Toshio Moritani, MD,PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose

TEACHING POINTS

-To demonstrate imaging findings of typical and atypical pilocytic astrocytomas using multimodal imaging including CT, MRI, diffusion, perfusion (DSC and DCE), APTw, MR spectroscopy and PET. -To learn genetic and oncogenic pathways of tumor development of pilocytic astrocytoma with or without NF1 -To discuss the pathological correlation

TABLE OF CONTENTS/OUTLINE

-Genetic and oncogenic pathways: tumor development of pilocytic astrocytomas with or without NF1-Pathology: microcystic change, myxoid degeneration, Rosenthal fiber, pilocytic variants such as diffuse variant or pilomyxoid astrocytoma -Multimodal Imaging and imaging techniques: CT, MRI, diffusion, perfusion (DSC and DCE), APTw, MR spectroscopy and PET Classically high ADC values, while high grade gliomas and embryonal tumors show lower ADC. Relatively wide range of ADC values in PAs. Classically low rCBV and rCBF and high K2 on DSC, and low VP, high VE, and partially high Ktrans on DCEIncreased choline and lactate peak on MRS which can be a pitfall of the diagnosis. APT maps often show high values for PA even this is low grade tumor. -Case presentations:Typical findings: Well-defined infratentorial cystic lesion with enhancing mural nodule and supratentorial enhancing mass, with facilitated diffusion, high ADC value, typical perfusion pattern, increased APTw Atypical findings: unusual locations, non-enhancing, exophytic, hemorrhagic, multicenteric/dissemination, relatively low ADC value, atypical perfusion pattern. Pediatric versus adult cases NF1 versus non NF1 Differential diagnosis

Pictorial Depiction of a Lexicon Based Approach to BT-RADS

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Ankush Jajodia, MD, MBBS, New Delhi, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Background: Imaging evaluation of brain tumor patients is challenging since imaging findings of tumor development and treatment-related alterations overlap significantly. The accurate interpretation of these tumors causes significant inter-observer variability going to tumor heterogeneity, especially in complex circumstances. Imaging evaluation of brain tumors with MRI plays a crucial role in managing these patients, who face poor survival [median 15 months]. A structured reporting system (BT-RADS) aims to increase uniformity among radiologists. The need for a structured glioma surveillance reporting system with a standardized management-based suggestion, which has the potential to improve clinical interpretation and facilitate more effective patient communication, has already been voiced. There has been a dearth of lexicon depiction and illustration in the literature review. Clinical relevance:A standardized reporting system with the BT-RADS is encouraged using the various sequence-based lexicon. The published lexicon and report template will improve the completeness and accuracy of generated reports.

TABLE OF CONTENTS/OUTLINE

Characterize lexicon on MRI using BT-RADS Review case examples using the BT-RADS descriptive parameters.

Stepwise Application of RANO Criteria on Follow-up Imaging and Treatment of Gliomas: A Guide for Residents

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Thurl Hugh Cledera, MD, Taguig, Philippines (*Presenter*) Nothing to Disclose

TEACHING POINTS

Gliomas are the most common intra-axial tumor of the central nervous system, among which the most common type is glioblastoma, which incidentally is a highly aggressive tumor. Imaging plays a pivotal role in the management of glioblastomas; hence guidelines have been developed to facilitate the interpretation of studies from pre-treatment studies down to post-surgical and post-radiation changes, one of which is known as the Response Assessment in Neuro-Oncology (RANO) Criteria. The criteria are broken down to complete response, partial response, stable disease, and progressive disease must be applied to all post-treatment glioma cases to guide therapy. Pseudoprogression and pseudoresponse are necessary to distinguish from the standard response criteria as they will have an effect on the treatment and follow-up of patients.

TABLE OF CONTENTS/OUTLINE

1. Introduction and Background 2. Step 1: Confirm Patient History and Treatment 3. Step 2: Know the Natural Course and Management of Glioblastoma 4. Step 3: Identifying Lesions 5. Step 4: Identifying Response Criteria a. Complete Response b. Partial Response c. Stable Disease d. Progressive Disease 6. Step 5: Check for Imaging Pitfalls a. Pseudoprogression (Post-surgical, Post-radiation, Post-chemotherapy) b. Pseudoresponse (VEGF Therapy)

Uncertainty Estimation in Auto-Segmentation and Image Reconstruction Tasks

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Marc Von Reppert, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To provide a structured overview of the concept of uncertainty estimation (UE) in the context of Machine Learning and Deep Learning.2. To summarize and review different approaches to measuring uncertainty.3. To provide a perspective on current applications of UE in the literature of neuroimaging in tasks like segmentation and image enhancement.4. To highlight sources of uncertainty in neuroimaging and provide an outlook on potential developments in the field.

TABLE OF CONTENTS/OUTLINE

1. Principles of Uncertainty Estimation: // Background: Understanding Uncertainty // Background: Machine Learning and Deep Learning // Types of Uncertainty // Methods of Measuring Uncertainty2. Application of Uncertainty Estimation in Neuroimaging: // Summary of Current Neuroimaging Applications // Brain Anatomical Segmentation // Brain Tumor Segmentation // Image Super-Resolution and Denoising // Collection of Publications3. Amide Proton Transfer Weighted Imaging (APTwi) in Brain Tumors: A Pictorial Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Magna Cum Laude

Participants
Guillaume Hamon, MD, Rennes, France (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aims of this exhibit are:1. To describe the basic theory and advantages of the APTwi technique2. To illustrate brain tumors and differential's features in APTwi3. To highlight and discuss potential pitfalls in APTwi4. To review the current clinical applications of APTwi in neuro-oncology

TABLE OF CONTENTS/OUTLINE

I. Understanding the APTwi technique1. Introduction to the Chemical Exchange Saturation Transfer (CEST) technique2. Basic physical principles of the amide-CEST contrast, so-called APTwi3. Technical consideration and limitations4. Image analysisII. Brain tumors, tumor mimics pitfalls in APTwi: an image-based approach1. Why to image amide protons in brain tumors?2. Primary and secondary brain tumors3. Tumor mimics4. Potential pitfalls in technique and image interpretationIII. Clinical applications of APTwi in neuro-oncology1. Main current published clinical applications of APTwi to image brain tumors2. Ongoing research and potential perspectives

Imaging Abnormalities Associated With Pediatric Pituitary Disorders

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Yun Song Choo, MBBS, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The pituitary gland occupies a small footprint in terms of volume within the cranium, but pathologies arising from or involving it can have profound and long-lasting effects on the growth and development of the pediatric patient. It is hence important to appreciate the range of abnormalities in the pituitary gland and sellar region arising from both congenital and acquired pathologies that may be seen on neuroimaging studies. In this education exhibit, we revisit the development of the pituitary gland and share approaches to pediatric pituitary abnormalities on imaging with illustrative cases. Some of the major teaching points are: • MRI is the modality of choice to investigate suspected pituitary abnormalities in the pediatric patient. • The anterior and posterior pituitary gland have different embryological origins. • On top of masses that involve the sella and suprasellar region, the radiologist should be aware of mass-like lesions and mimics that have previously resulted in unnecessary surgical intervention.

TABLE OF CONTENTS/OUTLINE

• Pituitary Gland Development and Anatomy • Imaging the Pediatric Pituitary Gland • Abnormalities of Size and Number • Abnormalities of the Posterior Pituitary • Pituitary Stalk Thickening • Masses and Mass-like Lesions

Checklist Based Approach to Interpret Pediatric Brain MRI Studies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Anvita Pauranik, MD, FRCPC, VANCOUVER, BC (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To develop a checklist-based methodical approach while interpreting pediatric brain MRI studies by knowing what to look for on different MR imaging planes and sequences, driven by the clinical question. 2. To understand the spectrum of age-related changes in a developing brain.3. To differentiate subtle pathology from normal variants using various case examples.

TABLE OF CONTENTS/OUTLINE

1. Midline sagittal brain. A. Commissures- size, shape, dysmorphisms. B. Sellar and Suprasellar region- Anterior/posterior pituitary gland, Infundibulum, Optic Chiasm, Floor of Third ventricle. Pineal gland C. Posterior fossa- Brainstem, Vermis and Cerebellar tonsils D. CSF Spaces- Cisterns, Aqueduct, Retrocerebellar space. E. Skull base including craniocervical junction, Scalp 2. Brain parenchyma-assessment on T1/T2/DWI/SWI. Age related changes, terminal zones of myelination versus white matter injury, subtle findings in altered sensorium- basal ganglia/ brainstem lesions.3 Ventricles- focal dilatation in PVHI, puckering in PVL, extra axial CSF spaces- prominence, collections, asymmetry, BESSI, cisterns- utility of Sagittal CISS 4. Flow Voids. 5. Extracranial - orbits, mastoids, paranasal sinuses.2. Checklist for focal seizure evaluation A. Midline- Hypothalamic Hamartoma versus inter-hypothalamic adhesion B.Cortical ribbon-blind spots C. Focal cortical Dysplasias-search patterns- Asymmetry in Grey-White matter signal, Sulcation. D. Mesial temporal lobe- early hippocampal sclerosis, dual lesions, temporo-polar changes, skull base defects3. Checklist for Neonatal brain MRI PLIC, Deep gray nuclei, Peri-Rolandic cortex, T1 bright punctate white matter lesions. Normal anisotropy on DWI.

Mind-Bending Cerebellar Anatomy Techniques

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Elissandra Lima, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To demonstrate the anatomy of the cerebellum by illustrations and imaging, with phylogenetic and functional considerations. To correlate the most frequent diseases with anatomic regions. To depict the importance of precise localization of the disease according to the anatomical point of the cerebellum.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Imaging protocol. 3. Embryonic development. 4. Cerebellum anatomy. 5. Cerebellar functional anatomy. 6. Phylogenetic considerations of the cerebellar segments. 7. Cerebellar connections and function. 8. Cerebellum vascular anatomy. 9. Clinical perspective: symptoms and diseases - including neoplastic, inflammatory, infections, congenital and degenerative. 10. Flowchart for imaging assessment of cerebellar anatomic regions. 11. Take-Home messages.

Need-to-know Neuroimaging with Clinical Correlation: Parkinson's Disease and Related Movement Disorders

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Leslie Starkey, MD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

Although Parkinson’s disease is a relatively common movement disorder (MD), the onset is insidious and diagnosis challenging due to the varied clinical manifestations and heterogeneity, so the integration of imaging and clinical features plays an extremely important role.Other MD can simulate Parkinson’s disease, including progressive supranuclear palsy, essential tremor, corticobasal degeneration, and carbon monoxide poisoning, among others.One area neuroradiologists may have interest but little opportunity for learning is the clinical side, e.g. classic neurological findings in MD.In this presentation, we teach imaging and clinical manifestations. Imaging is presented as cases followed by the neurologist's perspective, including diagnostic criteria and videos of findings useful for radiologists to know, such as the eye findings in supranuclear palsy.

TABLE OF CONTENTS/OUTLINE

General topics: 1) Parkinson’s disease 2) PSP 3) Corticobasal degeneration 4) CO poisoning.Radiology cases and videos of neurologic findings include:•DAT scan, Nigrosome-1 and the absent swallow tail sign, classic and spectrum.•Clinical videos: motor features: fascial masking, bradykinesia, rest tremors, and gate.•Scans without Evidence of Dopamine Deficit (SWEDDS).•Differential: dopa responsive dystonia, paroxysmal kinesigenic dykinesia, juvenile Huntington disease.•Deep brain stimulators, locations: VIM, GPi, STN.•Clinical videos: off meds, on meds, on meds and on DBS.•PSP: hummingbird sign.•Clinical videos: blink rate, eye movements, freezing speech, gait.•Corticobasal degeneration: asymmetric atrophy.•CO poisoning: globus pallidus lesions.•Clinical videos: gait freezing.

Moving to Diagnosis: Neuroimaging Systematic Approach to Neurometabolic Diseases Manifested as Movement Disorders

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Andres Abad, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To propose a neuroimaging systematic approach for the patients with movements disorders and suspicion of inborn error of metabolism etiology. To review the different neuroimaging presentation of the main inborn error of metabolism associated with movement disorders. To enrich the radiologist role into the diagnosis process of inborn error of metabolism To familiarize the radiologist with the neuroimaging findings present in uncommon congenital diseases that can produce movements disorders.

TABLE OF CONTENTS/OUTLINE

Introduction. Movements disorders classification. Inborn errors of metabolism associated with each movement disorder. Cases and images of neurometabolic diseases associated with chorea. Cases and images of neurometabolic diseases associated with dystonia. Cases and images of neurometabolic diseases associated with myoclonus. Cases and images of neurometabolic diseases associated with tremor. Cases and images of neurometabolic diseases associated with parkinsonism. Conclusion.

Far Beyond Atheromatosis: Unusual Findings of Carotid Duplex Scan

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Iza Vieira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: 1.Comprehend the normal anatomy of the common carotid artery (CCA), internal carotid artery (ICA) and external carotid artery (ECA) on B-mode ultrasound; 2.Recognize anatomy variations and uncommon findings on B-mode ultrasound and duplex scan, with the correlation of CT-angiography (CTA) when necessary;3.Correlate imaging findings with clinical presentation;4.Recognize complications and possible outcomes;5. Brief review of management options.

TABLE OF CONTENTS/OUTLINE

- Normal anatomy of the extracranial carotid system on ultrasound;- Anatomy variations of the extracranial carotid system; - Carotid kinking;- Carotid aneurysms;- Endoleak following endovascular aneurysm repair;- Carotid artery pseudoaneurysm;- Carotid dissection;- Carotid web;- Carotid-jugular arteriovenous fistula;- Occlusion of the CCA and internalization of the ECA;- Takayasu arteritis;- Carotidynia; -Complications and outcomes.

A Checklist Approach to Interpreting Cerebral Digital Subtraction Angiography

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Charlotte Chung, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

As diagnostic and interventional neuroradiology become increasingly siloed, most diagnostic neuroradiologists no longer perform catheter-based neuroangiography. However, basic understanding of cerebral digital subtraction angiography (DSA), the gold standard for diagnosis of cerebrovascular pathologies, remains crucial for accurate interpretation of noninvasive brain CT and MR angiogram. This exhibit introduces the art of interpreting 2-dimensional (2D) cerebral DSA to the contemporary diagnostic neuroradiologist.Educational objectives of this exhibit include:- Outline imaging techniques and protocol for a typical diagnostic cerebral angiogram- Provide an annotated atlas for normal cerebral arterial and venous anatomy on 2D DSA- Introduce a checklist approach for interpretation of 2D cerebral DSA- Illustrate angiographic appearance of variant anatomy and various pathologies

TABLE OF CONTENTS/OUTLINE

I. 2D DSA imaging techniquesII. Diagnostic cerebral angiogram imaging protocolIII. Annotated atlas of normal anterior and posterior circulation on 2D DSAIV. Step-by-step checklist for interpretation of 2D cerebral DSAV. Systemic checklist-based illustration of variant and abnormal angiographic findingsVI. Application of the checklist approach using case-based examples

Neurovascular Imaging at 7T: Small Vessel Anatomy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Neethu Gopal, MBBS, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultra-high resolution MR angiography (MRA) of the brain with a voxel size=0.3 x 0.3 x 0.3 mm is now achievable thanks to more readily available 7 Tesla clinical MR scanners and modern acceleration techniques. This advancement in our imaging capability allows for visualization of small normal vascular structures that were previously imperceptible on routine non-invasive vascular imaging.Teaching Points:1. Revisit normal arterial anatomy of the smaller branches of the circle of Willis including normal anatomic variants. A combination of 2D and cinematic rendered images as well as illustrations will be utilized.2. Demonstrate the normal cross sectional imaging appearance of these small vessels. In many cases, MRA images will be fused with 3D T1-weighted or T2-weighted sequences to better orient the viewer and demonstrate the spatial relationship of these vessels with gray-matter and white matter structures within the brain parenchyma.3. Review pathological conditions associated with the smaller circle of Willis branches.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Serial review of normal anatomy followed by cross-sectional images. Arteries will be reviewed systematically from anterior circulation to posterior circulation. Arteries that will be covered include but are not limited to: Anterior Choroidal Artery and its Branches, Superior Hypophyseal Artery, Anatomic Variations of the Posterior Communicating Artery, Medial Lenticulostriate Arteries, Recurrent Artery of Heubner, Lateral Lenticulostriate Arteries, Posterior Cerebral Artery Branches, Artery of Percheron, Basilar Perforator Vessels.3. Review of cases with pathology4. Conclusion

Challenging Procedures at the C1-2 Spinal Level - Using CT Guidance to Improve Patient Care and Safety

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Ross Frederick, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

• There are several important procedures at the C1-2 level that can significantly improve patient quality of life. CT guidance makes these otherwise dangerous procedures safer and easier to perform.• There are key anatomical structures that must be avoided when performing these procedures, most notably the vertebral artery, posterior inferior cerebellar artery, C2 nerve, and spinal cord. A thorough understanding of anatomy in this region is crucial to perform these procedures confidently and safely.• Cervicogenic headache is an underrecognized and therefore undertreated condition that radiologists can treat with C1-2 facet joint injection, C2 nerve root block, or C2 ablation.• For patients with a contraindication to lumbar puncture, cervical puncture at the C1-2 level provides an alternative approach for CSF collection, injection of contrast for myelography, or injection of chemotherapy.

TABLE OF CONTENTS/OUTLINE

1. Introduction: types of procedures and the patients who can benefit from them2. Critical regional anatomya. Vertebral arteryb. PICAc. C2 nerved. Spinal cord3. Cervicogenic headache and atlantoaxial osteoarthritisa. C1-2 facet injection i. Indications ii. Technical considerationsb. C2 nerve root block i. Indications ii. Technical considerationsc. C2 nerve ablation i. Indications ii. Technical considerations 4. Cervical puncturea. Indication - contraindication to lumbar puncturei. CSF collection ii. Injection of contrast for myelography iii. Injection of chemotherapyb. Technical considerations

What Can it be in the Conus Medullaris? A Pictorial Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Felipe Pacheco, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The conus medullaris is affected by many conditions, including congenital, vascular, tumoral, inflammatory and infectious diseases, which many times are hardly differentiated because of the similarity of their clinical history and physical examination among different etiologies. Magnetic resonance imaging presents high sensitivity in the detection of these lesions and plays a relevant role in the diagnosis and in the evolutive controlThis panel aims to: Review the anatomy of the conus medullaris, including its anatomical limits, normal MR imaging findings and related clinical syndromes. Discuss and illustrate the imaging patterns of the main lesions in the conus medularis, including congenital, vascular, tumoral, inflammatory, infectious, among others. - Describe through illustrative cases the scenarios for diagnosis, focusing on typical imaging patterns, unexpected findings and red flags that aid the diagnosis.

TABLE OF CONTENTS/OUTLINE

- Anatomy of the conus medullaris - Normal appearance on CT and MRI-Main pathologies involving the conus medullaris, involving: - Congenital lesions: Caudal regression syndrome types 1 and 2, Ventriculus terminalis, Myelomeningocele -Neoplasic lesins: myxopapilar ependymoma, tanicytic ependymoma, leptomeningeal carcinomatosis, metastatic lesion, glioblastoma, dermoid cyst - Vascular lesions: arteriovenous dural fistula, cavernoma, ischemia-Systemic inflammatory diseases: IGG-4 related disease, Sarcoidosis, Dermatomyositis -Infectious diseases: Schistosomiasis, Tuberculosis, Herpes Virus, Polio-like-Auto-immune diseases: MOG antibody disease, Multiple Sclerosis, NMSOD - Red flags and diagnostic tips - Diagnostic Approach - Final remarks

What Can Go Wrong? Advanced Imaging of Malformation of Cortical Development

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Identified for RadioGraphics
Cum Laude

Participants
Julia Brunelli, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

This pictorial essay will review the main etiologies of malformations of cortical development (MCDs) based on illustrative cases and original drawings.MCD will be addressed according to the last consensus update, considering pathological, genetic and neuroimaging features. The entities are divided into three major groups, according to the pathophysiological path that leads to that malformation.The purpose of this exhibition is to:- Review the cortical development, and its three main stages: cellular proliferation and differentiation, neuronal migration, and cortical organization;- Describe the new consensus of MCDs;- Recognize the main etiologies of MCDs, according to their imaging findings, and understand how different etiologies, when damaging the same pathway, can cause the same radiologic pattern.

TABLE OF CONTENTS/OUTLINE

NORMAL CORTICAL DEVELOPMENT- Didactic original drawings of the stages of cortex formation.MALFORMATIONS OF CORTICAL DEVELOPMENT- The new consensus taking account pathological, genetic and neuroimaging features.CASE-BASED DIDACTICS- Sample cases to illustrate and solidify the concepts;- Review of the main pathologies, addressing the pathophysiological and genetic aspects that leads to each image pattern.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
María José Risco Fernandez, Toledo, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Knowledge of the normal embryologic development of the spinal cord is crucial for understanding spinal dysraphisms (SD). • They have been divided into open (OSD) and closed spinal dysraphisms (CSD), depending on the absence or presence of skin covering the defect. • Magnetic resonance imaging (MRI) is the modality of choice for the evaluation of these.

TABLE OF CONTENTS/OUTLINE

Spinal dysraphisms (DS) make reference to a wide spectrum of congenital abnormalities of the spine and spinal cord.Spinal development occurs throughout the 2nd and 6th week along embryologic stages of gastrulation, and primary and secondary neurulation. Anomalies in any of these stages can result in a defective or incomplete closure of the neural tube and structures of the dorsal midline. The clinical manifestations of these entities are heterogeneous: from being unnoticed to becoming incompatible with life outside the uterus. SD has been classically divided into two main groups depending on whether there is skin covering the defect: OSD and CSD.Magnetic resonance imaging (MRI) is the modality of choice for the detailed evaluation of these conditions. A step-by-step evaluation of the normal and abnormal imaging findings is critical to providing accurate surgical information. The aim of this pictorial review is to offer a systematic evaluation of SD on MRI, including normal and abnormal findings, classifying the type and the site of SD, and additional or associated findings both in pre and postnatal patients of our clinical practice.

Traumatic Spine Injury Classification: A Review of the AO Spine Injury Classification Systems Through Case Examples

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Chad Farris, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Review the AO Spine Injury Classification Systems for traumatic Injuries to the thoracolumbar spine (Thoracolumbar Injury Classification System), subaxial cervical spine (Subaxial Injury Classification System), and the upper cervical spine (Upper Cervical Injury Classification System).-Review case examples of traumatic spine injuries fitting into all of the morphological classifications based on the AO Spine Injury Classification Systems.

TABLE OF CONTENTS/OUTLINE

A. What are the AO Spine Classification Systems?B. Three basic parameters that all AO Spine Classification Systems are based on1. Morphological Classification of the Fracture, 2. Neurological Status, 3. Clinical ModifiersC. Case examples fitting into all of the morphological classifications within the AO Spine Classification Systems in the thoracolumbar spine, subaxial cervical spine, and upper cervical spine.1. Thoracolumbar Spine Examples: a. Type A0 Injury, b. Type A1 Injury, c. Type A2 Injury, d. Type A3 Injury, e. Type A4 Injury, f. Type B1 Injury, g. Type B2 Injury, h. Type B3 Injury, i. Type C Injury2. Subaxial Cervical Spine Examples: a. Type A0 Injury, b. Type A1 Injury, c. Type A2 Injury, d. Type A3 Injury, e. Type A4 Injury, f. Type B1 Injury, g. Type B2 Injury, h. Type B3 Injury, i. Type C Injury, j. Type F1 Injury, k. Type F2 Injury, l. Type F3 Injury, m. Type F4 Injury3. Upper Cervical Spine: a. Occipital Condyle and Occipital Cervical Joint Complex: i. Type A Injury, ii. Type B Injury, iii. Type C Injury, b. C1 Ring and C1-2 Joint Complex Injuries: i. Type A Injury, ii. Type B Injury, iii. Type C Injury, c. C2 and C2-3 Joint Complex Injuries: i. Type A Injury, ii. Type B Injury, iii. Type C Injury

Neurogenetics: What Should the Radiologist Know?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Mario Abizaid, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The autosomal recessive inheritance pattern, although rare, when considered as a group becomes prevalent. Those diseases have an increased prevalence in consanguineous marriage and restricted geographic areas, known as “founder effect”.- The autosomal dominant inheritance pattern is seen in heterozygosis and it is inherits from a parent who had the disease (family history). Less frequently, can emerge from a new mutation (mutation of de novo).- The trinucleotide repeat, as in Huntington's disease, is amplified with each generation, due to a misreading in the DNA.- There are mitochondrial proteins produced in the organelle itself (maternal inheritance pattern), as well as produced in the cell nucleus (autosomal or X-linked inheritance pattern).

Imaging Approach to Intraventricular Masses: Common and Uncommon MR Imaging Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Hee Soo Won, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To identify normal anatomy of ventricular system. To help narrow the differential diagnosis in intraventricular masses according to their location, patient's age, gender and underlying conditions. To describe the imaging features of intraventricular masses. To review common and uncommon location of intraventricular masses with MR imaging.

TABLE OF CONTENTS/OUTLINE

Imaging anatomy of ventricular system Imaging approach to intraventricular mass Review of common and uncommon MR imaging features of the following intraventricular neoplastic and nonneoplastic masses 1. Central neurocytoma 2. Subependymoma 3. glioblastoma 4. Subependymal giant cell astrocytoma 5. Lymphoma 6. Metastasis 7. Choroid plexus tumor 8. Choroid plexus cyst 9. Meningioma 10. Colloid cyst 11. Craniopharyngioma 12. Ependymoma 13. Epidermoid cyst 14. Pleomorphic xanthoastrocytoma 15. Multiple myeloma Summary and conclusionPlease visit the Learning Center to also view this presentation in hardcopy format.

Consensus Recommendations on Clinical APT-weighted Imaging Approaches at 3T for Brain Tumors

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Jinyuan Zhou, PhD, Baltimore, MD (*Presenter*) Inventor, Koninklijke Philips NV;Institutional license agreement, Koninklijke Philips NV;Speaker, Koninklijke Philips NV

TEACHING POINTS

Currently used amide proton transfer-weighted (APTw) MRI protocols vary substantially among different institutes. Thus, the results acquired from different patient studies are difficult to compare, which hampers uniform clinical application and interpretation. The purpose of this education exhibit is: 1) To review challenging issues for clinical APTw imaging at 3T. 2) To provide a rationale for optimized and standardized APTw brain tumor imaging. 3) To review specific recommendations for pulse sequences, acquisition protocols, and data processing methods for APTw imaging of brain tumors. 4) To provide tips for using APTw imaging in the clinical setting.

TABLE OF CONTENTS/OUTLINE

1) Introduction. 2) APTw MRI background and theory. 3) History of the mechanism and the evolution of its understanding. 4) APTw imaging pulse sequences, including RF saturation approaches and parameters, lipid suppression, and readout. 5) Acquisition protocols. 6) Data processing and display. 7) Brain tumor APTw imaging data interpretation and pitfalls. 8) Conclusions and remarks.

Paragangliomas of the Head, Neck, and Spine: Radiologic-Pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Robert Y. Shih, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The paraganglia are non-neuronal neuroendocrine cells that are part of the autonomic nervous system and derived from the neural crest. They are named for the location beside the paravertebral sympathetic ganglia.2. Pheochromocytes (chromaffin cells) are named for a characteristic brown color change of the paraganglia tissues when fixed in chromium salts, which reflects oxidation of stored catecholamines. These chromaffin cells are found in the adrenal medulla or beside sympathetic ganglia in the abdomen.3. There is another type of paraganglia, which has chemoreceptor rather than neuroendocrine functions, responsible for increasing respiration in response to acidosis, hypoxia, or hypercarbia. These parasympathetic paraganglia are composed of glomus cells and give rise to paragangliomas of the head and neck.4. Aside from paragangliomas of the head and neck, paragangliomas of the spine (specifically the cauda equina) are also encountered in neuroradiology. With the 2022 WHO Classification of Endocrine and Neuroendocrine Tumors, these are being reclassified as cauda equina neuroendocrine tumor (NET).5. Approximately 40% of paragangliomas are related to germline mutations, therefore genetic testing is indicated for all patients. While there are many familial endocrine tumor syndromes, hereditary paraganglioma syndromes involve mutations in succinate dehydrogenase (SDH).

TABLE OF CONTENTS/OUTLINE

1. What are the paraganglia?2. What is the relationship of paragangliomas and pheochromocytomas?3. What are the classic locations for paragangliomas of the head and neck?4. What is the classic location for paraganglioma of the spine?5. What is the significance of germline mutations for paragangliomas?

Expand The Differential - An Interesting Case Series of Bithalamic Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
David Wessling, MD, Council Bluffs, IA (*Presenter*) Nothing to Disclose

TEACHING POINTS

This education exhibit presents a series of unique pathologies that lead to bilateral thalamic region imaging abnormalities. Our intention is to demonstrate numerous pathologies, expand the differential considerations of bithalamic lesions and raise the awareness of less commonly encountered disease processes. Many of the cases chosen were either were initially misinterpreted or puzzled the neuroradiologists at our academic institution. Many of the cases required multiple imaging modalities including advanced imaging techniques such as perfusion, diffusion tensor imaging and spectroscopy to either make a diagnosis, narrow the differential, or guide further management. Our aim with creating this exhibit is to describe the clinical presentation, demonstrate imaging appearances and defining characteristics, and provide interpretation of studies across multiple imaging modalities. Additionally, an explanation for how each study aids the radiologist's impression is provided. Our exhibit will advance the audience's comfort when faced with interpreting bithalamic imaging abnormalities. This will help to minimize patient harm from unnecessary intervention or delayed diagnosis.

TABLE OF CONTENTS/OUTLINE

This exhibit is intended to serve as a collection of interesting disease processes with bithalamic involvement. Specific interests will be given to cases utilizing multiple different imaging modalities and those which required advanced imaging techniques. These cases will be organized categorically; vascular, metabolic/toxic, neoplastic, inflammatory, infectious and seizures. Tables and diagrams will be created to highlight similarities and differences when applicable.

Machine Learning in Alzheimer's Disease: Diagnostic Classification Using MR Neuroimaging Data

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Stephanos Leandrou, PhD, MSc, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Alzheimer's Disease (AD) is a neurodegenerative disease and its diagnosis relies mainly on cognitive tests. An important limitation of cognitive tests is the diagnosis of AD after structural changes have occurred within the brain. Therefore, these patients have a long prodromal phase when effective treatment strategies may be applied to delay or alter the onset of the symptoms. Research on quantitative MRI-derived biomarkers is an active research area which detects brain neurodegeneration before AD symptoms appear. In this study multi-modal features from both entorhinal cortex (ERC) and hippocampus where extracted from 194 normal controls (NC), 284 mild cognitive impairment (MCI) and 130 AD subjects. Texture analysis was mainly used which evaluates statistical properties of the tissue image quantitatively; therefore, it could detect smaller-scale changes of neurodegeneration. The use of ERC texture features is very limited in the literature, however, it is the first structure affected. We hypothesized that through the earlier involvement of ERC and the use of texture features, it is likely to detect microscopic alterations of the disease before atrophy spreads. This study used Machine Learning (ML) methods to address high dimensional data and discover new biomarkers in the assessment of AD. These directions will help to manage the disease progression and develop novel treatment strategies. This study innovates by using multi-modal data (incl. ERC) in the assessment of AD through a ML-based classification. An area under curve of 0.940, 0.806, and 0.786 was seen between NC vs AD, NC vs MCI and MCI vs AD subjects, respectively.

Learning from Machines: A Resident's Guide to AI Mistakes in Neuroradiology and What Residents Can Learn From Them

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Certificate of Merit

Participants
Austin Young, (*Presenter*) Nothing to Disclose

TEACHING POINTS

With the steady advancement of computer vision technology, artificial intelligence (AI) algorithms have been shown to outperform radiologists in certain imaging interpretation tasks [1]. These technologies have been increasingly applied in clinical practice to aid in detection/diagnosis, disease prediction, and image segmentation [2]. Our institution has recently acquired an AI software package that allows for detection of acute hemorrhage, large vessel occlusion, and quantitative evaluation of perfusion deficits. This software package is expected to help provide a more prompt and accurate diagnosis by delivering qualitative and quantitative analysis of critical findings [3]. In this exhibit we highlight common pathologies where AI interpretation was discordant with the underlying pathology as determined by final attending interpretation, highlighting potential pitfalls in overreliance on this new technology in imaging interpretation. As we analyze these cases, an emphasis will be placed on the human component of imaging, how information must be integrated and synthesized to arrive at a proper diagnosis with the goal of providing direction for future deep learning algorithms and improved resident education.

TABLE OF CONTENTS/OUTLINE

Case 1: Pseudo-subarachnoid hemorrhage incorrectly interpreted as true hemorrhage Case 2: Erroneous interpretation of decreased blood vessel density secondary to subdural hematoma Case 3: Presence of endovascular coils causing false interpretation of large vessel occlusion Case 4: Erroneous interpretation of decreased blood vessel density due to intraparenchymal hemorrhage Case 5: Cortical laminar necrosis wrongly interpreted as subarachnoid hemorrhage

Arterial Spin Labeling Perfusion Technique in Neurovascular Diseases: Technical Aspects, Artifacts and Clinical Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Carlos Basoa Ramos, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To review the technical principles of the Arterial Spin Labelling (ASL) technique.• To list the main artifacts that radiologists should be aware of.• To review the main applications of the ASL technique, with special attention to neurovascular pathology (acute and chronic ischemia, arteriovenous shunt and moya-moya disease, among others).

TABLE OF CONTENTS/OUTLINE

ASL is an underused magnetic resonance imaging (MRI) technique that uses water molecules within arterial blood as endogen contrast to obtain quantitative information of cerebral blood flow (CBF). Thus, ASL does not use exogenous contrast agents, being an alternative to other more established MRI perfusion techniques.Radiofrequency pulses are applied proximal to the brain, at neck vessels, to obtain an inversion of longitudinal magnetization of arterial blood water molecules. This process is called labelling. After a short period of time called post labelling delay (PLD) imaging is performed. Two imaging acquisitions are made, one unlabelled and one labelled. Subtraction of the unlabelled images will provide cerebral perfusion data.There are multiple labelling techniques but nowadays guidelines recommend implementation of 3D pseudocontinuous ASL (PCASL) in clinical practise.ASL has been studied and compared as well with other perfusion MRI techniques in neurodegenerative diseases, neuro-oncology, and neurovascular diseases.ASL technique is a useful technique in neurovascular pathology, especially in the control of patients with treated arteriovenous malformations.

The Multiple Faces of Typical Atypical Primary Central Nervous System Lymphomas

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the demographics, differential diagnosis, and current standard for definitive diagnosis of primary central nervous system lymphoma 2. Describe the imaging features of typical and atypical PCNSL, including location, enhancement pattern, signal intensity in multiple sequences, presence or absence of hemorrhage, necrosis and calcification 3. Educate the radiologist regarding the differences in management of PCNSL and its main differential diagnoses, and discuss why prompt diagnosis is crucial for improved outcomes 4. Provide a brief outline of currently under investigation alternative methods for earlier and less invasive PCNSL diagnosis and classification, including the role of systematic classification tools and machine learning algorithms

TABLE OF CONTENTS/OUTLINE

• Demographics of PCNSL • Presentation, important clinical features and imaging findings of multiple typical and atypical histologically-proven PCNSL patients from our institution (71 patients available) • Differential diagnoses of PCNSL • Definitive diagnosis of PCNSL • Management of PCNSL vs management of its main differential diagnosis • Alternative methods for earlier and less invasive PCNSL diagnosis and classification

Finding the Specific in Non-Specific: Imaging in Acute Decompensation in Inherited Metabolic Disorders

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Garima Sharma, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Most inherited metabolic disorders present as a severe progressive illness, however, some of them are often complicated by acute decompensation. These events are precipitated by the accumulation of toxic metabolites leading to encephalopathy and severe neurological injury. The factors triggering such episodes are generally states of an increased catabolic state, i.e., infection, trauma, or even increased consumption of any specific food component. While imaging is often ordered along with other investigations for a complete evaluation, most of the time the findings are labeled as non-specific. Hence, it is important for the radiologist to know: a)The metabolic disorders which can present as metabolic compensation b)Clinical clues and biochemistry c)Specific imaging features for various entities d) Mimics and major differential diagnosis. The most important mimics for these entities are hypoxic-ischemic injuries, sepsis, and vascular events (e.g. stroke). Magnetic Resonance Imaging (MRI) is the most important imaging modality for adequate evaluation of these patients.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Causes of acute decompensation in inherited metabolic disorders3. Clinical presentations4. Understanding the biochemistry5. Role of imaging6. Specific imaging features a. Organic acidemias b. Urea cycle disorders c. Maple syrup urine disease d. Fatty acid oxidation defects e. Glycogen storage disease (type I) f. Leighs Disease

Participants
Taisa Guarilha, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Retinoblastomas are the most prevalent form of eye cancer in children, mostly occurring in first infancy. Most of them are diagnosed by the detection of leukocoria at ophthalmologist clinics. Nonetheless, image analysis performed by a radiologist can provide an assessment of key features that highly impact prognosis and treatment definition. We can see beyond the eye by detecting optic nerve involvement, extraocular tumor, and intracranial extension.The goal of this paper are:Review the anatomy of the orbit regionDiscuss epidemiology and clinical findingsDemonstrate how retinoblastomas can present itselfExemplify the six groups according to the Grouping Classification of Retinoblastoma FeaturesDemonstrate common and uncommon metastasisShow differential diagnosis

TABLE OF CONTENTS/OUTLINE

> Anatomy of the orbit region> Epidemiology and clinical findings> Imaging features> Present and explain cases from groups A to F from the Grouping Classification of Retinoblastoma Features> Metastasis:-optic nerve involvement-trilateral retinoblastoma-intracranial metastasis-spinal metastasis-leptomeningeal metastasis -abdominal metastasis-bone metastasis > Differential diagnosis:- Coats Disease- Meduloepithelioma- Retinal Hamartoma - Persistent hyperplastic primary vitreous- Optic pathway glioma-Meningioma>Postoperative control findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Heber Colares Costa, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To illustrate the imaging spectrum of lissencephaly spectrum along with their genetic relationship. To exemplify the classification systems based on the most likely causative genes. To demonstrate the challenges of the new imaging and severity classification tools to guide and prioritize genetic testing for patients' clinical management and genetic counseling. To depict the differential diagnoses and a flowchart for assessing the lissencephaly spectrum.

TABLE OF CONTENTS/OUTLINE

1. Background. 2. Imaging protocol. 3. Clinical perspective and importance of analysis of lissencephaly spectrum. 4. The genetic cascade of events implicated in cortical development. 4. Imaging assessment and their correlation with the genetic abnormalities. 5. Imaging pearls correlated with the lissencephaly spectrum. 6. Differential diagnoses. 7. Flowchart for imaging assessment. 8. Take-Home messages.

Neurocutaneous Diseases, Clues for Neuroradiology Findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Karla Fuentes Badillo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Neurofibromatosis Type I Characterized by the involvement of the nerve sheath. Imaging findings include white matter lesions, bone lesion associated with plexiform neurofibromas, focal areas of signal intensity hyperintense in T2, plexiform and paraspinal neurofibromas. Neurofibromatosis Type II NF2 is a hereditary syndrome characterized by multiple cranial nerve schwannomas, specifically with bilateral vestibular schwannomas, meningiomas and spinal tumors. They can be evaluated on CT but are better characterized by MRI. Tuberous Sclerosis Complex Characterized by the presence of hamartomas. Cortical tubers appear in 95% of patients, subependymal giant cell astrocytomas tend to have intense enhancement, white matter abnormalities with variable appearance and subependymal nodules. Sturge Weber Syndrome Characterized by detects subcortical calcification at an earlier age than plain film and can also demonstrate associated parenchymal volume loss, tram-track sign of cortical and subcortical calcification. Von Hippel Lindau The most common lesions are retinal angiomas, hemangioblastomas of the cerebellum and spinal cord, visceral cyst and tumors. HGBL is seen as a well-defined cerebellar cyst with nodule on NECT, on MR imaging on T1 is observed as an iso/hypointense nodule with Flow voids (large feeding vessels within the periphery), while on T2/FLAIR is evidenced as a hyperintense nodule, which blooms in case of hemorrhage and enhances strongly without changes on cyst wall.

TABLE OF CONTENTS/OUTLINE

Neurofibromatosis Type I, Neurofibromatosis Type II, Tuberous Sclerosis, Sturge Weber, Von Hippel Lindau

Microtubulin Dysfunction - Key Imaging Features

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Joel Samuel, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Neurological abnormalities found on MRI brain in tubulinopathies predominantly consists of dysmorphic basal ganglia(90%),cerebral cortical malformations(60%), microcephaly(30%),callosal abnormalities(80%), ventriculomegaly(90%), asymmetric brain stem(60%), andsmall cerebellar vermis or hemispheres(50%).

TABLE OF CONTENTS/OUTLINE

LEARNING OBJECTIVE:The aim of this study is to describe the spectrum of key imaging findings associated with Tubulinopathies. BACKGROUND:Tubulinopathies are a heterogenous group of rare disorders that lead to complex brain malformation ,caused by mutation in tubulin genes.Study design:The study included MRI brain of 10 patients with symptoms of developemental delay, microcephaly, seizures and imaging features suggestive of tubulinopathies were studied over a period of three years.Microcephaly, cerebral cortical malformations, callosal abnormalities,ventriculomegaly, dysmorphic basal ganglia,hypoplasia of internal capsule, asymmetric brain stem, and small cerebellar vermis or hemispheres were the predominant finding seen in MRI.CONCLUSION:Knowledge of the main imaging findings of tubulinopathies is critical. Given the rarity of these conditions and lack of discriminating clinical features, imaging may be the only clue to an underlying tubulinopathy. Also helps in further genetic workup for these patients and identifying the gene mutated and helps in treatment .

Imaging Abnormalities in Patients with Alzheimers Disease Treated with Anti-Amyloid Beta Therapy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Awards
Identified for RadioGraphics

Participants
Amit K. Agarwal, MD, MBBS, Jacksonville, FL (*Presenter*) Stockholder, Gilead Sciences, Inc

TEACHING POINTS

-To discuss the novel therapeutic strategies for Alzheimer's disease, with focus on the recently approved anti-amyloid beta therapy- To illustrate the imaging abnormalities in patients with Alzheimer’s Disease treated with Anti-Amyloid Beta Therapy- To discuss the protocol for monitoring and assessment for imaging abnormalities in patients on Anti-Amyloid Beta Therapy- To discuss the imaging differentials of ARIA (with focus on cerebral amyloid angiopathy)

TABLE OF CONTENTS/OUTLINE

-Neuropathology of Alzheimer's disease (AD)-Role of cerebral amyloid-B (Ab) in Alzheimer's disease-Brief discussion on current imaging modalities for diagnosis and monitoring of AD (MRI, Amyloid PET,Tau PET)-Therapeutic strategies against amyloid-ß peptides in Alzheimer’s disease- Imaging Abnormalities in Patients with Alzheimer’s Disease Treated with Anti-Amyloid Beta Therapy - Amyloid-related imaging abnormalities: edema (ARIA-E) and hemorrhage(ARIA-H)- International Collaboration for Real-World Evidence in Alzheimer's Disease (ICARE AD) -MRI Acquisition Protocol Proposed to ICARE AD Sites ARIA Monitoring- Imaging differentials of ARIA (cerebral amyloid angiopathy, PRES)

How Much Do You Know About MRI Patterns of Brainstem Inflammatory Lesions?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Carlota Garcia de Andoin Sojo, MD, Bilbao, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

When facing inflammatory lesions of the brainstem there are a number of differential diagnoses and accurate diagnosis can be difficult. Knowing clinical features and MRI findings, especially on the extent of dissemination, number, morphology and appearance of the lesions in different MRI sequences radiologists will be able to reach the correct diagnosis.

TABLE OF CONTENTS/OUTLINE

Objective: To describe MRI findings of major inflammatory and immune-mediated diseases that affect the brainstem.Methods A revision of the most characteristic inflammatory lesions of the brainstem has been made in MRI-illustrated challenging quiz format.Findings 1. Immune-mediated inflammatory disorders: illustrated quiz-mode cases will lead to the revision of disorders that involve the brainstem, including Multiple Sclerosis, Neuromyelitis Optica Spectrum Disorder, Myelin Oligodendrocyte Glycoprotein antibody-induced demyelination, Neuro-Behçet, Neurosarcoidosis, Histiocytic disorders, Bickerstaff Brainstem Encephalitis, Acute Haemorrhagic Encephalomyelitis, Hurst disease, Systemic Lupus Erythematous2. Differential diagnosis should be done having in mind MRI and clinical features of other diseases that also cause brainstem inflammation, such as paraneoplastic encephalitis, Alexander leukodystrophy, Wilson disease, Wernicke-Korsakoff syndrome and CNS infections (listeria, tuberculosis and enterovirus).Conclusion Knowing the typical MRI presentation of each of the disorders that cause brainstem inflammations radiologists can give important information to achieve an accurate diagnosis and establish appropriate treatments.

The Radiologist's Guide to Non-Traumatic Orbital Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Emily Haas, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Orbital pathology identification and diagnosis is of critical importance as delayed diagnosis and management may ultimately result in vision loss for many patients. Development of an appropriate differential diagnosis of orbital lesions is vital as to guide our clinician colleagues in appropriate next steps and future follow-up. This educational exhibit aims to review orbital anatomy and explore non-traumatic orbital pathology by underlying etiology. While there may be overlap in imaging features, we will discuss characteristic imaging findings for each diagnosis that help to distinguish them amongst each other and alleviate diagnostic dilemma.

TABLE OF CONTENTS/OUTLINE

1. Vascular: Venous Malformation, Capillary Hemangioma, Orbital Varix, Carotid-Cavernous Fistula, Lymphatic Malformation, Granulomatosis with Polyangiitis (GPA). 2. Infectious/ Inflammatory: Pre-septal Cellulitis, Post-septal Cellulitis, Orbital Abscess, Dacryocystitis, Invasive Fungal Infection, Optic Neuritis, Idiopathic Orbital Inflammation, Thyroid-Associated Orbitopathy, Papilledema. 3. Neoplastic: Optic Nerve Sheath Meningioma, Optic Glioma, Rhabdomyosarcoma, Dermoid, Lymphoproliferative Disorders, Metastases.

Imaging of Headache in Relation to CSF Pressure/Volume Problem: What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Hyeongwoo Kim, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Brain and spine imagings are key components in diagnosis and treatment strategy of SIH and IIH. After reviewing this educational exhibition, radiology residents should be able to understand clinical manifestations in headaches with CSF pressure/volume problem and how to approach imaging diagnosis with better imaging protocols.

TABLE OF CONTENTS/OUTLINE

New onset or progressive headache is often the most common symptom of intracranial hypotension or hypertension syndrome. In spite of imaging advances, spontaneous intracranial hypotension (SIH) and idiopathic intracranial hypertension (IIH) are often misdiagnosed and if untreated, lead to severe neurologic impairment such as cognitive decline for SIH or visual impairment for IIH. The purpose of this educational exhibition is to review the related imaging findings of intracranial hypotension or hypertension and the suggested imaging protocols in patients with headache associated with CSF problem. We retrospectively evaluated MR images and clinical reports of headache patients collected at our hospital from 2011 to 2021. Contents Organization 1. Introduction 2. SIH 1) clinical manifestation 2) brain imaging for SIH 3) spine imaging for CSF leak 4) suggested imaging protocol 3. IIH 1) clinical manifestation 2) brain imaging for IIH 3) suggested imaging protocol 4. New concept of CSF physiology and glymphatic in relation to SIH and IIH 5. Summery

Carotid Cavernous Fistula: Classification, Arterial and Venous Anatomy, Clinical Presentation and Diagnosis and Endovascular Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - NR

Participants
Shadab Alam, MBBS, BANGALORE, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Carotid cavernous fistula(CCF) are classified hemodynamically as high flow and low flow, etiologically as spontaneous, traumatic and Iatrogenic and anatomically as direct and indirect. 2) Clinical presentation is influenced by venous drainage patterns and shunt flow rate. 3) Endovascular approach depends on the type of CCF and angiographic findings which could be transarterial or transvenous. 4) Alternative approach for indirect CCF include transorbital superior ophthalmic vein approach and transfemoral Superior Petrosal Sinus Approach

TABLE OF CONTENTS/OUTLINE

The exabit will include:Classification of CCF. Arterial and venous anatomy with emphasis on the ECA and ICA anastomosis. Various clinical presentation. Imaging appearance of CCF. Angiographic anatomy and angiographic check list to plan treatment. Illustration interventional hardware for treatment planning. Case illustration of various treatment options like Transarterial coiling, parent artery occlusion, coil plus EVOH Embolisation, transvenous approach, various alternative approaches with case illustrations. Tips and tricks planning and execution of cases.

OBEE

OB/Gynecology Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Sub-Events

OBEE-1 How To Expand Your Diagnosis of Deep Endometriosis on Routine Pelvic Imaging

Participants
Scott Young, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review uterine video clips on routine pelvic ultrasound and evaluate sliding sign maneuvers, differences in technique depending on uterine version. -Accurately locate important anatomical landmarks, including the torus uterinus and uterosacral ligaments on TVUS. -Understand how DE observations may appear different depending on uterine version and transducer position in the anterior and posterior vaginal fornices. -Recognize characteristics of DE bowel observations and assess bowel DE size and depth of invasion, critical factors which guide the level of surgical expertise required for resection. How to recognize DE on routine CT and MR examinations performed for clinical indications other than endometriosis. -Recognize characteristics of DE observations outside the pelvic compartments on routine CT, MSK pelvic, and non-dedicated abdominopelvic MR. -Utilize cues including location, signal, and enhancement characteristics to make an early diagnosis of DE.

