA to the contemporary diagnostic neuroradiologist.Educational objectives of this exhibit include:- Outline imaging techniques and protocol for a typical diagnostic cerebral angiogram- Provide an annotated atlas for normal cerebral arterial and venous anatomy on 2D DSA- Introduce a checklist approach for interpretation of 2D cerebral DSA- Illustrate angiographic appearance of variant anatomy and various pathologies

TABLE OF CONTENTS/OUTLINE

I. 2D DSA imaging techniquesII. Diagnostic cerebral angiogram imaging protocolIII. Annotated atlas of normal anterior and posterior circulation on 2D DSAIV. Step-by-step checklist for interpretation of 2D cerebral DSAV. Systemic checklist-based illustration of variant and abnormal angiographic findingsVI. Application of the checklist approach using case-based examples

NREE-65 Neurovascular Imaging at 7T: Small Vessel Anatomy

Participants
Neethu Gopal, MBBS, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultra-high resolution MR angiography (MRA) of the brain with a voxel size=0.3 x 0.3 x 0.3 mm is now achievable thanks to more readily available 7 Tesla clinical MR scanners and modern acceleration techniques. This advancement in our imaging capability allows for visualization of small normal vascular structures that were previously imperceptible on routine non-invasive vascular imaging.Teaching Points:1. Revisit normal arterial anatomy of the smaller branches of the circle of Willis including normal anatomic variants. A combination of 2D and cinematic rendered images as well as illustrations will be utilized.2. Demonstrate the normal cross sectional imaging appearance of these small vessels. In many cases, MRA images will be fused with 3D T1-weighted or T2-weighted sequences to better orient the viewer and demonstrate the spatial relationship of these vessels with gray-matter and white matter structures within the brain parenchyma.3. Review pathological conditions associated with the smaller circle of Willis branches.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Serial review of normal anatomy followed by cross-sectional images. Arteries will be reviewed systematically from anterior circulation to posterior circulation. Arteries that will be covered include but are not limited to: Anterior Choroidal Artery and its Branches, Superior Hypophyseal Artery, Anatomic Variations of the Posterior Communicating Artery, Medial Lenticulostriate Arteries, Recurrent Artery of Heubner, Lateral Lenticulostriate Arteries, Posterior Cerebral Artery Branches, Artery of Percheron, Basilar Perforator Vessels.3. Review of cases with pathology4. Conclusion

NREE-66 Challenging Procedures at the C1-2 Spinal Level - Using CT Guidance to Improve Patient Care and Safety

Participants
Ross Frederick, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

• There are several important procedures at the C1-2 level that can significantly improve patient quality of life. CT guidance makes these otherwise dangerous procedures safer and easier to perform.• There are key anatomical structures that must be avoided when performing these procedures, most notably the vertebral artery, posterior inferior cerebellar artery, C2 nerve, and spinal cord. A thorough understanding of anatomy in this region is crucial to perform these procedures confidently and safely.• Cervicogenic headache is an underrecognized and therefore undertreated condition that radiologists can treat with C1-2 facet joint injection, C2 nerve root block, or C2 ablation.• For patients with a contraindication to lumbar puncture, cervical puncture at the C1-2 level provides an alternative approach for CSF collection, injection of contrast for myelography, or injection of chemotherapy.

TABLE OF CONTENTS/OUTLINE

1. Introduction: types of procedures and the patients who can benefit from them2. Critical regional anatomya. Vertebral arteryb. PICAc. C2 nerved. Spinal cord3. Cervicogenic headache and atlantoaxial osteoarthritisa. C1-2 facet injection i. Indications ii. Technical considerationsb. C2 nerve root block i. Indications ii. Technical considerationsc. C2 nerve ablation i. Indications ii. Technical considerations 4. Cervical puncturea. Indication - contraindication to lumbar puncturei. CSF collection ii. Injection of contrast for myelography iii. Injection of chemotherapyb. Technical considerations

NREE-67 Spinal Vascular Pathologies: An Approach for Diagnosis and Management

Participants
Moataz Ahmed Sayed Mohammed Soliman, MD, MSc, CHICAGO, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Describe normal vascular supply and drainage of the spine. • Outline various types of spinal arteriovenous shunting and hyper-vascular spinal lesions: Common imaging findings and pitfalls. • Discuss imaging features of common differential diagnosis • Illustrate therapeutic options for spinal arteriovenous shunting and outcomes.

TABLE OF CONTENTS/OUTLINE

1. Introduction a. Normal arterial supply of the spinal cord b. Normal venous drainage of the spinal cord 2. Classification and cross-sectional imaging findings of spinal vascular lesions with angiographic correlation a. Spinal Arteriovenous shunts i. Type I: Spinal Dural Arteriovenous Fistula. ii. Type II: Spinal Glomus AVM iii. Type III: juvenile Spinal AVM iv. Type IV: Intradural Peri-medullary AVF b. Intramedullary hypervascular neoplastic lesions i. Cavernous malformation ii. Hemangioblastoma iii. Paraganglioma c. Spinal cord aneurysms i. Imaging features ii. Therapeutic interventions d. Cord infarct i. Etiology ii. Imaging manifestations 3. Role of interventional radiology in management of spinal vascular lesions a. Therapeutic embolization b. Preoperative devascularization 4. Conclusion and take-home messages

NREE-68 Intramedullary Spinal Cord Injuries: A Potpourri”

Participants
Juliana Benez, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: • To illustrate the imaging features found in different intramedullary pathologies, including their location, affected vertebral segment, contrast media uptake, and specific features. • To demonstrate intramedullary pathologies didactically divided into five groups: demyelinating, neoplastic, vascular, metabolic, and other lesions. • Illustrated review of a case series of intramedullary pathologies.

TABLE OF CONTENTS/OUTLINE

• Introduction - Epidemiology - Clinical scenarios - Typical imaging findings, with differences between the various intramedullary pathologies • Case series of Intramedullary spinal cord injuries • References • Conclusion

NREE-69 What Can it be in the Conus Medullaris? A Pictorial Review

Participants
Felipe Pacheco, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The conus medullaris is affected by many conditions, including congenital, vascular, tumoral, inflammatory and infectious diseases, which many times

are hardly differentiated because of the similarity of their clinical history and physical examination among different etiologies. Magnetic resonance imaging presents high sensitivity in the detection of these lesions and plays a relevant role in the diagnosis and in the evolutive controlThis panel aims to: Review the anatomy of the conus medullaris, including its anatomical limits, normal MR imaging findings and related clinical syndromes. Discuss and illustrate the imaging patterns of the main lesions in the conus medularis, including congenital, vascular, tumoral, inflammatory, infectious, among others. - Describe through illustrative cases the scenarios for diagnosis, focusing on typical imaging patterns, unexpected findings and red flags that aid the diagnosis.

TABLE OF CONTENTS/OUTLINE

- Anatomy of the conus medullaris - Normal appearance on CT and MRI-Main pathologies involving the conus medullaris, involving: -Congenital lesions: Caudal regression syndrome types 1 and 2, Ventriculus terminalis, Myelomeningocele -Neoplasic lesins: myxopapilar ependymoma, tanicytic ependymoma, leptomeningeal carcinomatosis, metastatic lesion, glioblastoma, dermoid cyst -Vascular lesions: arteriovenous dural fistula, cavernoma, ischemia-Systemic inflammatory diseases: IGG-4 related disease, Sarcoidosis, Dermatomyositis -Infectious diseases: Schistosomiasis, Tuberculosis, Herpes Virus, Polio-like-Auto-immune diseases: MOG antibody disease, Multiple Sclerosis, NMSOD - Red flags and diagnostic tips - Diagnostic Approach - Final remarks

NREE-7 What Can Go Wrong? Advanced Imaging of Malformation of Cortical Development

Awards
Identified for RadioGraphics
Cum Laude

Participants
Julia Brunelli, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

This pictorial essay will review the main etiologies of malformations of cortical development (MCDs) based on illustrative cases and original drawings.MCD will be addressed according to the last consensus update, considering pathological, genetic and neuroimaging features. The entities are divided into three major groups, according to the pathophysiological path that leads to that malformation.The purpose of this exhibition is to:- Review the cortical development, and its three main stages: cellular proliferation and differentiation, neuronal migration, and cortical organization;- Describe the new consensus of MCDs;- Recognize the main etiologies of MCDs, according to their imaging findings, and understand how different etiologies, when damaging the same pathway, can cause the same radiologic pattern.

TABLE OF CONTENTS/OUTLINE

NORMAL CORTICAL DEVELOPMENT- Didactic original drawings of the stages of cortex formation.MALFORMATIONS OF CORTICAL DEVELOPMENT- The new consensus taking account pathological, genetic and neuroimaging features.CASE-BASED DIDACTICS- Sample cases to illustrate and solidify the concepts;- Review of the main pathologies, addressing the pathophysiological and genetic aspects that leads to each image pattern.

NREE-70 Spinal Dysraphisms: Step-by-Step

Participants
María José Risco Fernandez, Toledo, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Knowledge of the normal embryologic development of the spinal cord is crucial for understanding spinal dysraphisms (SD). • They have been divided into open (OSD) and closed spinal dysraphisms (CSD), depending on the absence or presence of skin covering the defect. • Magnetic resonance imaging (MRI) is the modality of choice for the evaluation of these.

TABLE OF CONTENTS/OUTLINE

Spinal dysraphisms (DS) make reference to a wide spectrum of congenital abnormalities of the spine and spinal cord.Spinal development occurs throughout the 2nd and 6th week along embryologic stages of gastrulation, and primary and secondary neurulation. Anomalies in any of these stages can result in a defective or incomplete closure of the neural tube and structures of the dorsal midline. The clinical manifestations of these entities are heterogeneous: from being unnoticed to becoming incompatible with life outside the uterus. SD has been classically divided into two main groups depending on whether there is skin covering the defect: OSD and CSD.Magnetic resonance imaging (MRI) is the modality of choice for the detailed evaluation of these conditions. A step-by-step evaluation of the normal and abnormal imaging findings is critical to providing accurate surgical information. The aim of this pictorial review is to offer a systematic evaluation of SD on MRI, including normal and abnormal findings, classifying the type and the site of SD, and additional or associated findings both in pre and postnatal patients of our clinical practice.

NREE-71 Traumatic Spine Injury Classification: A Review of the AO Spine Injury Classification Systems Through Case Examples

Participants
Chad Farris, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review the AO Spine Injury Classification Systems for traumatic Injuries to the thoracolumbar spine (Thoracolumbar Injury Classification System), subaxial cervical spine (Subaxial Injury Classification System), and the upper cervical spine (Upper Cervical Injury Classification System).-Review case examples of traumatic spine injuries fitting into all of the morphological classifications based on the AO Spine Injury Classification Systems.

TABLE OF CONTENTS/OUTLINE

A. What are the AO Spine Classification Systems?B. Three basic parameters that all AO Spine Classification Systems are based on1. Morphological Classification of the Fracture, 2. Neurological Status, 3. Clinical ModifiersC. Case examples fitting into all of the morphological classifications within the AO Spine Classification Systems in the thoracolumbar spine, subaxial cervical spine, and upper cervical spine.1. Thoracolumbar Spine Examples: a. Type A0 Injury, b. Type A1 Injury, c. Type A2 Injury, d. Type A3 Injury, e. Type A4 Injury, f. Type B1 Injury, g. Type B2 Injury, h. Type B3 Injury, i. Type C Injury2. Subaxial Cervical Spine Examples: a. Type A0 Injury, b. Type A1 Injury, c. Type A2 Injury, d. Type A3 Injury, e. Type A4 Injury, f. Type B1 Injury, g. Type B2 Injury, h. Type B3 Injury, i. Type C Injury, j. Type F1 Injury, k. Type F2 Injury, l. Type F3 Injury, m. Type F4 Injury3. Upper Cervical Spine: a. Occipital Condyle and Occipital Cervical Joint Complex: i. Type A Injury, ii. Type B Injury, iii. Type C Injury, b. C1 Ring and C1-2 Joint Complex Injuries: i. Type A Injury, ii. Type B Injury, iii. Type C Injury, c. C2 and C2-3 Joint Complex Injuries: i. Type A Injury, ii. Type B Injury, iii. Type C Injury

NREE-72 Resting-state FMRI Seed-based Connectivity Map as a Diagnostic Visualization Biomarkers in Different Brain Disorders

Participants
Mohamed Eid, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

We plotted seed based connectivity (SBC) for about 40 main dynamic functional connectivity networks for each cases , then we reviewed the homogeneity of cerebral and cerebellar brain activity in both sides and we determined for epileptic case visualization the sign of Bull's eye of as abnormal disrupted brain activity as a reference for seizer's onset zone (SOZ) .And as regards to the alcohol toxicity induced bilateral total blindness we determine the visualization of normal bilateral dynamic functional connectivity and activity in the occipital networks and compared it to the normal control cases.3o Normal controls cases , 25 clinical confirmed uncontrolled epileptic patients and one case of alcohol toxicity induced total bilateral

eyes blindness although normal signal intensities of both optic nerves and chiasm in conventional MRI sequences and MRI post gad contrast.Methods We obtained raw data from MRI Toshiba and Siemens 1.5 Tesla for all cases after written Informed consent as follow ; Bold EPI sequences (as a functional raw data) about 3:40 minute duration ,High resolution axial T1 WI (as an anatomical raw data) , about 3:20 minute.All data preprocessed ,post processed and analysed used MATLAB based softwares , CONN toolbox .

TABLE OF CONTENTS/OUTLINE

Abstract Patient Methods Cases and figures / pdf

NREE-74 Neurogenetics: What Should the Radiologist Know?

Participants
Mario Abizaid, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The autosomal recessive inheritance pattern, although rare, when considered as a group becomes prevalent. Those diseases have an increased prevalence in consanguineous marriage and restricted geographic areas, known as “founder effect”.- The autosomal dominant inheritance pattern is seen in heterozygosis and it is inherits from a parent who had the disease (family history). Less frequently, can emerge from a new mutation (mutation of de novo).- The trinucleotide repeat, as in Huntington's disease, is amplified with each generation, due to a misreading in the DNA.- There are mitochondrial proteins produced in the organelle itself (maternal inheritance pattern), as well as produced in the cell nucleus (autosomal or X-linked inheritance pattern).

TABLE OF CONTENTS/OUTLINE

Autosomal recessive inheritance patternMetachromatic leukodystrophyHorizontal gaze palsy with progressive scoliosisCARASILMaple syrup urine diseasePKANWilsons’s diseasePhenylketonuriaAutosomal dominant inheritance pattern CADASILNeurofibromatosis type 1Von Hippel LindauMarfan SyndromeTuberous sclerosis .X linked disorders patternX linked adrenoleukodistrophyPelizaeus-Merzbacher diseaseRett syndromeIncontinentia pigmentiTrinucleotide repeat expansion Huntington's diseaseFragile x associated tremor ataxia syndromeFriedreich ataxiaMitochondrial diseaseMELASLeight SyndromeLHONKern-Sayres SyndromeOncogeneticproto-oncogene and tumor suppressor geneIDH-wildtype and IDH-mutant H3 K27M-mutant RELA fusion-positive ependymomamedulloblastoma: WNT-activated and SHH-activatedC19MC-altered

NREE-75 Genetic Complexity and Imaging Assessment of the Mitochondrial Disorders

Participants
Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the terminology, epidemiology, pathology, clinical and genetic issues of the mitochondrial disorders. To illustrate the imaging highlights of the primary mitochondrial disorders. To demonstrate the most common differential diagnosis based on imaging and epidemiology.