TABLE OF CONTENTS/OUTLINE

1. Title 2. Disclosures 3. Learning objectives 4. Pelvic anatomy review-Uterosacral ligament (USL)/torus uterinus-Relationship of USL to transducer position and uterine version-Surgically relevant measurements/observations-Case examples of normal and abnormal TVUS video sweeps of anterior and posterior fornix view for each uterine flexion/version-5. US of bowel endometriosis-Schematic/operative images-Case examples with pertinent measurements 6. Extrapelvic and uncommon DE locations-Anatomic hypothesis of extraperitoneal spread-CT and MR enhancement/signal characteristics-Schematic/operative images 7. Conclusion 8. References

OBEE-10 Post-treatment Complications of Gynecologic Malignancies

Participants
Tsukasa Saida, MD, Tsukuba, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologists need to be familiar with the imaging findings of the various complications that can occur in the treatment of gynecologic tumors and understand the urgency and symptoms of each. In this exhibition, we introduce various complications derived from gynecologic surgery and pelvis radiation therapy, and explain the diagnostic points of each complication.The teaching points of this exhibit are: 1. We classified postoperative complications immediately after surgery, subacute, and delayed complications. Complications immediately after surgery are caused by direct injury caused by surgical procedures. Subacute complications include infection, chylous ascites, deep venous thrombosis, and neuropathy. Delayed include, intestinal obstruction, hydronephrosis, lymphedema, and abdominal incisional hernia.2. Radiation-induced complications can be divided into acute and chronic effects. Acute effects occur during or immediately after radiation therapy, are reversible, and in most cases, the conservative treatment leaves no disability. Chronic effects include cervical stenosis, small bowel stricture, fistula formation, and insufficiency fractures that occur a few months later.

TABLE OF CONTENTS/OUTLINE

A. Complications after surgery (Immediately after surgery, Subacute, Delayed)B. Radiation-induced effects (Early effects, Late effects)

OBEE-11 Phenotypic Diversity of Uterine Mesenchymal Tumors (Excluding Smooth Muscle Tumors): Current Update on Genetics and Imaging

Participants
Steven Chua, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the taxonomy, epidemiology, clinical features, histopathology and biology of the diverse spectrum of mesenchymal, non-smooth muscle tumors of the uterus.2. Describe the salient multimodality cross-sectional imaging features of these tumors.3. Review the genetics, management and prognosis of these tumors.

TABLE OF CONTENTS/OUTLINE

1. Introduction, epidemiology and clinical features of mesenchymal, non-smooth muscle tumors of the uterus.2. Histopathological, immunohistochemistry and molecular pathology.3. CT, MR and PET/CT imaging features and tumor biology of this wide spectrum of

tumors.4. Prognosis and management. * Low grade Endometrial stromal sarcoma.* High grade Endometrial stroma sarcoma.* Adenosarcoma* Carcinosarcoma* Undifferentiated sarcoma.* Uterine tumor resembling sex cord stromal tumor.* PEComa.* Inflammatory myofibroblastic tumor.* Solitary fibrous tumor. Conclusion.

OBEE-12 Management and Imaging Evaluation of Peripartum Hemorrhage: What Radiologists Need to Know

Participants
Moataz Ahmed Sayed Mohammed Soliman, MD, MSc, CHICAGO, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understand normal imaging findings of the utero-fetal complex. • Recognize multimodality imaging findings of conditions predisposing to peripartum hemorrhage. • Discuss Imaging pitfalls for peripartum hemorrhage. • Impact of the preoperative radiological diagnosis on management and role of radiologists.

TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Normal imaging anatomy of the uteroplacental complex 2. Ante-partum hemorrhage: a. Definitions b. Etiology: (Placental abruption, Placenta previa, Gestational trophoblastic disease, Vasa Previa, Uterine rupture) c. Management 3. Postpartum hemorrhage a. Definitions b. Normal imaging findings of the postpartum uterus. c. Classification and risk factors i. Primary postpartum hemorrhage: (Uterine atony, traumatic pelvic hematoma, bladder flap hematoma, retained products of conception, coagulopathies, and placenta accrete spectrum) ii. Secondary postpartum hemorrhage: (Retained products of conception, Infection, Uterine subinvolution, Coagulopathies, Delayed presentation of genital tract hematoma, Vascular bleeding from vascular malformation, and pseudoaneurysms)

OBEE-13 The Postop Pelvis: A Review of Complications Following Surgery for Gynecological Malignancies

Participants
Marie Vogel, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The radiologist plays a crucial role in detecting and characterizing acute and chronic complications following surgery for gynecologic malignancies.2. Knowledge of the multimodality imaging spectrum of common complications can lead to timely diagnoses and improved patient care.3. A thorough understanding of the common surgical techniques available and identification of pertinent findings on the preoperative imaging can help to identify a subset of patients who may be at higher risk for certain postsurgical complications.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will: 1. Briefly overview the common management options and surgical techniques for uterine, cervical, endometrial and ovarian cancer.2. Review and illustrate common acute postoperative complications in a case-based format including: - Hemorrhage - Infection/Abscess - Vaginal Cuff Dehiscence - Bowel injury - Ureteral and bladder injury 3. Review and illustrate common subacute to chronic postoperative complications, including: - Lymphocele/Seroma - Peritoneal inclusion cyst - Adhesive disease and bowel obstruction - Pelvic floor dysfunction - Recurrence, including a detailed discussion of the most common pattern of recurrence for each gynecological malignancy

OBEE-14 Elucidating the Spectrum of Extra-uterine Smooth Muscle Neoplasms in Women: Cross-sectional Imaging Findings.

Participants
Steven Chua, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe taxonomy and histopathology of the diverse spectrum of extra-uterine smooth muscle tumors. 2. Discuss examples of different growth patterns, clinical features and locations of these extra-uterine tumors.3. Highlight the salient imaging features of these tumors by multimodality cross-sectional imaging.

TABLE OF CONTENTS/OUTLINE

1. Introduction, epidemiology and clinical features.2. Different growth patterns, including benign metastasizing leiomyoma, diffuse peritoneal leiomyomatosis, intravenous leiomyomatosis, parasatic and retroperitoneal.3. Histopathology and biological behavior.4. Multimodality imaging.5. Prognosis and Management.* Leiomyoma.* STUMP.* Leiomyosarcoma.* Angioleiomyoma.* Extrauterine leiomyomas of the urethra, vagina, broad ligament, round ligament and adnexum.* Retroperitoneal leiomyoma with Mullerian Features. 6. Conclusion.

OBEE-15 Pictorial guide to O-RADS MRI and online calculator

Participants
Priyanka Jha, MBBS, San Francisco, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review and understand the O-RADS MRI lexicon terminology with imaging examples 2. Understand protocol requirements to adequately assess adnexal lesion with O-RADS MRI 3. Develop an algorithmic approach, guiding the readers through 4 key questions, to arrive at a final score

TABLE OF CONTENTS/OUTLINE

1. O-RADS MRI governing principles 2. Technical Requirements for O-RADS MRI assessment 3. Essential O-RADS MRI Calculator Definitionsa. Adnexal b. Lesion c. Cystic lesion d. Types of fluid e. Solid tissue f. Enhancement 4. Understanding types of enhancing solid tissue a. Mural nodule b. Papillary projection c. Irregular septation d. Irregular wall e. Large solid component 5. Lesion assessment on dynamic contrast enhancement a. Low risk curves b. Intermediate risk curves c. High risk curves 6. O-RADS MRI assessment of non-ovarian lesions: Fallopian tubes and para-ovarian cysts

OBEE-16 The path to mri expertise in endometriosis - correlation of mri cases with videolaparoscopy

Awards
Certificate of Merit

Participants
Alan Hummel, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologist training in endometriosis assessment by MRI should be ongoing. Videolaparoscopic correlation is consensually a key part of this development towards expertise.To assess the anatomy of the female pelvis on MRI and videolaparoscopy with the particularities, advantages, and disadvantages of each one.To review the imaging manifestations and the radiological approach in MRI endometriosis workup.To explain in a simplified and didactic way how to interpret the videolaparoscopy for endometriosis.To correlate the findings of pelvic resonance with videolaparoscopy filming in simple, complex, and challenging cases

TABLE OF CONTENTS/OUTLINE

Anatomy review for MRI and Videolaparoscopy based on key images, videos, and schematic illustrations.What surgeons see and we don't, and what we need to tell them, otherwise they won't see.Simplifying the approach to MRI endometriosis appraisal. Understanding videolaparoscopy surgeries for endometriosis research and treatment.Case-based review of: - Endometriosis in the ANTERIOR compartment - MRI and Videolaparoscopy correlated. - Endometriosis in the MIDDLE compartment - MRI and Videolaparoscopy correlated. - Endometriosis in the POSTERIOR compartment - MRI and Videolaparoscopy correlated. - Limitations of the methods - How far can the radiologist go? - Post operatory features on MRI and videolaparoscopy.

OBEE-17 DWI Fast MRI: Optimization of Pelvic MRI Pulse Sequences in Gynecologic Imaging

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Rebecca Rakow-Penner, MD, PhD, San Diego, CA (*Presenter*) Research Grant, General Electric Company;Consultant, Human Longevity Inc;Stockholder, CureMetrix, Inc;Stock options, CorTechs Labs, Inc

TEACHING POINTS

Understand the clinical utility of MR imaging of the female pelvisDescribe the underlying principles of rapid and diffusion weighted imaging techniques used to optimize female pelvic MRI evaluationIllustrate the applications of these MRI techniques in the evaluation of different gynecological malignancies

TABLE OF CONTENTS/OUTLINE

Background a) Female pelvic anatomy and types of gynecologic malignancies b) Standard female pelvic MRI protocolMR Imaging TechniquesRapid ImagingFast Spin Echo (FSE) / Turbo Spin Echo (TSE)Gradient Echo (GRE)Radial K-SpaceRadial Volume Interpolated Breath Hold Exam (VIBE)Golden Angle Radial Sparse Parallel (GRASP)Parallel ImagingCompressed SenseDiffusion weighted imagingParallel Imaging (PI)Reduced FOVDistortion CorrectionHow are these used to evaluate gynecologic malignancies? Review key casesTest yourself with MCQ assessmentConclusion

OBEE-18 Spectrum of Cystic and solid tumors of the Ovary at Imaging : Simplified Classification and Practical approach

Participants
Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review cystic and solid tumors of the ovary on the basis of tumor origin including differential diagnosis. 2. Describe latest WHO classification of ovarian tumors. 3. Discuss a practical approach to determine key imaging features along with clinical information to narrow down the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Although ovarian tumors have similar clinical and radiologic features, predominant or specific imaging features may be present in some types of ovarian tumors. Familiarity with the clinical and imaging features of various ovarian tumors is important in narrowing the differential Classification of ovarian tumors on the basis of tumor of origin Epithelial tumors -serous -mucinous tumors, -Endometrioid -clear cell -Brenner tumor Germ cell tumors -Mature and immature teratoma, -Dysgerminoma, -Endodermal sinus tumor, Sex cord-stromal tumors -Fibrothecoma -Granulosa cell, -Sertoli-Leydig cell tumors

OBEE-19 Imaging the posttreatment pelvis with gynecologic cancer

Participants
Stephanie Nougaret, MD, PhD, Montpellier, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To become familiar with the CT and MR imaging appearances of the treated female pelvis following chemotherapy, radiation therapy or surgery.• To describe the most common complications of the treated female pelvis for gynecologic malignancies.• To recognize the patterns of recurrence.• To list the potential pitfalls in the interpretation of posttreatment imaging findings.

TABLE OF CONTENTS/OUTLINE

Gynecologic malignancies are usually treated with surgery, chemotherapy, or radiation therapy. Posttreatment imaging plays a crucial role in the assessment of treatment response, tumor recurrence and post treatment complication. Imaging of the treated pelvis following for example chemotherapy and radiation therapy is particularly challenging due to alteration of the normal anatomy and loss of tissue planes.Outline:Ovarian and endometrial cancer: Post-surgical normal aspect Post-surgical complications: Most

common complicationsHematomaInfection and abscess formationOther complicationsLymphoceleSurgically-induced fistula and sinus tracts Recurrence: imaging presentation: what and where to look for: the essential role of baseline imaging.Cervical cancer: Post chemoradiotherapy normal aspectPost chemoradiotherapy complications: induced cystitis, induced gastrointestinal complications, fistulas, bone changesAssessment of response after CRTRecurrence: imaging presentation: what and where to look for, evaluation for exenteration

OBEE-2 How to Start an Endometriosis Imaging Program: the American Experience

Awards
Certificate of Merit

Participants
Lekui Xiao, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. A dedicated MRI protocol is crucial for identifying endometriosis. 2. Templated reports for endometriosis are high yield for clinicians because they ensure that all anatomic areas of interest are reviewed. 3. Pre-operative review of MRI in multidisciplinary rounds can alter patient management. 4. Re-evaluation of post-operative MRI exams and associated intraoperative findings and pathology serve as a teaching guide for all parties involves. Specifically, for radiologists, review of concordance/discordance between imaging and intraoperative findings helps refine our imaging protocols and detection accuracy while recognizing the limitations of imaging. 5. Understanding the medical and surgical ramifications of endometriosis develops our relationship with gynecology colleagues to better manage complex cases. 6. Ultimately, earlier diagnosis of endometriosis reduces unnecessary distress and improves disease management.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Significance of endometriosis and importance of accurate diagnosis 2. Role of imaging, with emphasis on MRI, in evaluating endometriosis 3. MRI protocol to optimize visualization 4. Details discussed in multidisciplinary cases 5. How multidisciplinary cases help radiologists, gynecology, and patients 6. Example cases demonstrating how reporting MRI findings can be refined through multidisciplinary rounds. a. Deep infiltrative endometriosis b. Bladder endometriosis c. Bowel endometriosis d. Ovarian endometriomas e. Malignant Transformation f. Clues for diagnosing subtle disease 7. Teaching Points 8. Conclusion

OBEE-20 Imaging of Post-treatment Complications in Gynecologic Malignancies

Participants
Renuka Ashtekar, MBBS, MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Enumerate expected changes in the pelvis following radiation therapy and chemotherapy.2. Describe common as well as uncommon complications following chemotherapy (CT), radiation therapy (RT) and surgery.3. Complications associated with the advent of targeted therapy and immunotherapy.

TABLE OF CONTENTS/OUTLINE

1. Introduction- Imaging modalities in pre-treatment workup and post-treatment monitoring of gynecologic malignancies.- Overview of treatment options in different types of gynecologic cancers.2. Expected changes in the pelvic structures post radiation therapy and chemotherapy.3. Post-surgical imaging- expected post-operative findings.4. Gastrointestinal complications following surgery/RT/CT and their imaging features.5. Genitourinary complications following surgery/RT/CT and their imaging features.6. Musculoskeletal complications following RT/CT and their imaging features.7. Post treatment vascular complications and their imaging features.8. Emerging treatments and associated complications and their imaging features.

OBEE-21 You should not pass: Simplifying MR Defecography

Awards
Magna Cum Laude

Participants
Brenda Hernandes dos Santos Teixeira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe and highlight image acquisition protocols in Magnetic Resonance (MR) Defecography. 2. Improve the understanding of female pelvic floor anatomy using a didactic approach by illustrations and MR images. 3. Recognition of MR Defecography imaging patterns of pelvic floor dysfunctions and diagnostic value.

TABLE OF CONTENTS/OUTLINE

Review of the main imaging female pelvic floor anatomy. MR Defecography protocols. Case-based examples and illustrative key points of the main pelvic floor disorders: Anterior compartment: - Cystocele - Urethra Hypermobility. Middle compartment: - Uterine prolapse. Posterior compartment: - Enterocele - Rectocele - Rectal prolapse - Rectal intussusception - Anismus4. Discuss the perspectives for MR Defecography in clinical routine and imaging findings that aid surgical decisions.5. Conclusions and "take home messages": consolidate the acquired knowledge.

OBEE-22 It's Not All About the Bump- Imaging of the Adnexa During Pregnancy

Awards
Certificate of Merit

Participants
Catherine Phillips, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Complete OB assessment should include dedicated adnexal imaging. Early recognition of adnexal pathology permits timely

diagnosis and necessary treatment. 2. First trimester offers a unique opportunity to identify adnexal pathology before the enlarging uterus displaces the adnexa and possibly conceals lesions. 3. Adnexal pathology findings during pregnancy may be subtle. Diagnosis may be facilitated by transvaginal scanning, which provides superior resolution and is particularly helpful in obese patients. 4. US remains the diagnostic imaging test of choice to not only localize patient's symptoms and characterize incidental masses of pregnancy, but also guide therapeutic planning if needed. MRI can be helpful as a supplemental modality, particularly if lesions are large or of uncertain origin.

TABLE OF CONTENTS/OUTLINE

1. Diagrammatic depiction and imaging of normal anatomy of the adnexa (US, CT and MRI) 2. Review of imaging appearance of benign adnexal lesions with focus on how their appearance can differ during pregnancy including: Corpus luteum, Hemorrhagic cysts, Dermoid, Endometriomas including decidualized endometriomas, Hydrosalpinx, Fibroma, Torsion, Ovarian hyperstimulation (hormonal or treatment related), Subserosal fibroid projecting into the adnexa (and associated torsion), Complications related to prior surgeries.3. Imaging appearance of neoplastic adnexal lesions including: Borderline tumors, Struma ovarii, Cystadenoma and adenocarcinoma, Immature ovarian teratoma. 4. Adnexal pregnancies including interstitial, ectopic pregnancies, and pregnancies in uterine Mullerian anomalies. 5. Mimics of adnexal pathology in pregnancy.

OBEE-23 A Game of Patterns: A Case based review on Ultrasonographic Imaging of Ovarian-Adnexal lesions

Participants
Madhumitha B, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

This exhibit aims to 1. Review the ACR US- ORADS risk stratification method. 2. Precisely identify and characterize the common ovarian and adnexal lesions. 3. Apply ORADS to these lesions and categorize them based on their risk for malignancy.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. ORADS 3. A Detective's Perspective -Observation -Deduction -Knowledge 4. Case Series 5. Conclusion

OBEE-24 The right iliac fossa: from a new perspective

Awards
Certificate of Merit

Participants
Giovanna Andreani, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Endometriosis is defined as the presence of endometrial tissue outside the uterine cavity and frequently affects about 10% of women of reproductive age, generating symptoms such as dysmenorrhea, dyspareunia and pelvic pain, and infertility. Endometriotic involvement of structures of the right iliac fossa accounts for about 29% of women diagnosed with endometriosis and may affect the distal ileum, cecum, appendix, round ligament, among others. Although it is not such a frequent site of involvement, radiologists must be familiar with the imaging findings for the hypothesis of endometriosis in this topography to be raised. The objective of this study is to didactically illustrate cases of endometriosis affecting the right iliac fossa, how to systemize imaging exams to not miss possible lesions, and what information must be provided, in order to allow proper diagnosis and therapeutic planning.

TABLE OF CONTENTS/OUTLINE

Discussion of the different radiological findings of endometriosis and its involvement in structures of the right iliac fossa, based on cases obtained in our institution's digital archive in different imaging modalities, including ultrasound and magnetic resonance imaging. We also provide literature review, teaching points and references.

OBEE-25 Peripartum and Post-Partum Hemorrhage

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Nicole M. Hindman, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Bleeding during pregnancy can be due to a wide variety of etiologies, for which the majority will be evaluated by ultrasound as the first and often the only modality required.2. Post-partum bleeding /hemorrhage (PPH) can be due to a wide variety of etiologies. US remains the first line of imaging, however often additional modalities may be helpful to further discern etiology, extent and potential treatment options.

TABLE OF CONTENTS/OUTLINE

Section 1 will discuss relevant imaging modalities available. Section 2 will discuss the common etiologies of intrapartum bleeding, with a focus on late pregnancy. Some of the topics covered will include: Normal appearance of the placenta Bleeding related to the placenta including hematoma and abruption. Placenta previa Vasa previa Uterine rupture Diagnostic pitfalls. Section 3 will review the etiologies of bleeding in the post-partum period, typically termed post-partum hemorrhage (PPH) to include the following: Normal post-partum bleeding Retained products of conception, subinvolution of trophoblastic tissue and enhanced myometrial vascularity Review the distinction between AVM and enhanced myometrial vascularity Discuss rare etiologies of postpartum hemorrhage, such as uterine artery pseudoaneurysm. Various types of hematomas associated with caesarean section. Uterine dehiscence and/or rupture and their etiologies

OBEE-26 Vaginal Rejuvenation: Radiological Approach for Female Genital Anatomy and Procedures

Participants
Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Female genital minimal-invasive procedures are increasingly being performed. In this context, the radiologist has been requested to evaluate this region in order to recognize the anatomical aspects as well as to identify procedures or materials, including fillers, thread lifts, injectable lipolytic, collagen biostimulators, and its complications. To achieve accurate and timely detection and appropriate approach of each case, High frequency ultrasound (HFUS/24-33MHz) is the most effective method since it provides optimal anatomical information of the region and allows identification of different materials and procedures effects. This study aims to discuss and illustrate the radiologist's role in the evaluation of the female genital region with HFUS. The purpose of this exhibit is:- To describe the correct examination technique and preprocedure evaluation- To illustrate the anatomy of the female genital region- To show the main image patterns of the genital minimal-invasive aesthetic procedures- To list, classify and describe the most common related complications in genital region- To discuss the differential diagnosis in genital female lesions- To highlight the importance of HFUS guidance in genital procedures with videos

TABLE OF CONTENTS/OUTLINE

1. PREPROCEDURAL EVALUATION: Anatomical aspects and Female genital layers.2. PROCEDURES IMAGING FINDINGS AND GUIDANCE.3. COMPLICATIONS.4. DIFFERENTIAL DIAGNOSIS: most common genital lesions.5. CONCLUSION.

OBEE-27 Distal Mesonephric Anomalies:What Radiologists Need to Know about OHVIRA Syndrome

Participants
Mariko Kumazawa, MD, Shimotsuga-gun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Werner-Herlyn-Wunderlich syndrome (WHWS) is known as obstructed hemivagina and ipsilateral renal anomaly (OHVIRA), and it has also been reported using various other names. Distal mesonephric anomalies result in the inhibition of appropriate development, fusion between the Müllerian ducts (the origin of the uterus and the vagina), resorption of the separating walls, and abnormal kidney development. There are many reports of various subtypes of WHWS by degree of development.The purposes of this educational exhibit are as follows:- To understand the embryology of this syndrome; what kind of malformation may occur?- To be able to predict what malformation causes a clinical presentation given clinical information, such as a patient’s complaint and age.- To know the points of interpretation that contribute to treatment.

TABLE OF CONTENTS/OUTLINE

1. Present embryology explaining OHVIRA and a classification of uterine malformations according to embryology published by Acién.2. Describe the relationship between various uterine and renal-urinary malformations and their clinical presentation.3. Discuss the key points of magnetic resonance imaging and interpretation that contribute to appropriate treatments with case presentations as follows: i) two cases of OHVIRA with ipsilateral ectopic ureter, ii) two cases of acute abdominal pain by hematometra or peritonitis, and iii) a case of Gardner’s cyst.4. Summarize the history of the various terms.

OBEE-28 What's going on with the uterus: getting to know the new ASRM classification of Müllerian structures anomalies

Participants
Paolo Franco, MD, Milano, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

Müllerian structures anomalies are developmental malformations of the female genital tract, with prevalence estimated from 0.5 to 6.7% in the general population. Many of these conditions may lead to significant health and reproductive consequences. Over the years, several systems have been proposed to classify müllerian anomalies. The most used ones are the American Fertility Society (AFS) Classification from 1988 and the European Society of Human Reproduction (ESHRE) and Embryology-European Society for Gynecological Endoscopy (ESGE) Classification, which includes not only uterine but also cervical and vaginal anomalies.The 2021 American Society for Reproductive Medicine (ASRM) Classification (MAC2021) was recently developed to update previous classification systems, include all malformations categories, and promote a more standardized terminology.The purposes of this exhibit are: (1) to review female genitourinary system embryology; (2) to get familiar with congenital female malformations; (3) to explore the new 2021 ASMR Müllerian anomalies classification; (4) to compare it with previous classifications, particularly those developed by AFS and ESHRE-ESGE; (5) to describe MRI findings of female genital anomalies by showing interesting cases.

TABLE OF CONTENTS/OUTLINE

1. Female genitourinary system embryology and normal anatomy 2. Previous Mullerian anomalies classifications 3. The new 2021 ASMR Mullerian anomalies classification 4. MR female imaging protocols 5. MRI findings of the different female genital malformations

OBEE-29 MRI in uterine cancers with uncertain origin: endometrial or cervical. A radiological point of view

Participants
Luca Russo, MD, Roma, Italy (*Presenter*) Grant, Elekta AB

TEACHING POINTS

Therapeutic options and clinical management of cervical and endometrial cancers differs significantly. When clinical and histological analysis of a uterine mass are inconclusive, pelvic magnetic resonance imaging (MRI) may help establish the site of origin, allowing appropriate management and treatment planning. Radiologists should be aware of the morphologic (location, shape and different patterns of growth) and functional (enhancement pattern, tumor perfusion, diffusion-weighted imaging and spectroscopy) MRI features that can support the correct assessment of the site of origin.

TABLE OF CONTENTS/OUTLINE

1. Introduction to the clinical problem and suggested MRI protocol 2. Typical MRI features of primary cervical and endometrial cancers 3. Morphologic MRI features that can help discriminate between endocervical and endometrial cancers, including location, shape and locoregional spread 4. Functional MRI features that can help discriminate between endocervical and endometrial cancers, including enhancement pattern and tumor perfusion, diffusion-weighted imaging and spectroscopy 5. Conclusion

OBEE-3 How to Improve Your Routine Transvaginal Ultrasound for Detection of Endometriosis - A Practical

Guide for General Radiologists

Awards
Certificate of Merit

Participants
Luciana P. Chamie, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Endometriosis is a chronic inflammatory disease with significant diagnostic delays varying from four to 11 years 2. Although characteristically multifocal, the retrocervical space is the most common location of deep infiltrative endometriosis (DIE), present in most patients at the initial diagnosis as a hypoechogenic nodule or thickening affecting the uterosacral ligaments. 3. This repetitive and predictable characteristic of retrocervical endometriosis makes it suitable for early diagnosis. 4. Accurate diagnosis can have a tremendous impact on the evolution of the disease, quality of life, and fertility outcomes. 5. Transvaginal sonography (TVS) is the first-line imaging modality to investigate endometriosis and a cost-effective tool. 6. The standard TVS protocol misses the evaluation of the most common locations of endometriosis 7. The addition of a simple algorithm to the standard TVS protocol can reduce the late diagnosis and improve clinical care in patients suffering from long-standing undiagnosed endometriosis.

TABLE OF CONTENTS/OUTLINE

1. Title 2. Disclosures 3. Learning Objectives 4. Background information about endometriosis including last updates. Review the most common sites of endometriosis and anatomical landmarks . Discuss the typical presentation of DIE though TVS 5. Standard TVS limitations- discuss why basic ultrasound protocol miss endometriosis detection 6. Dedicated TVS protocol- comprehensive description on how to perform the maneuvers emphasizing advantages and limitations as well as potential pitfalls. 7. Imaging findings of endometriosis on TVS through case examples from mild to severe DIE 8. Conclusion 9. References

OBEE-30 Problems are opportunities in disguise: Added value of contrast enhanced US (CEUS) in evaluation of the female pelvic disease

Awards
Identified for RadioGraphics

Participants
Mariam Moshiri, MD, Brentwood, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound is the first imaging modality for evaluation of female pelvic disease followed by problem-solving or further evaluation with MRI and in rare cases other modalities such as CT, PET, angiography. Ultrasound Contrast agents (UCAs) have emerged as a valuable adjunct to ultrasound and allow visualization and evaluation of lesions that may not be possible on standard ultrasound imaging alone.We aim to describe and illustrate the utility of CEUS as a valuable adjunct in evaluation of disease in the female pelvis using a case-based approach. We will describe common pitfalls and offer some tips for optimizing the use of CEUS during such examinations. Lastly, we will suggest a workflow pattern that describes when CEUS use is appropriate

TABLE OF CONTENTS/OUTLINE

1. Stepwise review of technique for use of CEUS in the pelvis. 2. Review application through case-based approach with correlative imaging from other modalities and pathologic specimens(Cervical cancer; Fibroid; Ovarian lesions; Endometrial disease/lesions; Post-partum complications such as retained products of conception; AVM, etc; Hysterosalpingo contrast sonography (HyCoSy); Transperineal invasive procedures using CEUS such as biopsy, drainage, etc; 3.Tips and tricks-Lesion visualization: Compression, patient position, etc; Avoiding pitfalls of CEUS (avoiding accelerated bubble destruction, troubleshooting artifacts) 4.Table summarizing recommended utilization and techniques

OBEE-31 Hysterosalpingography as a useful tool for the study of fallopian tubes and uterine cavity when MRI is not available

Participants
Victor Lara Ameca, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Hysterosalpingography is a diagnostic procedure of great utility in the evaluation of the female reproductive tract. It provides useful information outlining the uterine cavity and the fallopian tubes. Radiologists should become familiar with the technique and the interpretation of HSG images.• The knowledge of the anatomy and common findings is necessary for the accuracy in the diagnosis and adequate interpretation of image findings.• There are several implications that should be taken into account performing these studies; patient preparation, good communication with the patient explaining the procedure and answering all the questions. An adequate technique in necessary to limit factors leading misinterpretation and to identify morphologic changes and corroborate them with complementary projections.• Describe step by step procedure to successfully perform this studies and achieve diagnostic images.• Present a systematic approach to adequate interpretation of hysterosalpingography.• Describe and illustrate findings related to anatomical abnormalities of the uterine cavity such as polyps, fibroids, adhesions, adenomyosis and congenital abnormalities. Describe and illustrate findings related to abnormalities of the fallopian tubes as hydrosalpinx, salpingitis isthmica nodosa and surgical changes.

TABLE OF CONTENTS/OUTLINE

• Introduction.• Indication.• Normal anatomy and variations.• Step by step procedure.• Illustrative and imaging findings of polyps, fibroids, adhesions, adenomyosis and congenital abnormalities. Describe and illustrate findings related to abnormalities of the fallopian tubes as hydrosalpinx, salpingitis isthmica nodosa and surgical changes• Conclusion.

OBEE-32 Normal and abnormal appearance of the ovaries during assisted reproduction: a multimodality review

Awards
Identified for RadioGraphics

Participants
Katherine Smith, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Assisted reproductive technology (ART) is increasing in utilization, thus increasing the likelihood that radiologists will encounter both the normal and abnormal imaging findings associated with these treatments.• Sonographic monitoring is used for follicle tracking during ART cycles, but these images are usually acquired and interpreted by obstetricians. Thus, many radiologists are unfamiliar with the normal imaging appearance of the female pelvis during ART treatments.• Radiologists should be familiar with the acute complications related to ART treatments.

TABLE OF CONTENTS/OUTLINE

A. Background• Overview of population data regarding the utilization of ART• Brief discussion of the clinical medicine involved with ARTB. Multimodality review of the normal appearance of the ovaries in patients undergoing ARTC. Abnormal ovarian appearance and complications in patients undergoing ART• Review of the Golan classification system for ovarian hyperstimulation syndrome• Discussion of the acute complications related to ART, including ovarian torsion and ectopic pregnancyD. Challenging and unusual cases• Case-based discussion of unique presentations in patients undergoing ART therapy• Problem-solving approach to challenging clinical or imaging scenarios

OBEE-33 Characterization of (minimally, partially, and predominantly) Solid Ovarian Masses

Participants
Manasi Arora, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Imaging characteristics (size, shape, vascularity, contrast enhancement) of solid ovarian masses (SOM) can help differentiate between malignant and benign lesions. Early and accurate imaging diagnosis of SOM has significant therapeutic and prognostic implications. The presence of solid components (greater than 3 mm) arising from the cyst wall or septation and protruding into the cyst cavity (papillary projections) has been shown to be the single most important predictor of malignancy. Through this exhibit, we aim to 1) outline the role of imaging in the diagnosis of SOM, 2) characterization of SOM based on their imaging features (ultrasound, CT, and MRI), 3) review the common and uncommon solid ovarian lesions, and 4) highlight the key imaging findings that allow differentiation of malignant solid ovarian tumors from benign and pseudo-lesions.

TABLE OF CONTENTS/OUTLINE

A case-based discussion of the imaging features of minimally, partially, and predominantly SOM, with emphasis on the characteristics of their solid components. Our discussion will outline a comparison between mixed solid and cystic as well as predominantly solid ovarian neoplasms that will include but are not limited to clear cell carcinoma, serous and mucinous carcinomas, endometroid carcinoma, dysgerminoma, granulosa cell tumors, and similar appearing benign lesions (fibromas, mature teratoma, brenner tumors) as well as pseudo-lesions that mimic a SOM on imaging.

OBEE-34 Anatomy and Functional Pathology of the Female Pelvic Girdle: From Bones to Bladder

Participants
Julie An, MD, San Diego, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The female pelvic floor including bony structures, the pelvic organs, and supportive myofascial components- These normal structures not only maintains the anatomic position of the pelvic organs but also allow for normal function- Pelvic floor dysfunction encompasses a group of disorders affected by deficit in these various structures and can lead to bladder, bowel, and/or sexual dysfunction which may inhibit daily activities and negatively impact

TABLE OF CONTENTS/OUTLINE

- Review the anatomy of the female pelvis by layers (the most physiologic system for organizing female pelvis):-- Osseous structures, with an emphasis on variations of the female pelvic bones-- Visceral organs and attachments-- Endopelvic Fascia- Cardinal, uterosacral, urethral ligaments, vaginal viscera-- Levator Ani- puborectalis, pubococcygeus, iliococcygeus, and coccygeus-- Perineal Membrane- insertion of perineal muscles, external anal sphincter, and superficial perineal muscles- Present normal and pathologic MRI cases resulting from injury to normal structures-- Endometriosis with scarring of the uterosacral ligament and broad ligament resulting in chronic pelvic pain-- Rectal cancer status post radiation with thinning and fat containing hernia adjacent to the levator ani resulting in rectal prolapse-- Sacral fracture resulting in injury of bilateral coccygeus and iliococcygeus at the level of fracture-- Multiparity with multiple vaginal delivery and subsequent injury to the coccygeus resulting in multi-compartmental prolapse

OBEE-35 Figo Staging Classification for Cervical Cancer - A Practical Guide for Radiologists

Participants
Bruna Alexandre, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review the female pelvis anatomy; Describe cervical cancer MRI protocol; Describe current management, treatment, and surgical techniques; Recognize the most important imaging features to report in tumor detection, primary staging and restaging, and post-treatment evaluation; Briefly review the 2018 FIGO Staging Classification; Discuss the key points that every radiologist needs to know about cervical cancer.

TABLE OF CONTENTS/OUTLINE

INTRODUCTION: Cervical cancer epidemiology; Cervical cancer prevention.FEMALE PELVIS ANATOMY: Review the female pelvis anatomy, highlighting the important landmarks for an adequate staging, correlating didactic illustrations with MRI.MANAGEMENT OF CERVICAL CANCER: Treatment guidelines and algorithmMRI IMAGING PROTOCOL: Exam preparation; MRI protocol.IMAGING EVALUATION: Step by step approach to evaluate cervical cancer; Didactic clinical cases approach to cervical cancer staging; Template reporting system; Limitations and pitfalls of cervical cancer MRI imaging; The most important information that

gynecologists/oncologists want to know from imaging; Post-treatment imaging evaluation.

OBEE-36 Imaging of Female Pelvic Masses of Unknown Origin: Tips and Tricks

Awards
Cum Laude

Participants
Francesca Rosa, MD, Savona, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To illustrate a step-by-step approach to female pelvic lesions to define the epicentre of a pelvic mass and to reach the proper diagnosis.2. To describe the radiological findings and specific imaging "signs" of a wide spectrum of pelvic disease.

TABLE OF CONTENTS/OUTLINE

1. Pelvic space anatomy description.2. Anatomic pelvic space-based approach to pelvic mass.3. Spectrum of imaging "signs" as imaging key to define the space of origin of a pelvic mass.4. List differential diagnosis peculiar to each space.

OBEE-37 Post-surgical Complications of Gynecological Procedures: An Updated Review

Participants
Ana Uski, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Know the "new normal anatomy" of the pelvis depending on the type of surgical procedure used. Discuss imaging modalities in the assessment of potential complications after gynecological surgery, focusing on CT and MRI. Recognize the radiological findings of these complications according to the type of procedure used.

TABLE OF CONTENTS/OUTLINE

Post-surgical gynecological complications are more frequent in extensive procedures, especially in the context of neoplasms, and may be seen less frequently in less invasive procedures such as myomectomies, placement of intrauterine devices, collection of endometrial sampling, endometriosis resection or repair pelvic floor. The most frequent complications include hematomas/ hemorrhages, collections, infections, vascular injuries, intestinal and urinary injuries, suture dehiscence, fistulas and lymphoceles, and different imaging modalities play an important role in their diagnosis and follow-up. In stable patients, an initial approach with ultrasound should be considered, but in cases of clinical worsening, computed tomography (CT) is the most indicated exam, while magnetic resonance imaging (MRI) is relevant in the evaluation of mainly late complications. Recognizing normal postsurgical anatomy, expected postoperative findings, complications of each procedure, and pitfalls in image interpretation will facilitate diagnosis.

OBEE-38 Multi-Modality Imaging of Endometriosis with Correlative Operative Images: What the Surgeon Wants to Know

Participants
Won-Kyung Sung, MBBS, Paddington, Australia (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Endometriosis affect approximately 10% of women of reproductive age and approximately 35-50% of women who suffer from pelvic pain or infertility? • Endometriotic lesions can exist in a variety of anatomic locations; this represents a diagnostic challenge that can lead to under- and delayed recognition of endometriosis due to lower degrees of suspicion • In addition, the diversity of anatomic location of endometriotic lesions can change surgical plans • While diagnostic laparoscopy with histological confirmation is a reliable method of diagnosis, imaging is a less invasive diagnostic alternative that can augment surgical interventions and aid in preoperative evaluation? • Ultrasonographic imaging (particularly transvaginal sonography (TVS)) can determine the location and extent of endometriosis in patients with suggestive clinical examinations • MR imaging is a high sensitivity and specificity second-line study, and it is especially useful in patients with previous equivocal TVS or involving structures poorly evaluated by US.

TABLE OF CONTENTS/OUTLINE

Purpose: The purpose of this study is to characterize and correlate laparoscopic and radiologic findings in the context of endometriosis and to highlight the role of radiologic interpretation in the surgical management of endometriosis patients.? ?? Content Organization? ?? 1.???? Overview of endometriosis? 2.???? Laparoscopic operative approach to endometriosis? 3.???? Imaging techniques, advantages, and disadvantages? 4.???? Case examples?

OBEE-39 Don't Ovary-Act: O-RADS US/MRI updates and integration

Participants
Daniela Garcia, MBBS, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. O-RADS classifies adnexal masses into different risk categories only applicable to asymptomatic patients with average risk of malignancy. 2. Early familiarization with lexicon and standardized reporting decreases ambiguity in surveillance and management of adnexal masses. 3. Presence of solid component and high vascularity/enhancement are highly associated with malignancy. 4. Integration of O-RADS US and MRI can confidently rule out malignancy when imaging features are characteristic.

TABLE OF CONTENTS/OUTLINE

Radiologists are usually the first providers to encounter adnexal masses in daily practice and the ones guiding management and surveillance with serial imaging. In the setting of equivocal radiology reports, due to difficulty in obtaining tissue biopsy samples, adnexal lesions are often managed surgically. O-RADS is a standardized reporting system that identifies different risk groups according to specific imaging descriptors with the goal of improving communication between radiologist and referring providers, helping detect patients with potential malignancy and avoiding unnecessary surgery. Integration of O-RADS US and MRI has proven

to have good predictive value and is easily reproducible. This exhibit is a pictorial, multimodality imaging based review of the O-RADS lexicon and its application in the daily evaluation of patients with adnexal masses.

OBEE-4 Postpartum Pelvis: Imaging Management of Early and Delayed Complications

Participants
Marianna Konidari, MD, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

The postpartum period refers to the time interval from birth to 6-8 weeks later, when the uterus undergoes physiologic involution and returns to its nongravid state. Familiarization with normal postpartum imaging findings of the pelvis is essential to avoid misdiagnosis of disease.Normal appearances of the pelvis following vaginal delivery differ from these after caesarean section. During the first days after CS, it may be difficult to distinguish normal early postoperative changes from possible uterine complications.US, CT, and MRI can be used for imaging of the postpartum pelvis, each having different indications depending on the clinical setting.The role of imaging in the diagnosis of acute and delayed delivery complications is crucial since these are associated with greater morbidity and can even be fatal.

TABLE OF CONTENTS/OUTLINE

Normal anatomy and physiology of the postpartum pelvis and correlation with multimodality imaging: which are the most common normal imaging findings.Vaginal delivery vs caesarean section: what imaging findings to normally expect after each type of delivery.Rationale behind imaging during the postpartum period. Which is the best modality in different clinical scenarios and why.Acute complications: key imaging findings and the implications for morbidity and treatment. Case-based discussion on haemorrhage/hematomas; uterine rupture; endometritis; retained products of conception; pelvic vein thrombosis; intraoperative injuries.Delayed complications: when to suspect them and what signs to look for in imaging. Case-based discussion on endometriosis/ ectopic pregnancy on CS scar; placenta accreta spectrum disorder; gestational trophoblastic disease.

OBEE-40 Rhombencephalosynapsis in fetal MRI: main findings and step-by-step evaluation

Participants
Patricia Oliveira-Szejnfeld, MD, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review the rhombencephalosynapsis disease spectrum concerning etiology, classification, epidemiological / clinical data and imaging features; 2) Demonstrate a structured evaluation of the fetal infratentorial structures through magnetic resonance imaging (MRI); 3) Depict the main findings of the rhombencephalosynapsis disease spectrum in fetal MRI as well as associated malformations and their implications in neonatal follow-up.

TABLE OF CONTENTS/OUTLINE

Teaching images will be employed to illustrate the following topics: 1) Embryology of infratentorial structures; 2) Rhombencephalosynapsis: underlying causes, disease spectrum, clinical findings and postnatal imaging; 3) Evaluation of infratentorial structures in fetal MRI (technical aspects and standardized imaging protocol; normal appearance; anatomical landmarks and how they change over time; pearls and pitfalls; potential limitations); 4) MR imaging findings in rhombencephalosynapsis disease spectrum (detailed and accurate analysis, with step-by-step morphological and biometric evaluation of the vermis and cerebellum); 5) Associated malformations in the antenatal period and their imaging findings, as well as a review of the additional evaluation required in the antenatal and postnatal period when the diagnosis is established.

OBEE-41 MRI of the fetal midbrain: a step-by-step evaluation of normal and altered findings beyond aqueductal stenosis

Participants
Patricia Oliveira-Szejnfeld, MD, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Conduct a brief review of antenatal ultrasound (US) findings that suggest midbrain anomalies;2) Demonstrate a structured evaluation of the fetal midbrain through magnetic resonance imaging (MRI);3) Highlight the main MRI findings of midbrain anomalies and associated malformations.

TABLE OF CONTENTS/OUTLINE

1) Brief review of midbrain embryology. 2) The antenatal sonographic evaluation concerning technical aspects and equipment features; time of best assessment; midbrain sonographic anatomy (size/growth normograms, shape, position, and texture; assessment of tectal length and anteroposterior diameter. Midbrain anomalies in fetal sonography (elongation, thinning, shortening, upward rotation) and potential limitations of antenatal US. 3) MRI evaluation of the fetal midbrain, concerning technical aspects and standardized imaging protocols; Main indications and when to perform; MRI anatomy and how to recognize the normal appearance and anatomical landmarks, as well as their changes over time. Detailed explanations will be provided on how to perform an accurate analysis, with step-by-step morphological and biometric evaluation. Finally, main midbrain malformations will be illustrated with teaching cases.

OBEE-42 As easy as pie: MR imaging of the placenta made simple - a practical guide for beginners

Participants
Ana De Ataide Goes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To prepare radiologists to evaluate placental MRI based on a structured reporting model. - To review and illustrate the role of MRI in the diagnosis of the main abnormalities of the placenta. - To provide illustrations to clarify the anatomy and pathology of the placenta. - To present clinical cases in correlation with pathology results. - To review the literature and present tips to reduce interobserver variability.

TABLE OF CONTENTS/OUTLINE

1) Background: The importance of placental MR imaging in different diagnostic settings and in the management of placental conditions. 2) Correlation between anatomy and histology of normal placenta, including the normal appearance on MRI. 3) Brief description of MRI protocol for placental assessment. 4) Structured reporting model to guide MRI evaluation. 5) Illustrative cases of the main conditions of the placenta with their imaging features and interpretation:- Anatomical variations; - Placenta previa; - Umbilical cord insertion on placenta; - Placenta accreta spectrum; - Placenta disruption; - Placenta neoplasm (as chorioangioma). 6) Additional findings. 7) Potential pitfalls in placental MRI.

OBEE-43 Non-Obstetrical Abdominal and Pelvic Imaging during Pregnancy: A Multimodality Review

Participants
Kyle Jensen, MD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Pregnant patients present with non-obstetrical pathology, which must be included in the differential diagnosis.2. Imaging pregnant patients requires specialized CT and MR protocols and considerations.3. Pregnant patients require unique imaging, work-up, and treatment of benign and malignant pathologies.

TABLE OF CONTENTS/OUTLINE

1. Imaging protocols in the gravid patient for US, CT, and MR with discussion on intravenous contrast use.2. Imaging of maternal infections including COVID-19.3. Imaging of acute abdominal or pelvic pain during pregnancy by organ system.4. Non-obstetrical, gynecologic pathology in the pregnant patient.5. Trauma imaging in the pregnant patient.6. Oncologic work-up during pregnancy.7. Imaging work-up of benign/incidental findings.

OBEE-44 Placental hemorrhage throughout gestation: from chorionic bump to Couvelaire uterus

Awards
Identified for RadioGraphics

Participants
Roya Sohaey, MD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

First trimester trophoblastic and early placental hemorrhage can present as chorionic bump or perigestational hemorrhage, and sonographic features can predict pregnancy outcome. Second and third trimester placental abruption can be marginal, retroplacental, preplacental, and intrauterine. Abruption is associated with maternal and fetal morbidity and mortality, therefore accurate imaging-guided classification is important.

TABLE OF CONTENTS/OUTLINE

1. Sonographic features of first trimester trophoblastic hemorrhage and which imaging findings predict outcome. We will focus on chorionic bump and perigestational hemorrhage 2. Sonographic features of abruption and which imaging findings predict outcome: marginal abruption, retroplacental abruption, pre-placental abruption, Couvelaire uterus (intra-myometrial hemorrhage) 3. Pitfalls of hemorrhage: adenomyosis, accreta, acute blood mimics placenta, and other mimickers

OBEE-45 Endometriosis-related infertility: Hysterosalpingography, Ultrasound and MRI findings

Participants
Luciana P. Chamie, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Endometriosis is a common disease that affects women of reproductive age, being responsible for almost 60% of infertility cases ? Laparoscopy is no longer the gold standard for the diagnosis of endometriosis, being replaced by imaging exams such as a transvaginal ultrasound (TVS) and pelvic MRI ? Radiologists should identify typical imaging findings on hysterosalpingography, ultrasound (US) and MRI related to endometriosis that may impair fertility outcomes ? Information provided by imaging methods is crucial for clinical counseling and surgical planning and to establish a fertility prognosis

TABLE OF CONTENTS/OUTLINE

? Definition of infertility and endometriosis; ? Types of endometriosis and role of radiological exams; ? Illustrated teaching cases reviewing findings on hysterosalpingography, US and MR that should be considered in the management of infertility related to endometriosis; ? Didactic approach of relevant data, including: ? Clinical: ¦ Patient`s age and anti-mullerian hormone dosage; ¦ Past obstetric history; ? Transvaginal ultrasound and MRI with bowel preparation: ¦ Antral follicle count; ¦ Endometriomas; ¦ Complex pelvic adhesions; ¦ Rectosigmoid endometriotic lesions; ¦ Subserous myometrial infiltration due to endometriosis; ¦ Hydrosalpinx; ¦ Post-operative findings (Isthmocele; thin uterine wall); ? Hysterosalpingography: ¦ Evaluation of tubal mobility and motility; ¦ Obliteration of fallopian tubes

OBEE-46 Hysterosalpingography and Caesarean section: A Niche subject

Participants
Elizabeth J. Evans, MBChB, Glasgow, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

By reviewing this exhibit the viewer will appreciate: The hysterosalpingographic (HSG) appearances of caesarean section scars The correlation between HSG appearances with other imaging modalities such as ultrasound and MRI. The importance of identifying adhesions, Asherman's syndrome, within the C-section scar and elsewhere in the cavity. The importance and relevance of other uterine and tubal abnormalities that may be contributing to secondary subfertility and which might influence future pregnancy outcomes.

TABLE OF CONTENTS/OUTLINE

Introduction. Background including data relating to increasing frequency of caesarean section and associated immediate and

chronic complications. The role of imaging in identifying uterine abnormality following caesarean section. Other uterine and tubal abnormalities which impact on the management of women with secondary subfertilty and previous Caesarean section. Suggest a simple grading system to correlate with appearances, severity and prognosis of caesarean section defects.

OBEE-47 Ovarian peritoneal carcinomatosis-Role of Radiologist in treatment

Participants
Reefath Jabaraj, FRCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To define the most common routes of ovarian peritoneal carcinomatosis dissemination in abdomenTo recognise imaging characteristics of ovarian peritoneal carcinomatosis Role of radiologist in preoperative imaging in treatment of carcinomatosis

TABLE OF CONTENTS/OUTLINE

IntroductionRoutes of spread in abdomenKey radiological findings in surgical planningResectable vs difficult to resect areas- a pictorial reviewImaging in evaluating the effectiveness of chemotherapyRole of follow up imaging in surveillance Take home message

OBEE-48 When Pregnancy Becomes a Problem"- Pictorial Essay of Common and Uncommon Gestational Complications in the Radiological Practice

Participants
Ulysses Torres, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To recall the theoretical basis of the range of differential diagnoses of complications directly related to the gestational period - the obvious and non-obvious ones. To discuss the classical imaging features of these complications. To present examples of rare cases and typical images. To review which information matters for the differential diagnosis, especially when thinking of ectopic pregnancy. To present challenging diagnostic cases and demonstrate how radiologists can help in outcomes.