TABLE OF CONTENTS/OUTLINE

1. Background with pathological, physiopathological, epidemiological, clinical, and genetic revision of the mitochondrial disorders. 2. Imaging pearls of mitochondrial disorders with an emphasis on MRI patterns and specific diagnoses. 3. Flowchart of assessment of the mitochondrial disorders. 4. Take-home messages.

NREE-76HC Imaging Approach to Intraventricular Masses: Common and Uncommon MR Imaging Findings

Participants
Hee Soo Won, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To identify normal anatomy of ventricular system. To help narrow the differential diagnosis in intraventricular masses according to their location, patient’s age, gender and underlying conditions. To describe the imaging features of intraventricular masses. To review common and uncommon location of intraventricular masses with MR imaging.

TABLE OF CONTENTS/OUTLINE

Imaging anatomy of ventricular system Imaging approach to intraventricular mass Review of common and uncommon MR imaging features of the following intraventricular neoplastic and nonneoplastic masses 1. Central neurocytoma 2. Subependymoma 3. glioblastoma 4. Subependymal giant cell astrocytoma 5. Lymphoma 6. Metastasis 7. Choroid plexus tumor 8. Choroid plexus cyst 9. Meningioma 10. Colloid cyst 11. Craniopharyngioma 12. Ependymoma 13. Epidermoid cyst 14. Pleomorphic xanthoastrocytoma 15. Multiple myeloma Summary and conclusionPlease visit the Learning Center to also view this presentation in hardcopy format.

NREE-77 Consensus Recommendations on Clinical APT-weighted Imaging Approaches at 3T for Brain Tumors

Participants
Jinyuan Zhou, PhD, Baltimore, MD (*Presenter*) Inventor, Koninklijke Philips NV;Institutional license agreement, Koninklijke Philips NV;Speaker, Koninklijke Philips NV

TEACHING POINTS

Currently used amide proton transfer-weighted (APTw) MRI protocols vary substantially among different institutes. Thus, the results acquired from different patient studies are difficult to compare, which hampers uniform clinical application and interpretation. The purpose of this education exhibit is: 1) To review challenging issues for clinical APTw imaging at 3T. 2) To provide a rationale for optimized and standardized APTw brain tumor imaging. 3) To review specific recommendations for pulse sequences, acquisition protocols, and data processing methods for APTw imaging of brain tumors. 4) To provide tips for using APTw imaging in the clinical setting.

TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) APTw MRI background and theory. 3) History of the mechanism and the evolution of its understanding. 4) APTw imaging pulse sequences, including RF saturation approaches and parameters, lipid suppression, and readout. 5) Acquisition protocols. 6) Data processing and display. 7) Brain tumor APTw imaging data interpretation and pitfalls. 8) Conclusions and remarks.

NREE-78 Paragangliomas of the Head, Neck, and Spine: Radiologic-Pathologic Correlation

Participants
Robert Y. Shih, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The paraganglia are non-neuronal neuroendocrine cells that are part of the autonomic nervous system and derived from the neural crest. They are named for the location beside the paravertebral sympathetic ganglia.2. Pheochromocytes (chromaffin cells) are named for a characteristic brown color change of the paraganglia tissues when fixed in chromium salts, which reflects oxidation of stored catecholamines. These chromaffin cells are found in the adrenal medulla or beside sympathetic ganglia in the abdomen.3. There is another type of paraganglia, which has chemoreceptor rather than neuroendocrine functions, responsible for increasing respiration in response to acidosis, hypoxia, or hypercarbia. These parasympathetic paraganglia are

composed of glomus cells and give rise to paragangliomas of the head and neck.4. Aside from paragangliomas of the head and neck, paragangliomas of the spine (specifically the cauda equina) are also encountered in neuroradiology. With the 2022 WHO Classification of Endocrine and Neuroendocrine Tumors, these are being reclassified as cauda equina neuroendocrine tumor (NET).5. Approximately 40% of paragangliomas are related to germline mutations, therefore genetic testing is indicated for all patients. While there are many familial endocrine tumor syndromes, hereditary paraganglioma syndromes involve mutations in succinate dehydrogenase (SDH).

TABLE OF CONTENTS/OUTLINE

1. What are the paraganglia?2. What is the relationship of paragangliomas and pheochromocytomas?3. What are the classic locations for paragangliomas of the head and neck?4. What is the classic location for paraganglioma of the spine?5. What is the significance of germline mutations for paragangliomas?

NREE-79 T2-FLAIR Mismatch Sign: My Favorite Evil

Participants
Larissa Martins, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:• To elucidate the characterization and criteria for the application of the T2-FLAIR mismatch signal, described as one of the main radiophenotypes in neuroradiology, with a specificity close to 100% in the identification of IDH-mutant, 1p/19q-intact lower-grade glioma• Propose a checklist for the proper identification of the T2-FLAIR mismatch radiopheotype• Demonstrate practical tips and possible pitfalls to achieve the highest possible positive predictive value when faced with a probable T2-FLAIR mismatch• Discuss the differential diagnoses of lesions that present a sign of partial T2-FLAIR mismatch*?aß?e ?? ???te?ts/??t???e • Introduction:o Mismatch T2-FLAIR: What is it?o Differential Diagnosis• Checklist for the proper identification of the T2-FLAIR mismatch• Practical examples of lesions with true T2-FLAIR mismatch and lesions that mimic this radiophenotype• Differential diagnoses of lesions that present a sign of partial T2-FLAIR mismatch

NREE-8 Expand The Differential - An Interesting Case Series of Bithalamic Pathology

Participants
David Wessling, MD, Council Bluffs, IA (*Presenter*) Nothing to Disclose

TEACHING POINTS

This education exhibit presents a series of unique pathologies that lead to bilateral thalamic region imaging abnormalities. Our intention is to demonstrate numerous pathologies, expand the differential considerations of bithalamic lesions and raise the awareness of less commonly encountered disease processes. Many of the cases chosen were either were initially misinterpreted or puzzled the neuroradiologists at our academic institution. Many of the cases required multiple imaging modalities including advanced imaging techniques such as perfusion, diffusion tensor imaging and spectroscopy to either make a diagnosis, narrow the differential, or guide further management. Our aim with creating this exhibit is to describe the clinical presentation, demonstrate imaging appearances and defining characteristics, and provide interpretation of studies across multiple imaging modalities. Additionally, an explanation for how each study aids the radiologist’s impression is provided. Our exhibit will advance the audience’s comfort when faced with interpreting bithalamic imaging abnormalities. This will help to minimize patient harm from unnecessary intervention or delayed diagnosis.

TABLE OF CONTENTS/OUTLINE

This exhibit is intended to serve as a collection of interesting disease processes with bithalamic involvement. Specific interests will be given to cases utilizing multiple different imaging modalities and those which required advanced imaging techniques. These cases will be organized categorically; vascular, metabolic/toxic, neoplastic, inflammatory, infectious and seizures. Tables and diagrams will be created to highlight similarities and differences when applicable.

NREE-80HC Machine Learning in Alzheimer's Disease: Diagnostic Classification Using MR Neuroimaging Data

Participants
Stephanos Leandrou, PhD, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Alzheimer’s Disease (AD) is a neurodegenerative disease and its diagnosis relies mainly on cognitive tests. An important limitation of cognitive tests is the diagnosis of AD after structural changes have occurred within the brain. Therefore, these patients have a long prodromal phase when effective treatment strategies may be applied to delay or alter the onset of the symptoms. Research on quantitative MRI-derived biomarkers is an active research area which detects brain neurodegeneration before AD symptoms appear. In this study multi-modal features from both entorhinal cortex (ERC) and hippocampus where extracted from 194 normal controls (NC), 284 mild cognitive impairment (MCI) and 130 AD subjects. Texture analysis was mainly used which evaluates statistical properties of the tissue image quantitatively; therefore, it could detect smaller-scale changes of neurodegeneration. The use of ERC texture features is very limited in the literature, however, it is the first structure affected. We hypothesized that through the earlier involvement of ERC and the use of texture features, it is likely to detect microscopic alterations of the disease before atrophy spreads. This study used Machine Learning (ML) methods to address high dimensional data and discover new biomarkers in the assessment of AD. These directions will help to manage the disease progression and develop novel treatment strategies. This study innovates by using multi-modal data (incl. ERC) in the assessment of AD through a ML-based classification. An area under curve of 0.940, 0.806, and 0.786 was seen between NC vs AD, NC vs MCI and MCI vs AD subjects, respectively.

NREE-82 Learning from Machines: A Resident's Guide to AI Mistakes in Neuroradiology and What Residents Can Learn From Them

Awards
Certificate of Merit

Participants
Austin Young, (*Presenter*) Nothing to Disclose

TEACHING POINTS

With the steady advancement of computer vision technology, artificial intelligence (AI) algorithms have been shown to outperform radiologists in certain imaging interpretation tasks [1]. These technologies have been increasingly applied in clinical practice to aid in detection/diagnosis, disease prediction, and image segmentation [2]. Our institution has recently acquired an AI software package that allows for detection of acute hemorrhage, large vessel occlusion, and quantitative evaluation of perfusion deficits. This software package is expected to help provide a more prompt and accurate diagnosis by delivering qualitative and quantitative analysis of critical findings [3]. In this exhibit we highlight common pathologies where AI interpretation was discordant with the underlying pathology as determined by final attending interpretation, highlighting potential pitfalls in overreliance on this new technology in imaging interpretation. As we analyze these cases, an emphasis will be placed on the human component of imaging, how information must be integrated and synthesized to arrive at a proper diagnosis with the goal of providing direction for future deep learning algorithms and improved resident education.

TABLE OF CONTENTS/OUTLINE

Case 1: Pseudo-subarachnoid hemorrhage incorrectly interpreted as true hemorrhage Case 2: Erroneous interpretation of decreased blood vessel

density secondary to subdural hematoma Case 3: Presence of endovascular coils causing false interpretation of large vessel occlusion Case 4: Erroneous interpretation of decreased blood vessel density due to intraparenchymal hemorrhage Case 5: Cortical laminar necrosis wrongly interpreted as subarachnoid hemorrhage

NREE-83 Decoding White Matter Tracts in Brain : Role of Diffusion Tensor Imaging (DTI) and Tractography in Brain Tumors

Participants
Dinesh Meher, MBBS, MD, Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to : 1.Discuss the construction of various white matter tractograms using appropriate regions of interest (ROIs). 2.Illustrate white matter tract pathological spectrum in various intra and extra axial brain tumors. 3.Review the importance of information provided by Diffusion tensor imaging (DTI) in addition to conventional MR imaging. 4.Discuss the importance of DTI in pre operative evaluation of brain tumors.

TABLE OF CONTENTS/OUTLINE

1.Introduction 2.DTI Physics 3.Normal white matter tracts in DTI 4.DTI patterns in brain tumors 5.Cases 6.Take home message

NREE-84 OpenAI, SciSpacy, Supervised Machine Learning, and Deep Learning for Automated Data Extraction from Radiology Reports

Participants
Ethan Wang, Dallas, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review how various natural language processing (NLP) techniques can be applied to optimize radiological text analysis involving binary classification and disease entity recognition. 2. Review the intricacies of Bag of Words text representation, supervised machine learning, pre-trained SciSpacy models, and fine-tuned OpenAI engine implementation for radiological text analysis. 3. Review the advantages, limitations, and optimal scenarios of different NLP approaches for radiological text analysis.

TABLE OF CONTENTS/OUTLINE

1. Introduction to NLP 2. Traditional NLP Applications for Binary Classification (BoW text representation, Deep Neural Networks, Supervised Machine Learning Algorithms) 3. Pre-Trained SciSpacy Models for Binary Classification and Disease Entity Extraction 4. Fine-Tuning OpenAI Engines for Binary Classification and Disease Entity Extraction 5. Advantages and Limitations of NLP (Time Expenditure, Flexibility, Integration with Traditional Statistics, Association with Task Complexity)

NREE-86 Arterial Spin Labeling Perfusion Technique in Neurovascular Diseases: Technical Aspects, Artifacts and Clinical Applications

Participants
Carlos Basoa Ramos, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review the technical principles of the Arterial Spin Labelling (ASL) technique.• To list the main artifacts that radiologists should be aware of.• To review the main applications of the ASL technique, with special attention to neurovascular pathology (acute and chronic ischemia, arteriovenous shunt and moya-moya disease, among others).

TABLE OF CONTENTS/OUTLINE

ASL is an underused magnetic resonance imaging (MRI) technique that uses water molecules within arterial blood as endogen contrast to obtain quantitative information of cerebral blood flow (CBF). Thus, ASL does not use exogenous contrast agents, being an alternative to other more established MRI perfusion techniques.Radiofrequency pulses are applied proximal to the brain, at neck vessels, to obtain an inversion of longitudinal magnetization of arterial blood water molecules. This process is called labelling. After a short period of time called post labelling delay (PLD) imaging is performed. Two imaging acquisitions are made, one unlabelled and one labelled. Subtraction of the unlabelled images will provide cerebral perfusion data.There are multiple labelling techniques but nowadays guidelines recommend implementation of 3D pseudocontinuous ASL (PCASL) in clinical practise.ASL has been studied and compared as well with other perfusion MRI techniques in neurodegenerative diseases, neuro-oncology, and neurovascular diseases.ASL technique is a useful technique in neurovascular pathology, especially in the control of patients with treated arteriovenous malformations.

NREE-87 What Brain Perfusion is Telling You and You Might Not Have Noticed

Participants
David Castanedo SR, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To analyze the most frequent perfusion alterations on perfusion CT (TCP) associated with "stroke mimics" . - To differentiate between real and false ischemic penumbras. - To identify the main pitfalls when analyzing these studies.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Analysis parameters.3. Introduction to perfusion anomalies.4. Imaging protocol.5. Clinical cases.5.1. Hyperperfusion.5.1.1. Epileptic seizure (ictal phase).5.1.2. High-grade gliomas.5.1.3. Reversible Posterior Encephalopathy Syndrome (PRES).5.1.4. Reperfusion/Hyperperfusion Syndrome.5.1.5. Viral encephalitis.5.2. Hypoperfusion.5.2.1. Transient ischemic accident (TIA).5.2.2. Vasospasm. 5.2.3.Bilateral carotid stenosis.5.2.4. Cerebral venous thrombosis.5.2.5. Migraine with aura.5.2.6. Hypoglycemia.5.2.6. Arterio-Venous Fistula Dural.5.3. Gray or conflictive areas.5.3.1. Chronic infarctions and "luxury perfusion"5.3.2. Lacunary infarctions.5.3.3. Crossed cerebellar diasquisis.5.3.4. Motion artifacts.5.3.5. Arterial and venous time-attenuation curves.5.3.6. Threshold values in color maps.5.3.7. Post-processing software.6. Take Home Messages.

NREE-88 The Multiple Faces of Typical Atypical Primary Central Nervous System Lymphomas

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the demographics, differential diagnosis, and current standard for definitive diagnosis of primary central nervous system lymphoma 2. Describe the imaging features of typical and atypical PCNSL, including location, enhancement pattern, signal intensity in multiple sequences, presence or absence of hemorrhage, necrosis and calcification 3. Educate the radiologist regarding the differences in management of PCNSL and its main differential diagnoses, and discuss why prompt diagnosis is crucial for improved outcomes 4. Provide a brief outline of currently under investigation alternative methods for earlier and less invasive PCNSL diagnosis and classification, including the role of systematic classification tools and machine learning algorithms

TABLE OF CONTENTS/OUTLINE

• Demographics of PCNSL • Presentation, important clinical features and imaging findings of multiple typical and atypical histologically-proven PCNSL

patients from our institution (71 patients available) • Differential diagnoses of PCNSL • Definitive diagnosis of PCNSL • Management of PCNSL vs management of its main differential diagnosis • Alternative methods for earlier and less invasive PCNSL diagnosis and classification

NREE-89 Finding the Specific in Non-Specific: Imaging in Acute Decompensation in Inherited Metabolic Disorders

Participants
Garima Sharma, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Most inherited metabolic disorders present as a severe progressive illness, however, some of them are often complicated by acute decompensation. These events are precipitated by the accumulation of toxic metabolites leading to encephalopathy and severe neurological injury. The factors triggering such episodes are generally states of an increased catabolic state, i.e., infection, trauma, or even increased consumption of any specific food component. While imaging is often ordered along with other investigations for a complete evaluation, most of the time the findings are labeled as non-specific. Hence, it is important for the radiologist to know: a)The metabolic disorders which can present as metabolic compensation b)Clinical clues and biochemistry c)Specific imaging features for various entities d) Mimics and major differential diagnosis. The most important mimics for these entities are hypoxic-ischemic injuries, sepsis, and vascular events (e.g. stroke). Magnetic Resonance Imaging (MRI) is the most important imaging modality for adequate evaluation of these patients.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Causes of acute decompensation in inherited metabolic disorders3. Clinical presentations4. Understanding the biochemistry5. Role of imaging6. Specific imaging features a. Organic acidemias b. Urea cycle disorders c. Maple syrup urine disease d. Fatty acid oxidation defects e. Glycogen storage disease (type I) f. Leighs Disease

NREE-9 Cytokines and the Central Nervous System: What the Radiologists Should Know

Awards
Identified for RadioGraphics

Participants
Mariko Kurokawa, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understand the role and mechanism of cytokines that affect the central nervous system (CNS), which often cause encephalitis/encephalopathy and cerebrovascular diseases.• Identify the causes, clinical features, and imaging features of cytokine storm.• Summarize cytokine engaging therapy including interferon-beta and chimeric antigen receptor (CAR) T-cell therapy with focus on the neuroradiological changes before and after treatment.

TABLE OF CONTENTS/OUTLINE

1. Cytokines and signaling pathways2. Cytokine storm and CNS:Mechanisms, Acute necrotizing encephalopathy (ANE), Cytotoxic lesion of the corpus callosum (CLOCC), Virus-associated necrotizing disseminated acute leukoencephalopathy (VANDEL), Acute disseminated encephalomyelitis (ADEM), Thromboembolism, Hemorrhage3. Cytokines and neurological diseasesDemyelinating diseases (multiple sclerosis, MS), Acute and chronic infarction, Tumors (Chordoma and angiomatoid fibrous histiocytoma), Castleman's diseases, and Mastocytosis4. Cytokine engaging therapy and neuroimagingInterferon (IFN) beta for MS treatment, IFN alpha for lymphoma and malignant melanoma, Cytokine releasing syndrome in CAR-T therapy5. Summary

NREE-90 Retinoblastoma: Beyond What the Eyes Can See

Awards
Cum Laude

Participants
Taisa Guarilha, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Retinoblastomas are the most prevalent form of eye cancer in children, mostly occurring in first infancy. Most of them are diagnosed by the detection of leukocoria at ophthalmologist clinics. Nonetheless, image analysis performed by a radiologist can provide an assessment of key features that highly impact prognosis and treatment definition. We can see beyond the eye by detecting optic nerve involvement, extraocular tumor, and intracranial extension.The goal of this paper are:Review the anatomy of the orbit regionDiscuss epidemiology and clinical findingsDemonstrate how retinoblastomas can present itselfExemplify the six groups according to the Grouping Classification of Retinoblastoma FeaturesDemonstrate common and uncommon metastasisShow differential diagnosis

TABLE OF CONTENTS/OUTLINE

> Anatomy of the orbit region> Epidemiology and clinical findings> Imaging features> Present and explain cases from groups A to F from the Grouping Classification of Retinoblastoma Features> Metastasis:-optic nerve involvement-trilateral retinoblastoma-intracranial metastasis-spinal metastasis-leptomeningeal metastasis -abdominal metastasis-bone metastasis > Differential diagnosis:- Coats Disease- Meduloepithelioma- Retinal Hamartoma - Persistent hyperplastic primary vitreous- Optic pathway glioma- Meningioma>Postoperative control findings

NREE-91 The New Horizons of Neuroimaging in Recognition of Patterns of Genetic-Phenotypic Lissencephaly Spectrum

Participants
Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the imaging spectrum of lissencephaly spectrum along with their genetic relationship. To exemplify the classification systems based on the most likely causative genes. To demonstrate the challenges of the new imaging and severity classification tools to guide and prioritize genetic testing for patients' clinical management and genetic counseling. To depict the differential diagnoses and a flowchart for assessing the lissencephaly spectrum.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Imaging protocol. 3. Clinical perspective and importance of analysis of lissencephaly spectrum. 4. The genetic cascade of events implicated in cortical development. 4. Imaging assessment and their correlation with the genetic abnormalities. 5. Imaging pearls correlated with the lissencephaly spectrum. 6. Differential diagnoses. 7. Flowchart for imaging assessment. 8. Take-Home messages.

NREE-92 Neurocutaneous Diseases, Clues for Neuroradiology Findings

Participants
Karla Fuentes Badillo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Neurofibromatosis Type I Characterized by the involvement of the nerve sheath. Imaging findings include white matter lesions, bone lesion associated with plexiform neurofibromas, focal areas of signal intensity hyperintense in T2, plexiform and paraspinal neurofibromas. Neurofibromatosis Type II NF2 is a hereditary syndrome characterized by multiple cranial nerve schwannomas, specifically with bilateral vestibular schwannomas, meningiomas and spinal

tumors. They can be evaluated on CT but are better characterized by MRI. Tuberous Sclerosis Complex Characterized by the presence of hamartomas. Cortical tubers appear in 95% of patients, subependymal giant cell astrocytomas tend to have intense enhancement, white matter abnormalities with variable appearance and subependymal nodules. Sturge Weber Syndrome Characterized by detects subcortical calcification at an earlier age than plain film and can also demonstrate associated parenchymal volume loss, tram-track sign of cortical and subcortical calcification. Von Hippel Lindau The most common lesions are retinal angiomas, hemangioblastomas of the cerebellum and spinal cord, visceral cyst and tumors. HGBL is seen as a well-defined cerebellar cyst with nodule on NECT, on MR imaging on T1 is observed as an iso/hypointense nodule with Flow voids (large feeding vessels within the periphery), while on T2/FLAIR is evidenced as a hyperintense nodule, which blooms in case of hemorrhage and enhances strongly without changes on cyst wall.

TABLE OF CONTENTS/OUTLINE

Neurofibromatosis Type I, Neurofibromatosis Type II, Tuberous Sclerosis, Sturge Weber, Von Hippel Lindau

NREE-93 Reinvent the Dragonfly: Pontocerebellar Hypoplasia Imaging and Genetics

Participants
Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate the spectrum of pontocerebellar hypoplasia through MRI, emphasizing the dragonfly signal sometimes present. To explain the physiopathology and genetic cascade involved. To demonstrate the imaging pearls with emphasis on the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Imaging protocol. 3. Clinical perspective and importance of analysis of pontocerebellar hypoplasia through MRI. 4. The genetic cascade of events implicated in the pontocerebellar hypoplasia. 5. Imaging pearls, including the dragonfly signal. 6. Differential diagnosis. 7. Flowchart for imaging assessment. 8. Take-Home messages.

NREE-94 Microtubulin Dysfunction - Key Imaging Features

Participants
Joel Samuel, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Neurological abnormalities found on MRI brain in tubulinopathies predominantly consists of dysmorphic basal ganglia(90%),cerebral cortical malformations(60%), microcephaly(30%),callosal abnormalities(80%), ventriculomegaly(90%), asymmetric brain stem(60%), andsmall cerebellar vermis or hemispheres(50%).

TABLE OF CONTENTS/OUTLINE

LEARNING OBJECTIVE:The aim of this study is to describe the spectrum of key imaging findings associated with Tubulinopathies. BACKGROUND:Tubulinopathies are a heterogenous group of rare disorders that lead to complex brain malformation ,caused by mutation in tubulin genes.Study design:The study included MRI brain of 10 patients with symptoms of developemental delay, microcephaly, seizures and imaging features suggestive of tubulinopathies were studied over a period of three years.Microcephaly, cerebral cortical malformations, callosal abnormalities,ventriculomegaly, dysmorphic basal ganglia,hypoplasia of internal capsule, asymmetric brain stem, and small cerebellar vermis or hemispheres were the predominant finding seen in MRI.CONCLUSION:Knowledge of the main imaging findings of tubulinopathies is critical. Given the rarity of these conditions and lack of discriminating clinical features, imaging may be the only clue to an underlying tubulinopathy. Also helps in further genetic workup for these patients and identifying the gene mutated and helps in treatment .

NREE-95 Imaging Abnormalities in Patients with Alzheimers Disease Treated with Anti-Amyloid Beta Therapy

Awards
Identified for RadioGraphics

Participants
Amit K. Agarwal, MD, MBBS, Jacksonville, FL (*Presenter*) Stockholder, Gilead Sciences, Inc

TEACHING POINTS

-To discuss the novel therapeutic strategies for Alzheimer's disease, with focus on the recently approved anti-amyloid beta therapy- To illustrate the imaging abnormalities in patients with Alzheimer’s Disease treated with Anti-Amyloid Beta Therapy- To discuss the protocol for monitoring and assessment for imaging abnormalities in patients on Anti-Amyloid Beta Therapy- To discuss the imaging differentials of ARIA (with focus on cerebral amyloid angiopathy)

TABLE OF CONTENTS/OUTLINE

-Neuropathology of Alzheimer's disease (AD)-Role of cerebral amyloid-B (Ab) in Alzheimer's disease-Brief discussion on current imaging modalities for diagnosis and monitoring of AD (MRI, Amyloid PET,Tau PET)-Therapeutic strategies against amyloid-ß peptides in Alzheimer’s disease- Imaging Abnormalities in Patients with Alzheimer’s Disease Treated with Anti-Amyloid Beta Therapy - Amyloid-related imaging abnormalities: edema (ARIA-E) and hemorrhage(ARIA-H)- International Collaboration for Real-World Evidence in Alzheimer's Disease (ICARE AD) -MRI Acquisition Protocol Proposed to ICARE AD Sites ARIA Monitoring- Imaging differentials of ARIA (cerebral amyloid angiopathy, PRES)

NREE-96 How Much Do You Know About MRI Patterns of Brainstem Inflammatory Lesions?

Participants
Carlota Garcia de Andoin Sojo, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

When facing inflammatory lesions of the brainstem there are a number of differential diagnoses and accurate diagnosis can be difficult. Knowing clinical features and MRI findings, especially on the extent of dissemination, number, morphology and appearance of the lesions in different MRI sequences radiologists will be able to reach the correct diagnosis.

TABLE OF CONTENTS/OUTLINE

Objective: To describe MRI findings of major inflammatory and immune-mediated diseases that affect the brainstem.Methods A revision of the most characteristic inflammatory lesions of the brainstem has been made in MRI-illustrated challenging quiz format.Findings 1. Immune-mediated inflammatory disorders: illustrated quiz-mode cases will lead to the revision of disorders that involve the brainstem, including Multiple Sclerosis, Neuromyelitis Optica Spectrum Disorder, Myelin Oligodendrocyte Glycoprotein antibody-induced demyelination, Neuro-Behçet, Neurosarcoidosis, Histiocytic disorders, Bickerstaff Brainstem Encephalitis, Acute Haemorrhagic Encephalomyelitis, Hurst disease, Systemic Lupus Erythematous2. Differential diagnosis should be done having in mind MRI and clinical features of other diseases that also cause brainstem inflammation, such as paraneoplastic encephalitis, Alexander leukodystrophy, Wilson disease, Wernicke-Korsakoff syndrome and CNS infections (listeria, tuberculosis and enterovirus).Conclusion Knowing the typical MRI presentation of each of the disorders that cause brainstem inflammations radiologists can give important information to achieve an accurate diagnosis and establish appropriate treatments.

NREE-97 The Radiologist's Guide to Non-Traumatic Orbital Pathology

Participants
Emily Haas, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Orbital pathology identification and diagnosis is of critical importance as delayed diagnosis and management may ultimately result in vision loss for many patients. Development of an appropriate differential diagnosis of orbital lesions is vital as to guide our clinician colleagues in appropriate next steps and future follow-up. This educational exhibit aims to review orbital anatomy and explore non-traumatic orbital pathology by underlying etiology. While there may be overlap in imaging features, we will discuss characteristic imaging findings for each diagnosis that help to distinguish them amongst each other and alleviate diagnostic dilemma.

TABLE OF CONTENTS/OUTLINE

1. Vascular: Venous Malformation, Capillary Hemangioma, Orbital Varix, Carotid-Cavernous Fistula, Lymphatic Malformation, Granulomatosis with Polyangiitis (GPA). 2. Infectious/ Inflammatory: Pre-septal Cellulitis, Post-septal Cellulitis, Orbital Abscess, Dacryocystitis, Invasive Fungal Infection, Optic Neuritis, Idiopathic Orbital Inflammation, Thyroid-Associated Orbitopathy, Papilledema. 3. Neoplastic: Optic Nerve Sheath Meningioma, Optic Glioma, Rhabdomyosarcoma, Dermoid, Lymphoproliferative Disorders, Metastases.