TABLE OF CONTENTS/OUTLINE

Diagram for diagnostic reasoning of gestational complication, dividing it as:- Related to location of pregnancy: including cases of ectopic pregnancy (cervical, cesarian scar, ampullar, interstitial, angular, intra-abdominal, cornual) and heterotopic pregnancy. - Related to gestational content: including cases of trophoblastic disease as complete and partial mola, invasive mola, and choriocarcinoma. - Related to placentary issues such as placenta accreta, placenta previa, retroplacental hemorrhage, and placental mass (chorioangioma). - Related to systemic/extrauterine issues, such as hepatic subcapsular hematoma related to HELLP syndrome and the last but not the least decidualized endometriosis.

OBEE-49 Imaging the post-treatment pelvis in gynecologic cancer

Participants
Behnaz Moradi, MD, Tehran, Iran, Islamic Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Complications of gynecologic cancer treatment can be categorized into early and late onset. They can be related to surgery or chemoradiotherapy. Different imaging modalities as ultrasound, CT scan and MRI based on the involved organ and their availability can be used for diagnosis.

TABLE OF CONTENTS/OUTLINE

In this exhibit, we will discuss about: 1) early complications as hematoma; genitourinary and gastrointestinal complications; infectious process; uterine rupture and wound dehiscence. 2) late complications as genitourinary and gastrointestinal complications; inclusion cyst and seroma formation; fistula; pelvic bone insufficiency fractures; neuritis; post radiotherapy vaginal and cervical stenosis and cystitis.

OBEE-5 Pelvic Deep Endometriosis: What Radiologists Should Point Out in Preoperative Imaging

Participants
Satoshi Asai, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Endometriosis is one of the most common and burdening gynecological diseases, estimated to surpass 50% prevalence in women with infertility and chronic pelvic pain. Three types of endometriosis are recognized: ovarian, superficial, and deep. Of these, deep endometriosis (DE) is the most severe form, and surgery is the final solution for symptomatic cases. However, not only it is difficult to recognize all lesions in the surgical field, but it is also difficult to see the relationship to the surrounding organs, and even the lesion itself can be the invisible area. Therefore, preoperative MRI is the key to successful surgery. We advocate for diagnostic imaging that gives the surgeons the information they really need. First, we advocate separate reading and structured reporting for anterior, middle, and posterior compartment of pelvis, which can facilitate the diagnosis of DE and also help to estimate possible complications. Second, based on our experience with complications, we will also discuss the sites of lesions that are prone to be overlooked, and optimal views and imaging methods. Additionally, we show the correlation between MRI and laparoscopic appearance as an aid to understanding DE.

TABLE OF CONTENTS/OUTLINE

- Introduction to pelvic deep endometriosis with diagnostic and surgical problem - Complications of surgery - structured reporting - key images which are easy to find and often associated with DE - the surgical outcome after structured reporting

OBEE-50 It's all about location, location, location: Distinguishing pregnancies in Mullerian anomalies from abnormally implanted pregnancies.

Participants

Glynis Sacks-Sandler, MBBCh, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Congenital uterine anomalies are often asymptomatic, and the first trimester sonogram may be the first opportunity to diagnose Mullerian anomalies. 2.The recently updated ASRM classification (2021) relies on simple diagrams and descriptions to expand recognition of the multiple variations. More accurate diagnosis based on imaging will lead to improved clinical outcomes. 3. 3D transvaginal ultrasound imaging offers a high degree of diagnostic accuracy. 4. Mullerian anomalies have recognized obstetrical implications, with the most common septate uterus often requiring hysteroscopic septal resection. 5. Pregnancies in association with Mullerian anomalies need to be distinguished from abnormally implanted gestations including interstitial and cesarian scar pregnancies.

TABLE OF CONTENTS/OUTLINE

1. Illustrate Mullerian Duct anomalies (MDA) in the non-gravid uterus with correlating 3D ultrasound. 2. Optimal imaging of early intrauterine pregnancies in association with MDA's including Arcuate uterus, Bicornuate uterus, Septate uterus, and Uterus didelphys. 3. Clinical implications of pregnancies in septate uterus and in non-communicating horns. 4. Imaging of "Mimics" including Interstitial pregnancy, angular pregnancy as well as degenerating fibroids. 5. Review of unusual cases

OBEE-51 The Bulky Uterus: A Resident's Guide to Diffuse Uterine Pathology

Participants
Elizabeth Deans, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Diffuse uterine disease can be seen in several pathologies ranging from benign to malignant. 2. Knowledge of the normal appearance of the uterus and cervix by ultrasound, computed tomography (CT) and magnetic resonance imaging (MRI) is important for early detection of pathology. 3. The radiologist plays a vital role by using a combination of key imaging features to help distinguish between these benign and malignant pathologies.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will:- Discuss the normal appearance of the uterus and cervix by ultrasound, computed tomography (CT), and magnetic resonance imaging (MRI)- For each of the following uterine pathologies, this exhibit will review pathophysiology and risk factors, describe and illustrate the spectrum of multimodality imaging appearances, and briefly discuss management options:- Diffuse uterine adenomyosis - Diffuse uterine leiomyomatosis - Post-radiation changes - Infection - Hormonal therapy changes - Postpartum changes - Uterine sarcoma/leiomyosarcoma - Invasive cervical/endometrial cancer - Metastatic uterine disease, including diffuse lymphomatous disease

OBEE-52 US and MRI of the Uterus: The Good, The Bad and The Ugly

Participants
Krupa Patel-Lippmann, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. US and MRI are complementary modalities in the evaluation of uterine lesions. US is the first line modality, with MRI utilized for equivocal or poorly visualized findings on US and delineation of suspected malignancy.2. Benign lesions include endometrial polyps, adenomyosis and leiomyomas, which have a characteristic appearance on US and MR. When present, the radiologist can be confident of the diagnosis.3. Malignant lesions include endometrial cancers and leiomyosarcomas. These lesions can be suggested based on their US appearance, with MRI used for confirmation and delineation of local tumor extent.4. Features on multiparametric MRI can help distinguish leiomyomas and leiomyosarcoma.

TABLE OF CONTENTS/OUTLINE

• Introduction to imaging the uterus A. Normal anatomy B. Describe the complementary role of US and MRI• Review imaging features of benign vs malignant endometrial and myometrial lesions A. Endometrial polyps and hyperplasia versus endometrial cancer B. Adenomyosis and leiomyomas versus leiomyosarcomas• Differentiating leiomyomas versus leiomyosarcomas A. Features of leiomyomas o US: Well-defined and multiple areas of shadowing o MRI: Smooth border, dark T2 signal, no restricted diffusion; homogenous enhancement B. Features of leiomyosarcoma o US: Limited shadowing, irregular margin o MRI: Lobular/irregular margin, cloudy high signal on T1, intermediate T2 signal, restricts diffusion and enhancement C. Overlapping features can be seen in cases of atypical leiomyoma, STUMP, and low grade leiomyosarcoma

OBEE-53 From Leiomyoma to Leiomyosarcoma: A Review of the Imaging Spectrum of Uterine Smooth Muscle Tumors with Pathological Correlation

Participants
Keith A. Ferguson, MD, (*Presenter*) Stockholder, Hims & Hers Health, Inc

TEACHING POINTS

- - Describe the spectrum of uterine smooth muscle tumors, from benign to malignant - - Discuss pathology of LM variants and provide updated clarifications on different terms such as atypical, cellular, mitotic LMs, STUMP, etc. - - Identify radiological features of uterine leiomyosarcomata (LMS), ordinary leiomyomata (LM), and leiomyoma variants including smooth muscle tumors of uncertain malignant potential (STUMP) - - Demonstrate correlations between the radiological and histopathological features of uterine LMS, LM, and STUMP

TABLE OF CONTENTS/OUTLINE

- Title, names, institutions - Review of uterine smooth muscle tumors o Epidemiology Risk factors, Pathogenesis o Presentation - Diagnosis, Management and treatment options o Indications for imaging in assessing uterine tumors CT, MRI, US, PET/CT o Characteristic imaging features of benign and malignant uterine tumors - Our multi-institutional project - List patient cohorts, demographics - Show examples of ordinary LM including imaging and path characteristics o Non-degenerated o Degenerated Cystic Myxoid Hemorrhagic - Show examples of LM variants including imaging and path characteristics o Cellular o STUMP - Show examples of LMS including imaging and path characteristics o Routine and variants (myxoid, epithelioid) o Metastasis: patterns of recurrence

and spread - Summarize characteristic imaging and histopathological features of uterine smooth muscle tumors - Conclusions and future steps - Acknowledgements, references

OBEE-54 Peritoneal Endometriosis and MRI: A New Look!

Participants
Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS 1) Endometriosis is a disease that affects thousands of women and compromises their quality of life, causing chronic pain, infertility, and problems in sexual life. 2) Peritoneal endometriosis is often underdiagnosed and prevents adequate treatment. 3) Laparoscopy is the gold standard exam for the investigation of endometriosis, but it is an invasive method, and many women refuse or are afraid to undergo laparoscopy. 4) Clarify doubts about the appropriate exam protocol and what are the myths about MRI in endometriosis. 5) MRI allows the identification of signs that support the diagnosis of peritoneal endometriosis. These signs are subtle, and it is essential that the radiologist knows how to identify them. 6) Demonstrate MRI images and their correlation with exploratory laparoscopy in superficial endometriosis.

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE 1) Overview of peritoneal endometriosis and a short quiz 2) Identification of focal, diffuse peritoneal thickening and peritoneal failure on MRI and laparoscopy 3) Identification of thickening and glandular tissue on the surface of organs 4) Identification of bloody fluid and septa on MRI and laparoscopy 5) Summary of changes found in each method.

OBEE-55 Ultrasound in Endometriosis: Chocolate Cysts and Beyond

Participants
Divya Singh, MD, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasonography is a widely available, inexpensive, real-time imaging modality which can be used to detect pelvic involvement by endometriosis beyond the classic ovarian endometriomas. Deep infiltrating endometriosis (DIE) implants are seen as well circumscribed, hypoechoic lesions with smooth or irregular margins using ultrasound.A systematic sonologic approach in evaluation of the pelvis is imperative for detection of DIE in the anterior and posterior compartments. Ultrasound offers the advantage of using soft markers like a negative sliding sign and probe tenderness to guide the search for DIE. Endometriomas undergo decidualisation during pregnancy which can mimic ovarian tumors on ultrasonography. Ultrasound can raise a red flag for occurrence of malignant transformation in long standing endometriomas.

TABLE OF CONTENTS/OUTLINE

Impact of endometriosis on women's health;Pathology;Clinical presentation: The great masquerader;Ultrasound evaluation technique;Sonographic features: Soft markers, overt findings;Changes in endometriosis in pregnancy;Malignant transformation of endometriomas; Conclusion

OBEE-56HC Intrauterine Contraceptive Devices: History, Imaging and Complications

Participants
Lisa Xuan, MD, BSc, Newmarket, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. For almost 100 years, iterations of intrauterine contraceptive devices (IUCD) have been in use. Older models are of historical interest and may be found incidentally on imaging.2. Both copper and hormone-releasing IUCDs are as effective as tubal ligation in preventing pregnancy, but a 2 in 100 person per year pregnancy rate persists.3. Malpositioning is the most common IUCD complication, and exists as a spectrum depending on severity.4. All malpositioning should be communicated to the clinician as it may lead to decreased contraceptive efficacy or require intervention.

TABLE OF CONTENTS/OUTLINE

A brief history of IUCDs-1st generation-Non-copper metal devices-2nd generation-Plastic devices-3rd generation-Copper bearing devices-4th generation-Hormone bearing devices-5th generation-Frameless intrauterine implantsRadiographic evaluation of IUCDs-Adequate positioning (on plain films, US and CT)-3D ultrasound as the gold standard in assessing malpositioningComplications of IUCDs-Malpositioning spectrum (expulsion, displacement, embedment, perforation)-Synchronous pregnancy-Ectopic pregnancy-Fragmentation of device-Clinical implicationsCased Based Imaging ScenariosSummaryPlease visit the Learning Center to also view this presentation in hardcopy format.

OBEE-6 Tips to Definitely Understand Pelvic Innervation in Endometriosis: The Guide You Asked For

Participants
Helena de Souza, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To prepare abdominal radiologists to evaluate magnetic resonance imaging (MRI) of pelvic innervation in the context of endometriosis.- To summarize the somatic and visceral neural anatomy in a practical way.- To illustrate the main findings of neural involvement by deep pelvic endometriosis with selected clinical cases.- To demonstrate the impact of such knowledge on patients' management and how radiologists may improve outcomes.

TABLE OF CONTENTS/OUTLINE

- Background: the importance of pelvic innervation MR imaging in diagnostic settings of deep pelvic endometriosis.- Description of the somatic and visceral neural anatomy and correlation with the normal appearance on MRI.- Interactive anatomical atlas and videos showing the pelvic innervation and its involvement in deep endometriosis based on anatomical diagrams and MRI imaging exams.- Tips and tricks.

OBEE-7 Plumbing Problems: Troubleshooting Tips for Complex Fetal Genitourinary Malformations

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
April Griffith, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1: Review all scans for development of urinoma, urinary ascites, obstructive dysplasia2: Assess bladder filling, changes in ureteric caliber, color Doppler for patent urethra3: Use MRI when low fluid, maternal habitus limit US assessment4: Confirm diagnoses with postnatal imaging, operative findings, genetic testing, autopsy

TABLE OF CONTENTS/OUTLINE

Megacystis-1st trimester aneuploidy-Euploid fetus: Posterior urethral valves (PUV), prune belly (PB), megacystis microcolon intestinal hypoperistalsis (MMIH), urethral atresia-Evaluate genitalia (dilated urethra in PB, MMIH in female)-Pitfall dilated vagina for distended bladderMulticystic dysplastic kidney (MCDK) vs obstructive dysplasia (OD)-MCKD large kidney, large cysts, no pelvic dilation-OD small, echogenic kidney, small cysts-Look for ureterocele, ectopic more likely with duplication, can insert in vaginaUrinary tract dilation (UTD)-Ureteropelvic junction obstruction: Pitfall MCDK-Duplicated system: Pitfall cystic adrenal mass vs obstructed upper moiety-Reflux: Variable ureter size-Report with 2014 UTD Classification SystemGenitourinary sinus malformation-Establish fetal sex (persistent cloaca, hydrocolpos, imperforate hymen in females)-Look for anal dimple-Fluid-fluid levels due to meconium/urine mixing in dilated vagina-Calcified meconium due to bowel-urinary tract fistula-MRI for evaluation of colon/rectum/anus--Meconium high T1, low T2, high GRE--Fluid low T1, high T2Anatomic variants-Crossed fused ectopia, pelvic kidney

OBEE-8 Pain Points: Making Sense of Pelvic Nerves Involved with Endometriosis and Chronic Pain

Awards
Cum Laude
Identified for RadioGraphics

Participants
Ceylan Colak, MD, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Endometriosis is a common condition impacting approximately 1 out of every 10 women of childbearing age. 2. Deep infiltrating endometriosis most commonly occurs in the pelvis and is typically multifocal. 3. Although rarely reported, several lumbosacral nerves course through the pelvis and can be involved by deep infiltrating endometriosis including the sciatic, pudendal, obturator and hypogastric nerves. 4. Neural involvement by endometriosis may lead to pain or other neurological symptoms including muscle weakness, numbness, incontinence and paraplegia. 5. MRI is the most reliable noninvasive modality to diagnosis neural involvement by endometriosis. Protocol optimization can help increase conspicuity of nerves involved by endometriosis. 6. Imaging findings are variable and include identification of a deep infiltrative endometriotic lesion directly involving the nerve or nerve thickening with increased enhancement. In chronic cases, muscle atrophy may be present. 7. Identification of neural involvement is important for early diagnosis and treatment to avoid irreversible nerve injury and loss of function.

TABLE OF CONTENTS/OUTLINE

1. Title 2. Disclosures 3. Learning Objectives 4. Background information about endometriosis with neural involvement 5. Normal anatomy of pelvic nerves with imaging examples 6. MRI protocol considerations 7. Imaging findings of nerves involved by endometriosis illustrated through case examples 8. Conclusion 9. References

OBEE-9 Postpartum and Post-abortion Complications - A Guide for Radiologists

Participants
Cynthia Borborema, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the normal imaging appearance of postpartum and post-abortion period and to distinguish it from complications that require treatment. To list radiologic features of early and late postpartum and post-abortion complications to provide a practical guide to help radiologists. To emphasize an integrated radiologic and clinical approach in the assessment of challenging postpartum and post-abortion conditions to improve the clinical impact of radiology reports.

TABLE OF CONTENTS/OUTLINE

Normal uterine changes in puerperium. Normal changes after cesarean delivery. Role of imaging in assessment of postpartum and post-abortion period and relevant report information. Diagnostic tools, with emphasis in computed tomography and magnetic resonance imaging. Usual and unusual postpartum and post-abortion complications (infectious, thromboembolic and hemorrhagic), including key patient history, risk factors, imaging findings, and pitfalls. Review of cesarean surgical technique (laparotomy, bladder flap creation and hysterotomy) and correlation with early related complications. Late cesarean delivery-related complications. Uterine complications after pregnancy-related curettage.

OBEE-1

How To Expand Your Diagnosis of Deep Endometriosis on Routine Pelvic Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Scott Young, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

Review uterine video clips on routine pelvic ultrasound and evaluate sliding sign maneuvers, differences in technique depending on uterine version. -Accurately locate important anatomical landmarks, including the torus uterinus and uterosacral ligaments on TVUS. -Understand how DE observations may appear different depending on uterine version and transducer position in the anterior and posterior vaginal fornices. -Recognize characteristics of DE bowel observations and assess bowel DE size and depth of invasion, critical factors which guide the level of surgical expertise required for resection. How to recognize DE on routine CT and MR examinations performed for clinical indications other than endometriosis. -Recognize characteristics of DE observations outside the pelvic compartments on routine CT, MSK pelvic, and non-dedicated abdominopelvic MR. -Utilize cues including location, signal, and enhancement characteristics to make an early diagnosis of DE.

TABLE OF CONTENTS/OUTLINE

1. Title 2. Disclosures 3. Learning objectives 4. Pelvic anatomy review-Uterosacral ligament (USL)/torus uterinus-Relationship of USL to transducer position and uterine version-Surgically relevant measurements/observations-Case examples of normal and abnormal TVUS video sweeps of anterior and posterior fornix view for each uterine flexion/version-5. US of bowel endometriosis-Schematic/operative images-Case examples with pertinent measurements 6. Extrapelvic and uncommon DE locations-Anatomic hypothesis of extraperitoneal spread-CT and MR enhancement/signal characteristics-Schematic/operative images 7. Conclusion 8. References

Post-treatment Complications of Gynecologic Malignancies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Tsukasa Saida, MD, Tsukuba, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiologists need to be familiar with the imaging findings of the various complications that can occur in the treatment of gynecologic tumors and understand the urgency and symptoms of each. In this exhibition, we introduce various complications derived from gynecologic surgery and pelvis radiation therapy, and explain the diagnostic points of each complication.The teaching points of this exhibit are: 1. We classified postoperative complications immediately after surgery, subacute, and delayed complications. Complications immediately after surgery are caused by direct injury caused by surgical procedures. Subacute complications include infection, chylous ascites, deep venous thrombosis, and neuropathy. Delayed include, intestinal obstruction, hydronephrosis, lymphedema, and abdominal incisional hernia.2. Radiation-induced complications can be divided into acute and chronic effects. Acute effects occur during or immediately after radiation therapy, are reversible, and in most cases, the conservative treatment leaves no disability. Chronic effects include cervical stenosis, small bowel stricture, fistula formation, and insufficiency fractures that occur a few months later.

TABLE OF CONTENTS/OUTLINE

A. Complications after surgery (Immediately after surgery, Subacute, Delayed)B. Radiation-induced effects (Early effects, Late effects)

Phenotypic Diversity of Uterine Mesenchymal Tumors (Excluding Smooth Muscle Tumors): Current Update on Genetics and Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Steven Chua, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the taxonomy, epidemiology, clinical features, histopathology and biology of the diverse spectrum of mesenchymal, non-smooth muscle tumors of the uterus.2. Describe the salient multimodality cross-sectional imaging features of these tumors.3. Review the genetics, management and prognosis of these tumors.

TABLE OF CONTENTS/OUTLINE

1. Introduction, epidemiology and clinical features of mesenchymal, non-smooth muscle tumors of the uterus.2. Histopathological, immunohistochemistry and molecular pathology.3. CT, MR and PET/CT imaging features and tumor biology of this wide spectrum of tumors.4. Prognosis and management. * Low grade Endometrial stromal sarcoma.* High grade Endometrial stroma sarcoma.* Adenosarcoma* Carcinosarcoma* Undifferentiated sarcoma.* Uterine tumor resembling sex cord stromal tumor.* PEComa.* Inflammatory myofibroblastic tumor.* Solitary fibrous tumor. Conclusion.

Management and Imaging Evaluation of Peripartum Hemorrhage: What Radiologists Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Moataz Ahmed Sayed Mohammed Soliman, MD, MSc, CHICAGO, IL (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Understand normal imaging findings of the utero-fetal complex. • Recognize multimodality imaging findings of conditions predisposing to peripartum hemorrhage. • Discuss Imaging pitfalls for peripartum hemorrhage. • Impact of the preoperative radiological diagnosis on management and role of radiologists.

TABLE OF CONTENTS/OUTLINE

1. Introduction: a. Normal imaging anatomy of the uteroplacental complex 2. Ante-partum hemorrhage: a. Definitions b. Etiology: (Placental abruption, Placenta previa, Gestational trophoblastic disease, Vasa Previa, Uterine rupture) c. Management 3. Postpartum hemorrhage a. Definitions b. Normal imaging findings of the postpartum uterus. c. Classification and risk factors i. Primary postpartum hemorrhage: (Uterine atony, traumatic pelvic hematoma, bladder flap hematoma, retained products of conception, coagulopathies, and placenta accrete spectrum) ii. Secondary postpartum hemorrhage: (Retained products of conception, Infection, Uterine subinvolution, Coagulopathies, Delayed presentation of genital tract hematoma, Vascular bleeding from vascular malformation, and pseudoaneurysms)

The Postop Pelvis: A Review of Complications Following Surgery for Gynecological Malignancies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Marie Vogel, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. The radiologist plays a crucial role in detecting and characterizing acute and chronic complications following surgery for gynecologic malignancies.2. Knowledge of the multimodality imaging spectrum of common complications can lead to timely diagnoses and improved patient care.3. A thorough understanding of the common surgical techniques available and identification of pertinent findings on the preoperative imaging can help to identify a subset of patients who may be at higher risk for certain postsurgical complications.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will: 1. Briefly overview the common management options and surgical techniques for uterine, cervical, endometrial and ovarian cancer.2. Review and illustrate common acute postoperative complications in a case-based format including: - Hemorrhage - Infection/Abscess - Vaginal Cuff Dehiscence - Bowel injury - Ureteral and bladder injury 3. Review and illustrate common subacute to chronic postoperative complications, including: - Lymphocele/Seroma - Peritoneal inclusion cyst - Adhesive disease and bowel obstruction - Pelvic floor dysfunction - Recurrence, including a detailed discussion of the most common pattern of recurrence for each gynecological malignancy

OBEE-14

Elucidating the Spectrum of Extra-uterine Smooth Muscle Neoplasms in Women: Cross-sectional Imaging Findings.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Steven Chua, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe taxonomy and histopathology of the diverse spectrum of extra-uterine smooth muscle tumors. 2. Discuss examples of different growth patterns, clinical features and locations of these extra-uterine tumors.3. Highlight the salient imaging features of these tumors by multimodality cross-sectional imaging.

TABLE OF CONTENTS/OUTLINE

1. Introduction, epidemiology and clinical features.2. Different growth patterns, including benign metastasizing leiomyoma, diffuse peritoneal leiomyomatosis, intravenous leiomyomatosis, parasatic and retroperitoneal.3. Histopathology and biological behavior.4. Multimodality imaging.5. Prognosis and Management.* Leiomyoma.* STUMP.* Leiomyosarcoma.* Angioleiomyoma.* Extrauterine leiomyomas of the urethra, vagina, broad ligament, round ligament and adnexum.* Retroperitoneal leiomyoma with Mullerian Features. 6. Conclusion.

OBEE-18

Spectrum of Cystic and solid tumors of the Ovary at Imaging : Simplified Classification and Practical approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Nikolas Brozovich, MD, Augusta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review cystic and solid tumors of the ovary on the basis of tumor origin including differential diagnosis. 2. Describe latest WHO classification of ovarian tumors. 3. Discuss a practical approach to determine key imaging features along with clinical information to narrow down the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

Although ovarian tumors have similar clinical and radiologic features, predominant or specific imaging features may be present in some types of ovarian tumors. Familiarity with the clinical and imaging features of various ovarian tumors is important in narrowing the differential Classification of ovarian tumors on the basis of tumor of origin Epithelial tumors -serous -mucinous tumors, -Endometrioid -clear cell -Brenner tumor Germ cell tumors -Mature and immature teratoma, -Dysgerminoma, -Endodermal sinus tumor, Sex cord-stromal tumors -Fibrothecoma -Granulosa cell, -Sertoli-Leydig cell tumors

Imaging the posttreatment pelvis with gynecologic cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Stephanie Nougaret, MD, PhD, Montpellier, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To become familiar with the CT and MR imaging appearances of the treated female pelvis following chemotherapy, radiation therapy or surgery.• To describe the most common complications of the treated female pelvis for gynecologic malignancies.• To recognize the patterns of recurrence.• To list the potential pitfalls in the interpretation of posttreatment imaging findings.

TABLE OF CONTENTS/OUTLINE

Gynecologic malignancies are usually treated with surgery, chemotherapy, or radiation therapy. Posttreatment imaging plays a crucial role in the assessment of treatment response, tumor recurrence and post treatment complication. Imaging of the treated pelvis following for example chemotherapy and radiation therapy is particularly challenging due to alteration of the normal anatomy and loss of tissue planes.Outline:Ovarian and endometrial cancer: Post-surgical normal aspect Post-surgical complications: Most common complicationsHematomaInfection and abscess formationOther complicationsLymphoceleSurgically-induced fistula and sinus tracts Recurrence: imaging presentation: what and where to look for: the essential role of baseline imaging.Cervical cancer: Post chemoradiotherapy normal aspectPost chemoradiotherapy complications: induced cystitis, induced gastrointestinal complications, fistulas, bone changesAssessment of response after CRTRecurrence: imaging presentation: what and where to look for, evaluation for exenteration

OBEE-2

How to Start an Endometriosis Imaging Program: the American Experience

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Certificate of Merit

Participants
Lekui Xiao, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. A dedicated MRI protocol is crucial for identifying endometriosis. 2. Templated reports for endometriosis are high yield for clinicians because they ensure that all anatomic areas of interest are reviewed. 3. Pre-operative review of MRI in multidisciplinary rounds can alter patient management. 4. Re-evaluation of post-operative MRI exams and associated intraoperative findings and pathology serve as a teaching guide for all parties involves. Specifically, for radiologists, review of concordance/discordance between imaging and intraoperative findings helps refine our imaging protocols and detection accuracy while recognizing the limitations of imaging. 5. Understanding the medical and surgical ramifications of endometriosis develops our relationship with gynecology colleagues to better manage complex cases. 6. Ultimately, earlier diagnosis of endometriosis reduces unnecessary distress and improves disease management.

TABLE OF CONTENTS/OUTLINE

1. Introduction: Significance of endometriosis and importance of accurate diagnosis 2. Role of imaging, with emphasis on MRI, in evaluating endometriosis 3. MRI protocol to optimize visualization 4. Details discussed in multidisciplinary cases 5. How multidisciplinary cases help radiologists, gynecology, and patients 6. Example cases demonstrating how reporting MRI findings can be refined through multidisciplinary rounds. a. Deep infiltrative endometriosis b. Bladder endometriosis c. Bowel endometriosis d. Ovarian endometriomas e. Malignant Transformation f. Clues for diagnosing subtle disease 7. Teaching Points 8. Conclusion

Imaging of Post-treatment Complications in Gynecologic Malignancies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Renuka Ashtekar, MBBS, MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Enumerate expected changes in the pelvis following radiation therapy and chemotherapy.2. Describe common as well as uncommon complications following chemotherapy (CT), radiation therapy (RT) and surgery.3. Complications associated with the advent of targeted therapy and immunotherapy.

TABLE OF CONTENTS/OUTLINE

1. Introduction- Imaging modalities in pre-treatment workup and post-treatment monitoring of gynecologic malignancies.- Overview of treatment options in different types of gynecologic cancers.2. Expected changes in the pelvic structures post radiation therapy and chemotherapy.3. Post-surgical imaging- expected post-operative findings.4. Gastrointestinal complications following surgery/RT/CT and their imaging features.5. Genitourinary complications following surgery/RT/CT and their imaging features.6. Musculoskeletal complications following RT/CT and their imaging features.7. Post treatment vascular complications and their imaging features.8. Emerging treatments and associated complications and their imaging features.

OBEE-21

You should not pass: Simplifying MR Defecography

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Magna Cum Laude

Participants
Brenda Hernandes dos Santos Teixeira, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe and highlight image acquisition protocols in Magnetic Resonance (MR) Defecography. 2. Improve the understanding of female pelvic floor anatomy using a didactic approach by illustrations and MR images. 3. Recognition of MR Defecography imaging patterns of pelvic floor dysfunctions and diagnostic value.

TABLE OF CONTENTS/OUTLINE

Review of the main imaging female pelvic floor anatomy. MR Defecography protocols. Case-based examples and illustrative key points of the main pelvic floor disorders: Anterior compartment: - Cystocele - Urethra Hypermobility. Middle compartment: - Uterine prolapse. Posterior compartment: - Enterocele - Rectocele - Rectal prolapse - Rectal intussusception - Anismus4. Discuss the perspectives for MR Defecography in clinical routine and imaging findings that aid surgical decisions.5. Conclusions and "take home messages": consolidate the acquired knowledge.

OBEE-22

It's Not All About the Bump- Imaging of the Adnexa During Pregnancy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Certificate of Merit

Participants
Catherine Phillips, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Complete OB assessment should include dedicated adnexal imaging. Early recognition of adnexal pathology permits timely diagnosis and necessary treatment. 2. First trimester offers a unique opportunity to identify adnexal pathology before the enlarging uterus displaces the adnexa and possibly conceals lesions. 3. Adnexal pathology findings during pregnancy may be subtle. Diagnosis may be facilitated by transvaginal scanning, which provides superior resolution and is particularly helpful in obese patients. 4. US remains the diagnostic imaging test of choice to not only localize patient's symptoms and characterize incidental masses of pregnancy, but also guide therapeutic planning if needed. MRI can be helpful as a supplemental modality, particularly if lesions are large or of uncertain origin.

TABLE OF CONTENTS/OUTLINE

1. Diagrammatic depiction and imaging of normal anatomy of the adnexa (US, CT and MRI) 2. Review of imaging appearance of benign adnexal lesions with focus on how their appearance can differ during pregnancy including: Corpus luteum, Hemorrhagic cysts, Dermoid, Endometriomas including decidualized endometriomas, Hydrosalpinx, Fibroma, Torsion, Ovarian hyperstimulation (hormonal or treatment related), Subserosal fibroid projecting into the adnexa (and associated torsion), Complications related to prior surgeries.3. Imaging appearance of neoplastic adnexal lesions including: Borderline tumors, Struma ovarii, Cystadenoma and adenocarcinoma, Immature ovarian teratoma. 4. Adnexal pregnancies including interstitial, ectopic pregnancies, and pregnancies in uterine Mullerian anomalies. 5. Mimics of adnexal pathology in pregnancy.

The right iliac fossa: from a new perspective

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Certificate of Merit

Participants
Giovanna Andreani, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Endometriosis is defined as the presence of endometrial tissue outside the uterine cavity and frequently affects about 10% of women of reproductive age, generating symptoms such as dysmenorrhea, dyspareunia and pelvic pain, and infertility. Endometriotic involvement of structures of the right iliac fossa accounts for about 29% of women diagnosed with endometriosis and may affect the distal ileum, cecum, appendix, round ligament, among others. Although it is not such a frequent site of involvement, radiologists must be familiar with the imaging findings for the hypothesis of endometriosis in this topography to be raised. The objective of this study is to didactically illustrate cases of endometriosis affecting the right iliac fossa, how to systemize imaging exams to not miss possible lesions, and what information must be provided, in order to allow proper diagnosis and therapeutic planning.

TABLE OF CONTENTS/OUTLINE

Discussion of the different radiological findings of endometriosis and its involvement in structures of the right iliac fossa, based on cases obtained in our institution's digital archive in different imaging modalities, including ultrasound and magnetic resonance imaging. We also provide literature review, teaching points and references.

Peripartum and Post-Partum Hemorrhage

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Nicole M. Hindman, MD, New York, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Bleeding during pregnancy can be due to a wide variety of etiologies, for which the majority will be evaluated by ultrasound as the first and often the only modality required.2. Post-partum bleeding /hemorrhage (PPH) can be due to a wide variety of etiologies. US remains the first line of imaging, however often additional modalities may be helpful to further discern etiology, extent and potential treatment options.

TABLE OF CONTENTS/OUTLINE

Section 1 will discuss relevant imaging modalities available. Section 2 will discuss the common etiologies of intrapartum bleeding, with a focus on late pregnancy. Some of the topics covered will include: Normal appearance of the placenta Bleeding related to the placenta including hematoma and abruption. Placenta previa Vasa previa Uterine rupture Diagnostic pitfalls. Section 3 will review the etiologies of bleeding in the post-partum period, typically termed post-partum hemorrhage (PPH) to include the following: Normal post-partum bleeding Retained products of conception, subinvolution of trophoblastic tissue and enhanced myometrial vascularity Review the distinction between AVM and enhanced myometrial vascularity Discuss rare etiologies of postpartum hemorrhage, such as uterine artery pseudoaneurysm. Various types of hematomas associated with caesarean section. Uterine dehiscence and/or rupture and their etiologies

Vaginal Rejuvenation: Radiological Approach for Female Genital Anatomy and Procedures

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Luciana Zattar, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Female genital minimal-invasive procedures are increasingly being performed. In this context, the radiologist has been requested to evaluate this region in order to recognize the anatomical aspects as well as to identify procedures or materials, including fillers, thread lifts, injectable lipolytic, collagen biostimulators, and its complications. To achieve accurate and timely detection and appropriate approach of each case, High frequency ultrasound (HFUS/24-33MHz) is the most effective method since it provides optimal anatomical information of the region and allows identification of different materials and procedures effects. This study aims to discuss and illustrate the radiologist's role in the evaluation of the female genital region with HFUS. The purpose of this exhibit is:- To describe the correct examination technique and preprocedure evaluation- To illustrate the anatomy of the female genital region- To show the main image patterns of the genital minimal-invasive aesthetic procedures- To list, classify and describe the most common related complications in genital region- To discuss the differential diagnosis in genital female lesions- To highlight the importance of HFUS guidance in genital procedures with videos

TABLE OF CONTENTS/OUTLINE

1. PREPROCEDURAL EVALUATION: Anatomical aspects and Female genital layers.2. PROCEDURES IMAGING FINDINGS AND GUIDANCE.3. COMPLICATIONS.4. DIFFERENTIAL DIAGNOSIS: most common genital lesions.5. CONCLUSION.

Distal Mesonephric Anomalies:What Radiologists Need to Know about OHVIRA Syndrome

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Mariko Kumazawa, MD, Shimotsuga-gun, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Werner-Herlyn-Wunderlich syndrome (WHWS) is known as obstructed hemivagina and ipsilateral renal anomaly (OHVIRA), and it has also been reported using various other names. Distal mesonephric anomalies result in the inhibition of appropriate development, fusion between the Müllerian ducts (the origin of the uterus and the vagina), resorption of the separating walls, and abnormal kidney development. There are many reports of various subtypes of WHWS by degree of development.The purposes of this educational exhibit are as follows:- To understand the embryology of this syndrome; what kind of malformation may occur?- To be able to predict what malformation causes a clinical presentation given clinical information, such as a patient's complaint and age.- To know the points of interpretation that contribute to treatment.

TABLE OF CONTENTS/OUTLINE

1. Present embryology explaining OHVIRA and a classification of uterine malformations according to embryology published by Acién.2. Describe the relationship between various uterine and renal-urinary malformations and their clinical presentation.3. Discuss the key points of magnetic resonance imaging and interpretation that contribute to appropriate treatments with case presentations as follows: i) two cases of OHVIRA with ipsilateral ectopic ureter, ii) two cases of acute abdominal pain by hematometra or peritonitis, and iii) a case of Gardner's cyst.4. Summarize the history of the various terms.

OBEE-28

What's going on with the uterus: getting to know the new ASRM classification of Müllerian structures anomalies

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Paolo Franco, MD, Milano, Italy (*Presenter*) Nothing to Disclose

TEACHING POINTS

Müllerian structures anomalies are developmental malformations of the female genital tract, with prevalence estimated from 0.5 to 6.7% in the general population. Many of these conditions may lead to significant health and reproductive consequences. Over the years, several systems have been proposed to classify müllerian anomalies. The most used ones are the American Fertility Society (AFS) Classification from 1988 and the European Society of Human Reproduction (ESHRE) and Embryology-European Society for Gynecological Endoscopy (ESGE) Classification, which includes not only uterine but also cervical and vaginal anomalies.The 2021 American Society for Reproductive Medicine (ASRM) Classification (MAC2021) was recently developed to update previous classification systems, include all malformations categories, and promote a more standardized terminology.The purposes of this exhibit are: (1) to review female genitourinary system embryology; (2) to get familiar with congenital female malformations; (3) to explore the new 2021 ASMR Müllerian anomalies classification; (4) to compare it with previous classifications, particularly those developed by AFS and ESHRE-ESGE; (5) to describe MRI findings of female genital anomalies by showing interesting cases.

TABLE OF CONTENTS/OUTLINE

1. Female genitourinary system embryology and normal anatomy 2. Previous Mullerian anomalies classifications 3. The new 2021 ASMR Mullerian anomalies classification 4. MR female imaging protocols 5. MRI findings of the different female genital malformations

MRI in uterine cancers with uncertain origin: endometrial or cervical. A radiological point of view

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Luca Russo, MD, Roma, Italy (*Presenter*) Grant, Elekta AB

TEACHING POINTS

Therapeutic options and clinical management of cervical and endometrial cancers differs significantly. When clinical and histological analysis of a uterine mass are inconclusive, pelvic magnetic resonance imaging (MRI) may help establish the site of origin, allowing appropriate management and treatment planning. Radiologists should be aware of the morphologic (location, shape and different patterns of growth) and functional (enhancement pattern, tumor perfusion, diffusion-weighted imaging and spectroscopy) MRI features that can support the correct assessment of the site of origin.

TABLE OF CONTENTS/OUTLINE

1. Introduction to the clinical problem and suggested MRI protocol 2. Typical MRI features of primary cervical and endometrial cancers 3. Morphologic MRI features that can help discriminate between endocervical and endometrial cancers, including location, shape and locoregional spread 4. Functional MRI features that can help discriminate between endocervical and endometrial cancers, including enhancement pattern and tumor perfusion, diffusion-weighted imaging and spectroscopy 5. Conclusion

How to Improve Your Routine Transvaginal Ultrasound for Detection of Endometriosis - A Practical Guide for General Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Certificate of Merit

Participants
Luciana P. Chamie, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Endometriosis is a chronic inflammatory disease with significant diagnostic delays varying from four to 11 years 2. Although characteristically multifocal, the retrocervical space is the most common location of deep infiltrative endometriosis (DIE), present in most patients at the initial diagnosis as a hypoechogenic nodule or thickening affecting the uterosacral ligaments. 3. This repetitive and predictable characteristic of retrocervical endometriosis makes it suitable for early diagnosis. 4. Accurate diagnosis can have a tremendous impact on the evolution of the disease, quality of life, and fertility outcomes. 5. Transvaginal sonography (TVS) is the first-line imaging modality to investigate endometriosis and a cost-effective tool. 6. The standard TVS protocol misses the evaluation of the most common locations of endometriosis 7. The addition of a simple algorithm to the standard TVS protocol can reduce the late diagnosis and improve clinical care in patients suffering from long-standing undiagnosed endometriosis.

TABLE OF CONTENTS/OUTLINE

1. Title 2. Disclosures 3. Learning Objectives 4. Background information about endometriosis including last updates. Review the most common sites of endometriosis and anatomical landmarks . Discuss the typical presentation of DIE though TVS 5. Standard TVS limitations- discuss why basic ultrasound protocol miss endometriosis detection 6. Dedicated TVS protocol- comprehensive description on how to perform the maneuvers emphasizing advantages and limitations as well as potential pitfalls. 7. Imaging findings of endometriosis on TVS through case examples from mild to severe DIE 8. Conclusion 9. References

Problems are opportunities in disguise: Added value of contrast enhanced US (CEUS) in evaluation of the female pelvic disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Identified for RadioGraphics

Participants
Mariam Moshiri, MD, Brentwood, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound is the first imaging modality for evaluation of female pelvic disease followed by problem-solving or further evaluation with MRI and in rare cases other modalities such as CT, PET, angiography. Ultrasound Contrast agents (UCAs) have emerged as a valuable adjunct to ultrasound and allow visualization and evaluation of lesions that may not be possible on standard ultrasound imaging alone.We aim to describe and illustrate the utility of CEUS as a valuable adjunct in evaluation of disease in the female pelvis using a case-based approach. We will describe common pitfalls and offer some tips for optimizing the use of CEUS during such examinations. Lastly, we will suggest a workflow pattern that describes when CEUS use is appropriate

TABLE OF CONTENTS/OUTLINE

1. Stepwise review of technique for use of CEUS in the pelvis. 2. Review application through case-based approach with correlative imaging from other modalities and pathologic specimens(Cervical cancer; Fibroid; Ovarian lesions; Endometrial disease/lesions; Post-partum complications such as retained products of conception; AVM, etc; Hysterosalpingo contrast sonography (HyCoSy); Transperineal invasive procedures using CEUS such as biopsy, drainage, etc; 3.Tips and tricks-Lesion visualization: Compression, patient position, etc; Avoiding pitfalls of CEUS (avoiding accelerated bubble destruction, troubleshooting artifacts) 4.Table summarizing recommended utilization and techniques

OBEE-31

Hysterosalpingography as a useful tool for the study of fallopian tubes and uterine cavity when MRI is not available

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Victor Lara Ameca, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Hysterosalpingography is a diagnostic procedure of great utility in the evaluation of the female reproductive tract. It provides useful information outlining the uterine cavity and the fallopian tubes. Radiologists should become familiar with the technique and the interpretation of HSG images.• The knowledge of the anatomy and common findings is necessary for the accuracy in the diagnosis and adequate interpretation of image findings.• There are several implications that should be taken into account performing these studies; patient preparation, good communication with the patient explaining the procedure and answering all the questions. An adequate technique in necessary to limit factors leading misinterpretation and to identify morphologic changes and corroborate them with complementary projections.• Describe step by step procedure to successfully perform this studies and achieve diagnostic images.• Present a systematic approach to adequate interpretation of hysterosalpingography.• Describe and illustrate findings related to anatomical abnormalities of the uterine cavity such as polyps, fibroids, adhesions, adenomyosis and congenital abnormalities. Describe and illustrate findings related to abnormalities of the fallopian tubes as hydrosalpinx, salpingitis isthmica nodosa and surgical changes.

TABLE OF CONTENTS/OUTLINE

• Introduction.• Indication.• Normal anatomy and variations.• Step by step procedure.• Illustrative and imaging findings of polyps, fibroids, adhesions, adenomyosis and congenital abnormalities. Describe and illustrate findings related to abnormalities of the fallopian tubes as hydrosalpinx, salpingitis isthmica nodosa and surgical changes• Conclusion.

OBEE-32

Normal and abnormal appearance of the ovaries during assisted reproduction: a multimodality review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Identified for RadioGraphics

Participants
Katherine Smith, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Assisted reproductive technology (ART) is increasing in utilization, thus increasing the likelihood that radiologists will encounter both the normal and abnormal imaging findings associated with these treatments.• Sonographic monitoring is used for follicle tracking during ART cycles, but these images are usually acquired and interpreted by obstetricians. Thus, many radiologists are unfamiliar with the normal imaging appearance of the female pelvis during ART treatments.• Radiologists should be familiar with the acute complications related to ART treatments.

TABLE OF CONTENTS/OUTLINE

A. Background• Overview of population data regarding the utilization of ART• Brief discussion of the clinical medicine involved with ARTB. Multimodality review of the normal appearance of the ovaries in patients undergoing ARTC. Abnormal ovarian appearance and complications in patients undergoing ART• Review of the Golan classification system for ovarian hyperstimulation syndrome• Discussion of the acute complications related to ART, including ovarian torsion and ectopic pregnancyD. Challenging and unusual cases• Case-based discussion of unique presentations in patients undergoing ART therapy• Problem-solving approach to challenging clinical or imaging scenarios

Characterization of (minimally, partially, and predominantly) Solid Ovarian Masses

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Manasi Arora, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Imaging characteristics (size, shape, vascularity, contrast enhancement) of solid ovarian masses (SOM) can help differentiate between malignant and benign lesions. Early and accurate imaging diagnosis of SOM has significant therapeutic and prognostic implications. The presence of solid components (greater than 3 mm) arising from the cyst wall or septation and protruding into the cyst cavity (papillary projections) has been shown to be the single most important predictor of malignancy. Through this exhibit, we aim to 1) outline the role of imaging in the diagnosis of SOM, 2) characterization of SOM based on their imaging features (ultrasound, CT, and MRI), 3) review the common and uncommon solid ovarian lesions, and 4) highlight the key imaging findings that allow differentiation of malignant solid ovarian tumors from benign and pseudo-lesions.

TABLE OF CONTENTS/OUTLINE

A case-based discussion of the imaging features of minimally, partially, and predominantly SOM, with emphasis on the characteristics of their solid components. Our discussion will outline a comparison between mixed solid and cystic as well as predominantly solid ovarian neoplasms that will include but are not limited to clear cell carcinoma, serous and mucinous carcinomas, endometroid carcinoma, dysgerminoma, granulosa cell tumors, and similar appearing benign lesions (fibromas, mature teratoma, brenner tumors) as well as pseudo-lesions that mimic a SOM on imaging.

Anatomy and Functional Pathology of the Female Pelvic Girdle: From Bones to Bladder

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Julie An, MD, San Diego, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The female pelvic floor including bony structures, the pelvic organs, and supportive myofascial components- These normal structures not only maintains the anatomic position of the pelvic organs but also allow for normal function- Pelvic floor dysfunction encompasses a group of disorders affected by deficit in these various structures and can lead to bladder, bowel, and/or sexual dysfunction which may inhibit daily activities and negatively impact

TABLE OF CONTENTS/OUTLINE

- Review the anatomy of the female pelvis by layers (the most physiologic system for organizing female pelvis):-- Osseous structures, with an emphasis on variations of the female pelvic bones-- Visceral organs and attachments-- Endopelvic Fascia- Cardinal, uterosacral, urethral ligaments, vaginal viscera-- Levator Ani- puborectalis, pubococcygeus, iliococcygeus, and coccygeus-- Perineal Membrane- insertion of perineal muscles, external anal sphincter, and superficial perineal muscles- Present normal and pathologic MRI cases resulting from injury to normal structures-- Endometriosis with scarring of the uterosacral ligament and broad ligament resulting in chronic pelvic pain-- Rectal cancer status post radiation with thinning and fat containing hernia adjacent to the levator ani resulting in rectal prolapse-- Sacral fracture resulting in injury of bilateral coccygeus and iliococcygeus at the level of fracture-- Multiparity with multiple vaginal delivery and subsequent injury to the coccygeus resulting in multi-compartmental prolapse

Post-surgical Complications of Gynecological Procedures: An Updated Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Ana Uski, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Know the "new normal anatomy" of the pelvis depending on the type of surgical procedure used. Discuss imaging modalities in the assessment of potential complications after gynecological surgery, focusing on CT and MRI. Recognize the radiological findings of these complications according to the type of procedure used.

TABLE OF CONTENTS/OUTLINE

Post-surgical gynecological complications are more frequent in extensive procedures, especially in the context of neoplasms, and may be seen less frequently in less invasive procedures such as myomectomies, placement of intrauterine devices, collection of endometrial sampling, endometriosis resection or repair pelvic floor. The most frequent complications include hematomas/ hemorrhages, collections, infections, vascular injuries, intestinal and urinary injuries, suture dehiscence, fistulas and lymphoceles, and different imaging modalities play an important role in their diagnosis and follow-up. In stable patients, an initial approach with ultrasound should be considered, but in cases of clinical worsening, computed tomography (CT) is the most indicated exam, while magnetic resonance imaging (MRI) is relevant in the evaluation of mainly late complications. Recognizing normal postsurgical anatomy, expected postoperative findings, complications of each procedure, and pitfalls in image interpretation will facilitate diagnosis.

Won-Kyung Sung, MBBS, Paddington, Australia (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Endometriosis affect approximately 10% of women of reproductive age and approximately 35-50% of women who suffer from pelvic pain or infertility? • Endometriotic lesions can exist in a variety of anatomic locations; this represents a diagnostic challenge that can lead to under- and delayed recognition of endometriosis due to lower degrees of suspicion • In addition, the diversity of anatomic location of endometriotic lesions can change surgical plans • While diagnostic laparoscopy with histological confirmation is a reliable method of diagnosis, imaging is a less invasive diagnostic alternative that can augment surgical interventions and aid in preoperative evaluation? • Ultrasonographic imaging (particularly transvaginal sonography (TVS)) can determine the location and extent of endometriosis in patients with suggestive clinical examinations • MR imaging is a high sensitivity and specificity second-line study, and it is especially useful in patients with previous equivocal TVS or involving structures poorly evaluated by US.

TABLE OF CONTENTS/OUTLINE

Purpose: The purpose of this study is to characterize and correlate laparoscopic and radiologic findings in the context of endometriosis and to highlight the role of radiologic interpretation in the surgical management of endometriosis patients.? ?? Content Organization? ?? 1.???? Overview of endometriosis? 2.???? Laparoscopic operative approach to endometriosis? 3.???? Imaging techniques, advantages, and disadvantages? 4.???? Case examples?

Don't Ovary-Act: O-RADS US/MRI updates and integration

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Daniela Garcia, MBBS, Philadelphia, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. O-RADS classifies adnexal masses into different risk categories only applicable to asymptomatic patients with average risk of malignancy. 2. Early familiarization with lexicon and standardized reporting decreases ambiguity in surveillance and management of adnexal masses. 3. Presence of solid component and high vascularity/enhancement are highly associated with malignancy. 4. Integration of O-RADS US and MRI can confidently rule out malignancy when imaging features are characteristic.

TABLE OF CONTENTS/OUTLINE

Radiologists are usually the first providers to encounter adnexal masses in daily practice and the ones guiding management and surveillance with serial imaging. In the setting of equivocal radiology reports, due to difficulty in obtaining tissue biopsy samples, adnexal lesions are often managed surgically. O-RADS is a standardized reporting system that identifies different risk groups according to specific imaging descriptors with the goal of improving communication between radiologist and referring providers, helping detect patients with potential malignancy and avoiding unnecessary surgery. Integration of O-RADS US and MRI has proven to have good predictive value and is easily reproducible. This exhibit is a pictorial, multimodality imaging based review of the O-RADS lexicon and its application in the daily evaluation of patients with adnexal masses.

Postpartum Pelvis: Imaging Management of Early and Delayed Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Marianna Konidari, MD, London, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

The postpartum period refers to the time interval from birth to 6-8 weeks later, when the uterus undergoes physiologic involution and returns to its nongravid state. Familiarization with normal postpartum imaging findings of the pelvis is essential to avoid misdiagnosis of disease.Normal appearances of the pelvis following vaginal delivery differ from these after caesarean section. During the first days after CS, it may be difficult to distinguish normal early postoperative changes from possible uterine complications.US, CT, and MRI can be used for imaging of the postpartum pelvis, each having different indications depending on the clinical setting.The role of imaging in the diagnosis of acute and delayed delivery complications is crucial since these are associated with greater morbidity and can even be fatal.

TABLE OF CONTENTS/OUTLINE

Normal anatomy and physiology of the postpartum pelvis and correlation with multimodality imaging: which are the most common normal imaging findings.Vaginal delivery vs caesarean section: what imaging findings to normally expect after each type of delivery.Rationale behind imaging during the postpartum period. Which is the best modality in different clinical scenarios and why.Acute complications: key imaging findings and the implications for morbidity and treatment. Case-based discussion on haemorrhage/hematomas; uterine rupture; endometritis; retained products of conception; pelvic vein thrombosis; intraoperative injuries.Delayed complications: when to suspect them and what signs to look for in imaging. Case-based discussion on endometriosis/ ectopic pregnancy on CS scar; placenta accreta spectrum disorder; gestational trophoblastic disease.

Rhombencephalosynapsis in fetal MRI: main findings and step-by-step evaluation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Patricia Oliveira-Szejnfeld, MD, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Review the rhombencephalosynapsis disease spectrum concerning etiology, classification, epidemiological / clinical data and imaging features; 2) Demonstrate a structured evaluation of the fetal infratentorial structures through magnetic resonance imaging (MRI); 3) Depict the main findings of the rhombencephalosynapsis disease spectrum in fetal MRI as well as associated malformations and their implications in neonatal follow-up.

TABLE OF CONTENTS/OUTLINE

Teaching images will be employed to illustrate the following topics: 1) Embryology of infratentorial structures; 2) Rhombencephalosynapsis: underlying causes, disease spectrum, clinical findings and postnatal imaging; 3) Evaluation of infratentorial structures in fetal MRI (technical aspects and standardized imaging protocol; normal appearance; anatomical landmarks and how they change over time; pearls and pitfalls; potential limitations); 4) MR imaging findings in rhombencephalosynapsis disease spectrum (detailed and accurate analysis, with step-by-step morphological and biometric evaluation of the vermis and cerebellum); 5) Associated malformations in the antenatal period and their imaging findings, as well as a review of the additional evaluation required in the antenatal and postnatal period when the diagnosis is established.

MRI of the fetal midbrain: a step-by-step evaluation of normal and altered findings beyond aqueductal stenosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Patricia Oliveira-Szejnfeld, MD, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Conduct a brief review of antenatal ultrasound (US) findings that suggest midbrain anomalies;2) Demonstrate a structured evaluation of the fetal midbrain through magnetic resonance imaging (MRI);3) Highlight the main MRI findings of midbrain anomalies and associated malformations.

TABLE OF CONTENTS/OUTLINE

1) Brief review of midbrain embryology. 2) The antenatal sonographic evaluation concerning technical aspects and equipment features; time of best assessment; midbrain sonographic anatomy (size/growth normograms, shape, position, and texture; assessment of tectal length and anteroposterior diameter. Midbrain anomalies in fetal sonography (elongation, thinning, shortening, upward rotation) and potential limitations of antenatal US. 3) MRI evaluation of the fetal midbrain, concerning technical aspects and standardized imaging protocols; Main indications and when to perform; MRI anatomy and how to recognize the normal appearance and anatomical landmarks, as well as their changes over time. Detailed explanations will be provided on how to perform an accurate analysis, with step-by-step morphological and biometric evaluation. Finally, main midbrain malformations will be illustrated with teaching cases.

As easy as pie: MR imaging of the placenta made simple - a practical guide for beginners

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Ana De Ataide Goes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To prepare radiologists to evaluate placental MRI based on a structured reporting model. - To review and illustrate the role of MRI in the diagnosis of the main abnormalities of the placenta. - To provide illustrations to clarify the anatomy and pathology of the placenta. - To present clinical cases in correlation with pathology results. - To review the literature and present tips to reduce interobserver variability.

TABLE OF CONTENTS/OUTLINE

1) Background: The importance of placental MR imaging in different diagnostic settings and in the management of placental conditions. 2) Correlation between anatomy and histology of normal placenta, including the normal appearance on MRI. 3) Brief description of MRI protocol for placental assessment. 4) Structured reporting model to guide MRI evaluation. 5) Illustrative cases of the main conditions of the placenta with their imaging features and interpretation:- Anatomical variations; - Placenta previa; - Umbilical cord insertion on placenta; - Placenta accreta spectrum; - Placenta disruption; - Placenta neoplasm (as chorioangioma). 6) Additional findings. 7) Potential pitfalls in placental MRI.

Non-Obstetrical Abdominal and Pelvic Imaging during Pregnancy: A Multimodality Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Kyle Jensen, MD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Pregnant patients present with non-obstetrical pathology, which must be included in the differential diagnosis.2. Imaging pregnant patients requires specialized CT and MR protocols and considerations.3. Pregnant patients require unique imaging, work-up, and treatment of benign and malignant pathologies.

TABLE OF CONTENTS/OUTLINE

1. Imaging protocols in the gravid patient for US, CT, and MR with discussion on intravenous contrast use.2. Imaging of maternal infections including COVID-19.3. Imaging of acute abdominal or pelvic pain during pregnancy by organ system.4. Non-obstetrical, gynecologic pathology in the pregnant patient.5. Trauma imaging in the pregnant patient.6. Oncologic work-up during pregnancy.7. Imaging work-up of benign/incidental findings.

Placental hemorrhage throughout gestation: from chorionic bump to Couvelaire uterus

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Identified for RadioGraphics

Participants
Roya Sohaey, MD, Portland, OR (*Presenter*) Nothing to Disclose

TEACHING POINTS

First trimester trophoblastic and early placental hemorrhage can present as chorionic bump or perigestational hemorrhage, and sonographic features can predict pregnancy outcome. Second and third trimester placental abruption can be marginal, retroplacental, preplacental, and intrauterine. Abruption is associated with maternal and fetal morbidity and mortality, therefore accurate imaging-guided classification is important.

TABLE OF CONTENTS/OUTLINE

1. Sonographic features of first trimester trophoblastic hemorrhage and which imaging findings predict outcome. We will focus on chorionic bump and perigestational hemorrhage 2. Sonographic features of abruption and which imaging findings predict outcome: marginal abruption, retroplacental abruption, pre-placental abruption, Couvelaire uterus (intra-myometrial hemorrhage) 3. Pitfalls of hemorrhage: adenomyosis, accreta, acute blood mimics placenta, and other mimickers

Endometriosis-related infertility: Hysterosalpingography, Ultrasound and MRI findings

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Luciana P. Chamie, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

? Endometriosis is a common disease that affects women of reproductive age, being responsible for almost 60% of infertility cases ? Laparoscopy is no longer the gold standard for the diagnosis of endometriosis, being replaced by imaging exams such as a transvaginal ultrasound (TVS) and pelvic MRI ? Radiologists should identify typical imaging findings on hysterosalpingography, ultrasound (US) and MRI related to endometriosis that may impair fertility outcomes ? Information provided by imaging methods is crucial for clinical counseling and surgical planning and to establish a fertility prognosis

TABLE OF CONTENTS/OUTLINE

? Definition of infertility and endometriosis; ? Types of endometriosis and role of radiological exams; ? Illustrated teaching cases reviewing findings on hysterosalpingography, US and MR that should be considered in the management of infertility related to endometriosis; ? Didactic approach of relevant data, including: ? Clinical: ¦ Patient`s age and anti-mullerian hormone dosage; ¦ Past obstetric history; ? Transvaginal ultrasound and MRI with bowel preparation: ¦ Antral follicle count; ¦ Endometriomas; ¦ Complex pelvic adhesions; ¦ Rectosigmoid endometriotic lesions; ¦ Subserous myometrial infiltration due to endometriosis; ¦ Hydrosalpinx; ¦ Post-operative findings (Isthmocele; thin uterine wall); ? Hysterosalpingography: ¦ Evaluation of tubal mobility and motility; ¦ Obliteration of fallopian tubes

Hysterosalpingography and Caesarean section: A Niche subject

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Elizabeth J. Evans, MBChB, Glasgow, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

By reviewing this exhibit the viewer will appreciate: The hysterosalpingographic (HSG) appearances of caesarean section scars The correlation between HSG appearances with other imaging modalities such as ultrasound and MRI. The importance of identifying adhesions, Asherman's syndrome, within the C-section scar and elsewhere in the cavity. The importance and relevance of other uterine and tubal abnormalities that may be contributing to secondary subfertility and which might influence future pregnancy outcomes.

TABLE OF CONTENTS/OUTLINE

Introduction. Background including data relating to increasing frequency of caesarean section and associated immediate and chronic complications. The role of imaging in identifying uterine abnormality following caesarean section. Other uterine and tubal abnormalities which impact on the management of women with secondary subfertilty and previous Caesarean section. Suggest a simple grading system to correlate with appearances, severity and prognosis of caesarean section defects.

OBEE-48

When Pregnancy Becomes a Problem"- Pictorial Essay of Common and Uncommon Gestational Complications in the Radiological Practice

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Ulysses Torres, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To recall the theoretical basis of the range of differential diagnoses of complications directly related to the gestational period - the obvious and non-obvious ones. To discuss the classical imaging features of these complications. To present examples of rare cases and typical images. To review which information matters for the differential diagnosis, especially when thinking of ectopic pregnancy. To present challenging diagnostic cases and demonstrate how radiologists can help in outcomes.

TABLE OF CONTENTS/OUTLINE

Diagram for diagnostic reasoning of gestational complication, dividing it as:- Related to location of pregnancy: including cases of ectopic pregnancy (cervical, cesarian scar, ampullar, interstitial, angular, intra-abdominal, cornual) and heterotopic pregnancy. - Related to gestational content: including cases of trophoblastic disease as complete and partial mola, invasive mola, and choriocarcinoma. - Related to placentary issues such as placenta accreta, placenta previa, retroplacental hemorrhage, and placental mass (chorioangioma). - Related to systemic/extrauterine issues, such as hepatic subcapsular hematoma related to HELLP syndrome and the last but not the least decidualized endometriosis.

Imaging the post-treatment pelvis in gynecologic cancer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Behnaz Moradi, MD, Tehran, Iran, Islamic Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

Complications of gynecologic cancer treatment can be categorized into early and late onset. They can be related to surgery or chemoradiotherapy. Different imaging modalities as ultrasound, CT scan and MRI based on the involved organ and their availability can be used for diagnosis.

TABLE OF CONTENTS/OUTLINE

In this exhibit, we will discuss about: 1) early complications as hematoma; genitourinary and gastrointestinal complications; infectious process; uterine rupture and wound dehiscence. 2) late complications as genitourinary and gastrointestinal complications; inclusion cyst and seroma formation; fistula; pelvic bone insufficiency fractures; neuritis; post radiotherapy vaginal and cervical stenosis and cystitis.

Pelvic Deep Endometriosis: What Radiologists Should Point Out in Preoperative Imaging

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Satoshi Asai, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Endometriosis is one of the most common and burdening gynecological diseases, estimated to surpass 50% prevalence in women with infertility and chronic pelvic pain. Three types of endometriosis are recognized: ovarian, superficial, and deep. Of these, deep endometriosis (DE) is the most severe form, and surgery is the final solution for symptomatic cases. However, not only it is difficult to recognize all lesions in the surgical field, but it is also difficult to see the relationship to the surrounding organs, and even the lesion itself can be the invisible area. Therefore, preoperative MRI is the key to successful surgery. We advocate for diagnostic imaging that gives the surgeons the information they really need. First, we advocate separate reading and structured reporting for anterior, middle, and posterior compartment of pelvis, which can facilitate the diagnosis of DE and also help to estimate possible complications. Second, based on our experience with complications, we will also discuss the sites of lesions that are prone to be overlooked, and optimal views and imaging methods. Additionally, we show the correlation between MRI and laparoscopic appearance as an aid to understanding DE.

TABLE OF CONTENTS/OUTLINE

- Introduction to pelvic deep endometriosis with diagnostic and surgical problem - Complications of surgery - structured reporting - key images which are easy to find and often associated with DE - the surgical outcome after structured reporting

OBEE-50

It's all about location, location, location: Distinguishing pregnancies in Mullerian anomalies from abnormally implanted pregnancies.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Glynis Sacks-Sandler, MBBCh, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1.Congenital uterine anomalies are often asymptomatic, and the first trimester sonogram may be the first opportunity to diagnose Mullerian anomalies. 2.The recently updated ASRM classification (2021) relies on simple diagrams and descriptions to expand recognition of the multiple variations. More accurate diagnosis based on imaging will lead to improved clinical outcomes. 3. 3D transvaginal ultrasound imaging offers a high degree of diagnostic accuracy. 4. Mullerian anomalies have recognized obstetrical implications, with the most common septate uterus often requiring hysteroscopic septal resection. 5. Pregnancies in association with Mullerian anomalies need to be distinguished from abnormally implanted gestations including interstitial and cesarian scar pregnancies.

TABLE OF CONTENTS/OUTLINE

1. Illustrate Mullerian Duct anomalies (MDA) in the non-gravid uterus with correlating 3D ultrasound. 2. Optimal imaging of early intrauterine pregnancies in association with MDA's including Arcuate uterus, Bicornuate uterus, Septate uterus, and Uterus didelphys. 3. Clinical implications of pregnancies in septate uterus and in non-communicating horns. 4. Imaging of "Mimics" including Interstitial pregnancy, angular pregnancy as well as degenerating fibroids. 5. Review of unusual cases

The Bulky Uterus: A Resident's Guide to Diffuse Uterine Pathology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Elizabeth Deans, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Diffuse uterine disease can be seen in several pathologies ranging from benign to malignant. 2. Knowledge of the normal appearance of the uterus and cervix by ultrasound, computed tomography (CT) and magnetic resonance imaging (MRI) is important for early detection of pathology. 3. The radiologist plays a vital role by using a combination of key imaging features to help distinguish between these benign and malignant pathologies.

TABLE OF CONTENTS/OUTLINE

This educational exhibit will:- Discuss the normal appearance of the uterus and cervix by ultrasound, computed tomography (CT), and magnetic resonance imaging (MRI)- For each of the following uterine pathologies, this exhibit will review pathophysiology and risk factors, describe and illustrate the spectrum of multimodality imaging appearances, and briefly discuss management options:- Diffuse uterine adenomyosis - Diffuse uterine leiomyomatosis - Post-radiation changes - Infection - Hormonal therapy changes - Postpartum changes - Uterine sarcoma/leiomyosarcoma - Invasive cervical/endometrial cancer - Metastatic uterine disease, including diffuse lymphomatous disease

US and MRI of the Uterus: The Good, The Bad and The Ugly

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Krupa Patel-Lippmann, MD, Nashville, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. US and MRI are complementary modalities in the evaluation of uterine lesions. US is the first line modality, with MRI utilized for equivocal or poorly visualized findings on US and delineation of suspected malignancy.2. Benign lesions include endometrial polyps, adenomyosis and leiomyomas, which have a characteristic appearance on US and MR. When present, the radiologist can be confident of the diagnosis.3. Malignant lesions include endometrial cancers and leiomyosarcomas. These lesions can be suggested based on their US appearance, with MRI used for confirmation and delineation of local tumor extent.4. Features on multiparametric MRI can help distinguish leiomyomas and leiomyosarcoma.

TABLE OF CONTENTS/OUTLINE

• Introduction to imaging the uterus A. Normal anatomy B. Describe the complementary role of US and MRI• Review imaging features of benign vs malignant endometrial and myometrial lesions A. Endometrial polyps and hyperplasia versus endometrial cancer B. Adenomyosis and leiomyomas versus leiomyosarcomas• Differentiating leiomyomas versus leiomyosarcomas A. Features of leiomyomas o US: Well-defined and multiple areas of shadowing o MRI: Smooth border, dark T2 signal, no restricted diffusion; homogenous enhancement B. Features of leiomyosarcoma o US: Limited shadowing, irregular margin o MRI: Lobular/irregular margin, cloudy high signal on T1, intermediate T2 signal, restricts diffusion and enhancement C. Overlapping features can be seen in cases of atypical leiomyoma, STUMP, and low grade leiomyosarcoma

From Leiomyoma to Leiomyosarcoma: A Review of the Imaging Spectrum of Uterine Smooth Muscle Tumors with Pathological Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Keith A. Ferguson, MD, (*Presenter*) Stockholder, Hims & Hers Health, Inc

TEACHING POINTS

- - Describe the spectrum of uterine smooth muscle tumors, from benign to malignant - - Discuss pathology of LM variants and provide updated clarifications on different terms such as atypical, cellular, mitotic LMs, STUMP, etc. - - Identify radiological features of uterine leiomyosarcomata (LMS), ordinary leiomyomata (LM), and leiomyoma variants including smooth muscle tumors of uncertain malignant potential (STUMP) - - Demonstrate correlations between the radiological and histopathological features of uterine LMS, LM, and STUMP

TABLE OF CONTENTS/OUTLINE

- Title, names, institutions - Review of uterine smooth muscle tumors o Epidemiology Risk factors, Pathogenesis o Presentation - Diagnosis, Management and treatment options o Indications for imaging in assessing uterine tumors CT, MRI, US, PET/CT o Characteristic imaging features of benign and malignant uterine tumors - Our multi-institutional project - List patient cohorts, demographics - Show examples of ordinary LM including imaging and path characteristics o Non-degenerated o Degenerated Cystic Myxoid Hemorrhagic - Show examples of LM variants including imaging and path characteristics o Cellular o STUMP - Show examples of LMS including imaging and path characteristics o Routine and variants (myxoid, epithelioid) o Metastasis: patterns of recurrence and spread - Summarize characteristic imaging and histopathological features of uterine smooth muscle tumors - Conclusions and future steps - Acknowledgements, references

Peritoneal Endometriosis and MRI: A New Look!

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Carolina Almeida, MD, Rio de Janeiro, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

TEACHING POINTS 1) Endometriosis is a disease that affects thousands of women and compromises their quality of life, causing chronic pain, infertility, and problems in sexual life. 2) Peritoneal endometriosis is often underdiagnosed and prevents adequate treatment. 3) Laparoscopy is the gold standard exam for the investigation of endometriosis, but it is an invasive method, and many women refuse or are afraid to undergo laparoscopy. 4) Clarify doubts about the appropriate exam protocol and what are the myths about MRI in endometriosis. 5) MRI allows the identification of signs that support the diagnosis of peritoneal endometriosis. These signs are subtle, and it is essential that the radiologist knows how to identify them. 6) Demonstrate MRI images and their correlation with exploratory laparoscopy in superficial endometriosis.

TABLE OF CONTENTS/OUTLINE

TABLE OF CONTENTS/OUTLINE 1) Overview of peritoneal endometriosis and a short quiz 2) Identification of focal, diffuse peritoneal thickening and peritoneal failure on MRI and laparoscopy 3) Identification of thickening and glandular tissue on the surface of organs 4) Identification of bloody fluid and septa on MRI and laparoscopy 5) Summary of changes found in each method.

Ultrasound in Endometriosis: Chocolate Cysts and Beyond

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Divya Singh, MD, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasonography is a widely available, inexpensive, real-time imaging modality which can be used to detect pelvic involvement by endometriosis beyond the classic ovarian endometriomas. Deep infiltrating endometriosis (DIE) implants are seen as well circumscribed, hypoechoic lesions with smooth or irregular margins using ultrasound.A systematic sonologic approach in evaluation of the pelvis is imperative for detection of DIE in the anterior and posterior compartments. Ultrasound offers the advantage of using soft markers like a negative sliding sign and probe tenderness to guide the search for DIE. Endometriomas undergo decidualisation during pregnancy which can mimic ovarian tumors on ultrasonography. Ultrasound can raise a red flag for occurrence of malignant transformation in long standing endometriomas.

TABLE OF CONTENTS/OUTLINE

Impact of endometriosis on women's health;Pathology;Clinical presentation: The great masquerader;Ultrasound evaluation technique;Sonographic features: Soft markers, overt findings;Changes in endometriosis in pregnancy;Malignant transformation of endometriomas; Conclusion

Intrauterine Contraceptive Devices: History, Imaging and Complications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Lisa Xuan, MD, BSc, Newmarket, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. For almost 100 years, iterations of intrauterine contraceptive devices (IUCD) have been in use. Older models are of historical interest and may be found incidentally on imaging.2. Both copper and hormone-releasing IUCDs are as effective as tubal ligation in preventing pregnancy, but a 2 in 100 person per year pregnancy rate persists.3. Malpositioning is the most common IUCD complication, and exists as a spectrum depending on severity.4. All malpositioning should be communicated to the clinician as it may lead to decreased contraceptive efficacy or require intervention.

TABLE OF CONTENTS/OUTLINE

A brief history of IUCDs-1st generation-Non-copper metal devices-2nd generation-Plastic devices-3rd generation-Copper bearing devices-4th generation-Hormone bearing devices-5th generation-Frameless intrauterine implantsRadiographic evaluation of IUCDs-Adequate positioning (on plain films, US and CT)-3D ultrasound as the gold standard in assessing malpositioningComplications of IUCDs-Malpositioning spectrum (expulsion, displacement, embedment, perforation)-Synchronous pregnancy-Ectopic pregnancy-Fragmentation of device-Clinical implicationsCased Based Imaging ScenariosSummaryPlease visit the Learning Center to also view this presentation in hardcopy format.

OBEE-8

Pain Points: Making Sense of Pelvic Nerves Involved with Endometriosis and Chronic Pain

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Awards
Cum Laude
Identified for RadioGraphics

Participants
Ceylan Colak, MD, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Endometriosis is a common condition impacting approximately 1 out of every 10 women of childbearing age. 2. Deep infiltrating endometriosis most commonly occurs in the pelvis and is typically multifocal. 3. Although rarely reported, several lumbosacral nerves course through the pelvis and can be involved by deep infiltrating endometriosis including the sciatic, pudendal, obturator and hypogastric nerves. 4. Neural involvement by endometriosis may lead to pain or other neurological symptoms including muscle weakness, numbness, incontinence and paraplegia. 5. MRI is the most reliable noninvasive modality to diagnosis neural involvement by endometriosis. Protocol optimization can help increase conspicuity of nerves involved by endometriosis. 6. Imaging findings are variable and include identification of a deep infiltrative endometriotic lesion directly involving the nerve or nerve thickening with increased enhancement. In chronic cases, muscle atrophy may be present. 7. Identification of neural involvement is important for early diagnosis and treatment to avoid irreversible nerve injury and loss of function.

TABLE OF CONTENTS/OUTLINE

1. Title 2. Disclosures 3. Learning Objectives 4. Background information about endometriosis with neural involvement 5. Normal anatomy of pelvic nerves with imaging examples 6. MRI protocol considerations 7. Imaging findings of nerves involved by endometriosis illustrated through case examples 8. Conclusion 9. References

OBEE-9

Postpartum and Post-abortion Complications - A Guide for Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - OB

Participants
Cynthia Borborema, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

To review the normal imaging appearance of postpartum and post-abortion period and to distinguish it from complications that require treatment. To list radiologic features of early and late postpartum and post-abortion complications to provide a practical guide to help radiologists. To emphasize an integrated radiologic and clinical approach in the assessment of challenging postpartum and post-abortion conditions to improve the clinical impact of radiology reports.

TABLE OF CONTENTS/OUTLINE

Normal uterine changes in puerperium. Normal changes after cesarean delivery. Role of imaging in assessment of postpartum and post-abortion period and relevant report information. Diagnostic tools, with emphasis in computed tomography and magnetic resonance imaging. Usual and unusual postpartum and post-abortion complications (infectious, thromboembolic and hemorrhagic), including key patient history, risk factors, imaging findings, and pitfalls. Review of cesarean surgical technique (laparotomy, bladder flap creation and hysterotomy) and correlation with early related complications. Late cesarean delivery-related complications. Uterine complications after pregnancy-related curettage.

PDEE

Pediatric Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Sub-Events

PDEE-1 Cardiac and Pericardial Neoplasm in Children: Radiologic-Pathologic Correlation

Awards
Identified for RadioGraphics
Cum Laude

Participants
Mariangeles Medina Perez, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

· Illustrate the most common cardiac and pericardial masses in children and their relative prevalence. · Describe the characteristic imaging characteristics of primary pediatric benign and malignant cardiac and pericardial neoplasm based on pathologic features. · Identify imaging features that can help differentiate benign from malignant etiology.

TABLE OF CONTENTS/OUTLINE

· Role of imaging with delineation of technique and pediatric protocols. · Characterization of specific primary cardiac and pericardial tumors with description of clinical considerations, imaging features by different modalities, and pathologic features. · Appropriate differential diagnosis according to tumor location and imaging features.

PDEE-10 The Many Faces of Lymphomas in Pediatric Patients: Spectrum of Multimodality Imaging Findings in Thoracic and Abdominal lymphomas

Participants
Luisa Faria, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Lymphomas account for 10%-15% of all cancers in the pediatric age group, being the third most common malignancy, following leukemia and malignant brain tumors. All organ systems may be involved, including the central nervous system, head and neck, thorax, abdomen, gonads, and bone, and several different histologic subtypes can be found. As a result, the spectrum of imaging findings is wide and the diagnosis can be challenging (particularly in extranodal disease), with considerable imaging overlap with other diseases.The purposes of this exhibit are: (1) to illustrate the spectrum of multimodality imaging findings in thoracic and abdominal lymphomas in the pediatric age group (2) to point out the most important differential diagnosis and lymphoma mimickers.

TABLE OF CONTENTS/OUTLINE

(1) Review of epidemiology and histologic subtypes. (2) Chest involvement (imaging findings, mimickers, and differential diagnosis): chest wall, pleura, lungs, mediastinal structures. (3) Abdominal involvement (imaging findings, mimickers, and differential diagnosis): liver, pancreas, biliary tree, spleen, small bowel, colon, kidney, ureters, peritoneum, and testes.

PDEE-11 Complications in Transjugular Liver Biopsy (TJLB) and Tips to Avoid Them

Participants
Juan Calle Toro, MD, MS, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Different techniques can be used before, during, and after a TJLB to avoid potential complications

TABLE OF CONTENTS/OUTLINE

Liver biopsy remains the gold standard to diagnose cirrhosis, hepatitis, nonalcoholic fatty liver disease, primary biliary cirrhosis, autoimmune hepatitis and post-transplant for the diagnosis of rejection 1.Transjugular liver biopsy (TJLB) is preferred in patients with coagulopathies given the low risk of bleeding. Diagnostic sample rate in TJLB is 96.1% with low technical failure rate of 3.2%. Technical failure is usually due to failure to catheterize the hepatic vein 1. Complications of TJLB include subcapsular perforation in 1.4%, neck hematoma in 0.8%, intraperitoneal hemorrhage in 0.6%, arrhythmia in 0.05%, and pneumothorax in 0.05% 2.We recommend several tips to avoid complications. Ultrasoundshould be performed prior to the procedure to confirm the patency of the hepatic veins and jugular access. Secondly, we recommend using Tru-Cut (Quick-Core). Additionally; TJLB should be perform during breath hold. Finally, when in position to fire the biopsy needle, we advise wedging the cannula antero-lateral if the right hepatic vein is used, or lateral if the middle hepatic vein is used. The procedure should ideally be done in facilities equipped to handle bleeding complications 3.It is recommended to avoid TJLB in patients with thrombosis of the right IJ vein, thrombosis of hepatic veins, cholangitis, or lack of patient cooperation 4. In those cases, alternative routes can be considered such as transfemoral biopsy, endoscopic ultrasound-guided liver biopsy, or Laparoscopic liver biopsy 5.

PDEE-12 Ultrasound Evaluation of The Chest: Neonatal and Pediatric Cases

Participants
Muhammad Khan, MD, Memphis, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review proper chest ultrasound technique.2. To discuss normal appearance of chest on US.3. To discuss and illustrate ultrasound imaging appearance of neonatal and pediatric chest abnormalities by correlating the cases with cross sectional imaging.4. Reinforcement of the ALARA principle along with the dictum of "Image gently"

TABLE OF CONTENTS/OUTLINE

Ultrasound (US) is an excellent imaging modality for initial evaluation of chest due to its portable nature, lack of radiation and no need for contrast administration and sedation. Due to recent advances and improvement in technology the use of US in evaluation of chest has significantly increased. The main indications for chest US in children include, follow up and evaluation of antenatally detected lung abnormalities, assessment of an opaque hemithorax, differentiating cystic from solid lesions, evaluation of chest wall lesion, mediastinal masses, lung lesions, diaphragmatic hernia/eventration and clarify inconclusive plain film findings.Table of contents:Introduction - Chest Ultrasound Technique- normal anatomy and appearance - simple pleural effusion, empyema, ECMO and trauma related hemothorax, chest wall and mediastinal masses(teratoma, neuroblastoma, chest wall masses lipoblastoma, hemangioma), diaphragmatic hernia, eventration, hiatal hernia, pneumonia, necrotizing pneumonia, and atelectasis

PDEE-13 MR Insights into Fetal Brain Development: What is Normal and What is Not

Awards
Certificate of Merit

Participants
Maria Camila Cortes Albornoz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• 1. Fetal life is the most dynamic period of human brain development. • 2. MRI demonstrates all major developmental processes in vivo: hemispheric cleavage, sulcation, evolution of transient telencephalic zones, involution of germinal matrix, myelination, and growth of the corpus callosum and vermis. • 3. Awareness of normal fetal brain development enables the clinical fetal imager to identify abnormalities as they emerge.

TABLE OF CONTENTS/OUTLINE

Illustration of normal processes of fetal brain development on structural images: Single-shot T2, Steady State Free Precession, T1-VIBE. Compare and contrast cases of normal development with pathologic cases. The collection includes: holoprosencephaly, polymicrogyria, cortical malformations, ventriculomegaly, callosal dysgenesis, vermian hypoplasia, rhombencephalosynapsis, among others. Review of emerging sequences on fetal MRI and their role in characterizing brain development: T2*-weighted and DTI.

PDEE-14 Cancer Therapy-Related Hepatic Injury In Children: An Imaging Review From the Pediatric LI-RADS Workgroup

Awards
Cum Laude
Identified for RadioGraphics

Participants
Cara Morin, PhD, Memphis, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The liver is the primary organ for the metabolism of many chemotherapeutic agents, and drug-induced liver injury is common in children undergoing cancer therapy. Acute toxic effects of cancer therapy in children include cholestasis, hepatitis, steatosis, steatohepatitis, hemosiderosis, and vascular complications such as sinusoidal obstruction syndrome. Longer-term effects of cancer therapy can include fibrosis, liver failure, and focal liver lesions that can be confused for metastatic disease.

TABLE OF CONTENTS/OUTLINE

Introduction (including incidence and the effects of therapy on peri-operative morbidity)Imaging modalities Discussion of specific roles and pros/cons in childrenDescription of quantitative sequences to assess for steatosis/iron deposition Specific etiologies of liver injuryHepatitisCholestasis/biliary injuryVascular complications (e.g., SOS, PV thrombosis)0Hepatic GVHDSteatosis steatohepatitisIron depositionRadiation injuryExpected appearance of treated metastatic disease (including post-ablation)Fibrosis cirrhosisFocal liver lesions FNH-like lesions, perfusion abnormalities, metastases, etc.Diagnostic challenges of underlying steatosis/siderosisDiagnostic challenges of differentiating benign lesions from recurrent/metastatic disease

PDEE-15 Ingested Foreign Bodies in Children-How Do We Image and What To Report

Participants
Jeong Rye Kim, MD, PhD, Cheoan, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the role of each imaging modality in the diagnosis of ingested foreign bodies in children2. Review the general management considerations according to the location and the opacity of foreign bodies3. Discuss imaging findings and management guidelines of specific types of ingested foreign bodies

TABLE OF CONTENTS/OUTLINE

1.How to image children with ingested foreign bodies a. First imaging step: Radiography i. Guidelines for radiographic work-up ii. Things to report iii. What if there are negative findings on radiographs? b. Second line imaging modalities: CT versus US2. General management considerations a. According to the location of FBs b. Radioopaque versus radiolucent FBs3. Imaging findings and

management guidelines of specific types of ingested FBs. a. Magnets b. Battery c. Sharp FBs d. Blunt FBs (marbles, coins) e. Glass f. Water absorbent beads

PDEE-16 Visceral Torsions and Atypical Obstructions in the Pediatric Age Group

Participants
Ankita Chauhan, MD,MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Background Information: Children often present to the pediatric emergency department with acute abdominal pain. It is particularly challenging to assess young children as they generally show nonspecific symptoms (fussiness, lethargy, inconsolable crying). An older child can often localize the pain and describe its character. The clinical signs of volvulus often are nonspecific, and radiologists often are consulted for diagnostic evaluations. Prompt diagnosis is crucial as a delay in diagnosis will result in increased morbidity and mortality. Teaching Points: 1. To learn the pathophysiology of visceral torsions and become familiar with their classic imaging appearances. 2. To become accustomed to identifying the twist in the hollow viscus and visceral torsions. 3. To become familiar with a few atypical but essential to know presentations of bowel obstruction in children.4. To acquire a basic understanding of the radiographic obstructive bowel gas patterns.

TABLE OF CONTENTS/OUTLINE

-Goals and objectives -Background information -Anatomy - Visceral torsions (midgut volvulus, gastric volvulus, small bowel internal hernia with volvulus, small bowel intussusception with volvulus, trichobezoar with volvulus, cecal volvulus, colonic volvulus, splenic torsion) -Atypical bowel obstruction (bezoars) -Summary

PDEE-17 Imaging Approach and Radiological Pitfalls of Pediatric Gastrostomy Tube Placement

Participants
Lauren May, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points: 1. Gastrostomy tubes are indicated for long term nutritional support, gastric decompression, or for future gastrojejunostomy conversion. 2. After placement or tube exchange, contrast can be administered through the gastrostomy to confirm intraluminal placement in the stomach. 3. Radiological technique may involve fluoroscopy by the radiologist or can be performed remotely with radiographs. 4. A checklist of findings to confirm placement includes contrast flowing dependently in the stomach away from the tube, contrast progressing to the small bowel, and visualization of the gastrostomy balloon. 5. Complications of gastrostomy tube placement include peritoneal leakage, enteric transgression, stomach perforation, buried bumper, gastric outlet obstruction, gastric or colonic cutaneous fistula formation, and gastrostomy site hernia. 6. Ultrasound and CT may be useful adjuncts for trouble-shooting challenging cases.

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline: 1. Introduction 2. Clinical indications and gastrostomy tube placement technique 3. Fluoroscopy technique to confirm tube placement 4. Limited portable radiograph technique to confirm tube placement 5. Checklist to evaluate gastrostomy tube placement on radiographs and fluoroscopy 6. Ultrasound and CT: Useful problem-solving adjuncts 7. Illustrative case examples of complications highlighting pitfalls of imaging interpretation

PDEE-18 Typical and Not-so Typical Presentations of Childhood Intussusception

Participants
Ankita Chauhan, MD,MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Background Information: Acute abdominal pain is a common complaint in pediatric emergency departments. Patients less than two years of age may present with inconsolable crying, fussiness, and/or lethargy, making the assessment particularly challenging compared to an older child able to localize the pain and describe its character. Intussusception's clinical symptoms are often nonspecific, and radiologists frequently perform diagnostic evaluations and therapeutic interventions. Teaching Points: 1. To acquire a basic understanding of the imaging features of intussusception with particular attention to the radiographic clues to the diagnosis. 2. To learn the pathophysiology of entero-enteric and entero-colic intussusceptions in the pediatric age group. 3. To become familiar with the atypical pathologic causes of intussusception. 4. To understand the radiologist’s role in treating intussusception and recognizing complications of the disease or its treatment. 5. To recognize potential mimics of the disease.

TABLE OF CONTENTS/OUTLINE

-Goals and objectives -Background information -Radiographic signs of intussusception - Types of intussusceptions -Management of entero-enteric intussusception -Management of ileocolic intussusception -Air enema (procedure, indications, contraindications, complications) -Mimics of Intussusception -Summary

PDEE-19 A Tour of Biliary Disorders, Anomalies, and Malignancies in Children

Awards
Identified for RadioGraphics

Participants
Curtis Simmons, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Distinct underlying genetic conditions can be made or suspected based on radiological/radiogenomic features. 2. Many congenital abnormalities can be understood from variations in embryological development. 3. While pediatric biliary malignancy is rare, rhabdomyosarcoma and cholangiocarcinoma are the two most likely entities. 4. Intra-operative cholangiograms can help visualize the biliary system not well evaluated with traditional imaging techniques. 5. The diagnosis of biliary atresia is evolving practice, with a delayed diagnosis causing a substantial increase in need for hepatic transplant.

TABLE OF CONTENTS/OUTLINE

Introduction // Embryological Development of Ducts // Congenital Gallbladder Anomalies: Gallbladder agenesis, intrahepatic gallbladder, floating gallbladder, duplicated gallbladder, septate gallbladder // Anomalous pancreaticobiliary junctions: Aberrant cystic duct insertion, aberrant biliary ducts // Cholecystic processes: Neonatal hepatitis, biliary atresia, Alagille syndrome // Congenital cystic lesions: Choledochal cysts (types 1-4), Caroli's disease, Von Meyenburg complex, polycystic liver disease, complex and simple biliary cysts // Biliary filling anomalies: Cholelithiasis, choledocholithiasis, bile plug syndrome, sickle cell related cholelithiasis // Biliary changes in systemic genetic conditions: cystic fibrosis, autosomal dominant polycystic kidney disease, autosomal recessive polycystic kidney disease // Inflammatory biliary conditions: Sclerosis cholangitis // Pediatric biliary neoplasms: Rhabdomyosarcoma, cholangiocarcinoma // Conclusion

PDEE-2 Pediatric Cardiac Masses: Multimodality Imaging with Rad-path Correlation

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pediatric cardiac masses are rare, but it is important for radiologists to recognize these in time for initiating appropriate management. 1. To review the spectrum of cardiac masses in the pediatric population 2. To discuss the role of multimodality imaging in the evaluation of pediatric cardiac masses 3. To review optimal CT and MRI protocols of pediatric cardiac masses 4. To illustrate the imaging appearances of several pediatric masses with pathologic correlation

TABLE OF CONTENTS/OUTLINE

• Introduction • Spectrum of pediatric cardiac masses • Multimodality imaging of pediatric cardiac masses- Ultrasound, CT, MRI, Nuclear medicine, cardiac cath • Review and illustration of the following pediatric masses with case examples and path correlation where available - Benign tumors- Rhabdomyoma, fibroma, teratoma, myxoma, hemangioma, inflammatory myofibroblastic tumor - Malignant tumors- Metastases, sarcoma, lymphoma, leukemia - Non-neoplastic masses- Thrombus, Eosinophilic myocarditis, pericardial cyst, lipomatous hypertrophy of atrial septum, aneurysm, pseudoaneurysm, diverticulum, hamartomatous malformations - Anatomical variations- Prominent crista terminalis, Chiari network, taenia sagittalis, coumadin ridge

PDEE-20CS Standardized Performance of Pediatric Appendix Ultrasound for Radiologists, Clinicians and Sonographers Introduction

Participants
Lori L. Barr, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Rationale of using a standardized exam protocol, sonographer worksheet and reporting template is explained. Identify and document the ultrasound characteristics of the normal and abnormal: appendix, right lower quadrant mesenteric fat, cecum, adjacent bowel loops, and right lower quadrant lymph nodes. Apply a standardized exam protocol to demonstrate presence or absence of primary and secondary appendicitis findings, a standardized sonographer worksheet and a standardized reporting template. Synthesize the imaging and sonographer worksheet information into a standardized report/impression that decreases the number of equivocal exams.

TABLE OF CONTENTS/OUTLINE

Welcome and Pre-training Assessment has 4 activities, welcome, introduction to how the learning portal works, pre-training assessment and acknowledgments. Pediatric Ultrasound Appendix Exam Performance has 10 interactive activities: Minimum components of a complete exam, Required Images and Cines for a Complete Exam, Completing the Standardized Sonographer Worksheet, 10 Tips to Turn an Incomplete Exam into a Complete Exam, Normal Appendix, Appendix Not Identified No Appendicitis, Acute Appendicitis Not Perforated, 5 YO with right lower quadrant pain, Acute Appendicitis Perforated and Other Pathology That Presents with Right Lower Quadrant Pain. Pediatric Ultrasound Appendix Exam Interpretation has 7 activities: What is the Difference Between a Non-diagnostic Exam and an Equivocal Report?, Why use a standardized reporting template?, Download a Standardized Reporting Template, Definitive vs. Equivocal Interpretations, How to Minimize Equivocal Studies using a Template, 12 YO with RLQ Pain, Take This Post-training Assessment

PDEE-22 Imaging Approach to Distal Neonatal Bowel Obstruction

Awards
Identified for RadioGraphics

Participants
Samantha Gerrie, MBChB, FRANZCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe a structured approach to multimodality imaging workup of distal neonatal bowel obstruction including Hirschsprung disease, functional immaturity of the large bowel, meconium ileus, colonic atresia and segmental volvulus.2. Highlight appropriate use of abdominal ultrasound (US) in specific problem solving scenarios.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Hirschsprung disease a. Presentation, types, associationsb. Radiographic finding c. Lower gastrointestinal (LGI) contrast study findings d. Pitfalls i. Total colonic Hirschsprung disease ii. Delayed or misdiagnosis in premature neonates iii. Delayed presentation in children with chronic constipation3. Functional immaturity of the large bowel a. Presentation b. Radiographic findings c. LGI contrast study findings d. Pitfalls i. Long-segment Hirschsprung disease mimicking functional immaturity ii. No clear caliber difference between right and left colon4. Meconium ileus a. Presentation, associations b. Radiographic findings c. LGI contrast study findings i. Simple meconium ileus ii. Meconium ileus complicated by segmental volvulus5. Ileal atresia a. Presentation b. Radiographic findings c. LGI contrast study findings6. Colonic atresia a. Presentation b. Radiographic findings c. LGI contrast study findings7. Segmental volvulus a. Presentation b. Radiographic findings c. US findings - "mini whirlpool" sign d. Upper and lower gastrointestinal contrast study findings8. Conclusion

PDEE-23 Awards

Imaging Approach to Proximal Neonatal Bowel Obstruction

Identified for RadioGraphics

Participants
Samantha Gerrie, MBChB, FRANZCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe a structured approach to multimodality imaging workup of proximal neonatal bowel obstruction including esophageal atresia, pyloric stenosis, duodenal atresia, duodenal web, malrotation with midgut volvulus and jejunal atresia. 2.Discuss the role of plain radiographs. 3. Discuss use of upper gastrointestinal (UGI) series and ultrasound (US) in establishing diagnosis or narrowing the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Esophageal atresia a. Types, presentation, associations b. Radiographic findings 3. Gastric/pyloric atresia a. Presentation b. Radiographic findings 4. Hypertrophic pyloric stenosis a. Presentation b. US findings i. Pylorus measurements ii. Pitfall - confusing gastroesophageal junction with pylorus 5. Duodenal atresia a. Presentation b. Radiographic findings i. Double bubble sign ii. Pitfall - Y-shaped hepatopancreatic duct anomaly 6. Duodenal web a. Presentation b. Radiographic, UGI series and US findings 7. Annular pancreas a. Presentation b. US findings 8. Malrotation with midgut volvulus a. Presentation b. Radiographic findings c. US findings i. SMA/SMV relationship ii. Position of third part of duodenum iii. Whirlpool sign d. UGI series findings i. Course of duodenum ii. Position of duodenojejunal junction (DJJ) iii. Corkscrew sign iv. Pitfalls - Abnormal position of DJJ due to extrinsic compression or displacement 9. Jejunal atresia a. Presentation b. Radiographic findings 10. Conclusion

PDEE-24 Post-transplant Malignant Neoplasms in Pediatric Liver Transplantation

Participants
Thaise Marquez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The objectives of this exhibit are:To review the frequency and the main types of malignancies in children post-liver transplantation, including: 1) "de novo" tumors and 2) recurrence of neoplasms in patients transplanted for oncological causes.To illustrate the aforementioned tumors with cases attended in our service.To highlight the importance of clinical follow-up in the post-transplant period, in order to diagnose neoplastic lesions at an early stage, reducing graft loss and increasing post-transplant survival.

TABLE OF CONTENTS/OUTLINE

1. Recurrence of liver tumors in pediatric patients post-transplant.Review of the transplant criteria for children with liver tumors, as well as the most common tumors that require liver transplantation.Overview of the expected prognosis and usual management of those patients.Illustrated cases of our Pediatric Radiology group.2. The occurrence of “de novo” tumors in children post-liver transplant.Post-Transplant Lymphoproliferative Disease (PTLD): definition, characteristics, risk factors, pathology, categories and radiographic features.Non-PTLD tumors: a brief mention of the main non-PTLD malignancies, focusing on Kaposi's sarcoma.Ilustrated cases of our institute, including some rare “de novo” cancers.

PDEE-25HC Postoperative Imaging Findings of Biliary Atresia in Children

Participants
Jisun Hwang, MD, Hwaseong-si, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Describe the main surgical technique of Kasai portoenterostomy-Identify the imaging findings of complications after Kasai operation -Describe the indication and main surgical technique of liver transplantation -Identify the preoperative imaging evaluation and postoperative complications after liver transplantation

TABLE OF CONTENTS/OUTLINE

- Kasai portoenterostomy procedure 1) Surgical technique 2) Imaging findings after Kasia portoenterostomy procedure * Cholangitis and bile lakes * Portal hypertension and variceal bleeding * Hepatic tumor - Living-related liver transplantation for biliary atresia 1) Indication and surgical technique 2) Preoperative imaging evaluation (donor and recipient) 3) Imaging findings after liver transplantation * Vascular complication (hepatic artery thrombosis, portal vein stenosis, hepatic vein stenosis) * Nonvascular complication (biliary stricture, bile leak)Please visit the Learning Center to also view this presentation in hardcopy format.

PDEE-26 Staging and Restaging Pediatric Abdominal Tumors: A Practical Guide

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Luisa Faria, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The most common abdominal malignancies diagnosed in the pediatric population include neuroblastoma, nephroblastoma (Wilms' tumor), hepatoblastoma, lymphoma, germ cell tumors, and rhabdomyosarcomas. Each of these tumors has characteristic imaging findings and patterns of locoregional and distant spread. The staging systems are unique and the surgical and oncological management rely heavily on imaging evaluation. The purposes of this exhibit are: (1) to review imaging techniques and discuss the selection among imaging modalities, (2) to review the diagnostic approach of each tumor, (3) to organize the key points for determining tumor stage using a case-based approach, (4) to systematize the posttreatment response evaluation and surveillance and (5) to point out imaging findings of particular prognostic importance.

TABLE OF CONTENTS/OUTLINE

(1) Epidemiology of pediatric abdominal tumors. (2) The role of each imaging modality in staging and restaging pediatric abdominal

tumors. (3) Neuroblastoma: diagnostic approach, staging, and response assessment. (4) Nephroblastoma (Wilms' tumor): diagnostic approach, staging, and response assessment. (5) Hepatoblastoma: diagnostic approach, staging, and response assessment. (6) Lymphoma: diagnostic approach, staging, and response assessment. (7) Germ cell tumors: diagnostic approach, staging, and response assessment. (8) Rhabdomyosarcoma: diagnostic approach, staging, and response assessment.

PDEE-27 I Found a Mass in The Adrenal Region of A Neonate: Should I Be Concerned? Sonographic Findings In The Differential Diagnosis of Usual and Unusual Neonatal Suprarenal Masses

Participants
Gabriela Pinho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: To review the normal sonographic aspect of the neonatal adrenal gland; To emphasize the importance of assessing the adrenal gland in our routine neonatal abdominal sonographic studies; To show based on cases from our Pediatric Radiology group, usual and unusual neonatal adrenal and suprarenal masses; To show the outcome of each case; To discuss risk factors and pathophysiology of the main neonatal adrenal and suprarenal masses.