NREE-98 Imaging of Headache in Relation to CSF Pressure/Volume Problem: What Radiologists Need to Know

Participants
Hyeongwoo Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Brain and spine imagings are key components in diagnosis and treatment strategy of SIH and IIH. After reviewing this educational exhibition, radiology residents should be able to understand clinical manifestations in headaches with CSF pressure/volume problem and how to approach imaging diagnosis with better imaging protocols.

TABLE OF CONTENTS/OUTLINE

New onset or progressive headache is often the most common symptom of intracranial hypotension or hypertension syndrome. In spite of imaging advances, spontaneous intracranial hypotension (SIH) and idiopathic intracranial hypertension (IIH) are often misdiagnosed and if untreated, lead to severe neurologic impairment such as cognitive decline for SIH or visual impairment for IIH. The purpose of this educational exhibition is to review the related imaging findings of intracranial hypotension or hypertension and the suggested imaging protocols in patients with headache associated with CSF problem. We retrospectively evaluated MR images and clinical reports of headache patients collected at our hospital from 2011 to 2021. Contents Organization 1. Introduction 2. SIH 1) clinical manifestation 2) brain imaging for SIH 3) spine imaging for CSF leak 4) suggested imaging protocol 3. IIH 1) clinical manifestation 2) brain imaging for IIH 3) suggested imaging protocol 4. New concept of CSF physiology and glymphatic in relation to SIH and IIH 5. Summery

NREE-99 Carotid Cavernous Fistula: Classification, Arterial and Venous Anatomy, Clinical Presentation and Diagnosis and Endovascular Approach

Participants
Shadab Alam, MBBS, BANGALORE, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Carotid cavernous fistula(CCF) are classified hemodynamically as high flow and low flow, etiologically as spontaneous, traumatic and Iatrogenic and anatomically as direct and indirect. 2) Clinical presentation is influenced by venous drainage patterns and shunt flow rate. 3) Endovascular approach depends on the type of CCF and angiographic findings which could be transarterial or transvenous. 4) Alternative approach for indirect CCF include transorbital superior ophthalmic vein approach and transfemoral Superior Petrosal Sinus Approach

TABLE OF CONTENTS/OUTLINE

The exabit will include:Classification of CCF. Arterial and venous anatomy with emphasis on the ECA and ICA anastomosis. Various clinical presentation. Imaging appearance of CCF. Angiographic anatomy and angiographic check list to plan treatment. Illustration interventional hardware for treatment planning. Case illustration of various treatment options like Transarterial coiling, parent artery occlusion, coil plus EVOH Embolisation, transvenous approach, various alternative approaches with case illustrations. Tips and tricks planning and execution of cases.

Cranial Nerves Cavernoma: A Rare Presentation of an Usual Lesion

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Cum Laude

Participants
Danielly Santos SR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Through this pictorial essay a review will be made based on cases and original drawings about atypical location of Cavernous Malformations (MC's). The purposes of this exhibit are:- To review the normal anatomy of cranial nerves using schematic illustrations and imaging MRI.- To discuss imaging features of cavernous malformations (CM's) and their classification.- To display a compendium of cases of CM's involving the origin and path of cranial nerves.- To show the examination protocols and the best MRI sequence for assessing these cases.

TABLE OF CONTENTS/OUTLINE

Cavernous angiomas or malformations are angiographically occult vascular malformations found in approximately 0.4%-0.9% of the population, and they account for 10-20% of all cerebrovascular malformations. Their location is variable, with 70-80% having a supratentorial origin, followed by infratentorial location (15%) within the spinal cord (5%). Isolated cranial nerves CMs are extremely rare, and there are very few reports. Although rare, it poses a significant threat to nerve functions. Due to the limited number of cases and scarce evidence, no definite recommendation is available on the indications of surgery and treatment. However, it seems essential to treat patients with progressive neurological deficits.MRI imaging is crucial for the evaluation of CMs. It can be safely stated that the CISS/FIESTA sequence should be considered as a tool for evaluating the CM origin and nerve continuity and planning a surgical approach.

Bilateral Thalamic Lesions Report: Imaging Statistics and Facts

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the spectrum of bilateral thalamic lesions on MRI. To demonstrate that the MRI assessment of bilateral thalamic lesions can be simplified through a practical approach, listing the most valuable key imaging points. To identify potential imaging pitfalls, make possible the implementation of precise therapeutic measures, and avoid potentially harmful biopsies.

TABLE OF CONTENTS/OUTLINE

1. Anatomy of the thalamic region. 2. Main neoplasms presenting with bilateral involvement of the thalamus, including astrocytomas and lymphomas.3. Inflammatory, infectious, and demyelinating lesions that can manifest with bilateral thalamic involvement, including West Nile and Mycoplasma encephalitis. 4. Vascular causes: deep venous thrombosis, arterial infarction, and hypoxic-ischemic encephalopathy. 5. Toxic and metabolic causes, including Wernicke's encephalopathy, Fahr disease, and Leigh disease. 6. Clues for a practical imaging assessment and the avoidance of pitfalls.

Shedding light on the Substantia Nigra: Anatomy, Function, Imaging Technique and Pathophysiology.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Guillaume Curaudeau, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Anatomic features of the substantia nigra beget predictable imaging presentations of common and uncommon pathologies.Multi-modality and multi-sequence approach, including conventional T1 and T2-weighted images, DWI, SWI, and perfusion imaging are necessary to segregate different etiologies that affect the substantia nigra. The spectrum in imaging is reinforced via case based learning.Whereas DAT-SPECT scans have traditionally been used to evaluate Parkinsonian pathologies, improved high-resolution volumetric and susceptibility-weighted imaging are being leveraged for both Parkinsonian and non-Parkinsonian evaluation of etiologies affecting the substantia nigra. Understanding the difference between Wallerian and transneuronal degeneration Cellular idiosyncrasies of the nigrostriatial pathways including dense aquaporin-4 and elevated GABA receptor concentrations, as well as increased axonal aborization, contribute to higher metabolic burden and therefore lower threshold for development of oxidative stress.Genetic predispositions, some of which are newly characterized, foster accelerated pathways for nigrostriatal injury, and increased bionergetic burden.

Immunodeficiency-associated Primary CNS Lymphoma in Non-AIDS Patients - Clinico-Radiological Update

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Francis Astrid Garay Buitron, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Presurgical suspicion of CNS lymphoma is crucial for initial patient management: corticoids avoidance prior to biopsy.-Imaging features of CNS lymphoma are T2 hypointensity, homogeneous enhancement, and restricted diffusion, without hemorrhage. These features refer to diffuse large B-cell lymphoma of the CNS (Epstein-Barr virus-negative, immunocompetent hosts).-Immunodeficiency-associated CNS lymphoma (diffuse large B-cell, Epstein-Barr virus-positive) does not fulfill these imaging criteria and it appears ring-enhancing with necrosis and hemorrhage; mimicking glioblastoma or metastasis.-It has been mainly associated with AIDS, which incidence is decreasing; while other causes of immunocompromise are increasing.-MRI interpretations usually misdiagnose this entity as glioblastoma or metastasis, and it is not uncommon that patients undergo avoidable surgical resection.-We noted a TSE-T2 hypointensity of the central non-enhancing component in these tumors, which may provide an easily-recognizable clue. Also, DSC-PWI (low CBV and high percentage of signal recovery) could be very useful.-In this presentation, clinical and radiological features of patients with non-AIDS DLBC EBV-positive CNS lymphoma are described with emphasis on 'imaging pearls'.-Radiologists must be aware of any cause of immunocompromise when facing a ring-enhancing tumor and know the imaging pearls for immunodeficiency-associated CNS lymphoma.

Imaging Features of CNS Neuroblastoma with FOXR2 Activation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Lohith Kini, MD, PhD, (*Presenter*) Consultant, Blackfynn Inc

TEACHING POINTS

Primitive neuroectodermal tumors of the central nervous system (CNS-PNETs) are a heterogeneous group of highly aggressive, poorly differentiated embryonal tumors occurring predominantly in young children. With the discovery and advances in molecular and genetic diagnostics led to a reclassification of CNS embryonal tumors in the most recent 2021 WHO Classification of CNS Tumors. The varied molecular and genetic alterations, as well as distinct histopathological and imaging features, described in this new taxonomy could inform future targeted clinical decision-making and reduce diagnostic challenge due to a lack of defining molecular markers. Using gene methylation profiling, CNS neuroblastoma with FOXR2 activation (CNS NB-FOXR2) has been identified as a distinct subtype. This educational exhibit will discuss the key radiographic and molecular features of CNS NB-FOXR2, as well as similar entities on the radiologic differential diagnoses.

TABLE OF CONTENTS/OUTLINE

I. Overview of CNS neuroblastoma with FOXR2 activation (CNS NB-FOXR2). II. Characteristic imaging features and molecular classification of CNS NB-FOXR2. III. Radiologic differences between CNS NB-FOXR2 and other embryonic tumorsa. Medulloblastomab. CNS tumor with BCOR internal tandem duplication IV. Summary and Quiza. Summary of key radiologic findings of CNS NB-FOXR2.b. Quiz: apply this new knowledge to a few example cases to improve diagnostic precision.

Imaging Features of Primary Intracranial Sarcoma with DICER1 Mutation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Lohith Kini, MD, PhD, (*Presenter*) Consultant, Blackfynn Inc

TEACHING POINTS

A broad spectrum of primary intracranial sarcoma subtypes is now recognized, presumably arising from mesenchymal progenitor cells within the meningeal covering of the brain and along perivascular spaces. Building on the key advancements in radiographic and genetic and molecular diagnostics including DNA methylation profiling, primary intracranial sarcoma with DICER1 mutation (PISD) can now be characterized as a distinct tumor entity, newly defined by the 2021 WHO Classification of CNS Tumors. The significant histological variability of PISD makes diagnosis challenging, but DNA methylation profiling and gene panel sequencing have elucidated it as a homogenous entity. This educational exhibit will highlight the important and distinct radiographic and molecular features of PISD in contrast to other intracranial mesenchymal, non-meningothelial tumors such as rhabdomyosarcoma, CIC-rearranged sarcoma and solitary fibrous tumors.

TABLE OF CONTENTS/OUTLINE

I. Overview of primary intracranial sarcoma with DICER1 mutation (PISD). II. Characteristic imaging features and molecular classification of PISD. III. Radiologic differences between PISD and other intracranial mesenchymal, non-meningothelial tumors a. Rhabdomyosarcoma b. CIC-rearranged sarcoma c. Solitary fibrous tumors IV. Summary and Quiz a. Summary of key radiologic findings of PISD. b. Quiz: apply this new knowledge to a few example cases to improve diagnostic precision.

Brain Arteriovenous Malformations (AVMs): A Practical Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Danielly Santos SR, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To make the correct diagnosis, distinguishing brain AVMs from other intracranial vascular malformations and identify any complications at the time of presentation that may require immediate management;To stratify the risk of future complications, especially hemorrhage, perilesional hypoxemia or venous congestion, and thereby, establishing the appropriateness of conservative management or treatment;If AVM treatment is indicated, to choose the most effective modality for treatment with the lowest risk of adverse events;To follow the AVM over time, monitoring responses to treatment or ensuring stability with conservative management.

TABLE OF CONTENTS/OUTLINE

A AVM is a nidus of abnormal blood vessels connecting arteries and veins in the brain parenchyma through a shunt, primarily composed of enlarged feeding arteries through which arteriovenous shunting occurs with draining veins. Brain AVMs are rare lesions and most occur sporadically, although there are known associations with syndromes, such as hereditary hemorrhagic telangiectasia and cerebrofacial arteriovenous metameric syndrome. When imaging AVMs, it is important to first identify features suggesting elevated risk of hemorrhage or other morbidity, such as perinidal hypoxemia, and secondly, to inform the choice of treatment or observation that provides the best balance of risk and benefit to the individual patient. Longitudinal imaging surveillance, either with conservative management or after treatment, enables monitoring for resolution of the AVM or the development of adverse findings that may necessitate a change in management.

Signs or Sins of Stroke in the Young Population: The Unforgivable Vascular Imaging Mystery

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate that other vasculopathies besides atherosclerosis can cause ischemic stroke in young patients. To review the inflammatory, metabolic, coagulopathic, and genetic vasculopathies. To illustrate the imaging pearls of reversible cerebral vasoconstriction syndrome, carotid and vertebral dissection, carotid web, moyamoya, vasculitis, CADASIL, and drug abuse. To review these fewer common causes of stroke, sometimes misdiagnosed, and encourage the radiologist to go deeper into investigating these diseases.

TABLE OF CONTENTS/OUTLINE

1. Background of non-atherosclerotic vasculopathy causing ischemic stroke in young people. 2. Terminology, etiology, and pathology. 3. How CT and MRI angiography can help in differential diagnoses. 4. Vessel Wall MRI. 5. Carotid and vertebral dissection. 6. Carotid web. 7. Moya-Moya syndrome. 8. RCVS. 9. CADASIL. 10. Vasculitis. 11. Flowchart of imaging assessment. 12. Summary and Take-home messages.

Recanalization Therapy is a Matter of Mismatch

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the most beneficial practices in the ischemic stroke imaging assessment, emphasizing perfusion-diffusion evaluation of ischemic penumbra and FLAIR-diffusion mismatch. To show the importance of perfusion-diffusion mismatch evaluation in ischemic strokes with more than 6 hours of evolution. To explain the importance of FLAIR-diffusion mismatch evaluation in ischemic strokes with unknown onset time. To re-examine the current AHA/ASA Guidelines for the Early Management of Patients with Acute Ischemic Stroke Update.

TABLE OF CONTENTS/OUTLINE

1. Brief pathophysiological considerations of ischemic penumbra. 2. Flowchart of the objectives traced by the radiologist: critical objectives for stroke management. 3. Potentially salvageable brain: definition of ischemic penumbra through CT perfusion. 4. Potentially salvageable brain: definition of ischemic penumbra through MR perfusion-diffusion mismatch. 5. Strokes with unknown onset time: the importance of FLAIR-diffusion mismatch for clinical management. 7. Take-home messages.

Dose Size Matter? Going Beyond Large Vessels in Stroke Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Humza Haque, MD, Newark, NJ (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To appreciate the importance of more distal vasculature when a patient presents with clinical appreciable stroke symptoms- High clinical suspicion, such as with a high NIH Stroke Scale, without occlusion of a large vessel (ICA, M1, basilar), should prompt careful inspection of more distal vasculature Latest research trends have shown success with intervention upon smaller vessels, making the radiologist's role for detection vital [1]2. To understand the utility of CT perfusion to guide identification of smaller vessel occlusion.- CT perfusion increases sensitivity and specificity of the detection of an occluded vessel [2]3. To gain insight on pearls and pitfalls regarding vascular anatomy, CT technique, and to avoid common errors when faced with stroke imagingSaver et al. (2020) Stroke 51:2872.Amukotuwa et al. (2021) Stroke 52:3308.