TABLE OF CONTENTS/OUTLINE

Sonographic technique for the assessment of neonatal adrenal gland and suprarenal region. Usual sonographic aspects of the neonatal adrenal gland. Illustrated teaching cases from our Pediatric Radiology group showing the usual and unusual neonatal adrenal and suprarenal masses: Congenital adrenal hyperplasia associated with ambiguous genitalia and urogenital sinus demonstrated by transperineal ultrasound access; Fetal and neonatal congenital neuroblastoma; Adrenal hemorrhagic infarction: different sonographic aspects in the evolutionary stages of neonatal adrenal hemorrhage; Tips for the diagnosis of Infradiaphragmatic extralobar pulmonary sequestration associated with congenital cystic adenomatoid malformation / congenital pulmonary airway malformation by ultrasound.

PDEE-28 Biliary Atresia and the One Stick Wonder of Percutaneous Transhepatic Cholecystocholangiography

Participants
Elliott Russell, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• The learner will review basic pathophysiology and types of biliary atresia and differential diagnosis for neonatal cholestatic jaundice• The learner will gain familiarity with the diagnostic imaging pathways, including advantages and disadvantages of ultrasound, hepatobiliary iminodiacetic acid scan, and percutaneous transhepatic cholecystocholangiography (PTCC)• The learner will discover the technique for PTCC, including patient selection, patient preparation, and materials and methods• The learner will develop an understanding of PTCC image interpretation and implications for patient management through comprehensive case review

TABLE OF CONTENTS/OUTLINE

1. Clinical Scenario, Differential Diagnosis, and Importance of Timely Diagnosis 2. Biliary Atresia Pathophysiology/Types 3. Current Diagnostic Imaging Pathway, Including Advantages and Disadvantages 4. Percutaneous Transhepatic Cholecystocholangiography: Technique 5. Cases

PDEE-29 Pediatric Pancreaticobiliary Endoscopic Ultrasound Interventions as Primer for Radiologists-Case Based Review

Participants
Emmanuel Owusu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Diagnostic and therapeutic role of EUS in pediatric pancreaticobiliary conditions EUS.Preoperative and post-operative care of the pediatric patient.Evaluating safety, complications post EUS

TABLE OF CONTENTS/OUTLINE

What is EUS EUS equipmentIndications for EUS in evaluation of Pediatric Pancreaticobiliary diseasePancreatic pathologyPancreatic collections, pseudocystPancreatic/gastric masses Biliary pathology CBD obstruction, cholestasis Congenital biliary anomalies EUS technique FNA, stenting, LAMS Pre-operative assessment of EUS Absolute contraindications Post procedure follow-upstent complications (splenic artery hemorrhage, stent migration, recurrent pseudocyst post stent removal)Imaging findings

PDEE-3 Pre and Post Operative CTS: Overview of Congenital Heart Defects

Participants
Akinori Hata, MD, PhD, Suita, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Congenital heart defect (CHD) is the leading cause of death in infancy. CHDs often need interventions for complex structural cardiovascular abnormalities. Advances in the care for patients with CHD have improved survival. For radiologists, understanding pre-and post-operative status in patients with CHD is necessary for accurate interpretation of CT imaging. The purpose of this exhibit is 1) To overview structural abnormalities in typical types of CHDs on CT; 2) To know the procedure required in CHDs; and 3) To understand the hemodynamics in pre-and post-operative status of patients with CHD.

TABLE OF CONTENTS/OUTLINE

1. Overview of the types of typical CHDs 2. Introduction of the general concepts of surgeries for CHDs (palliative procedures and single-/two-ventricle repair) 3. Pre- and post-operative CTs for typical CHDs (Atrioventricular canal defect, Coarctation of the aorta, Double-outlet Right Ventricle, Ebstein anomaly, Heterotaxy syndrome, Hypoplastic left heart syndrome, Pulmonary atresia with intact ventricular septum, Tetralogy of Fallot, Transposition of the great arteries, Tricuspid atresia, Truncus Arteriosus, etc.)

PDEE-30 RASopathies for Radiologists: Familiarizing Radiologists With the Common Genetic Thread Linking Diseases of the Ras/MAPK Signaling Pathway

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Atsuhiko Handa, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

RASopathies are a clinically defined group of genetic syndromes caused by germline mutations in genes that encode components or regulators of Ras/MAPK signaling pathway. These disorders include neurofibromatosis type 1, Noonan syndrome, Noonan syndrome with multiple lentigines (formerly called LEOPARD syndrome), capillary malformation-arteriovenous malformation syndrome, Costello syndrome, cardio-facio-cutaneous syndrome, Legius syndrome, and other allied disorders (e.g. tuberous sclerosis). As a group, the RASopathies are among the most common genetic conditions, an incidence estimated to be about 1 per 1000 live births. Because of the common underlying Ras/MAPK pathway dysregulation, the RASopathies exhibit overlapping phenotypic features. The somatic mutations involving Ras/MAPK pathway have been well studied in cancer and appears to be a promising target for molecular inhibition to treat various malignancies. Similar treatment can potentially be used to ameliorate developmental defects in other RASopathies in the future. In fact, a pathway-based multidisciplinary clinic has already been established in many institutions to address unique challenges faced by individuals and families with RASopathies. The radiologist also needs to be aware of this emerging concept to participate in multidisciplinary care. Here we present the concept and imaging review of RASopathies with an emphasis on common features.

TABLE OF CONTENTS/OUTLINE

- Concept of RASopathies - NF1 - Noonan group - Other RASopathies - Allied disorders - Future directions

PDEE-32 Pediatric Ribs: Roadmap to Become A Rib Expert

Awards
Identified for RadioGraphics

Participants
Yuko Tsujioka, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pediatric rib lesions are diagnostic challenge for three reasons. First, they may be radiologically subtle. For example, a small costal mass that grows inward may be clinically silent. An early recognition of such a lesion that is at risk for serious complications, such as hemothorax or pneumothorax, is feasible only by well-trained eyes. Meticulous searching for trivial changes is essential. Second, they are diverse. There are a variety of rib changes that can lead to a diagnosis of hidden disorders. Examples include multiple posterior rib fractures in non-accidental injury, rib notch in coarctation of the aorta, thin ribs in severe neuromuscular diseases, twisted ribs in NF1, and canoe-paddle-like ribs in mucopolysaccharidosis. Radiologists need to know these rare, but diagnostic, radiological signs. Third, there are many normal variants. Radiologists should be familiar with the innocuous variants to avoid diagnostic errors and unnecessary imaging examinations. Here we provide a comprehensive imaging review of pediatric rib abnormalities and normal variants seen on routine chest radiographs to overcome these challenges. We also provide corresponding cross-sectional images, when available, to help understand the characteristic of each rib lesion.

TABLE OF CONTENTS/OUTLINE

Introduction - Normal rib variants - Tumors and tumor like-lesions - Inflammatory disorders - Rib abnormalities pointing to hidden disease (non-accidental injury, rib notch, twisted ribs, thin ribs, thin ribs with fractures, thin ribs with abnormal patterning, short ribs, broad ribs, dense ribs)

PDEE-33 Perils by the Sea: Radiologic Manifestations of Coastal Related Injuries and Disorders in Pediatric Patients

Awards
Certificate of Merit

Participants
Anna Fairfax, BS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review various injuries and disorders commonly seen in pediatric patients associated with coastal related activities. 2. Discuss the clinical presentations, management, and complications of various coastal, and broader water related, injuries and disorders. 3. Showcase imaging findings of coastal and water related injuries and disorders in pediatric patients via various imaging modalities.

TABLE OF CONTENTS/OUTLINE

1. Musculoskeletal a. Retained foreign bodies (e.g., oysters shells, impaled fishing hooks, stingray spines, shark teeth) b. Animal attacks/encounters (e.g., sharks, jellyfish, stingrays, sea urchins, crabs) c. Diving trauma d. Water sports trauma (e.g., boating and propeller injuries) 2. Lungs/airway a. Barotrauma/diving related disorders b. Aspiration of foreign bodies (e.g., shells and seafood) c. Drowning sequelae/pulmonary edema d. Laryngeal edema secondary to marine envenomation e. Hypersensitivity pneumonitis related to red tide 3. Neuro a. Anoxic brain injury secondary to drowning b. Trauma related to water sports and diving c. Barotrauma/diving related disorders 4. GI/abdomen a. Infection (I.e., Vibrio species) b. Water sports trauma

PDEE-34 Infantile Hemangioma Pitfalls: Clinical and Radiological Evaluation

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Emilio Inarejos Clemente, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

After reviewing this exhibit, the learner should:1.Be familiar with imaging modalities for vascular anomaly evaluation focused on hemangiomas2.Discuss the role of photodocumentation with radiological correlation and importance in evaluation of pathologies with cutaneous involvement3.Describe clinical features of infantile hemangiomas (IH) focusing on cutaneous lesions4.Illustrate the most frequent pitfalls that may mimic IH and clinical appearance5.Discuss most common imaging findings of these pitfalls and identify important differentiating imaging clues

TABLE OF CONTENTS/OUTLINE

1.Introduction of vascular anomalies and approach to ISSVA classification2.Types of IH, demographics and clinical appearance3.Imaging findings of different types of IH:Unifocal and multifocal diseases that can mimic IHClinical photographs, pathology when available and imaging findings of frequent lesions that can mimic IH focusing on ultrasound and MRI:Vascular origin:Other vascular anomalies: venous or arterio-venous malformationsOther hemangiomas: congenital hemangiomasVascular neoplasms of intermediate behavior: Kaposiform hemangioendothelioma, tufted angiomaNeoplasms:Benign: Lipomatous (lipoblastoma, angiolipoma), myofibroblastic tumors, fibrous hamartoma, neurofibromasIntermediate behavior: congenital fibrosarcomaMalignant: congenital sarcomas including rhabdomyosarcoma, lymphoma, metastastic neuroblastoma.Others:Fat necrosis, neural tube defects, ectopic thyroid4.Summary

PDEE-35 Imaging Evaluation of The Post-surgical Foot and Ankle in Children

Participants
Emilio Inarejos Clemente, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

After reviewing this exhibit, the learner should be able to:1. To discuss the most frequent pediatric disorders involving the foot and ankle that may require surgery2. To illustrate the imaging findings of the post-surgical evaluation of the foot and ankle in different modalities3. To describe the most frequent normal variants that may lead to misdiagnose

TABLE OF CONTENTS/OUTLINE

1. Technique: indications and protocols of the different imaging modalities in the post-surgical setting.2. Illustrate the post-surgical imaging evaluation of the most frequent pediatric disorders involving the foot and ankle:2.1. Congenital: congenital clubfoot, vertical talus, metatarsus adductus, tarsal coalition. Value of US and radiographs.2.2 Traumatic: osteochondral lesions, fractures, ligamentoplasty2.3. Infection secondary to surgery2.4. Benign tumors: aneurysmal bone cyst, osteoid osteoma, condroblastoma, osteochondroma, pigmented villonodular synovitis2.5. Malignant tumors: Ewing sarcoma, osteosarcoma. soft tissue sarcomas. Use of multiparametric MRI evaluation and DWI.3. Describe the most frequent normal variants involving the pediatric foot that may lead to misdiagnose: Hematopoietic marrow, bone marrow edema, Stieda process4. Conclusion

PDEE-36 Role of Whole-body Magnetic Resonance Imaging In Pediatric Musculoskeletal System: Aside From Tumors

Participants
Joao Pedro Costa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

I) To review the main applications of whole-body magnetic resonance imaging (WB-MRI) focused on non-neoplastic musculoskeletal conditions in pediatric population.II) To discuss and present the technical aspects and WB-MRI protocol used in our pediatric radiology department including main limitations.III) To illustrate with clinical cases the use of WB-MRI to assess and follow musculoskeletal diseases in children.IV) To correlate imaging information given by WB-MRI with the clinical and laboratory data and compared with other imaging modalities.

TABLE OF CONTENTS/OUTLINE

1. Introduction: performance and applications of WB-MRI in the evaluation of pediatric musculoskeletal non-neoplastic diseases; discuss WB-MRI protocols, with not only the advantages but also with current limitations in comparison with different imaging methods.2. Illustration of WB-MRI exams performed in our pediatric radiology department for diagnostic and follow-up evaluation of different musculoskeletal conditions: chronic recurrent multifocal osteomyelitis; pyogenic osteomyelitis; inflammatory myopathies; drug-induced myopathies; neuromuscular myopathies; fever of unknown origin; searching for rheumatologic inflammatory conditions.

PDEE-37 Intra-articular Osteoid Osteomas: Imaging Characteristics and Mimickers

Awards
Magna Cum Laude

Participants
Jade Iwasaka-Neder, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

o Intra-articular osteoid osteomas (OOs) are rare and may pose a diagnostic challenge to radiologists, as they sometimes mimic other pathologies such as arthritis, stress fracture, avascular necrosis, osteomyelitis, and osteochondral lesions.o Although intra-articular OO may involve any joint, the majority of cases are localized to the hip.o Imaging findings of intra-articular OOs include focal edema, joint effusion and synovitis. However, these lesions often lack the usual reactive sclerosis and periosteal new bone formation, making their diagnoses more difficult.o CT scan is the best imaging modality to identify the nidus of the OO, and is particularly useful for treatment planning.o Na-F PET/CT can confirm the diagnosis of OO in equivocal cases.

TABLE OF CONTENTS/OUTLINE

o Typical imaging findings of extra-articular OOo Imaging findings of intra-articular OO§ Imaging modality• Radiograph• MRI• CT• Bone scan• Na-F PET/CT§ Anatomical locations• Elbow• Wrist• Acetabulum• Femoral head and neck• Knee• Ankle• Tarsal boneso

Differential diagnoses and mimickers§ Stress fracture§ Osteomyelitis with or without Brodie abscess§ Osteochondritis dissecans§ Osteomyelitis§ Arthritis§ Chondroblastoma§ Synovial cyst§ Normal variants (e.g. supra-acetabular fossa)

PDEE-38 Whole-body MRI in Pediatric Musculoskeletal Diseases: Clinical Applications and Technical Considerations

Participants
Andre Mannato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss technical developments of WBMRI in musculoskeletal pediatric diseases, including acquisition and post-processing, as well as to propose an imaging protocol. Review the clinical applications of WBMRI in various disorders that involve the musculoskeletal system in children, especially in the oncology and rheumatology fields, exploring the typical and atypical imaging findings of each. Explore the role of WBMRI as a valuable imaging method for diagnosis, assessment of disease extent and follow-up, highlighting its advantages in comparison to standard imaging evaluation, specifically as they relate to the pediatric population.

TABLE OF CONTENTS/OUTLINE

In the last decades, WBMRI has emerged as a promising imaging method in musculoskeletal diseases, allowing a wide coverage assessment of bone and soft tissue in a single study. WBMRI is especially advantageous for the pediatric population since it avoids redundant examinations and exposure to ionizing radiation in patients who often undergo long-term surveillance. Also, due to patient's size, the examination can be performed with faster protocols and provide high quality images.For rheumatic and oncological diseases, WBMRI can have a large impact in diagnostic and follow-up workup of many pathologies such as chronic nonbacterial osteomyelitis, dermatomyositis, arthritis, tumor screening in cancer predisposition syndromes, evaluation of primary tumor, further investigation of distant lesions and other clinical applications. The development of new techniques and protocols makes WBMRI increasingly faster, safer and more accessible, and it is important for referring physicians and radiologists to recognize the role of this imaging method.

PDEE-39 Fast MRI: MSK Applications in Adults and Children

Participants
Joey Gu, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Gain a foundational understanding of the physics behind accelerating MR image acquisition and the various techniques currently in use2. Discern the benefits and limitations that accelerated MRI offers for patients, providers, and healthcare systems3. Recognize the specific clinical applications, in both an adult and pediatric populations, for fast MR examinations of the shoulder, spine, hip, knee, and ankle

TABLE OF CONTENTS/OUTLINE

What is Fast MRI?- MR physics of accelerating image acquisition- Overview of various acceleration techniques--Fast spin-echo, turbo spin-echo--High gradient performance modes--Undersampling: matrix resolution/partial Fourier phase--Interpolation of matrix resolution--Fast radiofrequency pulses, high receiver bandwidth--Advanced techniques (PI, SMS, synthetic techniques, etc.)Why Use Fast MRI?- In adults--Efficiency of examinations (high volume of adult MSK MRI exams)--Reduce artifact from hardware/implants--Reduce motion artifact- In children--Decrease need for sedation--Reduce motion artifactMSK applications of Fast MRI (for each anatomical area of interest, disease processes evaluated, diagnostic accuracy, and imaging appearances will be covered)- In adults (shoulder, spine, hip, knee, ankle)- In children (knee, spine, infection)Limitations of Fast MRI - Medicolegal implications- Lack of studies demonstrating efficacy for various clinical applications

PDEE-4 Cardiac Evaluation in Pediatric Chest Radiographs: Back To the Future With CT/MRI Correlation

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The last decade has seen tremendous growth of CT/MRI for evaluation of cardiac disorders. The humble chest radiograph still plays a key role, and it is important to interpret it accurately. The aim of this exhibit is 1. To discuss an approach to the interpretation of cardiac abnormalities in pediatric chest radiographs 2. To correlate radiographic cardiac abnormalities with CT/MRI appearances 3. To review common misses and pitfalls in radiographs

TABLE OF CONTENTS/OUTLINE

1. ROLE OF IMAGING IN CARDIAC DISEASES 2. ROLE OF CHEST RADIOGRAPH in pediatric cardiac disease 3. ENLARGED CARDIAC SILHOUETTE- Cardiomegaly- Criteria; Individual chamber enlargement; Pericardial effusion- double oreo cookie sign 4. PULMONARY VASCULATURE- Arterial, venous, edema 5. ALGORITHMIC APPROACH TO DIAGNOSIS OF CONGENITAL HEART DISEASES CYANOTIC HEART DISEASE A. Decreased blood flow - Normal size heart- TOF; Big heart- Ebstein, pulmonary atresia with intact septum B. increased blood flow - TGA- Egg-on-string; TAPVR- Snowman; Truncus- Right arch Single ventricle C. Pulmonary edema - Normal size heart- TAPVR infracardiac; Big heart- hypoplastic left heart ACYANOTIC HEART DISEASE A. Increased arterial flow- Normal LA- ASD; Large LA , normal aortic knob- VSD; Large LA and aortic knob- PDA B. Increased venous flow- Cardiac failure C. Normal flow- AS, Coarctation 6. OTHER FINDINGS -Box-shaped heart- Ebstein's; Boot-shaped- TOF; Wall-to-wall heart- Ebstein, pericardial effusion; Figure-of-3, rib notching- Coarctation; Scimitar sign- PAPVR; Asymmetric main, left PA enlargement- Pulmonic valve stenosis; 7. APPROACH TO VASCULAR RING/SLING- Tracheal and esophageal impressions. 8. PROSTHETIC VALVE EVALUATION 9. PITFALLS/MISSES

PDEE-40 Update On the Radiological Approach of Musculoskeletal Pediatric Infections: From Classical to Challenging Cases

Participants
Stephanie Takara, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

I) Review the main types of musculoskeletal infections and their particularities in children (epidemiology, etiology and pathophysiology), based on cases of our pediatric radiology department in correlation with clinical, laboratory and anatomopathological data.II) Discuss the use and indication of each imaging modality for the different types of musculoskeletal infections and purpose a diagnostic investigation flowchart.III) Present the main imaging findings, advantages and limitations of imaging modalities.

TABLE OF CONTENTS/OUTLINE

1. IntroductionThe importance of imaging exams for an early and correct diagnosis of pediatric musculoskeletal infection.The main uses of each imaging method.2. Spondylodiscitis and intradural infectionsEpidemiology and pathophysiologyThe role of each imaging method and imaging findings3. OsteomyelitisPathophysiologyThe role of each imaging method and imaging aspectsChronic findings and sequelae4. Septic arthritisEpidemiology and pathophysiologyThe role of each imaging method and imaging findings5. Soft tissue infectionEpidemiology and pathophysiologyThe role of each imaging method and imaging findings

PDEE-41 Clavicular Pathologies in the Pediatric Age Group: A Pictorial Review

Participants
Ankita Chauhan, MD,MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Background Information: The clavicle connects the upper extremity to the axial skeleton. It is the first bone to ossify in the fetus. Epiphysis of the clavicle, however, is the last to ossify and fuse in adult life. The most common lesions of the clavicle are traumatic. Nontraumatic lesions of the clavicle are rare, more so in the pediatric age group. Radiologists need to know pathologies affecting the clavicle and their imaging appearance. Considering patient age, clinical symptoms, and other associated imaging findings can help make the correct diagnosis. Teaching Points 1. To discuss the development and normal anatomy of the clavicle. 2. To discuss various congenital (or developmental), traumatic, metabolic, infective, inflammatory, or benign and malignant neoplastic pathologic processes that can involve the clavicle. 3. To illustrate the imaging spectrum of clavicular pathologies in the pediatric age group. 4. To discuss various radiological features that can help make the correct diagnosis.

TABLE OF CONTENTS/OUTLINE

-Goals and objectives -Background information -Anatomy -Pathologic entities (fracture, pseudoarthrosis, infantile cortical hyperostosis (Caffey disease), hyperparathyroidism, cleidocranial dysostosis, chronic recurrent multifocal osteomyelitis, benign bone tumors such as unicameral bone cyst, aneurysmal bone cyst, malignant bone tumors, metastasis) -Summary

PDEE-42 Multimodality Imaging of Pediatric High Flow Vascular Malformations in the Brain and Spine

Participants
Amanda Baker, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Goal: To review multimodality imaging in the diagnosis and treatment of pediatric high flow vascular malformations in the brain and spine. Specifically, the exhibit will pinpoint features on US, CT, MRI, and catheter angiography that will allow the radiologist to accurately diagnosis the type of malformation and describe its characteristics.

TABLE OF CONTENTS/OUTLINE

Review diagnostic algorithms to aid in the classification of pediatric high flow vascular malformations in the brain and spine:Brain:1. Nidal arteriovenous malformations2. Dural arteriovenous fistulae.3. Non-galenic pial arteriovenous fistulae.4. Vein of Galen malformations.Spine:1. Epidural spinal arteriovenous fistulae.2. Dural spinal arteriovenous fistulae.3. Perimedullary spinal arteriovenous fistulae.4. Spinal arteriovenous malformations.

PDEE-43 Imaging Approach to Hypomyelinating Leukodystrophies (HLDs)

Participants
Prateek Malik, MD, Toronto, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

Hypomyelinating leukodystrophies (HLDs) are a rapidly expanding subgroup of inherited white matter disorders characterized by a permanent and substantial deficit in myelin. More than 50 genes are now linked with HLDs, the vast majority being discovered over the last 15 years. Since the first description of Pelizaeus-Merzbacher disease (PMD) in 1910, the understanding of white matter disorders and the key cellular players has improved tremendously. We discuss an updated review of the understanding of normal myelination, key terminologies in HLDs and provide a stepwise methodology in assessment of HLDs determined by key radiological findings.

TABLE OF CONTENTS/OUTLINE

1. Normal myelination - Neurobiology: Key players and myelin maintenance - Imaging normal myelination: key MRI changes, normal milestones and development of key structures - Pitfalls and caveats: Variable signal, permanent deficit Vs myelin stability, corrected gestational age 2. Hypomyelinating leukodystrophies (HLDs) - Updates in classification of white matter disorders including HLDs - Key terminologies - Stepwise approach to assessing HLDs: • Determining key pattern • Assessing for ABCDs • Assessing sub-patterns and clinical clues • Imaging differentials for specific patterns • Alternate imaging phenotypes

PDEE-44 Radiomics for Predicting Tumor Immune Profile of Pediatric Glioma

Participants
Nastaran Khalili, MD, MPH, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Central nervous system (CNS) tumors are the leading cause of cancer-related death in children. Glioma accounts for more than half of pediatric CNS tumors. Complete resection is the mainstay of therapy but is not feasible for deeply seated or highly infiltrative

tumors. Hence, immunotherapeutic approaches are being increasingly applied in pediatric glioma. The immunological profile of the tumor microenvironment (TME) is regarded as a powerful tool for predicting tumor behavior and determining response to immunotherapy. Radiomics, which is the automated high-throughput extraction and processing of quantitative imaging based on intensity, shape, volume, and textural features provides insight into the underlying immunobiological processes within the TME. The purpose of this exhibit is to discuss how this non-invasive method facilitates the categorization and risk stratification of patients based on their tumor immune profile and to describe the role of radiomics in advancing personalized, patient-tailored therapy for pediatric glioma.

TABLE OF CONTENTS/OUTLINE

1. Brief review of the pathophysiology, prognosis, and current treatments for pediatric glioma. 2. Basic principles of radiomics and its role in understanding tumor immune biology. 3. Correlation between radiomics features, immune biomarkers and clinical outcomes in glioma according to existing literature. 4. Current challenges and future directions for the application of radiomics in the immune characterization of pediatric glioma.

PDEE-45 Diffusion-weighted Imaging Patterns in Pediatric Neurometabolic Disorders

Participants
Caleb Epps, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibit is to increase understanding of diffusion weighted-imaging patterns in pediatric neurometabolic disorders to improve diagnostic accuracy and characterization. By the end of this exhibit, the viewer should be able to recognize general DWI patterns and internalize a simplistic practical approach to pediatric neurometabolic disorders.

TABLE OF CONTENTS/OUTLINE

Pediatric neurometabolic disorders encompass an immense group of diseases that are diagnostically challenging for both clinicians and radiologists. Though they are rare individually, collectively they remain a source of significant pediatric morbidity. Though simple classification is problematic, one classification schema includes disorders of toxic accumulation, energy metabolism, complex molecules, and unique pathophysiology. Accurate and timely diagnosis is crucial as treatment depends on the underlying pathophysiology. Good clinical outcomes are associated with earlier intervention in some disorders. Cytotoxic, excitotoxic, and intramyelinic cerebral edema are pathologic processes common in many neurometabolic disorders and manifest on DWI. DWI signal abnormalities can be grossly categorized into white matter-dominant, peripheral gray matter, and deep gray matter. Of note, the practicality of this model compensates for its lack of specificity given that some disorders may demonstrate overlapping patterns. Though the work up of pediatric neurometabolic disorders largely remains a multi-disciplinary effort, an improved understanding of DWI patterns in pediatric neurometabolic disorders can facilitate timely diagnosis and help reduce long term morbidity.

PDEE-46 An Imaging Review of Pediatric Monogenetic CNS Vasculopathy with Genetic Correlation

Awards
Identified for RadioGraphics

Participants
Neetika Gupta, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the current literature on rare genetic causes of CNS vasculopathy in children.2. Describe the CNS and extra-CNS imaging findings in various genetic pediatric CNS vascular disorders3. Discuss the role of conventional imaging modalities and advanced imaging sequences in the diagnosis and prognosis of cerebral vascular disorders. 4. To emphasize the diagnostic and prognostic role of neuroimaging in the evaluation of pediatric monogenetic vascular disorders.

TABLE OF CONTENTS/OUTLINE

1. Comprehensive discussion of the various monogenetic disease resulting in CNS vascular disorders in children.2. Identify and familiarize with the salient imaging features of rare genetic pediatric CNS vasculopathy that could help in the diagnosis and narrow the differentials.3. Recommend a clinico-radiological approach pertinent genetic workup for the systematic evaluation of these rare genetic pediatric CNS vascular disorder 4. Identify the genetic causes imperative to reach a final diagnosis and guide the appropriate treatment.

PDEE-47 Advanced Imaging Evaluation of Pediatric Language Pathways: Where Do We Stand

Participants
Monica Rebollo Polo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review the major language pathways and their development in children from newborns to older children evaluated with advanced neuroimaging (DWI, fMRI) - - Show the areas of activation related to language evaluated with resting state functional Magnetic Resonance (rsfMRI) - Task evaluation of language (presurgical language lateralization assessment) - Clinical indications of imaging language assessment -Show pathology that interferes with normal language pathways development

TABLE OF CONTENTS/OUTLINE

- Language pathways overview with deterministic and probabilistic tractography (arcuate fasciculus, uncinate fasciculus, inferior front-occipital fasciculus, inferior longitudinal fasciculus, frontal aslant tract) - Maturation and development of the language pathways - Dorsal and ventral language pathways representing auditory-motor integration and auditory-conceptual mapping - Rs fMRI language networks - Task evaluation of language (antonym generation, sentences completion, object naming, passive story listening) - Clinical examples (presurgical assessment in brain tumors, language lateralization in epilepsy, language pathways anomalies) Clinical entities that affect language pathways (prematurity, congenital infections, malformations of cortical development)

PDEE-48 Vertebral Artery Dissection in Children

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Stephen B. Little, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Vertebral artery dissection (VAD) is the most common cause of isolated posterior circulation arterial ischemic stroke (PCAIS) in children. Posterior circulation infarcts due to VAD are often multifocal, occasionally of varying age, and may be associated with abrupt intracranial (downstream) arterial occlusions. 2) Extracranial VAD in children most often involves the proximal V3 segment. This portion of V3 is short, often transversely oriented, located in close proximity to bone and surrounded by fat and a periarterial venous plexus. Cervical vascular imaging protocols should take these challenging anatomic features into consideration. 3) VAD is often missed on clinically performed 2D TOF MRA and CE-MRA of the neck. In our experience, 3D TOF MRA or CTA of the neck are more reliable vascular imaging alternatives for VAD in children. 4) At presentation, extracranial VAD in children is most often characterized by segmental stenosis or occlusion at the C2 level, CASCADE 4a (3). Vertebral artery pseudoaneurysm (CASCADE 4a (1)) is less frequent and may be present at initial diagnosis or at follow-up. Intimal flap, double lumen and wall hematoma are infrequent findings on CTA or MRI/MRA. 5) Potentially pathogenic osseous anomalies are not uncommon and are best demonstrated on CT/CTA. 6) Digital subtraction angiography (DSA) with head turning may reveal dynamic vertebral artery compression but management is controversial.

TABLE OF CONTENTS/OUTLINE

1. Stroke Patterns in VAD 2. Intracranial Vascular Findings in VAD 3. Extracranial Vascular Findings in VAD 4. Osseous Anomalies in VAD 5. Protocols - Optimizing MRA and CTA for Diagnosis of VAD in Children

PDEE-49 Imaging Diagnosis of Hydrocephalus and Ventricular Enlargement in Fetuses and Children

Awards
Certificate of Merit

Participants
Hirozumi Mori, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

There are a wide variety of causative diseases that indicate hydrocephalus and ventricular enlargement during fetal and childhood, but first, a hint for differentiation can be obtained by classifying the mechanism.By picking up the findings in more detail in the classification and examining whether the causative disease is single or combined, more accurate diagnose is possible.This time, We will explain how to pick up the findings and recent topics related to diseases.

TABLE OF CONTENTS/OUTLINE

•The criteria for diagnosing hydrocephalus and ventricular enlargement during the fetal period are shown.•We will classify the causative diseases of hydrocephalus and ventricular enlargement in the fetal and childhood and outline them.1.CSF circulation dsorders-Posterior fossa malformation-Hereditary disease-Meningitis-Tumor-Cerebral hemorrhage2.Encephaloclastic disorder-Cerebral Ischemia-Congenital infection3.Encephalodysplasia-Neuronal migration disorders-Cerebral Hemisphere separation disorders•In particular, We will explain in detail about congenital malformations.1.Posterior fossa malformation-Dandy-walker cyst-Blake's pouch cyst-Subarachnoid cyst-Arnold-chiari malformation2.Neuronal migration disorders3.Cerebral Hemisphere separation disorders-Holoprosencephaly-Callosal anomaly

PDEE-5 Examination of The Optimal Imaging Method for 3D-CT After Fontan Procedure

Participants
Norihiko Okamoto, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In 3D-CT after Fontan procedure, laminar flow of contrast agent caused by Fontan circulation occurs, which makes it difficult to accurately diagnose the presence or absence of thrombus. Also, the CT number required for 3D-imaging cannot be obtained. In addition, since it is necessary to diagnose Fontan-associated liver disease, multiphase CT scanning is unavoidable and the radiation dose increases. In order to solve this problem, we considered the optimal imaging method. We analyzed past clinical cases. Next, we prepared a tube simulating a blood vessel, injected a two-step diluted contrast agent (opposite ratio) into it, and performed CT scanning on it. The inside of the tube became uniform when the contrast agent and saline were injected at a ratio of 7 to 3/3 to 7. By monitoring the conduit immediately after systemic circulation, it became possible to easily determine the scan timing. At this scan timing, the occurrence of laminar flow was suppressed, and the CT number was sufficiently obtained. In addition to that, it is now possible to diagnose Fontan-associated liver disease. The double-concentration injection method (7 to 3/3 to 7 ratio) made it possible to simultaneously diagnose multiple findings after the Fontan procedure in one phase, and reduced the radiation dose.

TABLE OF CONTENTS/OUTLINE

1. Clinical problems in 3D-CT after Fontan procedure. 2. Analyze past clinical cases. (Laminar flow) 3. Examination of contrast agent injection method. 4. Optimization of CT scanning. 5. Verification of clinical efficacy.

PDEE-50 Neuroimaging of Neonatal Stroke: Venous Focus

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Lilian Lai, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Perinatal stroke is common and can result in lifelong morbidity. Perinatal stroke can be divided into arterial or venous ischemic stroke and hemorrhagic stroke (typically involving full-term neonates). Arterial ischemic infarcts can be recognized by their arterial distribution, but concurrent hypoxic ischemic injury can complicate interpretation. Less well recognized and under-diagnosed are venous infarcts. The majority of pediatric cerebral sinovenous thrombosis occurs in the neonatal period, and neonates may be more susceptible to venous thrombosis given their incomplete development of alternative indirect pathways of venous drainage. Hemorrhagic infarcts can be due to a myriad of causes and may require MR venogram or angiogram for further evaluation. This exhibit will review imaging patterns of perinatal stroke, with focus on neonatal venous thrombosis.

TABLE OF CONTENTS/OUTLINE

1) Ischemic arterial perinatal stroke and potential mimics 2) Arterial versus venous drainage pathways and infarct patterns 3) Embryology and anatomy of cerebral venous system: emphasis on medullary and subpial veins 4) Cerebral venous thrombosis including dural venous sinus and cerebral vein thrombosis; medullary vein thrombosis (stand-alone or in association with intraventricular hemorrhage in premature and full-term neonates; subpial hemorrhage due to superficial subpial venous congestion 5) Hemorrhagic infarcts 6) Imaging techniques for perinatal stroke evaluation 7) Treatment and clinical implications of arterial/venous thrombosis

PDEE-51 Pediatric Brain MRI: Normal For Age or Subtle Pathology?

Participants
Anvita Pauranik, MD, FRCPC, VANCOUVER, BC (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To elucidate the difference between age-related changes and subtle pathology in pediatric brain MR studies2. To understand the spectrum of normal variants in a developing brain.

TABLE OF CONTENTS/OUTLINE

1. PARENCHYMA. Unmyelinated white matter versus edema in newborn. Normal T1 hyperintense basal ganglia versus hypoxic injury. Terminal zones of myelination versus white matter injury. Dorsal pontine tegmentum: normal hyperintensity versus encephalitis. Central tegmental tract hyperintensity- maturational signal versus metabolic etiology. Normal diffusion anisotropy of corticospinal tracts in newborn versus mild HIE. Peri-dentate hyperintensity-normal versus pathological. (Krabbe, LCH). Prematurity versus abnormal sulcation. Temporal pole-unmyelinated white matter versus Focal cortical dysplasia. SWI: deep gray abnormal mineralization. 2. VENTRICLES: developmental asymmetry versus dysmorphism. Perivascular spaces- normal distribution versus genetic etiology, overgrowth syndrome. Deep sulci: developmental asymmetry versus bottom of sulcus dysplasia. BESSI versus Glutaric aciduria, Abusive head injury. 3. MIDLINE: Cerebellar tonsils-normal variant tonsillar descent versus Chiari 1 deformity. Normal thinning at isthmus versus focal white matter loss. Commissural dysmorphism, abnormal thickening. InterHypothalamic adhesion versus hypothalamic hamartoma. Cysts: incidental versus pathological. PDH deficiency, Zellweger. Retrocerebellar CSF space- variant versus abnormal. Pineal gland- spectrum of cysts. Sella: Pars intermedia remnants versus craniopharyngioma. Marrow signal: clivus heterogeneity

PDEE-52 What You Know About Rolling In the Deep: Pediatric Inflammatory and Infectious Conditions Involving the Thalami and Basal Ganglia in COVID Times

Participants
Kevin Oh, MD, Suwanee, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduce common and uncommon pediatric infectious and inflammatory disorders involving the bilateral thalami and/or basal ganglia using a case based approach to include etiologies relevant during the COVID pandemic. For example, acute disseminated encephalomyelitis including MOG antibody disease, acute necrotizing encephalopathy of childhood including that related to COVID-19, and viral encephalitis. 2. Discuss pathology, common imaging findings, and selected treatments for these patients.3. Discuss briefly differential diagnoses to consider for bilateral thalamic/basal ganglia lesions, such as metabolic disorders and neoplasms.

TABLE OF CONTENTS/OUTLINE

1. Introduction to pediatric infectious/inflammatory lesions in the basal ganglia and thalami. 2. Case based review of interesting cases within this category: Case presentation; Appropriate labs/pathology studies; Short description of the pathology/pathophysiology of the disease entity; Case images with explanation of common imaging features; Appropriate treatment if indicated; Prognosis. 3. Review of differential diagnoses that can mimic these appearances, such as metabolic (gangliosidosis), ischemic, and neoplastic processes (glioma) involving the bilateral thalami and/or basal ganglia.

PDEE-53 What Now? Ultrasound or Computed Tomography? Decision Making Flowchart for Pediatric Head Trauma (PHT) and Birth Related Head Injuries (BRHI)

Participants
Gabriela Pinho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: to review the anatomy of the layers of the scalp; To discuss the main sonographic findings of pediatric head trauma (PHT) and birth related head injuries (BRHI); To gain awareness of the frequency of computed tomography (CT) performed after PHT and BRHI in our service, and critically analyze its impact on patient's management; To propose a decision-making flowchart for the diagnostic management of initial assessment of PHT and BRHI focusing on the role of ultrasound (US) as an initial diagnostic tool.

TABLE OF CONTENTS/OUTLINE

Anatomy of the scalp, skull and meninges; Risk factors for BRHI; Main indications of cranial ultrasound; Main types of injury observed after PHT and BRHI; Decision making flowchart for diagnostic management after PHT or BRHI: US or CT? Illustrative cases from our Pediatric Radiology group showing the properconducts; Critically analyze the frequency of computed tomography

performed after PHT and BRHI, and evaluate its impact on patient's management in our service.

PDEE-54 Pediatric Leukemia: How Can We Help?

Participants
Maria Trujillo Ariza, MD, Villagarcia de Arosa, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Leukemia is the most common malignancy during childhood, is a multisystemic disease, as radiologist we don't play and important role at diagnosis but we must be aware of the possible imaging findings at the beginning of the disease, possible treatment complications and relapse:- To describe the typical imaging findings at diagnosis.- To summarize the imaging findings of possible complications during treatment.- To review the imaging findings that suggest relapse.

TABLE OF CONTENTS/OUTLINE

- Epidemiology and presentation of Pediatric Leukemia: Acute Lymphoblastic Leukemia (ALL) vs Acute Myeloblastic Leukemia (AML).-Utility of imaging techniques: x-ray, US, CT and MRI.- Imaging findings: at diagnosis, of treatment complications (short and long term) and in case of relapse.

PDEE-55 Diagnosing VHL Disease By Understanding Morphology from Pathophysiology: What Radiologists Can Learn From The Nobel Prize

Participants
Sho Koyasu, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The essence of the pathogenesis in VHL disease is the accumulation of the transcription factor HIF in cells with mutations in the VHL gene throughout the body, resulting in increased viability and tumorigenesis. This was highlighted by the Nobel Prize in Physiology or Medicine in 2019. VHL-associated tumors overexpress downstream genes of HIF, resulting in hypervascularization, clear cytoplasm, disrupted cell polarity, and cilia dysfunction. These characteristics can be observed from imaging of VHL-associated tumors throughout the body, with tumors showing strongly enhanced regions accompanied by cyst formations of various sizes. In clinical practice, the role of the radiologist becomes even more important after the diagnosis of VHL disease is made. In collaboration with other departments, it is necessary for radiologists to distinguish tumors that need to be treated from others. It is also important to be aware that there are some potential imaging pitfalls. The purpose of this exhibit is: 1. To introduce the history and molecular mechanisms of VHL disease. 2. To discuss the relationship between pathophysiology, morphology, and imaging findings. 3. To present images of common and uncommon VHL disease-related tumors. 4. To help the audience better understand problematic situations related to VHL disease in actual practice.

TABLE OF CONTENTS/OUTLINE

1. The history of VHL disease, including the discovery, the Nobel Prize, and the new drug approved by the FDA last year. 2. Discussion of imaging findings of VHL-related tumors from molecular mechanisms. 3. Explanation of common as well as rare VHL-related tumors from a morphological perspective. 4. Review of representative cases that are difficult to differentiate.

PDEE-56HC Imaging Spectrum of Rhabdoid Predisposition Syndrome with underlying SMARCB1 and SMARCA4 Mutations

Participants
Ayat Yousef, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. List the manifestations of Rhabdoid tumor predisposition syndrome (RTPS) associated with SMARCB1 and SMARCA4 mutations in children. 2. Describe the imaging characteristics of rhabdoid tumors, specifically atypical rhabdoid teratoid tumors according to their molecular subtype. 3. Discuss the proposed imaging protocol for surveillance and post treatment assessment in RTPS.

TABLE OF CONTENTS/OUTLINE

Inactivation of the tumor suppressor gene SMARCB1 or rarely SMARCA4 is the hallmark of several types of tumors. Patients with SMARC mutations have a high risk of developing synchronous and multifocal rhabdoid tumors (RTs) in early life as a part of rhabdoid tumor predisposition syndromes (RTPS). Other tumors with germline SMARC mutations include cribriform neuroepithelial tumor (CRINET), schwannoma, meningioma, renal cell carcinoma, malignant peripheral nerve sheath tumor and ovarian cancer. RTs frequently arise in the central nervous system, known as atypical teratoid rhabdoid tumor (ATRT). Recently three molecular sub-types of ATRT have been described, each having location tendency and imaging characteristics. The second most common extra-cranial location is rhabdoid tumors of the kidneys (RTK) followed by other locations in the head and neck, liver and rest of the body grouped under extra-renal malignant rhabdoid tumors (ERMRT). Dedicated MRI is the main modality of choice for characterizing rhabdoid tumors and post treatment changes. Other studies like US abdomen, CT and whole-body MRI can be used for metastasis and surveillance in RTPS. Understanding the different imaging manifestations of SMARC mutation can play a pivotal role in disease detection, surveillance and management approach.Please visit the Learning Center to also view this presentation in hardcopy format.

PDEE-57 Imaging Guidelines for Common Pediatric Abdominal Tumors

Participants
Zoe Winston, MBBS, Manchester, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review of international imaging guidelines for paediatric abdominal tumours including renal, adrenal gland and liver tumours.2. Literature review of the advantages and disadvantages of MR compared to CT imaging in paediatric abdominal tumours3. Explore case examples of paediatric abdominal tumours, comparing multimodality imaging and also documenting findings from local experience

TABLE OF CONTENTS/OUTLINE

CT and MR imaging are both used for the diagnosis of common paediatric abdominal tumours. There are differing guidelines internationally for imaging paediatric abdominal tumours. The International Society of Paediatric Oncology (SIOP) and Children's Cancer and Leukaemia Group (CCLG) provide guidelines in Europe and the UK, and the Children's Oncology Group (COG) in North America. A literature review will provide an overview of the international guidelines for imaging of common paediatric abdominal tumours, exploring the advantages and disadvantages of MR and CT evaluation of paediatric abdominal tumours with review of relevant case-based imaging.

PDEE-58 Retinoblastoma: Standardized Imaging Protocols and Reports with Relevance to Current Staging and Treatment

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Vivek Pai, MBBS,MD, Toronto, Singapore (*Presenter*) Nothing to Disclose

TEACHING POINTS

Retinoblastoma (RB) is the most common primary intraocular tumor of childhood. Diagnostic techniques and treatment have evolved rapidly over recent years. Accurate staging is key in initiating appropriate treatment for patients with RB, thereby maximizing survival and preserving vision potential. The aims of this educational exhibit are: 1. Review current standards of ocular and radiological imaging utilized in the staging of retinoblastoma. 2. Define the role of imaging in the clinical differentiation of the various stages of RB. 3. Discuss the importance of multimodal imaging in the assessment of the true clinical stage of the disease. 4. Suggest potential standard fields of reporting which are essential for the staging of children with RB.

TABLE OF CONTENTS/OUTLINE

1. Discussion on clinical and multimodal imaging evaluation in patients with RB 2. Discussion and development of imaging protocols and the importance of imaging in guiding treatment decisions. 3. Demonstrate multimodal images that describe: a) Anterior segment involvement, b) Vitreous and subretinal seeds, c) Intraocular hemorrhage, d) Choroidal invasion, e) Scleral and episcleral involvement, f) Optic nerve invasion, g) Trilateral lesions and intracranial involvement. h) Ophthalmic artery variants that impact chemo-embolization 4. Checklists and standardized reports

PDEE-59 Complications After Pediatric Stem Cell Transplant: From Head to Toe

Participants
Luisa Faria, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The number of disorders in the pediatric age group that benefit from hematopoietic stem cell transplantation (HSCT) is increasing. Nowadays, HSCT is being used for the treatment of leukemia, benign hematologic disorders, autoimmune diseases, certain genetic diagnoses, some forms of lymphoma, and even solid tumors. As a result of the expanding indications, there has been a year-to-year increase in the number of transplantations. Given this scenario, imaging plays a key role in the timely diagnosis of possible complications. The purposes of this multicentric educational exhibit are: (1) to understand the basic principles of HSCT and indications of this procedure in children, (2) to review the predictable timeline of immune suppression after HSCT (3) to systematize the main complications after HSCT in children, based in a multi-institutional experience in pediatric imaging.

TABLE OF CONTENTS/OUTLINE

(1) Review of the basic principles of HSCT, (2) Classical and novel indications of HSCT in children, (3) Timeline of immune suppression after HSCT and the expected infectious and non-infectious complications in each phase, (4) Case-based approach to the main complications following HSCT in each body segment, combining the clinical scenario with characteristic imaging findings: central nervous system, head and neck, chest, abdomen, and musculoskeletal.

PDEE-6 Preventing Life-Threatening Respiratory Tract Bleeding in Kids!: A Systematic Imaging Approach to Shed Light on The Silent Killer

Participants
Akari Makidono, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

#1. Bleeding from the respiratory tract can stay undetected in children until major event occurs since small amount of hemoptysis is commonly veiled by swallowing bloody sputum. Even patients with potentially life-threatening conditions can present with non-specific symptoms, therefore, radiologists should be aware of minor signs and findings of these conditions to prevent major events to occur.#2. Among various diagnostic studies for major respiratory tract bleeding, multidetector CT plays a critical role in determining the cause, site of bleeding, and involved vessels and thus, guiding the caring team toward proper management. For this purpose, systematic imaging approach being demonstrated in this educational exhibit would be helpful for radiologists.

TABLE OF CONTENTS/OUTLINE

- Causes and pathophysiology - Diagnosis and management - Categories of causes - 1) Airway diseases: bronchiectasis, tracheostomy-related hemoptysis, foreign body aspiration, smoke inhalation - 2) Lung parenchymal diseases: infection, collagen vascular disease, idiopathic pulmonary hemosiderosis, coagulopathy, other causes of diffuse pulmonary hemorrhage - 3) Vascular diseases: congenital heart disease, pulmonary arterial hypertension, arteriovenous malformation/hereditary hemorrhagic telangiectasia, KCNT1 mutation-related hemoptysis - 4) Miscellaneous: trauma, tumor, catamenial hemoptysis, iatrogenic

PDEE-60 Current Applications of PET/MR Imaging for Evaluation of Pediatric Musculoskeletal Disease

Participants
Neetu Soni, MD, FRCR, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

• PET-MR combines the excellent soft-tissue resolution and functional capabilities of MR with the quantitative information provided by positron emission tomography (PET)• "Hybrid" MR imaging implies concurrent acquisition of morphologic and functional MR data• Tumor metabolic response predates change in tumor cellularity/morphology; PET-MR is more sensitive than morphologic MR and DW-MRI for assessment of therapeutic response in oncology• PET-MR decreases total number of required imaging studies, simplifying clinical workflows, thus following the "lean" methodology of quality improvement

TABLE OF CONTENTS/OUTLINE

• Normal appearances of hybrid PET-MR in the growing skeleton on an illustrative case-based template• Interpretive pitfalls on PET-MR resulting from normal physiologic attributes of the growing skeleton and technique-related• Current applications and limitations of hybrid PET-MR for assessment of entities affecting the growing skeleton

PDEE-61 Hotchpotch in Germ Cell Tumors

Participants
Akanksha Joshi, MBBS, MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Imaging characteristics of the germ cell tumors on imaging modalities such as CT (Computed Tomography), MRI (Magnetic Resonance Imaging) and USG (Ultrasonography) 2. The imaging features in differentiating the tumors- teratoma, chorio-carcinoma, dysgerminoma, yolk sac, etc. 3. The management of these tumors depending on the location, and aggressiveness.

TABLE OF CONTENTS/OUTLINE

1. Classification of the germ cell tumors in the paediatric population based on the location, age, histology and tumor markers. 2. The spectrum of cases depending the location. 3. Imaging features on CT (Computed Tomography), MRI (Magnetic resonance Imaging) and USG (Ultrasonography) and management of these tumors.

PDEE-62 Cartilaginous Bone Lesions in Pediatric and Adolescent Age Group: A Case-based Review

Participants
Mahesh Kumar JR, MBBS, MD, Mumbai, India (*Presenter*) Nothing to Disclose

TEACHING POINTS

Classifying pediatric and adolescents cartilaginous bone lesions.Recognizing the radiological and pathological features of chondroid matrix.Learning the imaging features of benign, benign aggressive and malignant cartilaginous bone lesions.Special emphasize on chondrosarcoma in pediatric and adolescent age group.Management of cartilaginous bone lesions.

TABLE OF CONTENTS/OUTLINE

Disclosure.Introduction.Classification of pediatric and adolescents cartilaginous bone lesions.Chondrosarcoma in pediatric and adolescents age group.Cases

PDEE-63 Treatment-related Complications in Children with Hematolymphoid Malignancy: Emergent Conditions and Late Effects

Awards
Identified for RadioGraphics

Participants
Claudia Cheung, MBBS, Hong Kong, Hong Kong (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Treatment of childhood hematolymphoid malignancies depends on stages and risk of the specific disease, but generally comprises of intensive chemotherapy regimens, with addition of radiotherapy and/or allogenic hematopoietic stem cell transplantation (HSCT) and novel immunotherapy for certain conditions.2. Severe myelosuppression and prolonged neutropenia are common, which are risk factors for invasive fungal infections from opportunistic organisms. Viral reactivation are common in HSCT recipients.3. Acute treatment-related toxicity depends on the chemotherapeutic agents for specific disease. For example, methotrexate is associated with acute toxic leukoencephalopathy. Multiple chemotherapy agents are implicated in posterior reversible encephalopathy syndrome. L-asparaginase is associated with pancreatitis and venous thromboembolism. Anthracyclines can cause myocardial cell injury which leads to left ventricular dysfunction. Understanding the treatment regimen used is important in reaching the correct diagnosis.4. Use of high dose corticosteroids can cause long term skeletal complications. Early recognition of avascular necrosis of femoral head is of particular importance as early orthopedic intervention is essential.5. Use of intensive radiotherapy can lead to development of secondary cancer. For acute leukemia, secondary brain tumours are common in patients who received cranial radiotherapy.

TABLE OF CONTENTS/OUTLINE

1 Introduction2 Brief overview of treatment regimens3 Treatment-related complications (classified by body systems)3(a) Infectious3(b) Acute treatment toxicity3(c) Late effects4 Conclusion

PDEE-64 Radiologists Role In Establishing The Diagnosis, Evaluating Risk Factors, Detecting Recurrence, and Determining the Effectiveness of Treatment in Langerhans Cell Histiocytosis

Participants
Takahiro Hosokawa, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Langerhans cell histiocytosis (LCH) predominantly affects children. Its clinical presentation varies significantly, from isolated and self-limiting to multisystem disorder with a life-threatening clinical course. Various organs are involved. Bone is affected most frequently, and the location of its involvement on imaging findings provides important clues for diagnosing LCH.After diagnosis, the

following risk factors should be evaluated: (1) risk of recurrence classified into three grades according to the degree of organ system involvement; I) multisystem (M-S) disease with involvement of high-risk organ (hematologic system, liver, and spleen), II) M-S disease without high-risk organ involvement, or III) single system involvement with one or multiple lesions; (2) risk of central nervous system involvement (manifesting as diabetes insipidus and neuro-degenerative complications); (3) risk of tracheal compression; anterior mediastinal or thyroid huge mass is a predictor of complications during general anesthesia. During follow-up, knowledge regarding the changes in imaging findings associated with pharmacotherapy and conservative treatment is required to evaluate the effectiveness of treatment and detect recurrence.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Imaging findings of LCH; involvement of various organs 3. Key imaging findings for diagnosing LCH 4. Evaluation of risks of recurrence, central nervous system involvement, and tracheal compression 5. Imaging findings during follow-up of patients 6. Conclusion

PDEE-65 PET/CT in Pediatric Oncology

Participants
Flavio Garcia Pires, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

After viewing this education exhibit, the learner should be able to: - Understand the principles of PET/CT as a hybrid imaging modality combining functional and anatomic information, which increases its diagnostic and prognostic accuracy; - Understand the importance of FDG PET/CT for the diagnosis, staging and posttreatment response assessment in pediatric oncology; - Identify specific malignancies when the use PET/CT is beneficial; - Instruct multidisciplinary team on the ideal patient preparation to minimize false positive and false negative sites of radiotracer uptake. - Identify expected/physiologic areas of radiotracer uptake and common pitfalls of imaging interpretation such as physiologic linear uptake in physes/apophyses and diffuse bone barrow uptake in generalized inflammatory states or gCSF administration.

TABLE OF CONTENTS/OUTLINE

1. RADIOTRACERS/MECHANISMS OF ACTION. 2. PATIENT PREPARATION. 3. PET INTERPRETATION. a. SUV. b. PHYSIOLOGIC FDG UPTAKE IN CHILDREN c. PITFALLS. 4. SPECIFIC DISEASES. a. LYMPHOMA/PTLD. b. SARCOMAS. i. OSTEOSARCOMA. ii. EWING'S SARCOMA. iii. RHABDOMYOSARCOMA. c. LESS INCIDENT TUMORS. i. GERM CELL TUMOR. ii. HEPATOBLASTOMA. iii. NEUROBLASTOMA. 1. FDG. 2. Ga-DOTATATE. iv. THYROID CANCER. 1. FDG. 2. Ga-DOTATE (FOR MEDULLARY SUBTYPE). v. MALIGNANT PERIPHERAL NERVE SHEATH TUMOR. vi. WILMS' TUMOR. vii. CNS TUMOR. 1. PITFALL: RADIATION NECROSIS. 5. FUTURE DIRECTIONS.

PDEE-66 Photon Counting Detector CT in Children: Advantages and Clinical Prospects

Participants
Juan Carlos Ramirez-Giraldo, PhD, Cary, NC (*Presenter*) Employee, Siemens AG

TEACHING POINTS

• Photon-counting detectors (PCD) technology directly converts individual x-ray photons into electrical pulses with small pixel size, that can be counted.• Traditional energy-integrating detector (EID) CT uses an indirect conversion process where x-ray photons are converted to light, and the signal is integrated over a short period of time. • PCD CT results in improved spatial resolution.• PCD CT results in improved contrast of small structures in pediatric patients. • PCD CT allows for substantial radiation dose reductions. • PCD CT allows for spectral imaging all the time.

TABLE OF CONTENTS/OUTLINE

• Review basic principles of photon counting CT• Discuss advantages of PCD CT• Discuss applications PCD CT in pediatric imaging and advantages compared to traditional EID CT images.Ø High resolution temporal bone CT Ø High resolution chest CT Ø Contrast enhanced Chest CT Ø Cardiac CT Ø CT angiography Ø Abdominal CT Ø Head CT

PDEE-67 Baby Steps Toward a Proper Interpretation of Neonatal Chest and Abdominal Radiographs

Participants
Deborah Otto, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:- To review the normal radiological aspects of chest and abdominal radiographs in neonates.- To illustrate some of the main thoracic and abdominal disorders that can be diagnosed in neonates through plain radiographs.

TABLE OF CONTENTS/OUTLINE

Chest:- Normal anatomy- Lines and tubes (correct placement parameters, correct and incorrect placement examples and complications).- Diffuse lung disorders (Surfactant deficiency, retained fetal fluid, meconium aspiration, congenital surfactant dysfunction, alveolar growth disorders)- Focal lung disorders (Congenital Pulmonary Airway Malformations, Bronchopulmonary sequestration, congenital lobar hyperinflation)- Diffuse or Focal disorders(Pneumonia, Interstitial Emphysema)Abdomen:- Normal anatomy and expected bowel gas pattern- Lines and tubes (correct placement parameters, correct and incorrect placement examples and complications).- Congenital gastrointestinal disorders (tracheoesophageal fistula, duodenal atresia, ileal atresia, malrotation, Hirschsprung disease and congenital diaphragmatic hernia).- Acquired gastrointestinal disorders (necrotizing enterocolitis, pneumoperitoneum, meconium peritonitis, gastric volvulus and midgut volvulus)

PDEE-7 Imaging Features of Pediatric Sarcoidosis: From Head to Toe

Awards
Identified for RadioGraphics

Participants
Gozde Ozer IV, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Sarcoidosis occurs approximately ten times less frequently in children than in adults. Pediatric sarcoidosis predominantly involves the lungs and lymphatic system but can affect any organ in the body. Characteristic chest CT findings of pulmonary sarcoidosis are mediastinal, bilateral hilar lymphadenopathy, and nodules with the perilymphatic distribution along the interlobular septa, interlobar fissures, and subpleural regions. Abdominal sarcoidosis may manifest as numerous small nodules in the liver and spleen. In addition, abdominal lymphadenopathies can be seen in one-third of the patients. Neurosarcoidosis is most commonly manifested by leptomeningeal and pituitary gland involvement. Leptomeningeal sarcoidosis can be seen as nodular or plaque-like thickening and enhancement of the leptomeninges. Orbital involvement of sarcoidosis is the most common presentation in the head and neck region. Although any part of the orbit can be involved, uveitis is the most common condition and is often bilateral.

TABLE OF CONTENTS/OUTLINE

General information and diagnostic criteria of sarcoidosis. The role of radiology in the diagnosis. Imaging patterns of pulmonary, abdominal, central nervous system, head and neck, and musculoskeletal-cutaneous involvement of sarcoidosis.

PDEE-8 Congenital Diaphragmatic Hernia: A Hole lot More than Morgagni

Participants
Christian Pecoraro, DO, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Embryology of the diaphragm and cause of congenital diaphragmatic hernias. Role of pre-natal imaging including MR + US in the diagnosis and prognostication of CDH. Post-natal imaging findings of typical right and left CDH. Imaging findings of acute Late-Presenting CDH. Review of surgical strategies for CDH repair, as well as expected and un-expected post-operative findings. Associated anomalies, syndromic and non-syndromic including urogenital, musculoskeletal neurological.

TABLE OF CONTENTS/OUTLINE

Introduction, definition, and embryology. Classification of CDH. Prenatal imaging findings of CDH. Postnatal imaging findings of CDH. Review of fetoscopic endoluminal tracheal occlusion (FETO) for CDH. Expected post-operative appearance of the diaphragm following surgical prosthetic patch repair/graft. Acute and late post-operative related complications of CDH, including associated decreased ipsilateral lung perfusion. Associated anomalies, syndromic and non-syndromic including urogenital, musculoskeletal neurological. Describe the respiratory morbidities found in CDH survivors, including chronic cough, wheezing, chest wall deformities (pectus excavatum) and scoliosis.

PDEE-9 Point of Care Ultrasound in Pulmonary Pathologies Applied to Intensive Care Unit Neonates

Participants
Vitor Romano, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are:Make a didactic review of the point of care ultrasound in pulmonary pathologies in intensive care unit neonates; Point out the indications and limitations of the ultrasound on the evaluation of the pulmonary parenchyma; Review the techniques of the pulmonary ultrasound; Review the anatomy and the thoracic structures that can be evaluated by this method; Review the normal and abnormal findings on thoracic ultrasound; Review the main arctifactuary lines on lung ultrasonography and it’s pathological correlations; Review the main protocols of thoracic ultrasound.

TABLE OF CONTENTS/OUTLINE

We will discuss the following topics and focus on the echography features of the normal and abnormal thoracic ultrasound:Ultrasound techniqueNormal findings on pulmonary ultrasonography (A lines;B lines;I lines;Z lines;E lines)Pathologic findings on thoracic ultrasonography: Parenchyma (Consolidation;Atelectasia;Congestion) and Pleura (Pleural effusion;Pneumothorax)Protocols.

Cardiac and Pericardial Neoplasm in Children: Radiologic-Pathologic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics
Cum Laude

Participants
Mariangeles Medina Perez, MD, Syracuse, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

· Illustrate the most common cardiac and pericardial masses in children and their relative prevalence. · Describe the characteristic imaging characteristics of primary pediatric benign and malignant cardiac and pericardial neoplasm based on pathologic features. · Identify imaging features that can help differentiate benign from malignant etiology.

TABLE OF CONTENTS/OUTLINE

· Role of imaging with delineation of technique and pediatric protocols. · Characterization of specific primary cardiac and pericardial tumors with description of clinical considerations, imaging features by different modalities, and pathologic features. · Appropriate differential diagnosis according to tumor location and imaging features.

PDEE-10

The Many Faces of Lymphomas in Pediatric Patients: Spectrum of Multimodality Imaging Findings in Thoracic and Abdominal lymphomas

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Luisa Faria, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Lymphomas account for 10%-15% of all cancers in the pediatric age group, being the third most common malignancy, following leukemia and malignant brain tumors. All organ systems may be involved, including the central nervous system, head and neck, thorax, abdomen, gonads, and bone, and several different histologic subtypes can be found. As a result, the spectrum of imaging findings is wide and the diagnosis can be challenging (particularly in extranodal disease), with considerable imaging overlap with other diseases.The purposes of this exhibit are: (1) to illustrate the spectrum of multimodality imaging findings in thoracic and abdominal lymphomas in the pediatric age group (2) to point out the most important differential diagnosis and lymphoma mimickers.

TABLE OF CONTENTS/OUTLINE

(1) Review of epidemiology and histologic subtypes. (2) Chest involvement (imaging findings, mimickers, and differential diagnosis): chest wall, pleura, lungs, mediastinal structures. (3) Abdominal involvement (imaging findings, mimickers, and differential diagnosis): liver, pancreas, biliary tree, spleen, small bowel, colon, kidney, ureters, peritoneum, and testes.

PDEE-11

Complications in Transjugular Liver Biopsy (TJLB) and Tips to Avoid Them

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Juan Calle Toro, MD, MS, San Antonio, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Different techniques can be used before, during, and after a TJLB to avoid potential complications

TABLE OF CONTENTS/OUTLINE

Liver biopsy remains the gold standard to diagnose cirrhosis, hepatitis, nonalcoholic fatty liver disease, primary biliary cirrhosis, autoimmune hepatitis and post-transplant for the diagnosis of rejection 1.Transjugular liver biopsy (TJLB) is preferred in patients with coagulopathies given the low risk of bleeding. Diagnostic sample rate in TJLB is 96.1% with low technical failure rate of 3.2%. Technical failure is usually due to failure to catheterize the hepatic vein 1. Complications of TJLB include subcapsular perforation in 1.4%, neck hematoma in 0.8%, intraperitoneal hemorrhage in 0.6%, arrhythmia in 0.05%, and pneumothorax in 0.05% 2.We recommend several tips to avoid complications. Ultrasoundshould be performed prior to the procedure to confirm the patency of the hepatic veins and jugular access. Secondly, we recommend using Tru-Cut (Quick-Core). Additionally; TJLB should be perform during breath hold. Finally, when in position to fire the biopsy needle, we advise wedging the cannula antero-lateral if the right hepatic vein is used, or lateral if the middle hepatic vein is used. The procedure should ideally be done in facilities equipped to handle bleeding complications 3.It is recommended to avoid TJLB in patients with thrombosis of the right IJ vein, thrombosis of hepatic veins, cholangitis, or lack of patient cooperation 4. In those cases, alternative routes can be considered such as transfemoral biopsy, endoscopic ultrasound-guided liver biopsy, or Laparoscopic liver biopsy 5.

PDEE-12

Ultrasound Evaluation of The Chest: Neonatal and Pediatric Cases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Muhammad Khan, MD, Memphis, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review proper chest ultrasound technique.2. To discuss normal appearance of chest on US.3. To discuss and illustrate ultrasound imaging appearance of neonatal and pediatric chest abnormalities by correlating the cases with cross sectional imaging.4. Reinforcement of the ALARA principle along with the dictum of "Image gently"

TABLE OF CONTENTS/OUTLINE

Ultrasound (US) is an excellent imaging modality for initial evaluation of chest due to its portable nature, lack of radiation and no need for contrast administration and sedation. Due to recent advances and improvement in technology the use of US in evaluation of chest has significantly increased. The main indications for chest US in children include, follow up and evaluation of antenatally detected lung abnormalities, assessment of an opaque hemithorax, differentiating cystic from solid lesions, evaluation of chest wall lesion, mediastinal masses, lung lesions, diaphragmatic hernia/eventration and clarify inconclusive plain film findings.Table of contents:Introduction - Chest Ultrasound Technique- normal anatomy and appearance - simple pleural effusion, empyema, ECMO and trauma related hemothorax, chest wall and mediastinal masses(teratoma, neuroblastoma, chest wall masses lipoblastoma, hemangioma), diaphragmatic hernia, eventration, hiatal hernia, pneumonia, necrotizing pneumonia, and atelectasis

MR Insights into Fetal Brain Development: What is Normal and What is Not

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Certificate of Merit

Participants
Maria Camila Cortes Albornoz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• 1. Fetal life is the most dynamic period of human brain development. • 2. MRI demonstrates all major developmental processes in vivo: hemispheric cleavage, sulcation, evolution of transient telencephalic zones, involution of germinal matrix, myelination, and growth of the corpus callosum and vermis. • 3. Awareness of normal fetal brain development enables the clinical fetal imager to identify abnormalities as they emerge.

TABLE OF CONTENTS/OUTLINE

Illustration of normal processes of fetal brain development on structural images: Single-shot T2, Steady State Free Precession, T1-VIBE. Compare and contrast cases of normal development with pathologic cases. The collection includes: holoprosencephaly, polymicrogyria, cortical malformations, ventriculomegaly, callosal dysgenesis, vermian hypoplasia, rhombencephalosynapsis, among others. Review of emerging sequences on fetal MRI and their role in characterizing brain development: T2*-weighted and DTI.

Cancer Therapy-Related Hepatic Injury In Children: An Imaging Review From the Pediatric LI-RADS Workgroup

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Cum Laude
Identified for RadioGraphics

Participants
Cara Morin, PhD, Memphis, TN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The liver is the primary organ for the metabolism of many chemotherapeutic agents, and drug-induced liver injury is common in children undergoing cancer therapy. Acute toxic effects of cancer therapy in children include cholestasis, hepatitis, steatosis, steatohepatitis, hemosiderosis, and vascular complications such as sinusoidal obstruction syndrome. Longer-term effects of cancer therapy can include fibrosis, liver failure, and focal liver lesions that can be confused for metastatic disease.

TABLE OF CONTENTS/OUTLINE

Introduction (including incidence and the effects of therapy on peri-operative morbidity)Imaging modalities Discussion of specific roles and pros/cons in childrenDescription of quantitative sequences to assess for steatosis/iron deposition Specific etiologies of liver injuryHepatitisCholestasis/biliary injuryVascular complications (e.g., SOS, PV thrombosis)0Hepatic GVHDSteatosis steatohepatitisIron depositionRadiation injuryExpected appearance of treated metastatic disease (including post-ablation)Fibrosis cirrhosisFocal liver lesions FNH-like lesions, perfusion abnormalities, metastases, etc.Diagnostic challenges of underlying steatosis/siderosisDiagnostic challenges of differentiating benign lesions from recurrent/metastatic disease

PDEE-15

Ingested Foreign Bodies in Children-How Do We Image and What To Report

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Jeong Rye Kim, MD, PhD, Cheoan, Korea, Republic Of (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Discuss the role of each imaging modality in the diagnosis of ingested foreign bodies in children2. Review the general management considerations according to the location and the opacity of foreign bodies3. Discuss imaging findings and management guidelines of specific types of ingested foreign bodies

TABLE OF CONTENTS/OUTLINE

1.How to image children with ingested foreign bodies a. First imaging step: Radiography i. Guidelines for radiographic work-up ii. Things to report iii. What if there are negative findings on radiographs? b. Second line imaging modalities: CT versus US2. General management considerations a. According to the location of FBs b. Radioopaque versus radiolucent FBs3. Imaging findings and management guidelines of specific types of ingested FBs. a. Magnets b. Battery c. Sharp FBs d. Blunt FBs (marbles, coins) e. Glass f. Water absorbent beads

Visceral Torsions and Atypical Obstructions in the Pediatric Age Group

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Ankita Chauhan, MD,MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Background Information: Children often present to the pediatric emergency department with acute abdominal pain. It is particularly challenging to assess young children as they generally show nonspecific symptoms (fussiness, lethargy, inconsolable crying). An older child can often localize the pain and describe its character. The clinical signs of volvulus often are nonspecific, and radiologists often are consulted for diagnostic evaluations. Prompt diagnosis is crucial as a delay in diagnosis will result in increased morbidity and mortality. Teaching Points: 1. To learn the pathophysiology of visceral torsions and become familiar with their classic imaging appearances. 2. To become accustomed to identifying the twist in the hollow viscus and visceral torsions. 3. To become familiar with a few atypical but essential to know presentations of bowel obstruction in children.4. To acquire a basic understanding of the radiographic obstructive bowel gas patterns.

TABLE OF CONTENTS/OUTLINE

-Goals and objectives -Background information -Anatomy - Visceral torsions (midgut volvulus, gastric volvulus, small bowel internal hernia with volvulus, small bowel intussusception with volvulus, trichobezoar with volvulus, cecal volvulus, colonic volvulus, splenic torsion) -Atypical bowel obstruction (bezoars) -Summary

PDEE-17

Imaging Approach and Radiological Pitfalls of Pediatric Gastrostomy Tube Placement

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Lauren May, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Teaching points: 1. Gastrostomy tubes are indicated for long term nutritional support, gastric decompression, or for future gastrojejunostomy conversion. 2. After placement or tube exchange, contrast can be administered through the gastrostomy to confirm intraluminal placement in the stomach. 3. Radiological technique may involve fluoroscopy by the radiologist or can be performed remotely with radiographs. 4. A checklist of findings to confirm placement includes contrast flowing dependently in the stomach away from the tube, contrast progressing to the small bowel, and visualization of the gastrostomy balloon. 5. Complications of gastrostomy tube placement include peritoneal leakage, enteric transgression, stomach perforation, buried bumper, gastric outlet obstruction, gastric or colonic cutaneous fistula formation, and gastrostomy site hernia. 6. Ultrasound and CT may be useful adjuncts for trouble-shooting challenging cases.

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline: 1. Introduction 2. Clinical indications and gastrostomy tube placement technique 3. Fluoroscopy technique to confirm tube placement 4. Limited portable radiograph technique to confirm tube placement 5. Checklist to evaluate gastrostomy tube placement on radiographs and fluoroscopy 6. Ultrasound and CT: Useful problem-solving adjuncts 7. Illustrative case examples of complications highlighting pitfalls of imaging interpretation

Typical and Not-so Typical Presentations of Childhood Intussusception

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Ankita Chauhan, MD,MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Background Information: Acute abdominal pain is a common complaint in pediatric emergency departments. Patients less than two years of age may present with inconsolable crying, fussiness, and/or lethargy, making the assessment particularly challenging compared to an older child able to localize the pain and describe its character. Intussusception's clinical symptoms are often nonspecific, and radiologists frequently perform diagnostic evaluations and therapeutic interventions. Teaching Points: 1. To acquire a basic understanding of the imaging features of intussusception with particular attention to the radiographic clues to the diagnosis. 2. To learn the pathophysiology of entero-enteric and entero-colic intussusceptions in the pediatric age group. 3. To become familiar with the atypical pathologic causes of intussusception. 4. To understand the radiologist’s role in treating intussusception and recognizing complications of the disease or its treatment. 5. To recognize potential mimics of the disease.

TABLE OF CONTENTS/OUTLINE

-Goals and objectives -Background information -Radiographic signs of intussusception - Types of intussusceptions -Management of entero-enteric intussusception -Management of ileocolic intussusception -Air enema (procedure, indications, contraindications, complications) -Mimics of Intussusception -Summary

A Tour of Biliary Disorders, Anomalies, and Malignancies in Children

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics

Participants
Curtis Simmons, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Distinct underlying genetic conditions can be made or suspected based on radiological/radiogenomic features. 2. Many congenital abnormalities can be understood from variations in embryological development. 3. While pediatric biliary malignancy is rare, rhabdomyosarcoma and cholangiocarcinoma are the two most likely entities. 4. Intra-operative cholangiograms can help visualize the biliary system not well evaluated with traditional imaging techniques. 5. The diagnosis of biliary atresia is evolving practice, with a delayed diagnosis causing a substantial increase in need for hepatic transplant.

TABLE OF CONTENTS/OUTLINE

Introduction // Embryological Development of Ducts // Congenital Gallbladder Anomalies: Gallbladder agenesis, intrahepatic gallbladder, floating gallbladder, duplicated gallbladder, septate gallbladder // Anomalous pancreaticobiliary junctions: Aberrant cystic duct insertion, aberrant biliary ducts // Cholecystic processes: Neonatal hepatitis, biliary atresia, Alagille syndrome // Congenital cystic lesions: Choledochal cysts (types 1-4), Caroli's disease, Von Meyenburg complex, polycystic liver disease, complex and simple biliary cysts // Biliary filling anomalies: Cholelithiasis, choledocholithiasis, bile plug syndrome, sickle cell related cholelithiasis // Biliary changes in systemic genetic conditions: cystic fibrosis, autosomal dominant polycystic kidney disease, autosomal recessive polycystic kidney disease // Inflammatory biliary conditions: Sclerosis cholangitis // Pediatric biliary neoplasms: Rhabdomyosarcoma, cholangiocarcinoma // Conclusion

Pediatric Cardiac Masses: Multimodality Imaging with Rad-path Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pediatric cardiac masses are rare, but it is important for radiologists to recognize these in time for initiating appropriate management. 1. To review the spectrum of cardiac masses in the pediatric population 2. To discuss the role of multimodality imaging in the evaluation of pediatric cardiac masses 3. To review optimal CT and MRI protocols of pediatric cardiac masses 4. To illustrate the imaging appearances of several pediatric masses with pathologic correlation

TABLE OF CONTENTS/OUTLINE

• Introduction • Spectrum of pediatric cardiac masses • Multimodality imaging of pediatric cardiac masses- Ultrasound, CT, MRI, Nuclear medicine, cardiac cath • Review and illustration of the following pediatric masses with case examples and path correlation where available - Benign tumors- Rhabdomyoma, fibroma, teratoma, myxoma, hemangioma, inflammatory myofibroblastic tumor - Malignant tumors- Metastases, sarcoma, lymphoma, leukemia - Non-neoplastic masses- Thrombus, Eosinophilic myocarditis, pericardial cyst, lipomatous hypertrophy of atrial septum, aneurysm, pseudoaneurysm, diverticulum, hamartomatous malformations - Anatomical variations- Prominent crista terminalis, Chiari network, taenia sagittalis, coumadin ridge

Standardized Performance of Pediatric Appendix Ultrasound for Radiologists, Clinicians and Sonographers Introduction

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Lori L. Barr, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Rationale of using a standardized exam protocol, sonographer worksheet and reporting template is explained. Identify and document the ultrasound characteristics of the normal and abnormal: appendix, right lower quadrant mesenteric fat, cecum, adjacent bowel loops, and right lower quadrant lymph nodes. Apply a standardized exam protocol to demonstrate presence or absence of primary and secondary appendicitis findings, a standardized sonographer worksheet and a standardized reporting template. Synthesize the imaging and sonographer worksheet information into a standardized report/impression that decreases the number of equivocal exams.

TABLE OF CONTENTS/OUTLINE

Welcome and Pre-training Assessment has 4 activities, welcome, introduction to how the learning portal works, pre-training assessment and acknowledgments. Pediatric Ultrasound Appendix Exam Performance has 10 interactive activities: Minimum components of a complete exam, Required Images and Cines for a Complete Exam, Completing the Standardized Sonographer Worksheet, 10 Tips to Turn an Incomplete Exam into a Complete Exam, Normal Appendix, Appendix Not Identified No Appendicitis, Acute Appendicitis Not Perforated, 5 YO with right lower quadrant pain, Acute Appendicitis Perforated and Other Pathology That Presents with Right Lower Quadrant Pain. Pediatric Ultrasound Appendix Exam Interpretation has 7 activities: What is the Difference Between a Non-diagnostic Exam and an Equivocal Report?, Why use a standardized reporting template?, Download a Standardized Reporting Template, Definitive vs. Equivocal Interpretations, How to Minimize Equivocal Studies using a Template, 12 YO with RLQ Pain, Take This Post-training Assessment

Imaging Approach to Distal Neonatal Bowel Obstruction

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics

Participants
Samantha Gerrie, MBChB, FRANZCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe a structured approach to multimodality imaging workup of distal neonatal bowel obstruction including Hirschsprung disease, functional immaturity of the large bowel, meconium ileus, colonic atresia and segmental volvulus.2. Highlight appropriate use of abdominal ultrasound (US) in specific problem solving scenarios.

TABLE OF CONTENTS/OUTLINE

1. Introduction2. Hirschsprung disease a. Presentation, types, associationsb. Radiographic finding c. Lower gastrointestinal (LGI) contrast study findings d. Pitfalls i. Total colonic Hirschsprung disease ii. Delayed or misdiagnosis in premature neonates iii. Delayed presentation in children with chronic constipation3. Functional immaturity of the large bowel a. Presentation b. Radiographic findings c. LGI contrast study findings d. Pitfalls i. Long-segment Hirschsprung disease mimicking functional immaturity ii. No clear caliber difference between right and left colon4. Meconium ileus a. Presentation, associations b. Radiographic findings c. LGI contrast study findings i. Simple meconium ileus ii. Meconium ileus complicated by segmental volvulus5. Ileal atresia a. Presentation b. Radiographic findings c. LGI contrast study findings6. Colonic atresia a. Presentation b. Radiographic findings c. LGI contrast study findings7. Segmental volvulus a. Presentation b. Radiographic findings c. US findings - "mini whirlpool" sign d. Upper and lower gastrointestinal contrast study findings8. Conclusion

Imaging Approach to Proximal Neonatal Bowel Obstruction

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics

Participants
Samantha Gerrie, MBChB, FRANZCR, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Describe a structured approach to multimodality imaging workup of proximal neonatal bowel obstruction including esophageal atresia, pyloric stenosis, duodenal atresia, duodenal web, malrotation with midgut volvulus and jejunal atresia. 2.Discuss the role of plain radiographs. 3. Discuss use of upper gastrointestinal (UGI) series and ultrasound (US) in establishing diagnosis or narrowing the differential diagnosis.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Esophageal atresia a. Types, presentation, associations b. Radiographic findings 3. Gastric/pyloric atresia a. Presentation b. Radiographic findings 4. Hypertrophic pyloric stenosis a. Presentation b. US findings i. Pylorus measurements ii. Pitfall - confusing gastroesophageal junction with pylorus 5. Duodenal atresia a. Presentation b. Radiographic findings i. Double bubble sign ii. Pitfall - Y-shaped hepatopancreatic duct anomaly 6. Duodenal web a. Presentation b. Radiographic, UGI series and US findings 7. Annular pancreas a. Presentation b. US findings 8. Malrotation with midgut volvulus a. Presentation b. Radiographic findings c. US findings i. SMA/SMV relationship ii. Position of third part of duodenum iii. Whirlpool sign d. UGI series findings i. Course of duodenum ii. Position of duodenojejunal junction (DJJ) iii. Corkscrew sign iv. Pitfalls - Abnormal position of DJJ due to extrinsic compression or displacement 9. Jejunal atresia a. Presentation b. Radiographic findings 10. Conclusion

Post-transplant Malignant Neoplasms in Pediatric Liver Transplantation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Thaise Marquez, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The objectives of this exhibit are:To review the frequency and the main types of malignancies in children post-liver transplantation, including: 1) "de novo" tumors and 2) recurrence of neoplasms in patients transplanted for oncological causes.To illustrate the aforementioned tumors with cases attended in our service.To highlight the importance of clinical follow-up in the post-transplant period, in order to diagnose neoplastic lesions at an early stage, reducing graft loss and increasing post-transplant survival.

TABLE OF CONTENTS/OUTLINE

1. Recurrence of liver tumors in pediatric patients post-transplant.Review of the transplant criteria for children with liver tumors, as well as the most common tumors that require liver transplantation.Overview of the expected prognosis and usual management of those patients.Illustrated cases of our Pediatric Radiology group.2. The occurrence of “de novo” tumors in children post-liver transplant.Post-Transplant Lymphoproliferative Disease (PTLD): definition, characteristics, risk factors, pathology, categories and radiographic features.Non-PTLD tumors: a brief mention of the main non-PTLD malignancies, focusing on Kaposi's sarcoma.Ilustrated cases of our institute, including some rare “de novo” cancers.

Staging and Restaging Pediatric Abdominal Tumors: A Practical Guide

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Luisa Faria, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The most common abdominal malignancies diagnosed in the pediatric population include neuroblastoma, nephroblastoma (Wilms' tumor), hepatoblastoma, lymphoma, germ cell tumors, and rhabdomyosarcomas. Each of these tumors has characteristic imaging findings and patterns of locoregional and distant spread. The staging systems are unique and the surgical and oncological management rely heavily on imaging evaluation. The purposes of this exhibit are: (1) to review imaging techniques and discuss the selection among imaging modalities, (2) to review the diagnostic approach of each tumor, (3) to organize the key points for determining tumor stage using a case-based approach, (4) to systematize the posttreatment response evaluation and surveillance and (5) to point out imaging findings of particular prognostic importance.

TABLE OF CONTENTS/OUTLINE

(1) Epidemiology of pediatric abdominal tumors. (2) The role of each imaging modality in staging and restaging pediatric abdominal tumors. (3) Neuroblastoma: diagnostic approach, staging, and response assessment. (4) Nephroblastoma (Wilms' tumor): diagnostic approach, staging, and response assessment. (5) Hepatoblastoma: diagnostic approach, staging, and response assessment. (6) Lymphoma: diagnostic approach, staging, and response assessment. (7) Germ cell tumors: diagnostic approach, staging, and response assessment. (8) Rhabdomyosarcoma: diagnostic approach, staging, and response assessment.

I Found a Mass in The Adrenal Region of A Neonate: Should I Be Concerned? Sonographic Findings In The Differential Diagnosis of Usual and Unusual Neonatal Suprarenal Masses

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Gabriela Pinho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: To review the normal sonographic aspect of the neonatal adrenal gland; To emphasize the importance of assessing the adrenal gland in our routine neonatal abdominal sonographic studies; To show based on cases from our Pediatric Radiology group, usual and unusual neonatal adrenal and suprarenal masses; To show the outcome of each case; To discuss risk factors and pathophysiology of the main neonatal adrenal and suprarenal masses.

TABLE OF CONTENTS/OUTLINE

Sonographic technique for the assessment of neonatal adrenal gland and suprarenal region. Usual sonographic aspects of the neonatal adrenal gland. Illustrated teaching cases from our Pediatric Radiology group showing the usual and unusual neonatal adrenal and suprarenal masses: Congenital adrenal hyperplasia associated with ambiguous genitalia and urogenital sinus demonstrated by transperineal ultrasound access; Fetal and neonatal congenital neuroblastoma; Adrenal hemorrhagic infarction: different sonographic aspects in the evolutionary stages of neonatal adrenal hemorrhage; Tips for the diagnosis of Infradiaphragmatic extralobar pulmonary sequestration associated with congenital cystic adenomatoid malformation / congenital pulmonary airway malformation by ultrasound.

Pre and Post Operative CTS: Overview of Congenital Heart Defects

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Akinori Hata, MD, PhD, Suita, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Congenital heart defect (CHD) is the leading cause of death in infancy. CHDs often need interventions for complex structural cardiovascular abnormalities. Advances in the care for patients with CHD have improved survival. For radiologists, understanding pre-and post-operative status in patients with CHD is necessary for accurate interpretation of CT imaging. The purpose of this exhibit is 1) To overview structural abnormalities in typical types of CHDs on CT; 2) To know the procedure required in CHDs; and 3) To understand the hemodynamics in pre-and post-operative status of patients with CHD.

TABLE OF CONTENTS/OUTLINE

1. Overview of the types of typical CHDs 2. Introduction of the general concepts of surgeries for CHDs (palliative procedures and single-/two-ventricle repair) 3. Pre- and post-operative CTs for typical CHDs (Atrioventricular canal defect, Coarctation of the aorta, Double-outlet Right Ventricle, Ebstein anomaly, Heterotaxy syndrome, Hypoplastic left heart syndrome, Pulmonary atresia with intact ventricular septum, Tetralogy of Fallot, Transposition of the great arteries, Tricuspid atresia, Truncus Arteriosus, etc.)

RASopathies for Radiologists: Familiarizing Radiologists With the Common Genetic Thread Linking Diseases of the Ras/MAPK Signaling Pathway

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Atsuhiko Handa, MD, Boston, MA (*Presenter*) Nothing to Disclose

TEACHING POINTS

RASopathies are a clinically defined group of genetic syndromes caused by germline mutations in genes that encode components or regulators of Ras/MAPK signaling pathway. These disorders include neurofibromatosis type 1, Noonan syndrome, Noonan syndrome with multiple lentigines (formerly called LEOPARD syndrome), capillary malformation-arteriovenous malformation syndrome, Costello syndrome, cardio-facio-cutaneous syndrome, Legius syndrome, and other allied disorders (e.g. tuberous sclerosis). As a group, the RASopathies are among the most common genetic conditions, an incidence estimated to be about 1 per 1000 live births. Because of the common underlying Ras/MAPK pathway dysregulation, the RASopathies exhibit overlapping phenotypic features. The somatic mutations involving Ras/MAPK pathway have been well studied in cancer and appears to be a promising target for molecular inhibition to treat various malignancies. Similar treatment can potentially be used to ameliorate developmental defects in other RASopathies in the future. In fact, a pathway-based multidisciplinary clinic has already been established in many institutions to address unique challenges faced by individuals and families with RASopathies. The radiologist also needs to be aware of this emerging concept to participate in multidisciplinary care. Here we present the concept and imaging review of RASopathies with an emphasis on common features.

TABLE OF CONTENTS/OUTLINE

- Concept of RASopathies - NF1 - Noonan group - Other RASopathies - Allied disorders - Future directions

Pediatric Ribs: Roadmap to Become A Rib Expert

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics

Participants
Yuko Tsujioka, MD, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Pediatric rib lesions are diagnostic challenge for three reasons. First, they may be radiologically subtle. For example, a small costal mass that grows inward may be clinically silent. An early recognition of such a lesion that is at risk for serious complications, such as hemothorax or pneumothorax, is feasible only by well-trained eyes. Meticulous searching for trivial changes is essential. Second, they are diverse. There are a variety of rib changes that can lead to a diagnosis of hidden disorders. Examples include multiple posterior rib fractures in non-accidental injury, rib notch in coarctation of the aorta, thin ribs in severe neuromuscular diseases, twisted ribs in NF1, and canoe-paddle-like ribs in mucopolysaccharidosis. Radiologists need to know these rare, but diagnostic, radiological signs. Third, there are many normal variants. Radiologists should be familiar with the innocuous variants to avoid diagnostic errors and unnecessary imaging examinations. Here we provide a comprehensive imaging review of pediatric rib abnormalities and normal variants seen on routine chest radiographs to overcome these challenges. We also provide corresponding cross-sectional images, when available, to help understand the characteristic of each rib lesion.

TABLE OF CONTENTS/OUTLINE

Introduction - Normal rib variants - Tumors and tumor like-lesions - Inflammatory disorders - Rib abnormalities pointing to hidden disease (non-accidental injury, rib notch, twisted ribs, thin ribs, thin ribs with fractures, thin ribs with abnormal patterning, short ribs, broad ribs, dense ribs)

Perils by the Sea: Radiologic Manifestations of Coastal Related Injuries and Disorders in Pediatric Patients

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Certificate of Merit

Participants
Anna Fairfax, BS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review various injuries and disorders commonly seen in pediatric patients associated with coastal related activities. 2. Discuss the clinical presentations, management, and complications of various coastal, and broader water related, injuries and disorders. 3. Showcase imaging findings of coastal and water related injuries and disorders in pediatric patients via various imaging modalities.

TABLE OF CONTENTS/OUTLINE

1. Musculoskeletal a. Retained foreign bodies (e.g., oysters shells, impaled fishing hooks, stingray spines, shark teeth) b. Animal attacks/encounters (e.g., sharks, jellyfish, stingrays, sea urchins, crabs) c. Diving trauma d. Water sports trauma (e.g., boating and propeller injuries) 2. Lungs/airway a. Barotrauma/diving related disorders b. Aspiration of foreign bodies (e.g., shells and seafood) c. Drowning sequelae/pulmonary edema d. Laryngeal edema secondary to marine envenomation e. Hypersensitivity pneumonitis related to red tide 3. Neuro a. Anoxic brain injury secondary to drowning b. Trauma related to water sports and diving c. Barotrauma/diving related disorders 4. GI/abdomen a. Infection (I.e., Vibrio species) b. Water sports trauma

PDEE-35

Imaging Evaluation of The Post-surgical Foot and Ankle in Children

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Emilio Inarejos Clemente, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

After reviewing this exhibit, the learner should be able to:1. To discuss the most frequent pediatric disorders involving the foot and ankle that may require surgery2. To illustrate the imaging findings of the post-surgical evaluation of the foot and ankle in different modalities3. To describe the most frequent normal variants that may lead to misdiagnose

TABLE OF CONTENTS/OUTLINE

1. Technique: indications and protocols of the different imaging modalities in the post-surgical setting.2. Illustrate the post-surgical imaging evaluation of the most frequent pediatric disorders involving the foot and ankle:2.1. Congenital: congenital clubfoot, vertical talus, metatarsus adductus, tarsal coalition. Value of US and radiographs.2.2 Traumatic: osteochondral lesions, fractures, ligamentoplasty2.3. Infection secondary to surgery2.4. Benign tumors: aneurysmal bone cyst, osteoid osteoma, condroblastoma, osteochondroma, pigmented villonodular synovitis2.5. Malignant tumors: Ewing sarcoma, osteosarcoma. soft tissue sarcomas. Use of multiparametric MRI evaluation and DWI.3. Describe the most frequent normal variants involving the pediatric foot that may lead to misdiagnose: Hematopoietic marrow, bone marrow edema, Stieda process4. Conclusion

Role of Whole-body Magnetic Resonance Imaging In Pediatric Musculoskeletal System: Aside From Tumors

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Joao Pedro Costa, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

I) To review the main applications of whole-body magnetic resonance imaging (WB-MRI) focused on non-neoplastic musculoskeletal conditions in pediatric population.II) To discuss and present the technical aspects and WB-MRI protocol used in our pediatric radiology department including main limitations.III) To illustrate with clinical cases the use of WB-MRI to assess and follow musculoskeletal diseases in children.IV) To correlate imaging information given by WB-MRI with the clinical and laboratory data and compared with other imaging modalities.

TABLE OF CONTENTS/OUTLINE

1. Introduction: performance and applications of WB-MRI in the evaluation of pediatric musculoskeletal non-neoplastic diseases; discuss WB-MRI protocols, with not only the advantages but also with current limitations in comparison with different imaging methods.2. Illustration of WB-MRI exams performed in our pediatric radiology department for diagnostic and follow-up evaluation of different musculoskeletal conditions: chronic recurrent multifocal osteomyelitis; pyogenic osteomyelitis; inflammatory myopathies; drug-induced myopathies; neuromuscular myopathies; fever of unknown origin; searching for rheumatologic inflammatory conditions.

Intra-articular Osteoid Osteomas: Imaging Characteristics and Mimickers

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Magna Cum Laude

Participants
Jade Iwasaka-Neder, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

o Intra-articular osteoid osteomas (OOs) are rare and may pose a diagnostic challenge to radiologists, as they sometimes mimic other pathologies such as arthritis, stress fracture, avascular necrosis, osteomyelitis, and osteochondral lesions.o Although intra-articular OO may involve any joint, the majority of cases are localized to the hip.o Imaging findings of intra-articular OOs include focal edema, joint effusion and synovitis. However, these lesions often lack the usual reactive sclerosis and periosteal new bone formation, making their diagnoses more difficult.o CT scan is the best imaging modality to identify the nidus of the OO, and is particularly useful for treatment planning.o Na-F PET/CT can confirm the diagnosis of OO in equivocal cases.

TABLE OF CONTENTS/OUTLINE

o Typical imaging findings of extra-articular OOo Imaging findings of intra-articular OO§ Imaging modality• Radiograph• MRI• CT• Bone scan• Na-F PET/CT§ Anatomical locations• Elbow• Wrist• Acetabulum• Femoral head and neck• Knee• Ankle• Tarsal boneso Differential diagnoses and mimickers§ Stress fracture§ Osteomyelitis with or without Brodie abscess§ Osteochondritis dissecans§ Osteomyelitis§ Arthritis§ Chondroblastoma§ Synovial cyst§ Normal variants (e.g. supra-acetabular fossa)

Whole-body MRI in Pediatric Musculoskeletal Diseases: Clinical Applications and Technical Considerations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Andre Mannato, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

Discuss technical developments of WBMRI in musculoskeletal pediatric diseases, including acquisition and post-processing, as well as to propose an imaging protocol. Review the clinical applications of WBMRI in various disorders that involve the musculoskeletal system in children, especially in the oncology and rheumatology fields, exploring the typical and atypical imaging findings of each. Explore the role of WBMRI as a valuable imaging method for diagnosis, assessment of disease extent and follow-up, highlighting its advantages in comparison to standard imaging evaluation, specifically as they relate to the pediatric population.

TABLE OF CONTENTS/OUTLINE

In the last decades, WBMRI has emerged as a promising imaging method in musculoskeletal diseases, allowing a wide coverage assessment of bone and soft tissue in a single study. WBMRI is especially advantageous for the pediatric population since it avoids redundant examinations and exposure to ionizing radiation in patients who often undergo long-term surveillance. Also, due to patient's size, the examination can be performed with faster protocols and provide high quality images.For rheumatic and oncological diseases, WBMRI can have a large impact in diagnostic and follow-up workup of many pathologies such as chronic nonbacterial osteomyelitis, dermatomyositis, arthritis, tumor screening in cancer predisposition syndromes, evaluation of primary tumor, further investigation of distant lesions and other clinical applications. The development of new techniques and protocols makes WBMRI increasingly faster, safer and more accessible, and it is important for referring physicians and radiologists to recognize the role of this imaging method.

PDEE-39

Fast MRI: MSK Applications in Adults and Children

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Joey Gu, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Gain a foundational understanding of the physics behind accelerating MR image acquisition and the various techniques currently in use2. Discern the benefits and limitations that accelerated MRI offers for patients, providers, and healthcare systems3. Recognize the specific clinical applications, in both an adult and pediatric populations, for fast MR examinations of the shoulder, spine, hip, knee, and ankle

TABLE OF CONTENTS/OUTLINE

What is Fast MRI?- MR physics of accelerating image acquisition- Overview of various acceleration techniques--Fast spin-echo, turbo spin-echo--High gradient performance modes--Undersampling: matrix resolution/partial Fourier phase--Interpolation of matrix resolution--Fast radiofrequency pulses, high receiver bandwidth--Advanced techniques (PI, SMS, synthetic techniques, etc.)Why Use Fast MRI?- In adults--Efficiency of examinations (high volume of adult MSK MRI exams)--Reduce artifact from hardware/implants--Reduce motion artifact- In children--Decrease need for sedation--Reduce motion artifactMSK applications of Fast MRI (for each anatomical area of interest, disease processes evaluated, diagnostic accuracy, and imaging appearances will be covered)- In adults (shoulder, spine, hip, knee, ankle)- In children (knee, spine, infection)Limitations of Fast MRI - Medicolegal implications- Lack of studies demonstrating efficacy for various clinical applications

Cardiac Evaluation in Pediatric Chest Radiographs: Back To the Future With CT/MRI Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

The last decade has seen tremendous growth of CT/MRI for evaluation of cardiac disorders. The humble chest radiograph still plays a key role, and it is important to interpret it accurately. The aim of this exhibit is 1. To discuss an approach to the interpretation of cardiac abnormalities in pediatric chest radiographs 2. To correlate radiographic cardiac abnormalities with CT/MRI appearances 3. To review common misses and pitfalls in radiographs

TABLE OF CONTENTS/OUTLINE

1. ROLE OF IMAGING IN CARDIAC DISEASES 2. ROLE OF CHEST RADIOGRAPH in pediatric cardiac disease 3. ENLARGED CARDIAC SILHOUETTE- Cardiomegaly- Criteria; Individual chamber enlargement; Pericardial effusion- double oreo cookie sign 4. PULMONARY VASCULATURE- Arterial, venous, edema 5. ALGORITHMIC APPROACH TO DIAGNOSIS OF CONGENITAL HEART DISEASES CYANOTIC HEART DISEASE A. Decreased blood flow - Normal size heart- TOF; Big heart- Ebstein, pulmonary atresia with intact septum B. increased blood flow - TGA- Egg-on-string; TAPVR- Snowman; Truncus- Right arch Single ventricle C. Pulmonary edema - Normal size heart- TAPVR infracardiac; Big heart- hypoplastic left heart ACYANOTIC HEART DISEASE A. Increased arterial flow- Normal LA- ASD; Large LA , normal aortic knob- VSD; Large LA and aortic knob- PDA B. Increased venous flow- Cardiac failure C. Normal flow- AS, Coarctation 6. OTHER FINDINGS -Box-shaped heart- Ebstein's; Boot-shaped- TOF; Wall-to-wall heart- Ebstein, pericardial effusion; Figure-of-3, rib notching- Coarctation; Scimitar sign- PAPVR; Asymmetric main, left PA enlargement- Pulmonic valve stenosis; 7. APPROACH TO VASCULAR RING/SLING- Tracheal and esophageal impressions. 8. PROSTHETIC VALVE EVALUATION 9. PITFALLS/MISSES

Update On the Radiological Approach of Musculoskeletal Pediatric Infections: From Classical to Challenging Cases

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Stephanie Takara, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

I) Review the main types of musculoskeletal infections and their particularities in children (epidemiology, etiology and pathophysiology), based on cases of our pediatric radiology department in correlation with clinical, laboratory and anatomopathological data.II) Discuss the use and indication of each imaging modality for the different types of musculoskeletal infections and purpose a diagnostic investigation flowchart.III) Present the main imaging findings, advantages and limitations of imaging modalities.