TABLE OF CONTENTS/OUTLINE

Define commonly used terms and abbreviations in the world of stroke and its imaging, including medium vessel occlusions (M2/3 middle cerebral artery, A2/3 anterior cerebral artery, and P2/3 posterior cerebral artery segments) [3]Review literature regarding large and more distal vessel occlusionCases and teaching points of medium vessel occlusions involving the ACA, MCA, and PCA with pertinent clinical information, non-contrast CT head, CT angiogram, CT perfusion, and MRI.Conclusion3. Arachnoid Cysts: Not Always Benign

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Glauber Siqueira I, MD,ARRT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:The objective of this iconographic essay is to highlight the main imaging aspects of computed tomography (CT) and magnetic resonance imaging (MRI) of complications related to arachnoid cysts through illustrative cases.Among the main findings, that stand out, are rupture with the formation of extra-axial collections such as subdural hygroma or hematoma, intracystic hemorrhage, herniations, and hydrocephalus.It is crucial that radiologists become familiar with the main diagnostic aspects in cross-sectional imaging of this frequent cause that is not always devoid of clinical significance.

TABLE OF CONTENTS/OUTLINE

Anatomical considerations: location, anatomical variants and its implications. Cystic characteristics on CT and MRI. Adjacent structures: brain, bone, vessel and nerves. Atypical imaging appearance: red flags on differential diagnosis Arachnoid cysts post-operative imaging.

Clues to Suspect Dural Arteriovenous Fistulas at Cross-sectional Imaging: Case-based Quiz and Review with Angiographic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Carlota Garcia de Andoin Sojo, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Even if arteriography is the gold standard radiological technique to confirm the presence of dural arteriovenous fistulas, some CT and MRI direct and indirect findings can suggest the diagnosis if seen.

TABLE OF CONTENTS/OUTLINE

ObjectivesTo describe different radiological signs that suggest the presence of dural arteriovenous fistulas in cross-sectional image modalities (CT and MRI).To show the correlation between the signs described before and the angiographic findings.MethodsA CT and MRI illustrated quiz with cases from our institution has been made to introduce the revision of each sign that suggests the presence of dural arteriovenous fistulas in non-invasive radiological tests.Direct signs: high signal of venous structures seen on time of flight (TOF) angiography MRI sequence; early enhancement of venous structures on contrast-enhanced angio-CT or MRI. Indirect signs: congestive parenchymatous or spinal oedema with variable hemorrhagic foci on MRI; intracranial intraparenchymal, subarachnoid or subdural haemorrhages; cerebral venous sinus thrombosis; prominent vascular structures in absence of nidus; area of increased blood flow in neuroperfusion studies; proptosis and orbital oedema; abnormally enlarged dural vascular channels in the skull. Conclusion:The knowledge of these findings in cross-sectional image modalities is useful for approaching the diagnosis and before performing an invasive test.

Certificate of Merit

Participants
Irline Cordeiro de Macedo Pontes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although MRI has increased in importance, CT myelography still has a key role in delineating the spinal anatomy, especially to demonstrate dural sac and its contents pathologies. Therefore the radiologists must be aware of the main indications and the principles of the exam technique. The aim of this exhibit is to:1. Detail the technique from lumbar and C1-C2 punctures.2. Demonstrate the differences between the acquisition techniques from CT myelography.3. Describe the differences between the contrast agents and the most suitable choice for the procedure.4. Display and illustrate the needles available for lumbar puncture and the best selection for each case. 5. Exhibit forms of prevention of post-dural puncture headache. 6. Demonstrate imaging findings from erroneous contrast administration.7. Illustrate the main indications from CT myelography with imaging findings.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION2. THE TECHNICAL ASPECTS FROM CT MYELOGRAPHY a. Lumbar and cervical punctures b. Acquisition techniques c. Contrast selectioni. Ionicii. Nonionic d. Needles selectioni. Conventional typeii. Pencil-point type e. Erroneous contrast administration: imaging findings.f. Post-dural puncture headache3. MAIN INDICATIONS AND IMAGING FINDINGS a. Main indications b. Diffusion for Clearing Confusion: Role of the Diffusion-weighted Imaging in the Spine and Spinal Cord

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Melih Akyuz, MD, Chicago, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS: 1. Diffusion-weighted imaging (DWI) in the spine is relatively new, yet has been a reliable imaging method for the characterization of a variety of disease entities 2. DWI provides information on the tissue microstructure depending on the alterations of the water-proton mobility. The efficacy of this technique has been proven in the evaluation of the abnormalities of not only the brain but also the spinal cord and spine 3. Previous studies have shown that DWI might be useful in the evaluation of vertebral fractures, degenerative changes of the spine, infection, infarction of the spinal cord, neoplasms, and various inflammatory conditions involving the spine and spinal cord

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS OUTLINE: 1. Describing different techniques of diffusion-weighted imaging in the spine2. Discuss various abnormalities involving the spine spinal cord their clinical manifestations3. Briefly discuss the sources and mechanisms of actions of different disease entities involving the spine4. Case-based imaging review of the abnormalities of the spine spinal cord with distinctive imaging findings emphasis on the use of the DWI in each entity

Magnetic Resonance Imaging Findings in Infectious and Granulomatous Spinal Cord Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Alice Abreu Mota, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Magnetic Resonance findings, associated with clinical and laboratorial exams, may help differentiate the specific etiology for infectious and granulomatous medulla and spinal cord pathologies. • Linear and nodular enhancement pattern with an "arborized" appearance is typical in neuroschistosomiasis. • The tuberculosis infection may lead to many complications like meningitis, radiculomyelitis, tuberculoma, myelitis, syringomyelia and spinal abscess. • Sarcoidosis lesions are frequently multiple and centrally located. • Toxoplasmosis is often indistinguishable from tuberculoma. • Abnormalities are mainly found in the dorsal columns in HTLV-1 and usually involve the posterior and lateral region of the cord in HIV. • In Varicella Zoster the T2 hyperintensity is in the lateral portion. • Myeloradiculopathy, myeloradiculitis, myelitis, myeloneuropathy, Guillain-Barre syndrome, have been reported in arboviruses.

TABLE OF CONTENTS/OUTLINE

Viral Myelitis • Varicella Zoster • Arboviruses (Chikungunya) • Citomegalovirus • HIV • HTLV-1 Others Infectious diseases • Tuberculosis • Neuroschistosomiasis • Neurotoxoplasmosis Non-infectious granulomatous disease • Sarcoidosis

Non-traumatic Spine Emergencies -A Primer for the On-Call Radiology Resident

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Emily Convery, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although trauma remains a common indication for emergency room clinician to order spine imaging study, there are several atraumatic causes that warrant emergent spine imaging. This differential includes acute disc herniations with compressive myelopathy, pyogenic osteomyelitis with epidural abscess, and acute inflammatory process such as Guillain Barre syndrome or demyelinating disease, as well as direct or leptomeningeal spread of metastatic disease and vascular pathologies. Having familiarity with typical clinical manifestations and emergent management of such disease process can aid the radiologist with obtaining the proper spinal level of imaging with appropriate imaging modality and if need be recommend further imaging outside the neural axis.

TABLE OF CONTENTS/OUTLINE

1) Overview of spinal anatomy imaging search pattern 2) Signs and symptoms of myelopathy 3) Degenerative disease 4) Infectious and inflammatory diseases 5) Malignant compressive pathology 6) Vascular pathology 7) Treatment/management options

Printed on: 02/07/23

Diffusion Kurtosis Imaging (DKI) in Neuroradiology: Technique and Clinical Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Silvia Lanzarote Vargas, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

DKI is a diffusion technique based on the use of very high values ??(b=2000 s/mm2) and on the complex tissue structural technique with interesting applications in neuroradiology, mainly in the diagnosis and follow-up of gliomas.

TABLE OF CONTENTS/OUTLINE

Kurtosis is a statistical measure that determines the degree of concentration that the values ??of a variable present around the central zone of the frequency distribution. Diffusion imaging (DWI) with low b values ??assumes that the movement of water molecules after the application of the gradients of the diffusion sequence is the same in any direction in space and follows a Gaussian distribution. In biological tissues the movement of water molecules varies from the Gaussian distribution. This degree of deviation is related to tissue structural complexity and barriers to the free diffusion of water and it can be calculated using DKI. This presentation will explain in a simple way what are the technical requirements necessary to obtain the DKI as well as the parameters that can be calculated, such as the kurtosis coefficient (K). It is intended to provide information that may be useful in routine clinical practice, illustrating representative cases. Examples of the different applications of DKI in the diagnosis and monitoring of different pathologies will be given. In brain tumors, it can be useful to differentiate high-grade and low-grade gliomas, as well as to distinguish between recurrence of high-grade gliomas and pseudoprogression or radionecrosis and gliomas from other tumors such as primary CNS lymphomas. We will also show the usefullness of DKI in the diagnosis of head and neck tumors as well as in neurodegenerative diseases.

Cavernous Sinus Hyperintense on Magnetic Resonance Angiography - Can You Differentiate Dural Arteriovenous Fistula from Cerebral Venous Reflux?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Keizo Tanitame, MD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnostic radiologists often encounter cavernous sinus hyperintense on three-dimensional time-of-flight magnetic resonance angiography (MRA). Even if detailed evaluation of the source images of MRA is performed, differentiation between dural arteriovenous fistula (DAVF) and cerebral venous reflux (CVR) is occasionally difficult. Cerebral digital subtraction angiography (DSA) is useful for differentiating them, but it is invasive and has a small risk of cerebral embolisms. CVR is observed mostly on the left side, and considered to be retrograde venous flow due to compression of the left brachiocephalic vein between the sternum and aortic arch or branches. We demonstrate several cases with diagnostic difficulty and focus the cause of retrograde venous flow in left cavernous sinus and some techniques suppressing the CVR on MRA.

TABLE OF CONTENTS/OUTLINE

1. Representative MRA and DSA images of cavernous sinus DAVF - Small arteriovenous shunts near the cavernous sinus 2. Representative MRA and DSA images of upward venous reflux in the cavernous sinus - Retrograde venous flow of the cavernous sinus and other venous sinuses 3. The cause of retrograde venous flow in the left cavernous sinus - Images and schematic illustration of left brachiocephalic vein compression 4. Suppression techniques against intracranial retrograde venous flow - The usefulness of MRA scanning in the supine position with shoulder pillows and small breathing

Probing Metabolism: The Role of Proton MR Spectroscopy in Neurometabolic Diseases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Milena Krieck Farche, MD, Campinas, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Describe the basic principles of magnetic resonance spectroscopy (MRS), with an emphasis on protocol acquisition and optimal technique in a variety of neurometabolic conditions. 2- Illustrate the normal spectra and main abnormal patterns of brain metabolites, integrating the spectroscopy information with the analysis of conventional MRI sequences.3- To review the main neurometabolic diseases in which spectroscopy can aid in establishing the correct diagnosis, presenting radiological tips for each clinical context.

TABLE OF CONTENTS/OUTLINE

1 - Introduction2 - Principles of Proton MR spectroscopy A) Choosing the localization techniqueB) Choosing the echo-time (TE)C) Deciding between single-voxel vs multi-voxelD) Choosing the voxel location3 - Normal spectra and main abnormal patterns of brain metabolites, including potential pitfalls and normal variants.4 - Role of spectroscopy in the diagnosis of specific neurometabolic diseases with a series of illustrative cases5 - A spectroscopy-based approach to narrow the differential diagnosis in certain clinico-radiological scenarios (leukodystrophies, mitochondrial diseases, etc.)6 - Conclusion

Abnormalities Associated with Cerebral Cortical (AACs) on MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Zhiqiang Zhang, MD,PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Abnormalities associated with cerebral cortical (AACs) present specific anatomic, pathological, clinical and radiological features, but have less been addressed. we proposed a diagnostic framework by categorizing AACs into focal, regional and diffuse types according to the shape on MRI.In summary. AACs cover a variety of pathologies, show radiological gyrus-thickness sign in focal AASs, outline-sketched sign in regional AACs and flower-mimic sign in diffuse AACs, and are well demonstrated with IR-based T1WI, SWI and DWI on MRI.

TABLE OF CONTENTS/OUTLINE

Regional AACs, mainly include diseases of MCD of FCD-I and tumors of long-term epilepsy. Diseases mainly present symptoms of seizures, and are well demonstrated as focal gyrus thickness on IR based T1WI.Regional AACs, lesions are within a lobe at a hemisphere, pathologically diversified into (1) MCDs of polymicrogyria, (2) VDs of cortical laminar necrosis, Isolated cortical venous thrombosis and meningioangiomatosis. (3) tumors of gliomas and MVNT. (4) Brain injury of status epilepticus and (5) CNS infections/inflammation. The diseases feature with consciousness disorders and are well demonstrated on SWI or DWI with outline-sketched sign of gyrus.Diffuse AACs, are mostly bilaterally distributed and cover widely cortical areas, include more pathological types of (1) VD of HIE and SSCNS. (2) Tumor of DLGNT. (3) Metabolic of MELAS, hypoglycemic and hyperammonia encephalopathy; (4) CJD (5) NIID and (7) Toxicosis of mercury and benzene. Diseases feature with cognitive impairments, are pathologically associated with energy metabolic abnormality in cortex, and presented with regular geometric/vivid flower-mimic shapes on DWI and FLAIR.

Spinal Vascular Lesions: What to Know, and How it Should be Reported

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Thiago Martins Fernandes Vilela, Mogi das Cruzes, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the normal anatomy of the spinal cord, the modified classification of spinal vascular lesions (by Spletz), a more practical classification based on the vascular anatomy of the spinal cord and the inborn or acquired nature of the lesion (Bicentre group).- To review the pathophysiological mechanisms and their clinical correlations.- To present and review some of the metameric and myelomeric syndromes.- To point out what information is expected beyond the diagnosis in each of the cases presented.- To propose a structured report.- To review post-operative image findings and complications of the most used procedures and techniques.

TABLE OF CONTENTS/OUTLINE

-- Introduction - Anatomy - Classifications - Pathophysiological mechanisms and their clinical correlations - MRI and digital angiography techniques -- Description of the imagine features, pointing out the most important information that is to be provided. -- Review of the post-operative image findings and complications of the most used procedures and techniques. -- Proposal of a structured report. -- Conclusion

Inborn Errors of Metabolism: A Step by Step Clinico-radiological Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Gabriela Bandeira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1-To review the classification of inborn errors of metabolism.2- To review the pathophysiology basic principles of the inborn errors of metabolism.3-To illustrate imaging findings related to genetically determined metabolic disorders.

TABLE OF CONTENTS/OUTLINE

1 - Introduction2 - Classification of inborn errors of metabolismDisorders of intermediary metabolism : aminoacidopathies, organic acidurias, latic acidemias, hyperammonemia and disorders of the urea cycle, disorders of fatty acid oxidation. Disorders of the biosynthesis and breakdown of complex molecules: purine and pyrimidine metabolism, lipoprotein metabolism, lysosomal storage disorders, peroxisomal disorders, porphyrias.Mitochondrial disorders: mitochondrial encephalomyopathy, lactic acidosis and stroke-like episodes (MELAS), Kearns-Sayre syndrome, MERRF (myoclonus epilepsy with ragged red fibers). Neurotransmitter defects and related disorders: disorders of glycine and serine metabolism.Disorders of mineral metabolism: Menkes disease, Wilson disease, others.3- General and specific clinical features of inborn errors of metabolism4 - Clinico-radiological approach to inborn errors of metabolism with illustrative cases5- Take home message6 - Conclusion7 - References

Molecular and Genetic Features of Adult Diffuse Gliomas: Essential Updates from WHO 2021 CNS Tumor Classification

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Ilan Benador, MD,PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diffuse adult gliomas have been previously organized into 15 separate entities primarily based on histological features. WHO CNS tumor classification 2021 has reorganized diffuse gliomas into only three subtypes based on molecular and genetic characteristics that better correlate with prognosis and treatment response: 1) astrocytoma, IDH-mutant, 2) oligodendroglioma, IDH-mutant, and 1p19q-codeleted, 3) glioblastoma, IDH-wildtype. Additionally, the following entities have been retired from the tumor nomenclature in the classification scheme: glioblastoma, IDH-mutant, astrocytoma, IDH-wildtype, and oligoastroglioma. This educational exhibit will highlight the key advancements in radiographic and molecular diagnosis of diffuse gliomas.

TABLE OF CONTENTS/OUTLINE

I. Overview of WHO 2021 CNS Tumor Classification of adult-type diffuse gliomas. II. Characteristic imaging features and molecular classification of adult-type gliomas. A) Astrocytoma, IDH mutant: ATRX mutation, CDKN2A/B deletion. B) Oligodendroglioma, IDH-mutant: 1p19q co-deleted, TERT promoter mutation. C) GBM, IDH-wildtype: TERT promoter mutation, EGFR amplification, Trisomy 7 Monosomy 10. III. Summary of key molecular signatures of each subtype. IV. Quiz: apply this new knowledge to a few example cases to improve diagnostic precision.

Distinguishing Mimics from the Great Mimicker: CNS Lymphoma in Immunocompromised Hosts

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Nima Omid-Fard, MD, BSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• In the immunocompromised setting, there are distinct radiologic findings of CNS lymphoma, including necrotic ring-enhancing lesions, increased propensity for intralesional hemorrhage, and multiplicity.• In this clinical context, advanced imaging with MR perfusion, spectroscopy and diffusion-weighted imaging can be used to increase accuracy in the diagnosis of lymphoma over mimics such as GBM, metastases or infection.• This knowledge is particularly relevant to radiologists as the incidence of immunodeficiency-related CNS lymphoma may be increasing.

TABLE OF CONTENTS/OUTLINE

• Briefly review typical imaging findings of primary and secondary CNS lymphoma • Discuss the potential for rare and atypical presentations of CNS lymphoma • A greater emphasis will then be placed on the unique imaging findings in immunodeficiency-associated CNS lymphoma, reviewing advanced imaging techniques including MR spectroscopy, diffusion, and MR perfusion. • Side-by-side multisequence comparison of immunocompromised vs immunocompetent CNS lymphoma • Side-by-side multisequence comparison of immunocompromised CNS lymphoma vs glioblastoma • Side-by-side multisequence comparison of immunocompromised CNS lymphoma vs metastasis • Side-by-side multisequence comparison of immunocompromised CNS lymphoma vs infection (toxoplasmosis)

The B - T Guide of Lymphomas

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate the typical MRI patterns and the classification of central nervous system (CNS) lymphomas. To explain the difference between intra-axial and extra-axial primary CNS lymphoma. To illustrate the importance of MRI in the trivial and atypical features of CNS lymphomas. To depict the importance of MRI in the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Diffuse large B-cell lymphoma and high-grade Burkitt-like B-cell lymphoma. 3. Low-grade T-cell lymphoma. 4. Lymphomas in the immunocompromised patient: AIDS-related diffuse large B-cell lymphoma. 5 EBV-positive diffuse large B-cell lymphoma, NOS. 6. Lymphomatoid granulomatosis. 7. Primary CNS posttransplant lymphoproliferative disorder. 8. Intravascular lymphoma. 9. MALT lymphoma of the dura. 10. Typical features, including hypercellularity and moderate to low perfusion. 11. Imaging assessment of the atypical imaging patterns of CNS lymphomas, including spontaneous remission and relapsing presentation, and corticospinal tract infiltration. 12. Differential diagnoses: meningioma, sarcoidosis, non-Langerhans cell histiocytosis, and IgG4-related disease. 13. Flowchart of evaluation. 14. Take-Home messages.

Unraveling Lesions of Chiasmatic-Hypotalamic Region: A Case Based Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Virginia Simonini, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The hypothalamus is a midline structure located below the thalamus, and together with the epithalamus and subthalamus, they constitute the diencephalon and its main function is homeostasis. - The optic chiasm is also a midline structure located anteriorly to the hypothalamus and is the point where both optic nerves meet and continue posteriorly as the optic tracts. - The hypothalamic-chiasmatic region can be affected by many diseases from multiple etiologies, such as neoplastic, developmental abnormalities and inflammatory/granulomatous, and the aim of this study is to didactically illustrate such cases. - Many important structures surround the hypothalamic-chiasmatic region, such as mamillary bodies (MB), pituitary stalk (PS), neuro and adenohypophysis, and can also be affected by those diseases. - Computed tomography (CT) is a limited method for the hypothalamic-chiasmatic region evaluation, since it has low contrast between structures. Hence, the imaging modality of choice for examination of this area is magnetic resonance imaging (MRI), specially midline sagittal slices.

TABLE OF CONTENTS/OUTLINE

- Illustrate normal hypothalamic-chiasmatic region anatomy. - Expose didactic cases of hypothalamic-chiasmatic region lesions, from many etiologies and how to evaluate trough imaging, illustrating described findings to consolidate the acquired knowledge. - Bibliographical references.

Retinobasltoma: A Giant for the Little Ones

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Karolina Cancela, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibition are: review the anatomy of the eyeball, including its main anatomical limits and the structures that compose it. Review vascularization characteristics and normal MR imaging findings. Correlated clinical syndromes. Discuss and illustrate the main imaging patterns of retinoblastoma. Detail the lesions according to their topography, whether unilateral, bilateral or even trilateral, configuring pineoblastoma.Describe diagnostic scenarios through illustrative cases, focusing on typical imaging patterns, unexpected tumor findings, dissemination patterns and imaging aspects of complications and post-treatment.

TABLE OF CONTENTS/OUTLINE

Retinoblastoma with its imaging patterns on MRI sequences; unilateral, bilateral or trilateral; structures involved: intra-orbital and/or extra-orbital; unexpected findings: other tumors as main differential diagnoses; post-treatment evaluation and complications; final considerations.

Imaging of Common and Uncommon Post-treatment Related Complications in the Brain and Spinal Cord

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
David Michaels, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Present cases which highlight both common and uncommon complications related to neurological treatment • Identify specific imaging findings to look for when presented with post-treatment cases • Give a brief summary of the natural time course of the above mentioned complications and how they will evolve over time on follow up imaging studies

TABLE OF CONTENTS/OUTLINE

Complications from treatment, whether related to medical, surgical, or radiation treatments, are important for the neuroradiologist to recognize and diagnose. Often, recognition of such complications is crucial, as it can change future care of the patient. This education exhibit will present cases which illustrate both common and uncommon complications related to neurological treatment. We will provide a succinct overview of patient history, followed by a comprehensive interpretation of pertinent imaging studies. Our institution functions as a large tertiary care referral center for the region, which translates into both rare complications of common treatments, and common complications of rare treatments. Finally, we will end each case with a brief comment on the prognosis of each complication, and what to look for on future imaging studies. Cases include acute toxic leukoencephalopathy from both immunosuppressive and chemotherapeutic agents, radiation-induced leukoencephalopathy and meningioma formation, and postsurgical complications to include Teflon granuloma and remote cerebellar hemorrhage, among others.

Development and Clinical Translation of a Neuro-analysis Pipeline for Automatic Quantitative Analysis Using the Kaapana Platform

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Vikas Bommineni, Orlando, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Quantitative measures, such as brain atrophy patterns related to neurodegenerative diseases, may provide complementary information to radiologists. However, translation of quantitative biomarkers to clinical practice has been limited. Recent advances in image analysis allow automated and rapid processing of medical image data, while new statistical methods enable collection of large harmonized reference datasets to perform comparative analyses of individual measures. We present a workflow on Kaapana, an open-source framework for medical data analysis, for translating laboratory-validated, quantitative measures into next-generation, precise biomarkers towards personalized diagnostics. The pipeline includes pretrained deep learning(DL) models for segmentation of brain anatomy, data harmonization to a cognitively normal reference population, and calculation of machine-learning based individualized summary scores that quantify neurodegeneration and brain aging. The pipeline inputs DICOM scans directly from scanners or Picture Archival and Communications Systems (PACS) and generates segmentation maps and a patient-specific summary report to visualize measures in comparison to expected distributions based on reference populations. Outputs are converted to DICOM for archival on PACS.

TABLE OF CONTENTS/OUTLINE

1) Introduction2) Neurodegeneration biomarkers3) Neuro-analysis pipeline:a) Pre-processing: Nifti conversion, skull stripping tissue segmentationb) Analysis: Data harmonization extraction of quantitative biomarkersc) Generation of summary reportd) DICOM output4) Workflow: Push data to Kaapana, trigger pipeline, QC results and push to PACS5) Future enhancements

Lumbar Spine MR Examination (2 Minutes, 30 seconds) Faster than Instant Noodles Using GRAPPA and Deep Learning Reconstruction with High Acceleration Factor

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Takeshi Hasuda, RT, Ueda-Shi, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibition was approved by our Medical Ethics Committee. One of the disadvantages of MRI examinations is the relatively long time required to acquire MR images. In MRI examinations of the spine, there are cases in which the examination needs to be performed quickly due to trauma, or patients with hernias or other pain that make it impossible to perform the examination in the same position for long periods of time due to rounded backs. In recent years, reconstruction technology using Deep Learning has been attracting attention, and high-speed and high-resolution MRI have been attracting attention. This education focused on Deep Resolve (DR), a Deep Learning Reconstruction (DLR) method, to understand the characteristics of DR and to optimize the imaging protocol. The teaching points of this exhibition are to (1) understand the outline of DR by validation using phantoms and to examine the optimal conditions in combination with parallel imaging (GRRAPPA), (2) practice the validation results in clinical practice and to analyze problems, and (3) optimize the parameters of Spine's imaging conditions based on the results and demonstrate scan times faster than instant noodles.

TABLE OF CONTENTS/OUTLINE

1. overview 2. understanding the characteristics of DR (Deep Resolve) 3. phantom verification 4. trial and error in actual clinical practice 5. MR images (comparison of original and optimized images) Faster than instant noodles

Synthetic MRI Evaluation of Sella Pathologies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Ranliang Hu, MD, (*Presenter*) Stockholder, Moderna, Inc;Stockholder, Pfizer Inc

TEACHING POINTS

Synthetic MRI is an emerging technique for clinical imaging, able to generate multiple contrast weighted images and parametric maps based on a single acquisition using multiple delay and and echo times. While Synthetic MRI has become available from multiple vendors and recent studies have shown it to produce comparable image quality to that of conventional brain MRI, it is still underutilized in part due to lack of experience among radiologists with the technique and post-processing. The sella region is complex for neuroradiologic evaluation due its small anatomy, subtle pathologies, complex tissue/enhancement characteristics. Technical developments in 3D synthetic MRI with higher spatial resolution has made sella imaging feasible, with ability to perform qualitative and quantitative tissue characterization. This education exhibit will review recent developments in Synthetic MRI for neuroimaging and through case examples demonstrate its role in the evaluation of pathologies in the sella region.

TABLE OF CONTENTS/OUTLINE

1. Background: a. Brief review of current literature2. Technical Overview: a. Acquisition b. Post-processing3. Case Review: a. Pituitary hyperplasia b. Rathke's cleft cyst c. Epidermoid cyst d. Pituitary adenoma e. Post-treatment adenoma f. Meningioma g. Craniopharyngioma4. Summary: a. Key points for qualitative interpretation b. Quantitative differences between pathologies c. Challenges and limitations

Trigeminal, Facial, Hypoglossal and Greater Occipital Nerves: Had You Seen Them Like This Before?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Marta Barrios Lopez, MD, Santander, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To summarize the most important anatomical relationships of the extracranial segments of the main cranial nerves (including the trigeminal, facial and hypoglossal nerves). We will also include those of the greater occipital nerve, the thickest cutaneous nerve in the human body. -To demonstrate the ability of 3D CRANI, an innovative MRI sequence, to help visualize these branches.

TABLE OF CONTENTS/OUTLINE

-INTRODUCTION- THE 3D CRANI SEQUENCE: a relatively new MRI technique that combines a STIR TSE black-blood sequence, a motion-sensitized driven equilibrium (MSDE) pulse and a pseudo steady-state (PSS) sweep.- TRIGEMINAL NERVE: introduction and origin. Extracranial segment.-Ophthalmic nerve. Maxillary nerve. Mandibular nerve: main anatomical relationships and branches. Useful details and their correlation with the clinic. - FACIAL NERVE: introduction and origin. Extracranial segment. Main extracranial branches and their relationship to the parotid gland. - HYPOGLOSSAL NERVE: introduction and origin. Main anatomical relationships in the neck.- GREATER OCCIPITAL NERVE: introduction, importance, anatomical landmarks. -CONCLUSIONS: 3D CRANI is useful to visualize the extraforaminal segments of the major cranial nerves.