TABLE OF CONTENTS/OUTLINE

1. IntroductionThe importance of imaging exams for an early and correct diagnosis of pediatric musculoskeletal infection.The main uses of each imaging method.2. Spondylodiscitis and intradural infectionsEpidemiology and pathophysiologyThe role of each imaging method and imaging findings3. OsteomyelitisPathophysiologyThe role of each imaging method and imaging aspectsChronic findings and sequelae4. Septic arthritisEpidemiology and pathophysiologyThe role of each imaging method and imaging findings5. Soft tissue infectionEpidemiology and pathophysiologyThe role of each imaging method and imaging findings

Clavicular Pathologies in the Pediatric Age Group: A Pictorial Review

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Ankita Chauhan, MD,MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Background Information: The clavicle connects the upper extremity to the axial skeleton. It is the first bone to ossify in the fetus. Epiphysis of the clavicle, however, is the last to ossify and fuse in adult life. The most common lesions of the clavicle are traumatic. Nontraumatic lesions of the clavicle are rare, more so in the pediatric age group. Radiologists need to know pathologies affecting the clavicle and their imaging appearance. Considering patient age, clinical symptoms, and other associated imaging findings can help make the correct diagnosis. Teaching Points 1. To discuss the development and normal anatomy of the clavicle. 2. To discuss various congenital (or developmental), traumatic, metabolic, infective, inflammatory, or benign and malignant neoplastic pathologic processes that can involve the clavicle. 3. To illustrate the imaging spectrum of clavicular pathologies in the pediatric age group. 4. To discuss various radiological features that can help make the correct diagnosis.

TABLE OF CONTENTS/OUTLINE

-Goals and objectives -Background information -Anatomy -Pathologic entities (fracture, pseudoarthrosis, infantile cortical hyperostosis (Caffey disease), hyperparathyroidism, cleidocranial dysostosis, chronic recurrent multifocal osteomyelitis, benign bone tumors such as unicameral bone cyst, aneurysmal bone cyst, malignant bone tumors, metastasis) -Summary

Multimodality Imaging of Pediatric High Flow Vascular Malformations in the Brain and Spine

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Amanda Baker, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Goal: To review multimodality imaging in the diagnosis and treatment of pediatric high flow vascular malformations in the brain and spine. Specifically, the exhibit will pinpoint features on US, CT, MRI, and catheter angiography that will allow the radiologist to accurately diagnosis the type of malformation and describe its characteristics.

TABLE OF CONTENTS/OUTLINE

Review diagnostic algorithms to aid in the classification of pediatric high flow vascular malformations in the brain and spine:Brain:1. Nidal arteriovenous malformations2. Dural arteriovenous fistulae.3. Non-galenic pial arteriovenous fistulae.4. Vein of Galen malformations.Spine:1. Epidural spinal arteriovenous fistulae.2. Dural spinal arteriovenous fistulae.3. Perimedullary spinal arteriovenous fistulae.4. Spinal arteriovenous malformations.

Imaging Approach to Hypomyelinating Leukodystrophies (HLDs)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Prateek Malik, MD, Toronto, ON (*Presenter*) Nothing to Disclose

TEACHING POINTS

Hypomyelinating leukodystrophies (HLDs) are a rapidly expanding subgroup of inherited white matter disorders characterized by a permanent and substantial deficit in myelin. More than 50 genes are now linked with HLDs, the vast majority being discovered over the last 15 years. Since the first description of Pelizaeus-Merzbacher disease (PMD) in 1910, the understanding of white matter disorders and the key cellular players has improved tremendously. We discuss an updated review of the understanding of normal myelination, key terminologies in HLDs and provide a stepwise methodology in assessment of HLDs determined by key radiological findings.

TABLE OF CONTENTS/OUTLINE

1. Normal myelination - Neurobiology: Key players and myelin maintenance - Imaging normal myelination: key MRI changes, normal milestones and development of key structures - Pitfalls and caveats: Variable signal, permanent deficit Vs myelin stability, corrected gestational age 2. Hypomyelinating leukodystrophies (HLDs) - Updates in classification of white matter disorders including HLDs - Key terminologies - Stepwise approach to assessing HLDs: • Determining key pattern • Assessing for ABCDs • Assessing sub-patterns and clinical clues • Imaging differentials for specific patterns • Alternate imaging phenotypes

PDEE-44

Radiomics for Predicting Tumor Immune Profile of Pediatric Glioma

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Nastaran Khalili, MD, MPH, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Central nervous system (CNS) tumors are the leading cause of cancer-related death in children. Glioma accounts for more than half of pediatric CNS tumors. Complete resection is the mainstay of therapy but is not feasible for deeply seated or highly infiltrative tumors. Hence, immunotherapeutic approaches are being increasingly applied in pediatric glioma. The immunological profile of the tumor microenvironment (TME) is regarded as a powerful tool for predicting tumor behavior and determining response to immunotherapy. Radiomics, which is the automated high-throughput extraction and processing of quantitative imaging based on intensity, shape, volume, and textural features provides insight into the underlying immunobiological processes within the TME. The purpose of this exhibit is to discuss how this non-invasive method facilitates the categorization and risk stratification of patients based on their tumor immune profile and to describe the role of radiomics in advancing personalized, patient-tailored therapy for pediatric glioma.

TABLE OF CONTENTS/OUTLINE

1. Brief review of the pathophysiology, prognosis, and current treatments for pediatric glioma. 2. Basic principles of radiomics and its role in understanding tumor immune biology. 3. Correlation between radiomics features, immune biomarkers and clinical outcomes in glioma according to existing literature. 4. Current challenges and future directions for the application of radiomics in the immune characterization of pediatric glioma.

PDEE-45

Diffusion-weighted Imaging Patterns in Pediatric Neurometabolic Disorders

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Caleb Epps, MD, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The aim of this exhibit is to increase understanding of diffusion weighted-imaging patterns in pediatric neurometabolic disorders to improve diagnostic accuracy and characterization. By the end of this exhibit, the viewer should be able to recognize general DWI patterns and internalize a simplistic practical approach to pediatric neurometabolic disorders.

TABLE OF CONTENTS/OUTLINE

Pediatric neurometabolic disorders encompass an immense group of diseases that are diagnostically challenging for both clinicians and radiologists. Though they are rare individually, collectively they remain a source of significant pediatric morbidity. Though simple classification is problematic, one classification schema includes disorders of toxic accumulation, energy metabolism, complex molecules, and unique pathophysiology. Accurate and timely diagnosis is crucial as treatment depends on the underlying pathophysiology. Good clinical outcomes are associated with earlier intervention in some disorders. Cytotoxic, excitotoxic, and intramyelinic cerebral edema are pathologic processes common in many neurometabolic disorders and manifest on DWI. DWI signal abnormalities can be grossly categorized into white matter-dominant, peripheral gray matter, and deep gray matter. Of note, the practicality of this model compensates for its lack of specificity given that some disorders may demonstrate overlapping patterns. Though the work up of pediatric neurometabolic disorders largely remains a multi-disciplinary effort, an improved understanding of DWI patterns in pediatric neurometabolic disorders can facilitate timely diagnosis and help reduce long term morbidity.

An Imaging Review of Pediatric Monogenetic CNS Vasculopathy with Genetic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics

Participants
Neetika Gupta, MBBS, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review the current literature on rare genetic causes of CNS vasculopathy in children.2. Describe the CNS and extra-CNS imaging findings in various genetic pediatric CNS vascular disorders3. Discuss the role of conventional imaging modalities and advanced imaging sequences in the diagnosis and prognosis of cerebral vascular disorders. 4. To emphasize the diagnostic and prognostic role of neuroimaging in the evaluation of pediatric monogenetic vascular disorders.

TABLE OF CONTENTS/OUTLINE

1. Comprehensive discussion of the various monogenetic disease resulting in CNS vascular disorders in children.2. Identify and familiarize with the salient imaging features of rare genetic pediatric CNS vasculopathy that could help in the diagnosis and narrow the differentials.3. Recommend a clinico-radiological approach pertinent genetic workup for the systematic evaluation of these rare genetic pediatric CNS vascular disorder 4. Identify the genetic causes imperative to reach a final diagnosis and guide the appropriate treatment.

Advanced Imaging Evaluation of Pediatric Language Pathways: Where Do We Stand

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Monica Rebollo Polo, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- Review the major language pathways and their development in children from newborns to older children evaluated with advanced neuroimaging (DWI, fMRI) - - Show the areas of activation related to language evaluated with resting state functional Magnetic Resonance (rsfMRI) - Task evaluation of language (presurgical language lateralization assessment) - Clinical indications of imaging language assessment -Show pathology that interferes with normal language pathways development

TABLE OF CONTENTS/OUTLINE

- Language pathways overview with deterministic and probabilistic tractography (arcuate fasciculus, uncinate fasciculus, inferior front-occipital fasciculus, inferior longitudinal fasciculus, frontal aslant tract) - Maturation and development of the language pathways - Dorsal and ventral language pathways representing auditory-motor integration and auditory-conceptual mapping - Rs fMRI language networks - Task evaluation of language (antonym generation, sentences completion, object naming, passive story listening) - Clinical examples (presurgical assessment in brain tumors, language lateralization in epilepsy, language pathways anomalies) Clinical entities that affect language pathways (prematurity, congenital infections, malformations of cortical development)

Vertebral Artery Dissection in Children

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Stephen B. Little, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Vertebral artery dissection (VAD) is the most common cause of isolated posterior circulation arterial ischemic stroke (PCAIS) in children. Posterior circulation infarcts due to VAD are often multifocal, occasionally of varying age, and may be associated with abrupt intracranial (downstream) arterial occlusions. 2) Extracranial VAD in children most often involves the proximal V3 segment. This portion of V3 is short, often transversely oriented, located in close proximity to bone and surrounded by fat and a periarterial venous plexus. Cervical vascular imaging protocols should take these challenging anatomic features into consideration. 3) VAD is often missed on clinically performed 2D TOF MRA and CE-MRA of the neck. In our experience, 3D TOF MRA or CTA of the neck are more reliable vascular imaging alternatives for VAD in children. 4) At presentation, extracranial VAD in children is most often characterized by segmental stenosis or occlusion at the C2 level, CASCADE 4a (3). Vertebral artery pseudoaneurysm (CASCADE 4a (1)) is less frequent and may be present at initial diagnosis or at follow-up. Intimal flap, double lumen and wall hematoma are infrequent findings on CTA or MRI/MRA. 5) Potentially pathogenic osseous anomalies are not uncommon and are best demonstrated on CT/CTA. 6) Digital subtraction angiography (DSA) with head turning may reveal dynamic vertebral artery compression but management is controversial.

TABLE OF CONTENTS/OUTLINE

1. Stroke Patterns in VAD 2. Intracranial Vascular Findings in VAD 3. Extracranial Vascular Findings in VAD 4. Osseous Anomalies in VAD 5. Protocols - Optimizing MRA and CTA for Diagnosis of VAD in Children

Imaging Diagnosis of Hydrocephalus and Ventricular Enlargement in Fetuses and Children

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Certificate of Merit

Participants
Hirozumi Mori, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

There are a wide variety of causative diseases that indicate hydrocephalus and ventricular enlargement during fetal and childhood, but first, a hint for differentiation can be obtained by classifying the mechanism.By picking up the findings in more detail in the classification and examining whether the causative disease is single or combined, more accurate diagnose is possible.This time, We will explain how to pick up the findings and recent topics related to diseases.

TABLE OF CONTENTS/OUTLINE

•The criteria for diagnosing hydrocephalus and ventricular enlargement during the fetal period are shown.•We will classify the causative diseases of hydrocephalus and ventricular enlargement in the fetal and childhood and outline them.1.CSF circulation dsorders-Posterior fossa malformation-Hereditary disease-Meningitis-Tumor-Cerebral hemorrhage2.Encephaloclastic disorder-Cerebral Ischemia-Congenital infection3.Encephalodysplasia-Neuronal migration disorders-Cerebral Hemisphere separation disorders•In particular, We will explain in detail about congenital malformations.1.Posterior fossa malformation-Dandy-walker cyst-Blake's pouch cyst-Subarachnoid cyst-Arnold-chiari malformation2.Neuronal migration disorders3.Cerebral Hemisphere separation disorders-Holoprosencephaly-Callosal anomaly

Examination of The Optimal Imaging Method for 3D-CT After Fontan Procedure

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Norihiko Okamoto, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In 3D-CT after Fontan procedure, laminar flow of contrast agent caused by Fontan circulation occurs, which makes it difficult to accurately diagnose the presence or absence of thrombus. Also, the CT number required for 3D-imaging cannot be obtained. In addition, since it is necessary to diagnose Fontan-associated liver disease, multiphase CT scanning is unavoidable and the radiation dose increases. In order to solve this problem, we considered the optimal imaging method. We analyzed past clinical cases. Next, we prepared a tube simulating a blood vessel, injected a two-step diluted contrast agent (opposite ratio) into it, and performed CT scanning on it. The inside of the tube became uniform when the contrast agent and saline were injected at a ratio of 7 to 3/3 to 7. By monitoring the conduit immediately after systemic circulation, it became possible to easily determine the scan timing. At this scan timing, the occurrence of laminar flow was suppressed, and the CT number was sufficiently obtained. In addition to that, it is now possible to diagnose Fontan-associated liver disease. The double-concentration injection method (7 to 3/3 to 7 ratio) made it possible to simultaneously diagnose multiple findings after the Fontan procedure in one phase, and reduced the radiation dose.

TABLE OF CONTENTS/OUTLINE

1. Clinical problems in 3D-CT after Fontan procedure. 2. Analyze past clinical cases. (Laminar flow) 3. Examination of contrast agent injection method. 4. Optimization of CT scanning. 5. Verification of clinical efficacy.

Neuroimaging of Neonatal Stroke: Venous Focus

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Lilian Lai, MD, Iowa City, IA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Perinatal stroke is common and can result in lifelong morbidity. Perinatal stroke can be divided into arterial or venous ischemic stroke and hemorrhagic stroke (typically involving full-term neonates). Arterial ischemic infarcts can be recognized by their arterial distribution, but concurrent hypoxic ischemic injury can complicate interpretation. Less well recognized and under-diagnosed are venous infarcts. The majority of pediatric cerebral sinovenous thrombosis occurs in the neonatal period, and neonates may be more susceptible to venous thrombosis given their incomplete development of alternative indirect pathways of venous drainage. Hemorrhagic infarcts can be due to a myriad of causes and may require MR venogram or angiogram for further evaluation. This exhibit will review imaging patterns of perinatal stroke, with focus on neonatal venous thrombosis.

TABLE OF CONTENTS/OUTLINE

1) Ischemic arterial perinatal stroke and potential mimics 2) Arterial versus venous drainage pathways and infarct patterns 3) Embryology and anatomy of cerebral venous system: emphasis on medullary and subpial veins 4) Cerebral venous thrombosis including dural venous sinus and cerebral vein thrombosis; medullary vein thrombosis (stand-alone or in association with intraventricular hemorrhage in premature and full-term neonates; subpial hemorrhage due to superficial subpial venous congestion 5) Hemorrhagic infarcts 6) Imaging techniques for perinatal stroke evaluation 7) Treatment and clinical implications of arterial/venous thrombosis

Pediatric Brain MRI: Normal For Age or Subtle Pathology?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Anvita Pauranik, MD, FRCPC, VANCOUVER, BC (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To elucidate the difference between age-related changes and subtle pathology in pediatric brain MR studies2. To understand the spectrum of normal variants in a developing brain.

TABLE OF CONTENTS/OUTLINE

1. PARENCHYMA. Unmyelinated white matter versus edema in newborn. Normal T1 hyperintense basal ganglia versus hypoxic injury. Terminal zones of myelination versus white matter injury. Dorsal pontine tegmentum: normal hyperintensity versus encephalitis. Central tegmental tract hyperintensity- maturational signal versus metabolic etiology. Normal diffusion anisotropy of corticospinal tracts in newborn versus mild HIE. Peri-dentate hyperintensity-normal versus pathological. (Krabbe, LCH). Prematurity versus abnormal sulcation. Temporal pole-unmyelinated white matter versus Focal cortical dysplasia. SWI: deep gray abnormal mineralization. 2. VENTRICLES: developmental asymmetry versus dysmorphism. Perivascular spaces- normal distribution versus genetic etiology, overgrowth syndrome. Deep sulci: developmental asymmetry versus bottom of sulcus dysplasia. BESSI versus Glutaric aciduria, Abusive head injury. 3. MIDLINE: Cerebellar tonsils-normal variant tonsillar descent versus Chiari 1 deformity. Normal thinning at isthmus versus focal white matter loss. Commissural dysmorphism, abnormal thickening. InterHypothalamic adhesion versus hypothalamic hamartoma. Cysts: incidental versus pathological. PDH deficiency, Zellweger. Retrocerebellar CSF space- variant versus abnormal. Pineal gland- spectrum of cysts. Sella: Pars intermedia remnants versus craniopharyngioma. Marrow signal: clivus heterogeneity

What You Know About Rolling In the Deep: Pediatric Inflammatory and Infectious Conditions Involving the Thalami and Basal Ganglia in COVID Times

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Kevin Oh, MD, Suwanee, GA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Introduce common and uncommon pediatric infectious and inflammatory disorders involving the bilateral thalami and/or basal ganglia using a case based approach to include etiologies relevant during the COVID pandemic. For example, acute disseminated encephalomyelitis including MOG antibody disease, acute necrotizing encephalopathy of childhood including that related to COVID-19, and viral encephalitis. 2. Discuss pathology, common imaging findings, and selected treatments for these patients.3. Discuss briefly differential diagnoses to consider for bilateral thalamic/basal ganglia lesions, such as metabolic disorders and neoplasms.

TABLE OF CONTENTS/OUTLINE

1. Introduction to pediatric infectious/inflammatory lesions in the basal ganglia and thalami. 2. Case based review of interesting cases within this category: Case presentation; Appropriate labs/pathology studies; Short description of the pathology/pathophysiology of the disease entity; Case images with explanation of common imaging features; Appropriate treatment if indicated; Prognosis. 3. Review of differential diagnoses that can mimic these appearances, such as metabolic (gangliosidosis), ischemic, and neoplastic processes (glioma) involving the bilateral thalami and/or basal ganglia.

What Now? Ultrasound or Computed Tomography? Decision Making Flowchart for Pediatric Head Trauma (PHT) and Birth Related Head Injuries (BRHI)

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Gabriela Pinho, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purposes of this exhibit are: to review the anatomy of the layers of the scalp; To discuss the main sonographic findings of pediatric head trauma (PHT) and birth related head injuries (BRHI); To gain awareness of the frequency of computed tomography (CT) performed after PHT and BRHI in our service, and critically analyze its impact on patient's management; To propose a decision-making flowchart for the diagnostic management of initial assessment of PHT and BRHI focusing on the role of ultrasound (US) as an initial diagnostic tool.

TABLE OF CONTENTS/OUTLINE

Anatomy of the scalp, skull and meninges; Risk factors for BRHI; Main indications of cranial ultrasound; Main types of injury observed after PHT and BRHI; Decision making flowchart for diagnostic management after PHT or BRHI: US or CT? Illustrative cases from our Pediatric Radiology group showing the properconducts; Critically analyze the frequency of computed tomography performed after PHT and BRHI, and evaluate its impact on patient's management in our service.

Pediatric Leukemia: How Can We Help?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Maria Trujillo Ariza, MD, Villagarcia de Arosa, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Leukemia is the most common malignancy during childhood, is a multisystemic disease, as radiologist we don't play and important role at diagnosis but we must be aware of the possible imaging findings at the beginning of the disease, possible treatment complications and relapse:- To describe the typical imaging findings at diagnosis.- To summarize the imaging findings of possible complications during treatment.- To review the imaging findings that suggest relapse.

TABLE OF CONTENTS/OUTLINE

- Epidemiology and presentation of Pediatric Leukemia: Acute Lymphoblastic Leukemia (ALL) vs Acute Myeloblastic Leukemia (AML).-Utility of imaging techniques: x-ray, US, CT and MRI.- Imaging findings: at diagnosis, of treatment complications (short and long term) and in case of relapse.

PDEE-55

Diagnosing VHL Disease By Understanding Morphology from Pathophysiology: What Radiologists Can Learn From The Nobel Prize

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Sho Koyasu, MD, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The essence of the pathogenesis in VHL disease is the accumulation of the transcription factor HIF in cells with mutations in the VHL gene throughout the body, resulting in increased viability and tumorigenesis. This was highlighted by the Nobel Prize in Physiology or Medicine in 2019. VHL-associated tumors overexpress downstream genes of HIF, resulting in hypervascularization, clear cytoplasm, disrupted cell polarity, and cilia dysfunction. These characteristics can be observed from imaging of VHL-associated tumors throughout the body, with tumors showing strongly enhanced regions accompanied by cyst formations of various sizes. In clinical practice, the role of the radiologist becomes even more important after the diagnosis of VHL disease is made. In collaboration with other departments, it is necessary for radiologists to distinguish tumors that need to be treated from others. It is also important to be aware that there are some potential imaging pitfalls. The purpose of this exhibit is: 1. To introduce the history and molecular mechanisms of VHL disease. 2. To discuss the relationship between pathophysiology, morphology, and imaging findings. 3. To present images of common and uncommon VHL disease-related tumors. 4. To help the audience better understand problematic situations related to VHL disease in actual practice.

TABLE OF CONTENTS/OUTLINE

1. The history of VHL disease, including the discovery, the Nobel Prize, and the new drug approved by the FDA last year. 2. Discussion of imaging findings of VHL-related tumors from molecular mechanisms. 3. Explanation of common as well as rare VHL-related tumors from a morphological perspective. 4. Review of representative cases that are difficult to differentiate.

Imaging Spectrum of Rhabdoid Predisposition Syndrome with underlying SMARCB1 and SMARCA4 Mutations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Ayat Yousef, MBBS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. List the manifestations of Rhabdoid tumor predisposition syndrome (RTPS) associated with SMARCB1 and SMARCA4 mutations in children. 2. Describe the imaging characteristics of rhabdoid tumors, specifically atypical rhabdoid teratoid tumors according to their molecular subtype. 3. Discuss the proposed imaging protocol for surveillance and post treatment assessment in RTPS.

TABLE OF CONTENTS/OUTLINE

Inactivation of the tumor suppressor gene SMARCB1 or rarely SMARCA4 is the hallmark of several types of tumors. Patients with SMARC mutations have a high risk of developing synchronous and multifocal rhabdoid tumors (RTs) in early life as a part of rhabdoid tumor predisposition syndromes (RTPS). Other tumors with germline SMARC mutations include cribriform neuroepithelial tumor (CRINET), schwannoma, meningioma, renal cell carcinoma, malignant peripheral nerve sheath tumor and ovarian cancer. RTs frequently arise in the central nervous system, known as atypical teratoid rhabdoid tumor (ATRT). Recently three molecular sub-types of ATRT have been described, each having location tendency and imaging characteristics. The second most common extra-cranial location is rhabdoid tumors of the kidneys (RTK) followed by other locations in the head and neck, liver and rest of the body grouped under extra-renal malignant rhabdoid tumors (ERMRT). Dedicated MRI is the main modality of choice for characterizing rhabdoid tumors and post treatment changes. Other studies like US abdomen, CT and whole-body MRI can be used for metastasis and surveillance in RTPS. Understanding the different imaging manifestations of SMARC mutation can play a pivotal role in disease detection, surveillance and management approach.Please visit the Learning Center to also view this presentation in hardcopy format.

PDEE-57

Imaging Guidelines for Common Pediatric Abdominal Tumors

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Zoe Winston, MBBS, Manchester, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review of international imaging guidelines for paediatric abdominal tumours including renal, adrenal gland and liver tumours.2. Literature review of the advantages and disadvantages of MR compared to CT imaging in paediatric abdominal tumours3. Explore case examples of paediatric abdominal tumours, comparing multimodality imaging and also documenting findings from local experience

TABLE OF CONTENTS/OUTLINE

CT and MR imaging are both used for the diagnosis of common paediatric abdominal tumours. There are differing guidelines internationally for imaging paediatric abdominal tumours. The International Society of Paediatric Oncology (SIOP) and Children's Cancer and Leukaemia Group (CCLG) provide guidelines in Europe and the UK, and the Children's Oncology Group (COG) in North America. A literature review will provide an overview of the international guidelines for imaging of common paediatric abdominal tumours, exploring the advantages and disadvantages of MR and CT evaluation of paediatric abdominal tumours with review of relevant case-based imaging.

Retinoblastoma: Standardized Imaging Protocols and Reports with Relevance to Current Staging and Treatment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Vivek Pai, MBBS,MD, Toronto, Singapore (*Presenter*) Nothing to Disclose

TEACHING POINTS

Retinoblastoma (RB) is the most common primary intraocular tumor of childhood. Diagnostic techniques and treatment have evolved rapidly over recent years. Accurate staging is key in initiating appropriate treatment for patients with RB, thereby maximizing survival and preserving vision potential. The aims of this educational exhibit are: 1. Review current standards of ocular and radiological imaging utilized in the staging of retinoblastoma. 2. Define the role of imaging in the clinical differentiation of the various stages of RB. 3. Discuss the importance of multimodal imaging in the assessment of the true clinical stage of the disease. 4. Suggest potential standard fields of reporting which are essential for the staging of children with RB.

TABLE OF CONTENTS/OUTLINE

1. Discussion on clinical and multimodal imaging evaluation in patients with RB 2. Discussion and development of imaging protocols and the importance of imaging in guiding treatment decisions. 3. Demonstrate multimodal images that describe: a) Anterior segment involvement, b) Vitreous and subretinal seeds, c) Intraocular hemorrhage, d) Choroidal invasion, e) Scleral and episcleral involvement, f) Optic nerve invasion, g) Trilateral lesions and intracranial involvement. h) Ophthalmic artery variants that impact chemo-embolization 4. Checklists and standardized reports

Complications After Pediatric Stem Cell Transplant: From Head to Toe

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Luisa Faria, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The number of disorders in the pediatric age group that benefit from hematopoietic stem cell transplantation (HSCT) is increasing. Nowadays, HSCT is being used for the treatment of leukemia, benign hematologic disorders, autoimmune diseases, certain genetic diagnoses, some forms of lymphoma, and even solid tumors. As a result of the expanding indications, there has been a year-to-year increase in the number of transplantations. Given this scenario, imaging plays a key role in the timely diagnosis of possible complications. The purposes of this multicentric educational exhibit are: (1) to understand the basic principles of HSCT and indications of this procedure in children, (2) to review the predictable timeline of immune suppression after HSCT (3) to systematize the main complications after HSCT in children, based in a multi-institutional experience in pediatric imaging.

TABLE OF CONTENTS/OUTLINE

(1) Review of the basic principles of HSCT, (2) Classical and novel indications of HSCT in children, (3) Timeline of immune suppression after HSCT and the expected infectious and non-infectious complications in each phase, (4) Case-based approach to the main complications following HSCT in each body segment, combining the clinical scenario with characteristic imaging findings: central nervous system, head and neck, chest, abdomen, and musculoskeletal.

Preventing Life-Threatening Respiratory Tract Bleeding in Kids!: A Systematic Imaging Approach to Shed Light on The Silent Killer

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Akari Makidono, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

#1. Bleeding from the respiratory tract can stay undetected in children until major event occurs since small amount of hemoptysis is commonly veiled by swallowing bloody sputum. Even patients with potentially life-threatening conditions can present with non-specific symptoms, therefore, radiologists should be aware of minor signs and findings of these conditions to prevent major events to occur.#2. Among various diagnostic studies for major respiratory tract bleeding, multidetector CT plays a critical role in determining the cause, site of bleeding, and involved vessels and thus, guiding the caring team toward proper management. For this purpose, systematic imaging approach being demonstrated in this educational exhibit would be helpful for radiologists.

TABLE OF CONTENTS/OUTLINE

- Causes and pathophysiology - Diagnosis and management - Categories of causes - 1) Airway diseases: bronchiectasis, tracheostomy-related hemoptysis, foreign body aspiration, smoke inhalation - 2) Lung parenchymal diseases: infection, collagen vascular disease, idiopathic pulmonary hemosiderosis, coagulopathy, other causes of diffuse pulmonary hemorrhage - 3) Vascular diseases: congenital heart disease, pulmonary arterial hypertension, arteriovenous malformation/hereditary hemorrhagic telangiectasia, KCNT1 mutation-related hemoptysis - 4) Miscellaneous: trauma, tumor, catamenial hemoptysis, iatrogenic

Current Applications of PET/MR Imaging for Evaluation of Pediatric Musculoskeletal Disease

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Neetu Soni, MD, FRCR, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

• PET-MR combines the excellent soft-tissue resolution and functional capabilities of MR with the quantitative information provided by positron emission tomography (PET)• "Hybrid" MR imaging implies concurrent acquisition of morphologic and functional MR data• Tumor metabolic response predates change in tumor cellularity/morphology; PET-MR is more sensitive than morphologic MR and DW-MRI for assessment of therapeutic response in oncology• PET-MR decreases total number of required imaging studies, simplifying clinical workflows, thus following the "lean" methodology of quality improvement

TABLE OF CONTENTS/OUTLINE

• Normal appearances of hybrid PET-MR in the growing skeleton on an illustrative case-based template• Interpretive pitfalls on PET-MR resulting from normal physiologic attributes of the growing skeleton and technique-related• Current applications and limitations of hybrid PET-MR for assessment of entities affecting the growing skeleton

Treatment-related Complications in Children with Hematolymphoid Malignancy: Emergent Conditions and Late Effects

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics

Participants
Claudia Cheung, MBBS, Hong Kong, Hong Kong (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Treatment of childhood hematolymphoid malignancies depends on stages and risk of the specific disease, but generally comprises of intensive chemotherapy regimens, with addition of radiotherapy and/or allogenic hematopoietic stem cell transplantation (HSCT) and novel immunotherapy for certain conditions.2. Severe myelosuppression and prolonged neutropenia are common, which are risk factors for invasive fungal infections from opportunistic organisms. Viral reactivation are common in HSCT recipients.3. Acute treatment-related toxicity depends on the chemotherapeutic agents for specific disease. For example, methotrexate is associated with acute toxic leukoencephalopathy. Multiple chemotherapy agents are implicated in posterior reversible encephalopathy syndrome. L-asparaginase is associated with pancreatitis and venous thromboembolism. Anthracyclines can cause myocardial cell injury which leads to left ventricular dysfunction. Understanding the treatment regimen used is important in reaching the correct diagnosis.4. Use of high dose corticosteroids can cause long term skeletal complications. Early recognition of avascular necrosis of femoral head is of particular importance as early orthopedic intervention is essential.5. Use of intensive radiotherapy can lead to development of secondary cancer. For acute leukemia, secondary brain tumours are common in patients who received cranial radiotherapy.

TABLE OF CONTENTS/OUTLINE

Radiologists Role In Establishing The Diagnosis, Evaluating Risk Factors, Detecting Recurrence, and Determining the Effectiveness of Treatment in Langerhans Cell Histiocytosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Takahiro Hosokawa, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Langerhans cell histiocytosis (LCH) predominantly affects children. Its clinical presentation varies significantly, from isolated and self-limiting to multisystem disorder with a life-threatening clinical course. Various organs are involved. Bone is affected most frequently, and the location of its involvement on imaging findings provides important clues for diagnosing LCH.After diagnosis, the following risk factors should be evaluated: (1) risk of recurrence classified into three grades according to the degree of organ system involvement; I) multisystem (M-S) disease with involvement of high-risk organ (hematologic system, liver, and spleen), II) M-S disease without high-risk organ involvement, or III) single system involvement with one or multiple lesions; (2) risk of central nervous system involvement (manifesting as diabetes insipidus and neuro-degenerative complications); (3) risk of tracheal compression; anterior mediastinal or thyroid huge mass is a predictor of complications during general anesthesia. During follow-up, knowledge regarding the changes in imaging findings associated with pharmacotherapy and conservative treatment is required to evaluate the effectiveness of treatment and detect recurrence.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Imaging findings of LCH; involvement of various organs 3. Key imaging findings for diagnosing LCH 4. Evaluation of risks of recurrence, central nervous system involvement, and tracheal compression 5. Imaging findings during follow-up of patients 6. Conclusion

Photon Counting Detector CT in Children: Advantages and Clinical Prospects

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Juan Carlos Ramirez-Giraldo, PhD, Cary, NC (*Presenter*) Employee, Siemens AG

TEACHING POINTS

• Photon-counting detectors (PCD) technology directly converts individual x-ray photons into electrical pulses with small pixel size, that can be counted.• Traditional energy-integrating detector (EID) CT uses an indirect conversion process where x-ray photons are converted to light, and the signal is integrated over a short period of time. • PCD CT results in improved spatial resolution.• PCD CT results in improved contrast of small structures in pediatric patients. • PCD CT allows for substantial radiation dose reductions. • PCD CT allows for spectral imaging all the time.

TABLE OF CONTENTS/OUTLINE

• Review basic principles of photon counting CT• Discuss advantages of PCD CT• Discuss applications PCD CT in pediatric imaging and advantages compared to traditional EID CT images.Ø High resolution temporal bone CT Ø High resolution chest CT Ø Contrast enhanced Chest CT Ø Cardiac CT Ø CT angiography Ø Abdominal CT Ø Head CT

Imaging Features of Pediatric Sarcoidosis: From Head to Toe

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Awards
Identified for RadioGraphics

Participants
Gozde Ozer IV, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Sarcoidosis occurs approximately ten times less frequently in children than in adults. Pediatric sarcoidosis predominantly involves the lungs and lymphatic system but can affect any organ in the body. Characteristic chest CT findings of pulmonary sarcoidosis are mediastinal, bilateral hilar lymphadenopathy, and nodules with the perilymphatic distribution along the interlobular septa, interlobar fissures, and subpleural regions. Abdominal sarcoidosis may manifest as numerous small nodules in the liver and spleen. In addition, abdominal lymphadenopathies can be seen in one-third of the patients. Neurosarcoidosis is most commonly manifested by leptomeningeal and pituitary gland involvement. Leptomeningeal sarcoidosis can be seen as nodular or plaque-like thickening and enhancement of the leptomeninges. Orbital involvement of sarcoidosis is the most common presentation in the head and neck region. Although any part of the orbit can be involved, uveitis is the most common condition and is often bilateral.

TABLE OF CONTENTS/OUTLINE

General information and diagnostic criteria of sarcoidosis. The role of radiology in the diagnosis. Imaging patterns of pulmonary, abdominal, central nervous system, head and neck, and musculoskeletal-cutaneous involvement of sarcoidosis.

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PD

Participants
Christian Pecoraro, DO, Rochester, NY (*Presenter*) Nothing to Disclose

TEACHING POINTS

Embryology of the diaphragm and cause of congenital diaphragmatic hernias. Role of pre-natal imaging including MR + US in the diagnosis and prognostication of CDH. Post-natal imaging findings of typical right and left CDH. Imaging findings of acute Late-Presenting CDH. Review of surgical strategies for CDH repair, as well as expected and un-expected post-operative findings. Associated anomalies, syndromic and non-syndromic including urogenital, musculoskeletal neurological.

TABLE OF CONTENTS/OUTLINE

Introduction, definition, and embryology. Classification of CDH. Prenatal imaging findings of CDH. Postnatal imaging findings of CDH. Review of fetoscopic endoluminal tracheal occlusion (FETO) for CDH. Expected post-operative appearance of the diaphragm following surgical prosthetic patch repair/graft. Acute and late post-operative related complications of CDH, including associated decreased ipsilateral lung perfusion. Associated anomalies, syndromic and non-syndromic including urogenital, musculoskeletal neurological. Describe the respiratory morbidities found in CDH survivors, including chronic cough, wheezing, chest wall deformities (pectus excavatum) and scoliosis.

PHEE-10 Classification of Rectal Conditions in CBCT Images for Prostate Cancer Radiation Therapy Using Deep Learning

Participants
Tomoki Kikuchi, Kiryu, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiation therapy for prostate cancer has the same outcome as surgery and is listed as a radical treatment option. Intensity-modulated radiotherapy is recommended as a treatment policy and is useful for reducing the risk of recurrence. It is necessary to give an appropriate dose distribution to the prostate to improve the therapeutic effect. Because of gas or stool dilation in the rectum, the position of the prostate becomes inaccurate. Positional inaccuracy causes excess or deficiency for dose distribution, so pretreatment such as exhaust gas and defecation is required before radiation therapy. The need for pretreatment is determined by the cone-beam computed tomography (CBCT) images. However, no clear criteria have been set, depending on the observer's subjectivity. Therefore, we propose a method of using deep learning to classify the rectal condition of CBCT images. Our method helps determine if pretreatment should be given before radiation therapy for prostate cancer patients. The main teaching points of this exhibition are to: 1. classify CBCT images according to the condition of the rectum. 2. understand how to use deep learning. 3. support observer decisions.

TABLE OF CONTENTS/OUTLINE

To support the decision on whether to perform pretreatment by classifying the rectal condition using deep learning in cone-beam CT.

PHEE-11 Semiquantitative Evaluation of Image Quality of Clinical CT Images By Radiologists: From Physical Evaluation of Phantom to Semiquantitative Evaluation of Clinical Images

Participants
Ikuo Kawashita, PhD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Physical characteristics such as the modulation transfer function (MTF), noise power spectrum (NPS), and detectability index are often measured on phantom CT images to obtain an objective evaluation of their quality. However, the image quality of phantom images is not always equivalent to that of clinical images and the physical evaluation of phantom images does not necessarily coincide with the subjective image quality on clinical images evaluated by radiologists. In this educational poster, we describe to diagnostic radiologists the semi-quantitative evaluation of the sharpness of structure contours (an MTF alternative), the image noise, and the detectability of objects on clinical CT images. We also discuss the limitations of semi-quantitative evaluation methods.

TABLE OF CONTENTS/OUTLINE

1. Introduction: a) Importance of semiquantitative evaluation of clinical images b) Limitations of general physical evaluations 2. Evaluation of the contour sharpness on clinical images a) MTF measurements using the blur of the edge profile curve on CT images b) Evaluation of the contour sharpness using the power spectrum 3. Evaluation of the noise characteristics of clinical CT images a) NPS measurement of flat areas without texture b) NPS measurement of non-flat textured areas 4. d'NPW: Detectability index measurements 5. Preconditions / limitations and estimation accuracy

PHEE-12 Understanding the Dosimetric Effect of Contrast Agents on External Beam Radiation Therapy

Participants
Zhou Wang, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In radiation therapy (RT), contrast agents (CA) are used in CT simulation during treatment planning for better target/organ delineation. This educational exhibit demonstrates the different dominant photon interaction mechanisms between kV (CT) and MV (RT) photons and CA. Due to the K-edge enhanced photoelectric effect of CA in CT, CA's CT number (HU) can be misrepresented in MV beam dose computation by an exaggerated relative electron density. CA is not typically used during RT delivery, and the difference is accounted for by overriding the HU of CA in treatment plans to tissue equivalent (e.g. 0 HU). Image-guided radiation therapy (IGRT) using on-board cone-beam CT (CBCT) is common in RT and has potential for use in adaptive radiation therapy (ART). There is interest in using CA during CBCT for IGRT and/or ART, raising the question of the dosimetric effect of CA on RT delivery following CBCT with CA. Clinical cases recomputed with different levels of overridden HU are presented to understand the dosimetric effect caused by CA during RT.

TABLE OF CONTENTS/OUTLINE

1) CA in CT simulation and HU value overridden in RT planning. 2) IGRT/ART and the use of CA in CBCT. 3) Difference in photon interactions - kV CBCT vs. MV RT beams. 4) Effect by HU of CA enhanced perirectal hydrogel spacer (e.g. SpaceOAR Vue) in prostate RT. 5) Recomputed IV/oral contrast clinical cases demonstrating the potential dosimetric effect when treating patient receiving CBCT CA imaging.

PHEE-13 Suggestion For The Dose Reduction of The Tomosynthesis Imaging By Using the Generated Interpolation Image Based On the Deep Learning

Participants
Ryohei Fukui, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Tomosynthesis is the 3-dimentional imaging technique used for the general X-ray and the mammography. The tomosynthesis imaging requires multiple projection images obtained from different angles. Although acquiring a large number of projection images improves an image quality of the reconstructed tomosynthesis image, however, a patient dose would be increased. If a precise interpolation image can be created and inserted into the dataset of reduced number of projection images instead of the real projection image, a significant reduction of the patient dose can be achieved. We are able to create a pseudo image easily by using the deep learning technique. The generative adversarial network (GAN) has improved its accuracy. We'll suggest the method for dose reduction by using a generated pseudo interpolation image based on the deep learning in the tomosynthesis. The aim of this exhibit is, 1. to learn the patient dose of the tomosynthesis, 2. to show the outline for generating the pseudo interpolation image by using the GAN, 3. to insert the generated pseudo image in the dataset of real projection images and reconstruct the tomosynthesis image, 4. to explain the problem of the proposed method. We hope that the patient dose would be reduced by our suggestion.

TABLE OF CONTENTS/OUTLINE

1. Patient dose of the tomosynthesis, 2. Image generation based on the deep learning. 3. Outline for generating the pseudo interpolation image, 4. Present the generated interpolation images and the reconstructed tomosynthesis image, 5. Dose reduction of the tomosynthesis.

PHEE-14 Routine Body Applications of Advanced Gemstone Spectral Imaging: What the Radiologist Need to Know

Participants
Shingo Harashima, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To describe basic principles and various imaging/analyzing techniques of advanced Gemstone Spectral Imaging (GSI); 2) To introduce technological features and optimal imaging option in advanced GSI based on experimental and clinical data; 3) To illustrate routine body applications of advanced GSI by presenting various clinical images.

TABLE OF CONTENTS/OUTLINE

1) Basic principles imaging/analyzing techniques. Single-source dual-energy CT with fast kV switching; Virtual monochromatic/material decomposition imaging (VMI/MDI); Spectral HU curve/effective atomic number (Z) analysis. 2) Technological features optimal imaging option. Novel high output x-ray tube/kV mA synchronized switching/iterative deep-learning reconstruction for high-quality imaging/high-precision analysis/reasonable radiation contrast media (CM) dose reduction. 3) Routine body applications. Low-keV VMI (vs. low-kV CT): improved image contrast/reduced CM dose; High-keV VMI: reduced image noise/beam-hardening metallic artifact; Iodine-enhanced MDI: organ perfusion tumor viability assessment/cystic solid mass differentiation; Iodine-suppressed MDI: virtual non-contrast CT; Hydroxyapatite-suppressed MDI: bone marrow edema imaging/calcification-free CT angiography; Fat-enhanced MDI/Spectral HU curve/effective Z: lipid-rich lesion detection; Effective Z: nephrolithiasis composition analysis.

PHEE-15 How to Make Full Use of Ultra-High-Resolution CT: the Concepts of Imaging Condition and the Clinical Applications

Participants
Yuta Miyamae, RT, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

•Ultra-high-resolution CT (U-HRCT) can provide high-quality CT images depending on the optimum imaging conditions. Especially, it is important to know the characteristics of the three scan modes and the six focus sizes.•U-HRCT images tend to be increased image noise because of the extension of representable frequency band. Deep learning reconstruction (DLR) effectively reduces image noise while maintaining spatial resolution and low-contrast detectability. However, the image quality should be evaluated by proper methods in order to optimize the exposure dose because the excessive reducing exposure dose may cause unexpected deterioration of image quality.•This exhibition explains how to properly understand the physical characteristics of U-HRCT imaging and utilize high-quality images in clinical practice. In addition, we will review papers on clinical application of U-HRCT and discuss the usefulness of high-resolution images.

TABLE OF CONTENTS/OUTLINE

1. Explanation of the physical characteristics of U-HRCT images.The physical characteristics of U-HRCT images will be explained in terms of resolution characteristics for in-plane and z-axis direction, noise characteristics, low-contrast detectability and temporal resolution.2. Investigation of exposure dose for clinical imaging.The exposure dose at clinical cases is shown about conventional MDCT and U-HRCT imaging.3. Presentation of clinical U-HRCT images.We report clinical cases that U-HRCT imaging has been useful for the diagnostic imaging and surgical supports.

PHEE-16 ACR CT Accreditation Testing and Routine Quality Control for Clinical Photon-Counting Detector CT: Practical Tips and Tricks

Awards
Certificate of Merit

Participants
Michael R. Bruesewitz, RT, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To explain the unique features of Photon-counting-detector (PCD) CT compared to conventional energy-integrating-detector (EID) CT • To demonstrate the similarities and differences between PCD-CT and EID-CT for Quality Control (QC) and ACR accreditation • To describe precautions needed to be taken in phantom and protocol selection for QC testing • To discuss additional procedures to fully evaluate the performance of PCD-CT

TABLE OF CONTENTS/OUTLINE

1. What is PCD and how is it different from the energy integrating detectors (EID) used on commercial CT scanners? a. PCD: Directly convert X-ray into electronic signals, count individual photon and record its energy b. EID: Indirect, 2 stage conversion of X-ray to visible light then to electronic signal. Signal is proportional to total energy deposited, without information on individual photon 2. Similarities and Differences in PCD and EID for ACR and QC testing a. Higher spatial resolution in PCD vs EID b. CT number differences between PCD and EID due to different photon-weighting scheme c. CT number of virtual monoenergetic images (VMI) and its use in QC testing d. Slice thickness wire measurement differences, especially on the high resolution of PCD-CT 3. Protocol and Phantom selection a. Scanning with required Adult and Pediatric ACR protocols to meet specifications b. Obtaining correct CTDI measurements for QC and ACR accreditation 4. Future Directions a. Higher line pair/cm resolution scans b. MTF measurements c. Multi-Energy scans and testing d. Iodine quantification accuracy

PHEE-17 Demystifying the Radiation Dose Summary Page in Interventional Fluoroscopy

Awards
Identified for RadioGraphics

Participants
Anzi Zhao, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Interventional fluoroscopic procedures may lead to high radiation dose to the patient, it's paramount to understand the details of radiation exposure of a procedure. The radiation dose summary page generated by the interventional fluoroscope is a form that displays important information about a procedure. It is extremely helpful for clinicians to better understand the details of irradiation events and their imaging acquisition parameters, as well as the total radiation dose of the procedure. After reviewing this exhibit, learners will be able to: 1. Understand the two imaging modes of interventional fluoroscopy. 2. Understand important operating parameters of interventional fluoroscopy. 3. Understand radiation dose metrics in interventional fluoroscopy and how to interpret them on radiation dose summary page.

TABLE OF CONTENTS/OUTLINE

1. Review imaging modes of interventional fluoroscopy. 2. Review the operating parameters of interventional fluoroscopy - kV, mA, pulse width, pulse rate, filter, field of view, beam geometry. 3. Review radiation dose metrics in interventional fluoroscopy, including their usage and caveats about indicating of patient dose and associated risks - reference air kerma, DAP, peak skin dose. 4. How these above-mentioned contents are displayed in the radiation dose summary page from two major interventional fluoroscope manufacturers. 5. Review manufacturer specific content in radiation dose summary page.

PHEE-18 US and Doppler Artifacts: Real or Pitfall?

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review and explain the most common ultrasound and Doppler artifacts; 2. To assess the clinical usefulness and downsides of US and Doppler artifacts; 3. To discuss how to emphasize, lessen, and avoid US artifacts and Doppler artifacts

TABLE OF CONTENTS/OUTLINE

1. Acoustic enhancement; 2. Acoustic shadowing; 3. Side lobe artifact; 4. Ring down artifact; 5. Reverberation artifact; 6. Anisotropy; 7. Aliasing artifact; 8. Twinkling artifact; 9. Blooming; 10. Color bruit artifact; 11. Comet tail artifact; 12. Mirror image artifact; 13. Beam width artifact; 14. Speed displacement artifact; 15. Hardware-related artifacts

PHEE-19 Protocol Management in MRI

Participants
Joshua Yung, PhD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Outline MRI protocol management as a continuous quality improvement process with a focus on challenges and methods for protocol standardization across a fleet of scanners and technologists.Understand the need and discuss the steps required for checking technical compliance of an MR acquisition as a quality control metric.Understand the unique challenges in monitoring MR acquisitions for protocol standardization and tools for quantitative assessment.

TABLE OF CONTENTS/OUTLINE

1. MRI protocol management and quality assurance a. Consistent execution b. Protocol standardization vs. acquisition standardization c. Applications for MR protocol standardization d. Performance assessments and quality improvements to address

deficiencies 2. Measuring MR protocol acquisition compliance a. Relevant parameters and pitfalls b. Processing pipeline c. Example of results dashboard d. Other use cases benefiting from compliance checks 3. Monitoring of MR protocol acquisition performance a. Benchmarking performance for comparison and performance improvement b. Relevant parameters and pitfalls c. Workflow diagram d. Challenges with a large multi-vendor MR fleet e. Example of acquisition report 4. Additional protocol analytics tools a. Scanner and protocol utilization, performance profiles and lifecycle management b. Relating acquisition parameters and image quality for protocol development c. Image quality event reporting by radiologists, clinicians and technologists for feedback as part of the quality improvement process 5. Conclusion

PHEE-1HC Neuroradiology Applications with 7T Magnetom Terra Clinical MRI Scanner. A Single-Center Clinical Experience: Indications and Sequence Parameters

Participants
Can Ozutemiz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Point out the indications for the usage of 7T MRI in clinical neuroradiology practice. Provide the sequence parameters we developed for each indication

TABLE OF CONTENTS/OUTLINE

7-Tesla Ultra-Highfield Magnetom Terra Clinical MRI Scanner has been recently available for clinical use. Currently, the scanner is only approved for knee and brain imaging with dedicated coils. However, the presets and already built-in sequences within the machine are not optimized for patient care in neuroradiology. At our center, we have been testing healthy volunteers and selected patients to optimize our sequences for each indication. In this abstract, first, we will describe the indications where 7-Tesla MRI could be used. While a routine brain MRI can be performed with this machine, specific indications where high-field MRI can be beneficial will be discussed. These include brain tumor imaging with dynamic susceptibility contrast perfusion, epilepsy focus evaluation, high detail cranial MR angiogram/venogram, multiple sclerosis plaque assessment, pituitary MRI, movement disorder evaluation/deep brain stimulator planning, and vessel wall imaging. With each indication, we will provide a table where we describe the sequence parameters including the sequence name, slice thickness, matrix, field-of-view, slice plane, distance factor, voxel size, and time. Imaging examples for each indication will also be provided.Please visit the Learning Center to also view this presentation in hardcopy format.