Mismatch of Arterial Spin Labeling (ASL) Compared to MR Dynamic Susceptibility Contrast Perfusion Weighted Imaging (DSC-PWI) in the Central Nervous System Diseases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Xiang Liu, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

MR dynamic susceptibility contrast perfusion weighted imaging (DSC-PWI) is the most commonly used perfusion imaging technique in the central nervous system (CNS) diseases, including brain tumors. MR arterial spin labeling (ASL) is a novel noninvasive MR sequence to quantify tissue blood flow. Most published studies showed that the relative cerebral blood volume (rCBV) derived from DSC-PWI and cerebral blood flow (CBF) of ASL. Based on our experience of more than 950 patients who had concurrent ASL and DSCPWI examinations, the purpose of this Education Exhibit is to present following teaching points of mismatch between ASL and DSCPWI in the evaluation of hemodynamic changes in the CNS diseases. 1. Learning the principle of DSC-PWI; 2. Learning the principle of ASL; 3. Learning advantages and limitations of DSC-PWI and ASL in the CNS diseases;

TABLE OF CONTENTS/OUTLINE

1. Introduction of the principle of DSC-PWI; 2. Introduction of the principle of ASL; 3. Sample cases comparing between DSC-PWI and ASL in glioma, brain metastasis, meningioma, vascular malformation, and MELAS, etc ; 4. Summary of advantages and limitations of DSC-PWI and ASL in the CNS diseases;

How Diffusion Tensor Imaging Enables Direct Targeting for Focused Ultrasound Surgery

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Hiroki Hori, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is to summarize how to implement diffusion tensor imaging (DTI) as a direct targeting method in transcranial MR-guided focused ultrasound surgery (TcMRgFUS). Although the atlas-based targeting method of indirect measuring the ventral intermediate nucleus (VIM) of the thalamus from the posterior commissure (PC) was widely used, it may not be precise, as the locations of the VIM, ventral caudal nucleus (Vc) and pyramidal tract (PT) etc., may vary in each subject based on our pilot study. Especially in the case of atrophic brain, it is difficult to measure the precise location of the VIM using the conventional indirect targeting method, hence a direct targeting strategy is more desired. DTI enables visualization and characterization of fibrous structures in the brain, and tractography-based direct targeting may become the method of choice for surgical targeting as it is capable of providing patient-specific coordinates. DSI studio is an open source, high spec image processing software tool that facilitates DTI data analysis. DSI studio assisted tractography-based direct targeting offers a practical and flexible approach to improve treatment efficacy and safety profiles after TcMRgFUS treatments.

TABLE OF CONTENTS/OUTLINE

1. What is TcMRgFUS a. Overview b. Traditional method of assessment c. Ablating location2. How to visualize each fiber a. Visualize VIM b. Visualize Vc c. Visualize PT3. Location of the nucleus and ablation outcome a. Mild adverse event b. Severe adverse event c. Recurrence and mild adverse event d. Perfect treatment4. Future outlook

The Role of APTw with fMRI, and DTI in Preoperative Planning

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Sevcan Turk, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Highlight the role of amide proton transfer weighted (APTw) imaging for preoperative planning of the brain tumors; grading, genetic mutations, peritumoral invasion, and white matter tumor infiltration• Discuss the potential of using APTw imaging in assessing treatment response and discrimination of true tumor progression from pseudoprogression• APTw high signals: hypercellular components of the tumor, extracellular tumor matrix, hematoma, necrosis.• Discuss the pros and cons, artifacts in interpreting APTw, fMRI, DTI, PWI

TABLE OF CONTENTS/OUTLINE

• Overview of imaging characteristics of brain tumors with emphasis on APTw in conjunction with fMRI, DTI, and PWI for preoperative planning.• Demonstrate cases of tumor progression versus treatment effects, peritumoral invasion, and genetic mutation and grade correlation APT, PWI, DWI parameters with the role of fMRI and DTI.• Differences of pediatric tumors on advanced imaging, the added value of APTw imaging• Necrosis, hemorrhage, calcification, and extracellular matrix effects on the signal intensity in APT, fMRI, DTI, and perfusion-weighted imaging. Pitfalls and accuracy of each advanced imaging method.

Neuronal and Mixed Glioneuronal Tumors: Image Correlation X Molecular Profile

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Milena Ouchar Sabino, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the main imaging findings of neuronal and mixed glioneuronal tumors with cases from three hospitals imaging departments. - To correlate some of the neuronal and mixed glioneuronal tumors to specific altered molecular profiles.

TABLE OF CONTENTS/OUTLINE

- A brief discussion of the new WHO 2021 CNS tumors classification, focusing on neuronal and mixed glioneuronal tumors.- The most frequently altered molecular pathways.- Correlation of neuronal and mixed glioneuronal tumors according to their most frequent location and clinical presentation.- A review of the main imaging features - cases of neuronal and mixed glioneuronal tumors and their associated altered molecular profiles: gangliogliomas, desmoplastic infantile ganglioglioma/astrocytoma, papillary glioneuronal tumor, DNET, rosette-forming glioneuronal tumor, multinodular and vacuolating neuronal tumor, diffuse leptomeningeal glioneuronal tumor, central neurocytoma, extraventricular neurocytoma, dysplastic cerebellar gangliocytoma (Lhermitte-Duclos), myxoid glioneuronal tumor.- An approach to neuronal and mixed glioneuronal tumors according to their imaging appearance (solid or cystic-solid and pseudocystic).

Photon-Counting CT Applications in Neuroradiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Fides Schwartz, MD, Durham, NC (*Presenter*) Nothing to Disclose

TEACHING POINTS

Photon-counting computed tomography (PCCT) is a new CT technology. PCCT uses energy-resolving detectors, instead of integrating the entire x-ray signal (energy integrating detectors: EID), enabling spectral acquisitions without the need of specialized acquisition strategies (e.g., dual-source). PCCT records photons in different energy bins, starting at a minimum energy threshold, so electronic noise can be avoided altogether. PCCT detectors use a two-step conversion (x-rays to electrical signal), rather than the 3-step conversion EID (x-rays to light to electrical signal), and inherently have higher spatial resolution as no septa (to separate voxels) are needed. This project is geared toward introducing the emerging technology of PCCT to the RSNA neuroradiology imaging community. The details of this technology will be explained using diagrams of the physics principles, and examples of standard EID vs PCCT patient scans to demonstrate the performance of the new scanner system.

TABLE OF CONTENTS/OUTLINE

1. PCCT - Detectors a. Comparison of energy-integrating vs photon-counting detectors b. How is higher spatial resolution of PCCT achieved? 2. PCCT - Photon Binning a. How does photon binning work? b. How are energy thresholds defined? c. How do thresholds help with electronic noise? 3. PCCT - Spectral Data a. How is it always available? b. What can it be used for? 4. Clinical examples a. Temporal Bone - superior spatial resolution b. Brain without contrast - higher image contrast c. CTA - improved contrast conspicuity d. Myelograms - material decomposition capabilities

Retinoblastoma Management: Emphasis on RB-RECIST Criteria with MRI Correlation after Intra-arterial Treatment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Sevcan Turk, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Highlight the role of MRI and diffusion-weighted imaging in the evaluation of retinoblastoma treatment response.• Discuss the ultrasound and MRI correlation of the different treatment response types of retinoblastoma.• Discuss the pearls and pitfalls in interpreting ultrasound and MRI.

TABLE OF CONTENTS/OUTLINE

• Clinical presentation, genetics, and epidemiology from the ophthalmologist field of view: evaluation of retinoblastoma with orbital US, CT, and MRI.• Retinoblastoma classification: what radiologists need to know.• When Intra-arterial treatment is indicated and how we do it.• Overview of imaging characteristics of retinoblastoma after intraarterial treatment with emphasis on ultrasound- MRI correlation of the RB-RECIST criteria assessment.• Discuss type 0-IV tumor regression patterns with MRI correlate.• Discuss the role of diffusion-weighted imaging in the discrimination of treatment effect and tumor progression.• DCE and DSC perfusion, SWI value in treatment response assessment.• The role of MRI in the evaluation of extraocular extension, optic nerve invasion, post-treatment complications, and intracranial abnormalities.• Surveillance: radiation field, secondary tumors, and beyond the optic nerve.

Deep Brain Stimulation (DBS) - Pre and Post Operative Imaging, From Adequate Nucleus and Fiber Tract Localization to Electrode Misplacement

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Cum Laude

Participants
Leandro Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

This panel aims to guide a good quality exam acquisition for Deep Brain Stimulator (DBS) study, in both pre and post operative evaluations. It will be shown how to accurately localize the targets for DBS implantation in different scenarios, such as Parkinson Disease (PD), tremors, dystonias and obsessive-compulsive disorder (OCD), with images acquired on CT and MRI, these from 1,5T, 3T and 7T, correlating the electrode targets in each case with the anatomy and histology.To showcase the MRI and CT imaging protocols, with advanced sequences that are useful for evaluation, such as diffusion tensor imaging (DTI) and functional brain MRI, for each scenario (pre e post operative), its uses and limitations. Post operative protocol and images to assert possible structural reasons for clinical failure of the DBS procedure and electrode misplacement.

TABLE OF CONTENTS/OUTLINE

1 - pre operative study: 1.1 - indications, physiology of action, and scientifically proven improvement1.1.1 - PD, tremor and dystonias1.1.2 - OCD1.2 - anatomy of the targets:1.2.1 - histology1.2.2 - MRI 1,5T, 3T and 7T 1.3. - acquisition protocol:1.3.1 - CT1.3.2 - structural MRI: IR, T2, FGATIR, DP1.3.3 - functional MRI: DTI, fMRI2 - post operative study2.1 - acquisition protocol:2.1.1 - CT2.1.2 - MRI2.2 - imaging evaluation2.2.1 - electrode positioning2.2.2 - other possible structural causes of failure

Beyond Five Millimeters Below the Foramen Magnum: Exploring the Depths of the Chiari 1 Deformity

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
James Loftus, MD, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Define the proper nomenclature and terminology of the Chiari 1 and related deformities including 0/0.5 and 1.5 and how they differ in pathogenesis and embryology from the other subtypes (Don't call it a malformation!). 2. Detail the imaging evaluation of the Chiari 1 and related deformities including conventional and phase contrast magnetic resonance imaging. 3. Review surgical techniques and post-surgical imaging of the Chiari 1 and related deformities including expected findings and complications.

TABLE OF CONTENTS/OUTLINE

I. Review of the pathogenesis, embryology, nomenclature, and proper terminology surrounding the Chiari 1 and related deformities. a. Subtypes of the Chiari deformities (0-1.5) and malformations (2-5) and their pathologic and embryologic basis. b. Further description of the anatomic changes in Chiari 0/0.5, 1, and 1.5 compared to normal patients. II. Imaging evaluation of the Chiari 0/0.5, 1, and 1.5 deformities. a. Conventional brain and cervical spine MRI. i. Proper measurement of tonsillar herniation and controversies. ii. Clues to abnormal CSF flow dynamics on conventional MRI sequences (No phase contrast, no problem!). b. Phase contrast MRI (PC-MRI). i. Evaluating the re-phased image, magnitude image, and phase image. ii. Brief note on quantitative PC-MRI. III. Surgical techniques and post-surgical imaging and complications. a. Surgical techniques and expected post-surgical imaging findings including evaluation of the adequacy of decompression on PC-MRI. b. Post-surgical complications the radiologist must recognize.

Transfontanellar Ultrasound Beyond Hemorrhages In Infants

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Pedro Da Silva, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Transfontanellar ultrasound (TFUS) has been increasingly used as a diagnostic and screening tool in pediatrics, even as a first-line imaging technique, due to its advantages over other imaging methods, especially for critical ill newborns, often unable to perform the other ones. In addition, ultrasound (US) is possible to be repeated whenever necessary, without harm to the patient. In this context, grey-scale, color and spectral Doppler assessment with TFUS plays an important role in the evaluation and screening of findings beyond hemorrhages in infants, including ventriculomegaly, cerebral ischemia and its progression, as well as cerebral blood flow patterns and complications related to the use of Extracorporeal Membrane Oxygenation (ECMO) in seriously ill children. Assessment of ventricular measurements in infants allows for rapid diagnoses, monitoring of ventricular dilatations in children who need several exams, and suggests early interventions, avoiding unnecessary and expensive additional imaging methods. Several US measurements of ventricular dimensions have been proposed and increasingly used in control and clinical or surgical decisions. Furthermore, due to the great impact on morbidity and mortality of hypoxic-ischemic encephalopathy in the neonatal population, the TFUS also plays an important role in the characterization and progression of ischemic lesions and their variations, such as ischemic lesion with hemorrhagic transformation.

TABLE OF CONTENTS/OUTLINE

· Review and discuss the advantages of transfontanellar ultrasound as an imaging method in infants· Discuss and understand ultrasound imaging and its sensitivity and specificity of intracranial findings beyond hemorrhages

Craniosynostosis and Craniofacial Malformations: A Radiological and Surgical Perspective

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Jameson Da Silva, MD, Teresina, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss important anatomical features of craniosynostosis which have surgical implications and should be included in imaging reports.Consider the role of CT, especially with 3D reconstruction, in preoperative planning. Briefly describe main strategies of surgical approaches for craniosynostosis, with technique considerations relevant for the imaging specialist.

TABLE OF CONTENTS/OUTLINE

Summary- Introduction.- Relevant Anatomy.- Craniosynostosis classification and types.- Craniofacial malformations associated.- Imaging technique and protocol (Radiography, CT, conventional MRI and MRI angiography).- Imaging of normal and pathologic sutures.- Craniosynostosis clinical syndromes associated.- Postoperative follow-up imaging.- The different surgical options available for the treatment of different types of craniosynostosis.- Conclusions.- References.

One Side at a Time - Unilateral or Asymmetric Centroencephalic Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Samya Alves, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Centroencephalic abnormalities can be detected on neuroimaging in a wide variety of pathological conditions. Bilateral and symmetrical alterations are well established in the literature, however, when we look at unilateral conditions, there is a gap in the systematization of the approach. Unilateral or asymmetric centroencephalic lesions will be addressed by an algorithm developed according to typical imaging patterns, such as diffusion restriction, SWI, expansive lesions and T1 contrast enhancement. The purpose of this exhibition is to:- Review anatomy and imaging aspects of the basal ganglia and thalamus;- List normal variations, common benign findings and main diseases that present by unilateral or asymmetric centrencephalic involvement;- Review of the main pathologies on a cased-based approach;- Organize the radiologic reasoning with an algorithm.

TABLE OF CONTENTS/OUTLINE

1. ANATOMY AND IMAGING- Basal ganglia and thalamus- Imaging techniques 2. DIFFERENTIAL DIAGNOSIS OF UNILATERAL/ASYMMETRIC CENTRENCEPHALIC LESIONS- Normal variants- Restricted diffusion- SWI- Volumetric alterations: enlargement and atrophy- T1 alteration: hypersignal, contrast enhancement and morphologic change.

Pediatric Neurodegenerative Diseases: Pathophysiology and Neuroimaging Features

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Ryo Kurokawa, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this review is to1. Understand the concept of pediatric neurodegenerative disorders (pedND)2. Demonstrate the brain imaging findings of pedND3. Show how clinical features can contribute to the diagnosis of pedND

TABLE OF CONTENTS/OUTLINE

1. Overview and definition of pedND2. Triplet Repeat Disease: Huntington disease (HD), Myotonic dystrophy type 1 (DM1), Spinocerebellar ataxia (SCA) type 1, SCA2, SCA3/Machado-Joseph disease (MJD), SCA7, SCA17, Fragile X syndrome (FXS), Friedreich's ataxia (FRDA)3. Autosomal Dominant: HD, DM1, SCA1, SCA2, SCA3/MJD, SCA7, SCA174. Autosomal Recessive: FRDA, Ataxia with Oculomotor Apraxia type 1 (AOA1), AOA2, Autosomal recessive spastic ataxia of Charlevoix-Saguenay (ARSACS), Ataxia telangiectasia (AT), Marinesco-Sjogren syndrome (MSS), Ataxia with vitamin E syndrome (AVED), Progressive myoclonus epilepsy type 1 (EPM1), Chorea-acanthocytosis (CHAC)5. X-linked: FXS, X-linked Charcot-Marie-Tooth disease (CMTX1)6. Cerebellar ataxia in pedND7. Diseases associated with secondary neurodegeneration: Amino acid metabolism disorders, Urea cycle disorders, Carbohydrate metabolism disorders, Mitochondrial disorders, Lysosomal storage disease, Peroxisomal disorders, Metal metabolism disorders Summary1. PedND have diverse pathomechanisms.2. Some pedNDs have pathognomonic radiological features that can help in differentiation.3. Clinical features can help diagnose pedNDs, especially when radiological findings are similar to others.

Top 7 Must Know Movement Disorders: Imaging with Clinical Videography Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Leslie Starkey, MD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnosis of movement disorders is challenging due to the varied clinical manifestations and heterogeneity, so the integration of imaging and clinical features plays an extremely important role.We have selected seven important movement disorders and provide multidisciplinary learning by introducing their imaging and clinical manifestations through a series of unknown cases followed by a clinical discussion including videos.In addition to important imaging manifestations, in collaboration with a neurologist, we present the typical diagnostic criteria and clinical examination findings that would be useful for radiologists to understand, such as the ataxia findings in spinocerebellar ataxia.

TABLE OF CONTENTS/OUTLINE

1. Amyotrophic lateral sclerosis imaging findings, followed by clinical pearls with video demonstration.2. Multiple system atrophy imaging findings, followed by clinical pearls with video demonstration.3. Spinocerebellar ataxia imaging findings, followed by clinical pearls with video demonstration.4. Huntington disease imaging findings, followed by clinical pearls with video demonstration.5. Fahr disease imaging findings, followed by clinical pearls with video demonstration.6. Creutzfeldt-Jakob disease imaging findings, followed by clinical pearls with video demonstration.7. Wilson disease imaging findings, followed by clinical pearls with video demonstration.

Visual Summary of the 2021 WHO Central Nervous System Tumor Classification

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Neiladri Khan, DO, Pittsburgh, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

The 2021 WHO Classification of Tumors of the Central Nervous System (CNS) is the fifth edition of the classification system, and it succeeds the fourth edition released in 2016.The 2021 classification incorporates changes in diagnostic principles, with a particular emphasis on the molecular profiling of tumors.A description of the new diagnostic principles, along with visual examples and graphics demonstrating their significance. We include two peculiar cases of IDH wild-type gliomas from our home institution which benefit from the new classification system.In addition to changes in diagnostic principles, several tumor-specific changes were also made. There are now also several entirely new tumor entities.The new concept of layered pathological reporting, and the impact of this new system on radiologists.

TABLE OF CONTENTS/OUTLINE

Title page - Disclosures - Introduction to the WHO classification system - Objectives - Brief overview of what is new in the 2021 update - Radiological and pathological visual examples of changes made to the diagnostic principles - IDH wild-type glioma, home institution interesting case 1 - IDH wild-type glioma, home institution interesting case 2 - Graphic rendition of changes made to specific tumor types - Introducing and explaining the concept of integrated diagnoses and layered reports, and what these changes mean for the radiologist - Conclusion - Biography

Genetics and Epigenetics of Brain Tumors for Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Gabriela Bandeira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- To review the oncogenesis of primary brain tumors.2- To understand the main molecular pathways involved in primary brain tumors.3- To integrate the oncogenesis knowledge with the new molecular parameters from the 5th edition of the WHO Classification of Tumors of the Central Nervous System (WHO CNS5).4- To review the phenotypic and the genotypic key features of some primary brain tumors (radiogenomics).

TABLE OF CONTENTS/OUTLINE

1- Introduction2- Oncogenesis in CNSFundamental ConceptsCell CycleLigands and ReceptorsCyclin-Dependent Kinases (CDKs)Cellular Signaling Pathways involved in brain tumorsEpigenetics : Histone modifications, DNA Methylation4- New molecular parameters from the 5th edition of the WHO Classification of Tumors of the Central Nervous System (WHO CNS5).5- Illustrative cases of primary brain tumors with confirmed genetic and epigenetic profiles.6- Take-home messages7- Conclusion8- References

Intracranial Cystic-appearing Images More than a Simple Find

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Eugenio Cézar Rocha Santos Filho, SAO PAULO, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is:To show different types of diseases that have cystic presentation. To demonstrate sites that are typically affected by each disease To help expand the differential diagnoses through the distinct imaging patterns of cystic lesions by a pictorial essay.

TABLE OF CONTENTS/OUTLINE

Overview of all pathologies and their division by etiologyCongenital:Arachnoid cyst: different locations and sizesEctodermal Inclusion CystsDermoid cystEpidermoid cystWhite epidermoide cystNeuroglial cystBlake pouch cystRathke's cleft cyst Corpus callosum agenesis and interhemispheric cystChoroid plexus cystChoroidal fissure cystColloid cysts of the third ventriclePineal cystsPerivascular spaces and its associationInfectious:Viral:CytomegalovirusBacterial:NeurosyphilisNeurotuberculosisAbscessProtozoaNeurotoxoplasmosisParasiticNeurocysticercosisChagas diseaseFungiAspergillosisNeurocryptococcosisNeoplastic:Intra-axial:Multinodular and vacuolating neuronal tumorDysembryoplastic neuroepithelial tumors (DNET)Primitive neuroectodermal tumors (PNET)Multinodular and vacuolating neuronal tumorCentral neurocytomaEpendymomaHemangioblastomaGliomasGangliogliomaMedulloblastomaMetastasis Extra-axial:MeningiomaSchwannomaMacroadenomaCraniopharyngiomaHemangiomaGerminomas Pineal tumorsDemyelinating:Demyelinating pseudotumorBalo diseaseOthersCobblestone malformationHypomelanosis of ItoMegalencephalic leukoencephalopathy with subcortical cystsPorencephalic cyst

Posterior Circulation Stroke: How Much Do You Know About It?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Celia Alonso, MD, Madrid, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

The objective of this educational exhibit is to shine a light on the acute management of vertebrobasilar stroke. Therefore, after reading it, the reader will: -Comprehend the epidemiology of vertebrobasilar strokes, their clinical presentation and etiology depending on the affected anatomical territory. -Learn the indications and limitations of imaging techniques in posterior circulation strokes, as well as their most frequent imaging features. -Know how to apply the two most important imaging prognostic scores in large vessel occlusions: pc-ASPECTS and BATMAN.

TABLE OF CONTENTS/OUTLINE

-Introduction. -Clinical considerations: its symptoms are frequently non-focal, overlap with those of anterior circulation strokes and simulate other neurological conditions ('stroke chameleons'), which usually leads to delayed diagnosis. -Etiology of posterior circulation strokes: ASCOD and topographic classification. -Vertebrobasilar anatomy, relevant variants shown with images. -Imaging techniques: indications, limitations and semiology. Imaging prognostic scores in large vessel occlusions: pc-ASPECTS and BATMAN. Its application will be shown using real cases. -All possible clinical scenarios (small, medium-sized and large vessel disease) will be shown with real cases studied with multimodal CT and/or brain MRI from our institution. -Treatment considerations. -Conclusion.

Imaging Cerebrospinal Fluid Hypotension: Cerebrospinal Fluid Fistula Hyper-knowledge

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Pedro Castro, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the most common symptoms related to cerebrospinal fluid (CSF) hypotension. To demonstrate the imaging aspects of spontaneous intracranial hypotension, a well-recognized entity. To explain that depicting the CSF leak location is the radiologist´s goal, allowing effective treatment. To show that CSF leak imaging can be challenging and often misdiagnosed, leading to severe CSF hypotension.

TABLE OF CONTENTS/OUTLINE

1. Revision of epidemiology and clinical presentation, including headache, rhinorrhea, and severe CSF hypotension. 2. Etiologies of intracranial hypotension and CSF leaks, including surgery and trauma. 3. Imaging strategies and findings of CSF leaks, including MRI and CT myelography assessment. 4. MRI vs. CT cisternography in the assessment of CSF fistulas. 5. CT myelography in the assessment of spinal CSF fistulas. 4. Differential diagnosis of CSF hypotension. 5. Treatment options: epidural blood patches and surgery. 6. Take-home messages.

Ultrahigh-resolution CTA of the Brain as a Tool for Pre- and Postoperative Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Miho Gomyo, Miraka, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn the basic principles and characteristics of ultrahigh-resolution CT. 2. To learn the kinds of image denoising reconstruction processing and understand their characteristics. 3. To learn the clinical importance of small arteries such as cortical arteries and perforators depicted by ultrahigh-resolution brain CTA.

TABLE OF CONTENTS/OUTLINE

1. Basic principles and characteristics 2. Image denoising reconstruction processing: FBP (filtered back-projection), hybrid IR (iterative reconstruction), full IR and deep learning reconstruction 3. Imaging anatomy and clinical importance the following arteries: cortical arteries, branches of main arteries and perforating arteries 4. Clinical application to preoperative and postoperative images: aneurysm, infectious aneurysm, dissecting aneurysm, arteriovenous malformation, moyamoya disease, arterial stenosis, temporal arteritis, superficial temporal artery-middle cerebral artery bypass and brain tumor

Quantitative Susceptibility Mapping: Overview and Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Alexey Dimov, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Quantitative susceptibility mapping (QSM) is an automated technique that post-processes three-dimensional (3D) gradient echo phase images to depict local tissue magnetic properties, which are blurred in conventional MRI sequences, such as T2w, T2*w and phase images.QSM makes use of the already acquired phase data, does not add scan time, and can be easily integrated into the clinical workflow.QSM provides superb contrast-to-noise ratio (CNR) for depicting deep gray nuclei that are rich with iron, which is useful for precise guidance of deep brain stimulation.QSM provides high fidelity and quantitative measurements of iron in proinflammatory activated microglia in neuroinflammatory disorders, such as in multiple sclerosis, Parkinson's disease, Alzheimer's disease.QSM allows unambiguous differentiation of diamagnetic calcification from paramagnetic iron such as in microbleeds.

TABLE OF CONTENTS/OUTLINE

1. Revision of the basic physics of tissue magnetism, gradient echo data, and phase post-processing for QSM2. Description of how QSM can be used to measure iron overloading in neurodegenerative diseases, such as Parkinson's disease.3. Overview of how QSM can be used to define deep brain stimulation targets.4. Synopsis of how QSM can be used to eliminate gadolinium injection in MRI monitoring of multiple sclerosis (MS) patients and to adjust therapy to measure chronic lesion activity for improved patient care.5. Summary of how QSM processing of phase plus quantitative blood oxygenation level dependent (qBOLD) modeling of magnitude can enable oxygen extraction fraction (OEF) mapping from the widely available multiecho gradient echo data without vascular challenge.

Applications of MR Bone Imaging to Vertebral Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Kazuhiro Tsuchiya, PhD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To learn basic concepts and technical aspects of bone imaging like CT by MRI.2. To know how MR bone images depict the normal vertebra and adjacent structures compared with CT.3. To know the differences, especially the advantages, of MR bone images from CT and conventional MR images in miscellaneous vertebral lesions.

TABLE OF CONTENTS/OUTLINE

1. Basic issues of MR bone imaging including currently employed scanning sequences and postprocessing methods.2. Characteristics of MR bone images of the normal vertebra, placing emphasis on the difference from conventional MR images as well as CT.3. Presentation of clinical cases with discussion of implications. Cases will cover spine degeneration (Modic changes), neoplastic lesions including primary and metastatic vertebral tumors, inflammatory changes such as spondylitis, vertebral fractures, and so on.4. Additional discussion including current limitations as well as future directions of this technique.

Multi-modality Imaging of Skull Base Tumors and Tumor-like Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Justin Caskey, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Basic skull base anatomy and anatomic landmarks relevant to the evaluation of skull base tumors and tumor-like lesions.2. Common skull base tumors and tumor-like lesions.3. Practical benefit of multi-modality imaging evaluation of skull base tumors and tumor-like lesions.Skull base pathology represents an often-challenging topic in neuroradiology. Anatomically, the skull base is a complex space formed by the ethmoid, sphenoid, occipital and paired frontal and temporal bones. Contained within and traversing through the skull base are critical neurovascular structures which must be carefully considered at radiologic evaluation. In many cases, multi-modality imaging, including perfusion weighted imaging, diffusion weighted imaging, and positron emission tomography, can provide a useful adjunct to standard neuroimaging techniques (CT, MRI) in evaluation of skull base pathology.

TABLE OF CONTENTS/OUTLINE

I. IntroductionII. Review of basic skull base anatomyIII. Brief overview of diffusion and perfusion imaging and positron emission tomographyIV. Case based examples of multi-modality imaging of skull base pathologya. Bone metastases from various primary sites, lymphoma, rhabdomyosarcomab. Primary bone tumor, chordoma, chondrosarcoma, giant cell tumorc. Skull base invasion from carcinoma, pituitary adenoma, meningiomad. Inflammatory pseudotumore. Bacterial and fungal osteomyelitisf. Benign tumor-like lesions, cholesterol granuloma, cholesteatoma, notochord origin lesion

Imaging features of Diffuse Pediatric-type High-grade Glioma, H3-/IDH-wildtype, and Diffuse Hemispheric Glioma, H3 G34-Mutant

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Andrew Chang, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diffuse pediatric high-grade gliomas (pHGG) are a heterogeneous group of brain tumors comprising 3-15% of all pediatric CNS tumors. In the 2021 WHO Classification of tumors of the CNS, two new subtypes of pHGG have been added to reflect the unique molecular features underlying each tumor: (1) diffuse pediatric-type high-grade glioma, H3-wildtype and IDH-wildtype (DPHGG H3/IDH-wt), and (2) diffuse hemispheric glioma, H3 G34-mutant (DHG H3G34M). This educational exhibit highlights the key MR imaging features of the two new tumor subtypes with emphasis on unique feature of each subtype that may aid in differential diagnosis.DPHGG H3/IDH-wt and DHG H3G34M demonstrate similar MRI features to other pHGGs, with low T2, high T2, and high FLAIR signal intensities, restricted diffusion, and variable enhancement pattern. Distinct features of DPHGG H3/IDH-wt include its propensity for frank intratumoral hemorrhage resulting in extensive edema, mass-effect, and hydrocephalus. In contrast, DHG H3G34M rarely develops hemorrhage and instead demonstrates cyst-and-nodule morphology with minimal surrounding edema or mass-effect.

TABLE OF CONTENTS/OUTLINE

[I] Overview of 2021 WHO Classification of diffuse pediatric-type high-grade gliomas. [II] Summary of key molecular genetic classification schemes. [III] Characteristic MRI features of diffuse pediatric-type high-grade gliomas (a) DPHGG H3/IDH-wt (b) DHG H3G34MPlease visit the Learning Center to also view this presentation in hardcopy format.