PHEE-2 Safely Imaging Patients Implanted with MRI Conditional, Non-conditional, and Other Active Devices

Awards
Identified for RadioGraphics
Certificate of Merit

Participants
Matthew Harwood, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Review device safety evaluation and patient scheduling processes.• Demonstrate how to interpret vendor manuals.• Demonstrate how and why decisions to refuse imaging are made.• Demonstrate how MRI protocols can be modified for patients with implanted devices without compromising diagnostic ability.• Discuss relevant background information for the above, such the MRI modes of operation, slew, SAR, and B1+rms

TABLE OF CONTENTS/OUTLINE

• Objectives• Trend in Patients Presenting for MRI with Active Devices• Overview of Devices, What Precisely Are We Talking About?• Device Labeling• MRI Safety Considerations: Torque, Induced Currents, RF Heating, Hearing Damage• Specific Absorption Rate (SAR)• B1+rms• Examples of How to Modify Protocols to Reduce SAR/ B1+rms• Gradient Slew Rate• MRI Modes of Operation• Suggested Device Assessment Strategy• How to Read Vendor Manuals with Examples• Scheduling and Evaluation Processes for Implanted Cardiac Devices• Process Modifications for Non-Conditional Devices and Other Active Devices• Case 1: MRI Was Requested but Not Performed• Case 2: MRI Successfully Performed with Process Modifications• Case 3: MRI Successfully Performed with Process Modifications• Summary of Important Points

PHEE-20 Basic Principles of Contrast Injection Protocols for Computed Tomography: Reintroduction for Clinicians by Simulation Software

Participants
Takeshi Nakaura, MD, Kumamoto, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

For contrast-enhanced computed tomography (CT) and CT angiography, it is necessary to stabilize the contrast enhancement using suitable contrast injection protocols. Furthermore, this protocol requires to be adjusted as CT evolves, and clinicians need to have a basic knowledge of it due to ongoing improvements such as photon-counting CT. The principles of the contrast injection protocols appear to be quite difficult; however, simulation software for contrast effects has been recently released, allowing doctors to use the program to test their understanding of the contrast injection protocol.The goal of this exhibition is to:1. Demonstrate the fundamental principles of a contrast injection protocol.2. Show contrast injection protocols and their contrast effects using simulation software under various conditions.

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline1) The simulation of dilution and diffusion of contrast material in vivoDilution by blood flowPassive diffusion using Fick’s law2) When and why does the peak enhancement occur?Simulation about the relationship between the contrast injection duration and enhancement curve3) Patient factors that affect the contrast enhancementPatient body sizeCardiac outputOthers4) How to optimize the contrast injection protocol for various examinations

PHEE-3 Artifacts Caused by Left Ventricular Assist Devices in Digital Radiographic and Mammographic Environment

Participants
Jill M. Lucas, RT, BA, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Identify electromagnetic interference artifacts in digital radiography and mammography • Isolation and investigation of artifacts using phantom studies • Potential reduction of artifacts due to LVAD devices

TABLE OF CONTENTS/OUTLINE

The use of left ventricular assist devices (LVAD) has been rapidly growing for patients with advanced heart failure, providing both a bridge-to-transplant and destination therapy. The presence of LVAD devices in clinical radiography and mammography exams have been accompanied by intermittent clinical complaints regarding line artifacts. Patient cases and artifact images were reviewed, from which electromagnetic interference (EMI) was determined to be the cause. Further investigation of two LVAD devices (HeartMate II and HeartMate 3, Abbott Inc.) in radiographic and mammographic environment was performed using phantoms. An appreciable difference was demonstrated in artifact appearance and magnitude depending on the LVAD model, flat panel detector type, and location of the LVAD pump relative to the detector. -Artifact identification; Examples clinical and phantom images will be shown -Variation in artifact appearance with differences in: LVAD model; Image receptor type and manufacturer; Imaging task, projection, and patient body habitus -Challenges; Breast imaging; Chest imaging, especially posteroanterior (PA) chest projection -Solutions: Positioning the patient so that LVAD is as far from image receptor as feasible; About 10 cm in PA chest imaging, or use anteroposterior projection if clinically acceptable; When possible, selecting a digital detector with improved EMI shielding, or utilizing a system with advanced processing for EMI artifact reduction

PHEE-4 Radiofrequency Safety in MR Imaging: What Are the Concerns?

Participants
Zhongwei Zhang, MD, PhD, St. Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

RF-induced thermal events including heating and burns in patients have become more common, concerns have accounted for more than half of the total adverse events according to FDA MRI-related adverse event reports. The purposes of this Education Exhibit are 1. Overview of RF-induced thermal events and thermal injury root causes analysis; 2. Explain the concept behind RF coils and B1 Field; 3. RF exposure and energy absorption: SAR definitions, types, methods for SAR calculation, factors affecting SAR, SAR reduction, B1+rms, Specific Energy Dose (SED), etc.; 4. Discuss RF heating mechanisms for tissues and implants; 5. Review current regulations and guidelines, RF energy monitoring approaches, and discuss strategies to prevent potential RF-induced thermal events; 6. Since SAR depends on system performance (B0, B1 field, RF transmission, etc), object properties (density, electrical conductivity, size, etc), geometry and patient positioning, and pulse sequences. A hands-on example will be presented to show SAR reduction in clinical protocols.

TABLE OF CONTENTS/OUTLINE

1. Introduction; 2. Overview of RF-induced thermal events and thermal injury root causes analysis; 3. RF coils and B1 field; 4. RF exposure and energy absorption; 5. RF heating mechanisms for tissues and implants; 6. RF safety and RF-induced thermal events prevention: emphasis on clinical protocols.

PHEE-5 A Picture Is Worth a Million Convolutions: A Simplified Explanation of Convolutional Neural Networks for Radiologists

Participants
Tianyuan Fu, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To help radiologists gain a basic understanding of convolutional neural networks (ConvNets) for the purposes of interpreting literature on applications of artificial intelligence (AI), machine learning (ML), and deep learning (DL) in radiology. 2) Describe how ConvNets fit into the paradigm of AI, ML, and DL. 3) Touch on the similarities between ConvNets and biological human vision, and explain what makes ConvNets highly accurate and efficient at analyzing pictures. 4) Define important terminology associated with ConvNet architecture.5) Explain the process through which ConvNets learn from imaging data with a simple illustration of how a raw image is translated into pixel data, passed as input and processed through the neural network, and translated into one or more outputs. 6) Give an overview of transfer learning and discuss examples of pre-trained ConvNet architectures.

TABLE OF CONTENTS/OUTLINE

1) Overview of artificial intelligence, machine learning, deep learning, and convolutional neural networks (ConvNets). 2) ConvNets and biological human vision. 3) What makes ConvNets accurate and efficient at image analysis? 4) Translating a raw image into training data for a ConvNet. 5) Describe how ConvNets process image data and in the process learn information stored as weights. 6) Illustrate what a complete ConvNet architecture looks like. 7) Discuss transfer learning and illustrate existing ConvNet architectures including VGG-16, Inception, ResNet, and others. 8) Summary of the essential basics of ConvNets for radiologists who are reading literature on AI and ML/DL applications in radiology.

PHEE-6 Emerging Applications of Cone-Beam Computed Tomography in Osseous Structure Assessment: A Pictorial Overview

Participants
Hamza Ibad, MBBS, Baltimore, MD (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Flat-panel-detectors-based CBCT allows high-resolution osseous structural assessments.2. CBCT enables investigation of joints at various motion states and weight-bearing (WB), providing physiological measurements of joints in diseased and non-diseased states.3. Recently introduced motion compensation algorithms, such as regionally applied auto-focus, have the potential to greatly

improve the diagnostic yield of CBCT examinations.4. Fast and high-resolution CBCT protocols permit temporomandibular joint (TMJ) assessment in closed- and open-mouth states5. CBCT enables accurate volumetric cartilage and bone mineral density evaluation of the knee joint complex, TMJ, and various other joints.6. Long-term outcomes of intraoperative use of CBCT in the orthopedic,oral, and maxillofacial repair of skeletal defects are currently under investigation.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Emerging developments in CBCT imaging - WB capabilities, motion artifact compensation algorithms, high-resolution dental protocols, and intraoperative CBCT systems (e.g. C-arms with three-dimensional capability).3. Use in MSK Imaging - Tibiofemoral joint space width quantification, ankle syndesmosis measurements, valgus hindfoot alignment measurements, and intraoperative fracture and joint reduction aid.4. Use in Dental Imaging - Volumetric TMJ analysis, fracture assessment and post-repair evaluation, endo- and periodontics.5. Limitations and prospects.

PHEE-7 Photon-Counting CT: Physics of Alternative Detector Approaches, Impacts on Image Quality, and Potential Applications

Participants
Paul E. Kinahan, PhD, Seattle, WA (*Presenter*) Co-founder, PET/X LLC

TEACHING POINTS

1. There are two established approaches for photon-counting CT detectors using silicon- and cadmium-based detectors, with different physical trade-offs.2. Photon-counting CT provides both lower noise and a much richer set of spectral (energy) information compared to CT scanners with standard energy-integrating detectors.3. Photon-counting CT also provides higher image resolution than CT scanners with standard energy-integrating detectors, albeit at a potentially higher cost and complexity.4. The are several clinical areas that can take advantage of the improved spatial and energy resolution of photon-counting CT systems.5. Developing appropriate workflows that take advantage of increased information per scan in an efficient manner is an important consideration.

TABLE OF CONTENTS/OUTLINE

Review the essential differences between photon-counting and energy-integrating CT systems, with an emphasis on the ability for lower noise and improved spectral (energy) information.Review the two established approaches for photon-counting CT detectors that use silicon- and cadmium-based detectors, with a discussion of the different physical trade-offsShow how the silicon- and cadmium-based detector designs necessarily lead to improved spatial resolution.Describe the roughly 50-fold increase in raw (sinogram) data generated by a photon-counting CT system and how it may impact clinical workflows..Provide illustrations of where the improved spatial and energy resolution of photon-counting CT systems can lead to improvements in imaging for oncology, cardiovascular, thoracic, musculoskeletal, and head and neck imaging.

PHEE-8 Seeing More with Super-Resolution Deep-Learning CT Reconstruction: Principles and Clinical Applications

Participants
Yasunori Nagayama, MD, Kumamoto, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The acquisition of high-resolution and low-noise CT images is crucial for the detailed evaluation of fine anatomical and pathological structures. Recently, the super-resolution deep-learning-based reconstruction (SR-DLR) utilizing the convolutional neural networks (CNNs) to enhance the spatial resolution and reduce image noise has been clinically available. The purpose of this exhibit is:1. To understand the basic concept and technical principles of the SR-DLR technique 2. To describe the image characteristics of SR-DLR and compare them with those of filtered back projection (FBP), hybrid iterative reconstruction (IR), model-based IR, and normal-resolution DLR (NR-DLR) 3. To review the impact of SR-DLR on the image quality and object detectability in the clinical examples

TABLE OF CONTENTS/OUTLINE

1. CNN-based super-resolution technique 2. Basic concept and technical details of SR-DLR 3. Image properties of SR-DLR: comparisons with FBP, hybrid IR, model-based IR, and NR-DLR algorithms A) Noise property B) Spatial resolution C) Low- and high-contrast object detectability 4. Clinical application of the SR-DLR technique A) Coronary CT for coronary plaque assessments B) Stent imaging C) Lung CT D) Cerebral CT angiogram E) Pediatric CT for the assessment of congenital heart diseases 5. Future directions A) Application to dual-energy CT B) Network training with photon counting CT

PHEE-9 Current Status and Future of Personal Dose Management-Necessity for Real-Time Measurement of the Occupational Radiation Dose in Interventional Radiology

Participants
Kenshin Hattori, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To understand current personal dose management to interventional radiology (IVR) staff.To understand importance of lens dosimeter.To understand the need for real-time measurement of occupational radiation dose in IVR. To compare fundamental characteristics among several occupational real-time dosimeters. To understand the fundamental characteristics of a real-time occupational dosimetry and display system (i3 system). To show the usefulness of the i3 system in occupational dose management for IVR.

TABLE OF CONTENTS/OUTLINE

The 2011 ICRP Statement significantly lowered the cataract threshold dose for the eye lens from 8 Gy to 0.5 Gy. Accordingly, dose limits for medical personnel have been lowered in many countries, and in Japan the dose limit has been significantly reduced from 150 mSv per year to an average of 20 mSv per year over a five-year period. Therefore, personal dose management is becoming increasingly important. Currently, glass badges and pocket dosimeters are used for personal dose management for medical staff, but in the future, lens dosimeters and real-time dosimeters may become important. Until now, it has not been possible to determine the time of exposure, but with the use of this real-time dosimeter, it is possible to understand at a glance. The new real-time dosimeters evaluated in this study have sufficient performance for clinical use, especially good angular dependence. These

dosimeters will be important in the future.

PHEE-10

Classification of Rectal Conditions in CBCT Images for Prostate Cancer Radiation Therapy Using Deep Learning

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Tomoki Kikuchi, Kiryu, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Radiation therapy for prostate cancer has the same outcome as surgery and is listed as a radical treatment option. Intensity-modulated radiotherapy is recommended as a treatment policy and is useful for reducing the risk of recurrence. It is necessary to give an appropriate dose distribution to the prostate to improve the therapeutic effect. Because of gas or stool dilation in the rectum, the position of the prostate becomes inaccurate. Positional inaccuracy causes excess or deficiency for dose distribution, so pretreatment such as exhaust gas and defecation is required before radiation therapy. The need for pretreatment is determined by the cone-beam computed tomography (CBCT) images. However, no clear criteria have been set, depending on the observer's subjectivity. Therefore, we propose a method of using deep learning to classify the rectal condition of CBCT images. Our method helps determine if pretreatment should be given before radiation therapy for prostate cancer patients. The main teaching points of this exhibition are to: 1. classify CBCT images according to the condition of the rectum. 2. understand how to use deep learning. 3. support observer decisions.

TABLE OF CONTENTS/OUTLINE

To support the decision on whether to perform pretreatment by classifying the rectal condition using deep learning in cone-beam CT.

PHEE-11

Semiquantitative Evaluation of Image Quality of Clinical CT Images By Radiologists: From Physical Evaluation of Phantom to Semiquantitative Evaluation of Clinical Images

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Ikuo Kawashita, PhD, Hiroshima, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

Physical characteristics such as the modulation transfer function (MTF), noise power spectrum (NPS), and detectability index are often measured on phantom CT images to obtain an objective evaluation of their quality. However, the image quality of phantom images is not always equivalent to that of clinical images and the physical evaluation of phantom images does not necessarily coincide with the subjective image quality on clinical images evaluated by radiologists. In this educational poster, we describe to diagnostic radiologists the semi-quantitative evaluation of the sharpness of structure contours (an MTF alternative), the image noise, and the detectability of objects on clinical CT images. We also discuss the limitations of semi-quantitative evaluation methods.

TABLE OF CONTENTS/OUTLINE

1. Introduction: a) Importance of semiquantitative evaluation of clinical images b) Limitations of general physical evaluations 2. Evaluation of the contour sharpness on clinical images a) MTF measurements using the blur of the edge profile curve on CT images b) Evaluation of the contour sharpness using the power spectrum 3. Evaluation of the noise characteristics of clinical CT images a) NPS measurement of flat areas without texture b) NPS measurement of non-flat textured areas 4. d'NPW: Detectability index measurements 5. Preconditions / limitations and estimation accuracy

PHEE-12

Understanding the Dosimetric Effect of Contrast Agents on External Beam Radiation Therapy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Zhou Wang, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In radiation therapy (RT), contrast agents (CA) are used in CT simulation during treatment planning for better target/organ delineation. This educational exhibit demonstrates the different dominant photon interaction mechanisms between kV (CT) and MV (RT) photons and CA. Due to the K-edge enhanced photoelectric effect of CA in CT, CA's CT number (HU) can be misrepresented in MV beam dose computation by an exaggerated relative electron density. CA is not typically used during RT delivery, and the difference is accounted for by overriding the HU of CA in treatment plans to tissue equivalent (e.g. 0 HU). Image-guided radiation therapy (IGRT) using on-board cone-beam CT (CBCT) is common in RT and has potential for use in adaptive radiation therapy (ART). There is interest in using CA during CBCT for IGRT and/or ART, raising the question of the dosimetric effect of CA on RT delivery following CBCT with CA. Clinical cases recomputed with different levels of overridden HU are presented to understand the dosimetric effect caused by CA during RT.

TABLE OF CONTENTS/OUTLINE

1) CA in CT simulation and HU value overridden in RT planning. 2) IGRT/ART and the use of CA in CBCT. 3) Difference in photon interactions - kV CBCT vs. MV RT beams. 4) Effect by HU of CA enhanced perirectal hydrogel spacer (e.g. SpaceOAR Vue) in prostate RT. 5) Recomputed IV/oral contrast clinical cases demonstrating the potential dosimetric effect when treating patient receiving CBCT CA imaging.

PHEE-13

Suggestion For The Dose Reduction of The Tomosynthesis Imaging By Using the Generated Interpolation Image Based On the Deep Learning

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Ryohei Fukui, PhD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Tomosynthesis is the 3-dimentional imaging technique used for the general X-ray and the mammography. The tomosynthesis imaging requires multiple projection images obtained from different angles. Although acquiring a large number of projection images improves an image quality of the reconstructed tomosynthesis image, however, a patient dose would be increased. If a precise interpolation image can be created and inserted into the dataset of reduced number of projection images instead of the real projection image, a significant reduction of the patient dose can be achieved. We are able to create a pseudo image easily by using the deep learning technique. The generative adversarial network (GAN) has improved its accuracy. We'll suggest the method for dose reduction by using a generated pseudo interpolation image based on the deep learning in the tomosynthesis. The aim of this exhibit is, 1. to learn the patient dose of the tomosynthesis, 2. to show the outline for generating the pseudo interpolation image by using the GAN, 3. to insert the generated pseudo image in the dataset of real projection images and reconstruct the tomosynthesis image, 4. to explain the problem of the proposed method. We hope that the patient dose would be reduced by our suggestion.

TABLE OF CONTENTS/OUTLINE

1. Patient dose of the tomosynthesis, 2. Image generation based on the deep learning. 3. Outline for generating the pseudo interpolation image, 4. Present the generated interpolation images and the reconstructed tomosynthesis image, 5. Dose reduction of the tomosynthesis.

Routine Body Applications of Advanced Gemstone Spectral Imaging: What the Radiologist Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Shingo Harashima, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To describe basic principles and various imaging/analyzing techniques of advanced Gemstone Spectral Imaging (GSI); 2) To introduce technological features and optimal imaging option in advanced GSI based on experimental and clinical data; 3) To illustrate routine body applications of advanced GSI by presenting various clinical images.

TABLE OF CONTENTS/OUTLINE

1) Basic principles imaging/analyzing techniques. Single-source dual-energy CT with fast kV switching; Virtual monochromatic/material decomposition imaging (VMI/MDI); Spectral HU curve/effective atomic number (Z) analysis. 2) Technological features optimal imaging option. Novel high output x-ray tube/kV mA synchronized switching/iterative deep-learning reconstruction for high-quality imaging/high-precision analysis/reasonable radiation contrast media (CM) dose reduction. 3) Routine body applications. Low-keV VMI (vs. low-kV CT): improved image contrast/reduced CM dose; High-keV VMI: reduced image noise/beam-hardening metallic artifact; Iodine-enhanced MDI: organ perfusion tumor viability assessment/cystic solid mass differentiation; Iodine-suppressed MDI: virtual non-contrast CT; Hydroxyapatite-suppressed MDI: bone marrow edema imaging/calcification-free CT angiography; Fat-enhanced MDI/Spectral HU curve/effective Z: lipid-rich lesion detection; Effective Z: nephrolithiasis composition analysis.

How to Make Full Use of Ultra-High-Resolution CT: the Concepts of Imaging Condition and the Clinical Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Yuta Miyamae, RT, Tokyo, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

•Ultra-high-resolution CT (U-HRCT) can provide high-quality CT images depending on the optimum imaging conditions. Especially, it is important to know the characteristics of the three scan modes and the six focus sizes.•U-HRCT images tend to be increased image noise because of the extension of representable frequency band. Deep learning reconstruction (DLR) effectively reduces image noise while maintaining spatial resolution and low-contrast detectability. However, the image quality should be evaluated by proper methods in order to optimize the exposure dose because the excessive reducing exposure dose may cause unexpected deterioration of image quality.•This exhibition explains how to properly understand the physical characteristics of U-HRCT imaging and utilize high-quality images in clinical practice. In addition, we will review papers on clinical application of U-HRCT and discuss the usefulness of high-resolution images.

TABLE OF CONTENTS/OUTLINE

1. Explanation of the physical characteristics of U-HRCT images.The physical characteristics of U-HRCT images will be explained in terms of resolution characteristics for in-plane and z-axis direction, noise characteristics, low-contrast detectability and temporal resolution.2. Investigation of exposure dose for clinical imaging.The exposure dose at clinical cases is shown about conventional MDCT and U-HRCT imaging.3. Presentation of clinical U-HRCT images.We report clinical cases that U-HRCT imaging has been useful for the diagnostic imaging and surgical supports.

ACR CT Accreditation Testing and Routine Quality Control for Clinical Photon-Counting Detector CT: Practical Tips and Tricks

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Awards
Certificate of Merit

Participants
Michael R. Bruesewitz, RT, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

• To explain the unique features of Photon-counting-detector (PCD) CT compared to conventional energy-integrating-detector (EID) CT • To demonstrate the similarities and differences between PCD-CT and EID-CT for Quality Control (QC) and ACR accreditation • To describe precautions needed to be taken in phantom and protocol selection for QC testing • To discuss additional procedures to fully evaluate the performance of PCD-CT

TABLE OF CONTENTS/OUTLINE

1. What is PCD and how is it different from the energy integrating detectors (EID) used on commercial CT scanners? a. PCD: Directly convert X-ray into electronic signals, count individual photon and record its energy b. EID: Indirect, 2 stage conversion of X-ray to visible light then to electronic signal. Signal is proportional to total energy deposited, without information on individual photon 2. Similarities and Differences in PCD and EID for ACR and QC testing a. Higher spatial resolution in PCD vs EID b. CT number differences between PCD and EID due to different photon-weighting scheme c. CT number of virtual monoenergetic images (VMI) and its use in QC testing d. Slice thickness wire measurement differences, especially on the high resolution of PCD-CT 3. Protocol and Phantom selection a. Scanning with required Adult and Pediatric ACR protocols to meet specifications b. Obtaining correct CTDI measurements for QC and ACR accreditation 4. Future Directions a. Higher line pair/cm resolution scans b. MTF measurements c. Multi-Energy scans and testing d. Iodine quantification accuracy

Demystifying the Radiation Dose Summary Page in Interventional Fluoroscopy

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Awards
Identified for RadioGraphics

Participants
Anzi Zhao, MS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Interventional fluoroscopic procedures may lead to high radiation dose to the patient, it's paramount to understand the details of radiation exposure of a procedure. The radiation dose summary page generated by the interventional fluoroscope is a form that displays important information about a procedure. It is extremely helpful for clinicians to better understand the details of irradiation events and their imaging acquisition parameters, as well as the total radiation dose of the procedure. After reviewing this exhibit, learners will be able to: 1. Understand the two imaging modes of interventional fluoroscopy. 2. Understand important operating parameters of interventional fluoroscopy. 3. Understand radiation dose metrics in interventional fluoroscopy and how to interpret them on radiation dose summary page.

TABLE OF CONTENTS/OUTLINE

1. Review imaging modes of interventional fluoroscopy. 2. Review the operating parameters of interventional fluoroscopy - kV, mA, pulse width, pulse rate, filter, field of view, beam geometry. 3. Review radiation dose metrics in interventional fluoroscopy, including their usage and caveats about indicating of patient dose and associated risks - reference air kerma, DAP, peak skin dose. 4. How these above-mentioned contents are displayed in the radiation dose summary page from two major interventional fluoroscope manufacturers. 5. Review manufacturer specific content in radiation dose summary page.

US and Doppler Artifacts: Real or Pitfall?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Marina Akuri, MD, Marilia, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review and explain the most common ultrasound and Doppler artifacts; 2. To assess the clinical usefulness and downsides of US and Doppler artifacts; 3. To discuss how to emphasize, lessen, and avoid US artifacts and Doppler artifacts

TABLE OF CONTENTS/OUTLINE

1. Acoustic enhancement; 2. Acoustic shadowing; 3. Side lobe artifact; 4. Ring down artifact; 5. Reverberation artifact; 6. Anisotropy; 7. Aliasing artifact; 8. Twinkling artifact; 9. Blooming; 10. Color bruit artifact; 11. Comet tail artifact; 12. Mirror image artifact; 13. Beam width artifact; 14. Speed displacement artifact; 15. Hardware-related artifacts

Protocol Management in MRI

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Joshua Yung, PhD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Outline MRI protocol management as a continuous quality improvement process with a focus on challenges and methods for protocol standardization across a fleet of scanners and technologists.Understand the need and discuss the steps required for checking technical compliance of an MR acquisition as a quality control metric.Understand the unique challenges in monitoring MR acquisitions for protocol standardization and tools for quantitative assessment.

TABLE OF CONTENTS/OUTLINE

1. MRI protocol management and quality assurance a. Consistent execution b. Protocol standardization vs. acquisition standardization c. Applications for MR protocol standardization d. Performance assessments and quality improvements to address deficiencies 2. Measuring MR protocol acquisition compliance a. Relevant parameters and pitfalls b. Processing pipeline c. Example of results dashboard d. Other use cases benefiting from compliance checks 3. Monitoring of MR protocol acquisition performance a. Benchmarking performance for comparison and performance improvement b. Relevant parameters and pitfalls c. Workflow diagram d. Challenges with a large multi-vendor MR fleet e. Example of acquisition report 4. Additional protocol analytics tools a. Scanner and protocol utilization, performance profiles and lifecycle management b. Relating acquisition parameters and image quality for protocol development c. Image quality event reporting by radiologists, clinicians and technologists for feedback as part of the quality improvement process 5. Conclusion

Neuroradiology Applications with 7T Magnetom Terra Clinical MRI Scanner. A Single-Center Clinical Experience: Indications and Sequence Parameters

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Can Ozutemiz, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Point out the indications for the usage of 7T MRI in clinical neuroradiology practice. Provide the sequence parameters we developed for each indication

TABLE OF CONTENTS/OUTLINE

7-Tesla Ultra-Highfield Magnetom Terra Clinical MRI Scanner has been recently available for clinical use. Currently, the scanner is only approved for knee and brain imaging with dedicated coils. However, the presets and already built-in sequences within the machine are not optimized for patient care in neuroradiology. At our center, we have been testing healthy volunteers and selected patients to optimize our sequences for each indication. In this abstract, first, we will describe the indications where 7-Tesla MRI could be used. While a routine brain MRI can be performed with this machine, specific indications where high-field MRI can be beneficial will be discussed. These include brain tumor imaging with dynamic susceptibility contrast perfusion, epilepsy focus evaluation, high detail cranial MR angiogram/venogram, multiple sclerosis plaque assessment, pituitary MRI, movement disorder evaluation/deep brain stimulator planning, and vessel wall imaging. With each indication, we will provide a table where we describe the sequence parameters including the sequence name, slice thickness, matrix, field-of-view, slice plane, distance factor, voxel size, and time. Imaging examples for each indication will also be provided.Please visit the Learning Center to also view this presentation in hardcopy format.

Basic Principles of Contrast Injection Protocols for Computed Tomography: Reintroduction for Clinicians by Simulation Software

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Takeshi Nakaura, MD, Kumamoto, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

For contrast-enhanced computed tomography (CT) and CT angiography, it is necessary to stabilize the contrast enhancement using suitable contrast injection protocols. Furthermore, this protocol requires to be adjusted as CT evolves, and clinicians need to have a basic knowledge of it due to ongoing improvements such as photon-counting CT. The principles of the contrast injection protocols appear to be quite difficult; however, simulation software for contrast effects has been recently released, allowing doctors to use the program to test their understanding of the contrast injection protocol.The goal of this exhibition is to:1. Demonstrate the fundamental principles of a contrast injection protocol.2. Show contrast injection protocols and their contrast effects using simulation software under various conditions.

TABLE OF CONTENTS/OUTLINE

Table of Contents/Outline1) The simulation of dilution and diffusion of contrast material in vivoDilution by blood flowPassive diffusion using Fick's law2) When and why does the peak enhancement occur?Simulation about the relationship between the contrast injection duration and enhancement curve3) Patient factors that affect the contrast enhancementPatient body sizeCardiac outputOthers4) How to optimize the contrast injection protocol for various examinations

Artifacts Caused by Left Ventricular Assist Devices in Digital Radiographic and Mammographic Environment

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Jill M. Lucas, RT, BA, (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Identify electromagnetic interference artifacts in digital radiography and mammography • Isolation and investigation of artifacts using phantom studies • Potential reduction of artifacts due to LVAD devices

TABLE OF CONTENTS/OUTLINE

The use of left ventricular assist devices (LVAD) has been rapidly growing for patients with advanced heart failure, providing both a bridge-to-transplant and destination therapy. The presence of LVAD devices in clinical radiography and mammography exams have been accompanied by intermittent clinical complaints regarding line artifacts. Patient cases and artifact images were reviewed, from which electromagnetic interference (EMI) was determined to be the cause. Further investigation of two LVAD devices (HeartMate II and HeartMate 3, Abbott Inc.) in radiographic and mammographic environment was performed using phantoms. An appreciable difference was demonstrated in artifact appearance and magnitude depending on the LVAD model, flat panel detector type, and location of the LVAD pump relative to the detector. -Artifact identification; Examples clinical and phantom images will be shown -Variation in artifact appearance with differences in: LVAD model; Image receptor type and manufacturer; Imaging task, projection, and patient body habitus -Challenges; Breast imaging; Chest imaging, especially posteroanterior (PA) chest projection -Solutions: Positioning the patient so that LVAD is as far from image receptor as feasible; About 10 cm in PA chest imaging, or use anteroposterior projection if clinically acceptable; When possible, selecting a digital detector with improved EMI shielding, or utilizing a system with advanced processing for EMI artifact reduction

Radiofrequency Safety in MR Imaging: What Are the Concerns?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Zhongwei Zhang, MD, PhD, St. Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

RF-induced thermal events including heating and burns in patients have become more common, concerns have accounted for more than half of the total adverse events according to FDA MRI-related adverse event reports. The purposes of this Education Exhibit are 1. Overview of RF-induced thermal events and thermal injury root causes analysis; 2. Explain the concept behind RF coils and B1 Field; 3. RF exposure and energy absorption: SAR definitions, types, methods for SAR calculation, factors affecting SAR, SAR reduction, B1+rms, Specific Energy Dose (SED), etc.; 4. Discuss RF heating mechanisms for tissues and implants; 5. Review current regulations and guidelines, RF energy monitoring approaches, and discuss strategies to prevent potential RF-induced thermal events; 6. Since SAR depends on system performance (B0, B1 field, RF transmission, etc), object properties (density, electrical conductivity, size, etc), geometry and patient positioning, and pulse sequences. A hands-on example will be presented to show SAR reduction in clinical protocols.

TABLE OF CONTENTS/OUTLINE

1. Introduction; 2. Overview of RF-induced thermal events and thermal injury root causes analysis; 3. RF coils and B1 field; 4. RF exposure and energy absorption; 5. RF heating mechanisms for tissues and implants; 6. RF safety and RF-induced thermal events prevention: emphasis on clinical protocols.

A Picture Is Worth a Million Convolutions: A Simplified Explanation of Convolutional Neural Networks for Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Tianyuan Fu, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To help radiologists gain a basic understanding of convolutional neural networks (ConvNets) for the purposes of interpreting literature on applications of artificial intelligence (AI), machine learning (ML), and deep learning (DL) in radiology. 2) Describe how ConvNets fit into the paradigm of AI, ML, and DL. 3) Touch on the similarities between ConvNets and biological human vision, and explain what makes ConvNets highly accurate and efficient at analyzing pictures. 4) Define important terminology associated with ConvNet architecture.5) Explain the process through which ConvNets learn from imaging data with a simple illustration of how a raw image is translated into pixel data, passed as input and processed through the neural network, and translated into one or more outputs. 6) Give an overview of transfer learning and discuss examples of pre-trained ConvNet architectures.

TABLE OF CONTENTS/OUTLINE

1) Overview of artificial intelligence, machine learning, deep learning, and convolutional neural networks (ConvNets). 2) ConvNets and biological human vision. 3) What makes ConvNets accurate and efficient at image analysis? 4) Translating a raw image into training data for a ConvNet. 5) Describe how ConvNets process image data and in the process learn information stored as weights. 6) Illustrate what a complete ConvNet architecture looks like. 7) Discuss transfer learning and illustrate existing ConvNet architectures including VGG-16, Inception, ResNet, and others. 8) Summary of the essential basics of ConvNets for radiologists who are reading literature on AI and ML/DL applications in radiology.

Emerging Applications of Cone-Beam Computed Tomography in Osseous Structure Assessment: A Pictorial Overview

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Hamza Ibad, MBBS, Baltimore, MD (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Flat-panel-detectors-based CBCT allows high-resolution osseous structural assessments.2. CBCT enables investigation of joints at various motion states and weight-bearing (WB), providing physiological measurements of joints in diseased and non-diseased states.3. Recently introduced motion compensation algorithms, such as regionally applied auto-focus, have the potential to greatly improve the diagnostic yield of CBCT examinations.4. Fast and high-resolution CBCT protocols permit temporomandibular joint (TMJ) assessment in closed- and open-mouth states5. CBCT enables accurate volumetric cartilage and bone mineral density evaluation of the knee joint complex, TMJ, and various other joints.6. Long-term outcomes of intraoperative use of CBCT in the orthopedic,oral, and maxillofacial repair of skeletal defects are currently under investigation.

TABLE OF CONTENTS/OUTLINE

1. Introduction.2. Emerging developments in CBCT imaging - WB capabilities, motion artifact compensation algorithms, high-resolution dental protocols, and intraoperative CBCT systems (e.g. C-arms with three-dimensional capability).3. Use in MSK Imaging - Tibiofemoral joint space width quantification, ankle syndesmosis measurements, valgus hindfoot alignment measurements, and intraoperative fracture and joint reduction aid.4. Use in Dental Imaging - Volumetric TMJ analysis, fracture assessment and post-repair evaluation, endo- and periodontics.5. Limitations and prospects.

Photon-Counting CT: Physics of Alternative Detector Approaches, Impacts on Image Quality, and Potential Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Paul E. Kinahan, PhD, Seattle, WA (*Presenter*) Co-founder, PET/X LLC

TEACHING POINTS

1. There are two established approaches for photon-counting CT detectors using silicon- and cadmium-based detectors, with different physical trade-offs.2. Photon-counting CT provides both lower noise and a much richer set of spectral (energy) information compared to CT scanners with standard energy-integrating detectors.3. Photon-counting CT also provides higher image resolution than CT scanners with standard energy-integrating detectors, albeit at a potentially higher cost and complexity.4. The are several clinical areas that can take advantage of the improved spatial and energy resolution of photon-counting CT systems.5. Developing appropriate workflows that take advantage of increased information per scan in an efficient manner is an important consideration.

TABLE OF CONTENTS/OUTLINE

Review the essential differences between photon-counting and energy-integrating CT systems, with an emphasis on the ability for lower noise and improved spectral (energy) information.Review the two established approaches for photon-counting CT detectors that use silicon- and cadmium-based detectors, with a discussion of the different physical trade-offsShow how the silicon- and cadmium-based detector designs necessarily lead to improved spatial resolution.Describe the roughly 50-fold increase in raw (sinogram) data generated by a photon-counting CT system and how it may impact clinical workflows..Provide illustrations of where the improved spatial and energy resolution of photon-counting CT systems can lead to improvements in imaging for oncology, cardiovascular, thoracic, musculoskeletal, and head and neck imaging.

Seeing More with Super-Resolution Deep-Learning CT Reconstruction: Principles and Clinical Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Yasunori Nagayama, MD, Kumamoto, Japan (*Presenter*) Nothing to Disclose

TEACHING POINTS

The acquisition of high-resolution and low-noise CT images is crucial for the detailed evaluation of fine anatomical and pathological structures. Recently, the super-resolution deep-learning-based reconstruction (SR-DLR) utilizing the convolutional neural networks (CNNs) to enhance the spatial resolution and reduce image noise has been clinically available. The purpose of this exhibit is:1. To understand the basic concept and technical principles of the SR-DLR technique 2. To describe the image characteristics of SR-DLR and compare them with those of filtered back projection (FBP), hybrid iterative reconstruction (IR), model-based IR, and normal-resolution DLR (NR-DLR) 3. To review the impact of SR-DLR on the image quality and object detectability in the clinical examples

TABLE OF CONTENTS/OUTLINE

1. CNN-based super-resolution technique 2. Basic concept and technical details of SR-DLR 3. Image properties of SR-DLR: comparisons with FBP, hybrid IR, model-based IR, and NR-DLR algorithms A) Noise property B) Spatial resolution C) Low- and high-contrast object detectability 4. Clinical application of the SR-DLR technique A) Coronary CT for coronary plaque assessments B) Stent imaging C) Lung CT D) Cerebral CT angiogram E) Pediatric CT for the assessment of congenital heart diseases 5. Future directions A) Application to dual-energy CT B) Network training with photon counting CT

Current Status and Future of Personal Dose Management-Necessity for Real-Time Measurement of the Occupational Radiation Dose in Interventional Radiology

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - PH

Participants
Kenshin Hattori, (*Presenter*) Nothing to Disclose

TEACHING POINTS

To understand current personal dose management to interventional radiology (IVR) staff.To understand importance of lens dosimeter.To understand the need for real-time measurement of occupational radiation dose in IVR. To compare fundamental characteristics among several occupational real-time dosimeters. To understand the fundamental characteristics of a real-time occupational dosimetry and display system (i3 system). To show the usefulness of the i3 system in occupational dose management for IVR.

TABLE OF CONTENTS/OUTLINE

The 2011 ICRP Statement significantly lowered the cataract threshold dose for the eye lens from 8 Gy to 0.5 Gy. Accordingly, dose limits for medical personnel have been lowered in many countries, and in Japan the dose limit has been significantly reduced from 150 mSv per year to an average of 20 mSv per year over a five-year period. Therefore, personal dose management is becoming increasingly important. Currently, glass badges and pocket dosimeters are used for personal dose management for medical staff, but in the future, lens dosimeters and real-time dosimeters may become important. Until now, it has not been possible to determine the time of exposure, but with the use of this real-time dosimeter, it is possible to understand at a glance. The new real-time dosimeters evaluated in this study have sufficient performance for clinical use, especially good angular dependence. These dosimeters will be important in the future.

Sub-Events

ROEE-1 Chemoradiation Complications in the Head and Neck: What the Oncologist Wants to Know

Awards
Certificate of Merit

Participants
Cameron Overfield, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Radiologists should be aware of current and novel oncologic treatment methods for head and neck cancer. After reviewing this presentation, the audience will understand the basics of the different oncologic treatment modalities for the head and neck. 2. Adverse effects with all treatment modalities may be early or delayed. It is imperative that these effects are recognized on imaging and not mistaken for residual, recurrent, or metastatic disease. The audience will be able to distinguish these entities in the head and neck as it relates to chemoradiation therapy and immunotherapy. 3. Treatment-induced malignancies are an unfortunate, but possible adverse delayed effect. An overview of the multimodality imaging characteristics of treatment-induced malignancies will be discussed.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Teaching Points and Target Audience 3. Principal Radiation and Systemic Therapies a. Radiation therapy b. Chemotherapy c. Immunotherapy (check-point inhibitors) 4. Early Adverse Effects a. Skin and soft tissue abnormalities b. Mucositis c. Inflammatory responses (salivary gland edema, laryngeal edema, retropharyngeal fluid) 5. Delayed Adverse Effects a. Salivary gland changes b. Thyroid gland injury c. Osseous and Cartilage abnormalities (osteonecrosis of the mandible, laryngeal chondronecrosis, fatty marrow replacement) d. Vasculopathy (accelerated atherosclerotic disease, "carotid blowout") e. Tissue necrosis (brain, cord) f. Cranial neuropathies (optic neuropathy, ototoxicity, facial neuropathy) 6. Treatment-induced Malignancies a. Most common associated neoplasms b. Multimodality imaging characteristics and most common anatomical locations 7. Conclusion

ROEE-2 MRI-Guided Pelvic Radiotherapy: A Primer for Radiologists

Awards
Identified for RadioGraphics

Participants
Jim Zhong, MD, Leeds, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Discuss the rationale for Magnetic Resonance Imaging Guided Radiotherapy (MRIgRT), including external beam radiotherapy (EBRT), stereotactic ablative radiotherapy (SABR), brachytherapy, and highlight the current evidence base. • Describe the current clinical experience of MRI-guided workflow for prostate, cervical and bladder cancer • Describe translation of clinical workflow onto the Elekta Unity MR-Linac (MRL) and provide examples of treated cases • Highlight the potential benefits and limitations of adaptive MRIgRT in prostate, cervical and bladder cancer • Discuss opportunities for the development of biologically driven adapted radiotherapy (ART) using functional MRI sequences (e.g. DWI, DCE-MRI, T1 oxygen enhanced (OE) MRI)

TABLE OF CONTENTS/OUTLINE

Computed Tomography (CT) is the standard imaging modality for RT planning however due to poor tissue contrast, accurate delineation of pelvic tumors remains difficult with several limitations, including clear demarcation of tumors or normal structures, which influences dose delivered to surrounding organs. MRI is superior at visualising and staging pelvic malignancies. Using MRI in the therapeutic setting allows for comprehensive anatomic information to improve organ delineation and accurate RT delivery, particularly in the era of hypofractionated RT. The availability of hybrid systems incorporating MRI with a linear accelerator (MRL) offers the opportunity for real-time MRI at each radiotherapy fraction, with the ability of plan adaption while the patient is on the treatment table. This overview highlights the current evidence, workflow and future opportunities that this technology brings for treating pelvic tumors.

ROEE-3 Dual Energy Metal Artifact Reduction for Iodine-125 Seed Identification of Prostate Brachytherapy Planning

Participants
Chiaki Suzuki, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In prostate brachytherapy, creating accurate post-planning dose distributions is important for defining the area to be treated. However, it was occasionally found on CT images that the exact number and location of sources could not be identified due to iodine-125 seed swelling and metal artifacts. In order to solve these problems, high-energy virtual monochromatic images (VMI) of dual-energy computed tomography (DECT) were used for treatment planning in combination with the metal artifact reduction processing technology (single energy metal artifact reduction: SEMER). To estimate iodine-125 seed swelling, the caliber of iodine-125 seed was calculated as the full width at half maximum. The metal artifacts were evaluated using the artifact index. The blooming artifacts were decreased at the higher keV levels. In addition, the SEMAR process markedly reduced the artifact index. As a result, the locations and number of iodine-125 seed were clearly identified in the dose distribution map of the treatment planning using high-energy (200keV) VMI with SEMAR. Reducing the overestimation of the high dose range helps us precisely reproduce the dose distribution near the urethra, which would be effective in reducing the risk of side effects.

TABLE OF CONTENTS/OUTLINE

1.Clinical problems with conventional CT. 2.Metal artifact reduction processing technology “SEMAR”. 3.Blooming artifact reduction using high-energy VMI. 4.Adaption of high-energy VMI with SEMAR to treatment planning 5.Effect on dose distribution

ROEE-4 Imaging of Radiation Therapy for Lung Cancer

Participants
Mylene T. Truong, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

In the treatment of patients with lung cancer, radiation therapy is an integral component, using conventional fractionated external-beam or high-precision dose techniques including three-dimensional conformal radiotherapy, stereotactic body radiation therapy, intensity-modulated radiation therapy, and proton therapy. Knowledge of the radiation technique used, radiation treatment plan, expected evolution over time of radiation-induced lung injury and patient specific parameters, such as previous radiotherapy, concurrent chemoradiotherapy, and/or immunotherapy, is important in the interpretation of imaging studies to manage patients. This review discusses factors that affect the development and severity of radiation-induced lung injury and its radiological manifestations with emphasis on the differences between conventional radiation and high precision dose radiotherapy techniques. Complications of radiation therapy include radiation recall pneumonitis, in situ pulmonary artery thrombosis, tumor recurrence and secondary malignancies.

TABLE OF CONTENTS/OUTLINE

Introduction: 3D-conformal radiation therapy Intensity modulated RT Stereotactic body RT Proton therapyRadiation induced lung injury: Patient specific parameters include age, heavy smoking history, poor performance status, pulmonary fibrosis, previous RT, concurrent chemoradiotherapy and/or immunotherapy.Imaging findings: Timelines for conventional versus SBRT, Acute versus chronic. Complications: Radiation recall pneumonitis, Tumor recurrence, In situ pulmonary artery thrombosis.

ROEE-5 Beware of the Raditation Changes! A Brief Pictorial Review of Post-Radiation Imaging Appearances in Pelvis Malignancies - Our Experience in MRI

Participants
Mario Zelaya Villafranco, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Recognize the benefits and usefulness of radiotherapy in the treatment of numerous tumors of the abdominal-pelvic cavity as primary, adjuvant or palliative therapy. Emphasizing the sensitivity of tissues to radiation depends on the rate of cell turnover. The response of different organs to damage depends on the dominant tissue type. We will recognize the different post-radiotherapy appearances in the pelvic organs and tissues by magnetic resonance imaging, and they will be compared with the cases of patients in our institution.

TABLE OF CONTENTS/OUTLINE

A brief review of post-radiotherapy changes in different pelvic malignancies will be carried out, comparing the current theory on post-radiotherapy changes in different organs and tissues, with the cases obtained in our institution.The pictorial review will include key theory about the main post-radiotherapy changes in the different tissues in MRI, as well as their main complications. Post-radiotherapy changes and their complications in different tissues will be included, such as: uterus and ovaries, urinary bladder, intestines (post-radiation proctitis) and soft and bone tissues (bone marrow changes) and their different appearances exemplified with cases obtained in our institution.

ROEE-6 Diagnosis and Management of Cholangiocarcinoma: Pearls and Pitfalls

Participants
Zack Nigogosyan, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Review epidemiology of cholangiocarcinoma2. Review pathophysiology of cholangiocarcinoma3. Review diagnostic criteria and staging of cholangiocarcinoma4. Review imaging features to identify cholangiocarcinoma on CT, MRCP, and MRI5. Evaluate cholangiocarcinoma on imaging post-treatment6. Review clinical management of cholangiocarcinoma

TABLE OF CONTENTS/OUTLINE

1. Overview of cholangiocarcinoma based on evidence-based literature including incidence, pathophysiology, and risk factors2. Discuss imaging methods such as CT, MRCP, and MRI in diagnosing cholangiocarcinoma3. Review clinical management of cholangiocarcinoma including interventional radiology approaches, medical oncology approaches, and radiation oncology approaches4. Discuss imaging findings of cholangiocarcinoma on CT and MRI post-treatment5. Summary

ROEE-7 How Advances in Imaging are Defining the Future of Precision Radiotherapy

Awards
Identified for RadioGraphics

Participants
Sandra Baleato Gonzalez, MD, PhD, Santiago de Compostela, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

Imaging has an essential role in radiotherapy (RT) planning. Recent advances in imaging have led to the development of new radiation therapy techniques and image-guided radiotherapy (IGRT). Furthermore, functional and molecular imaging techniques have allowed that tumor evaluation and treatment individualization are not only based on morphological criteria but also on biological tumor characteristics.The aim of this exhibit is:-To review the main biological effects of RT on tumor cells and tumor microenvironment.-To evaluate the importance of imaging in new radiotherapy techniques.-To discuss the contribution of advanced imaging techniques for tumor delineation, prognosis, prediction, and assessment of response/resistance to RT.-To review the future role of artificial intelligence, imaging biomarkers and radio(geno)mics in RT.

TABLE OF CONTENTS/OUTLINE

-Biological effects of RT on tumor cells and tumor microenvironment and how can imaging evaluate radiation effects.-The importance of imaging in new radiation therapy technologies (including IGRT, intensity-modulated RT, stereotactic body RT and proton beam therapy).-The complementary role of MRI and PET CT for tumor delineation and normal tissue identification.-Functional/molecular imaging techniques and multiparametric imaging in RT.-Precision RT and Imaging: the role of advanced imaging in tumor delineation and delivery, tumor heterogeneity (biologically targeted RT), prognosis, prediction, or assessment of response/resistance to RT.-Future directions in RT: artificial intelligence, imaging biomarkers and radio(geno)mics.-Conclusions

ROEE-8 Solving The Neuroradiology Mystery: Progression, Pseudoprogression, or Radiation Necrosis in Post-treatment Imaging of Gliomas

Participants
Maguy Farhat, MD, BS, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

Accurate timely diagnosis of treatment response in gliomas is crucial to avoid early inappropriate discontinuation of therapy or unnecessary toxic exposure to a treatment regimen. Pseudoprogression is a radiologic diagnosis defined by transient breakdown of the blood/brain barrier, with new contrast enhancement appearing within 3 months of completion of radiation therapy.Radiation necrosis can occur 3-12 months or even years after radiotherapy completion. Pseudoprogression is more likely to occur in patients with MGMT methylation promotion. Multiparametric imaging, including perfusion imaging and multivoxel MR Spectroscopy improves the ability to differentiate between tumor progression and treatment change. Delayed FDG PET optimizes conspicuity of progressive disease.

TABLE OF CONTENTS/OUTLINE

Overview of the standard of care approach for gliomas.Review conventional imaging findings of pseudoprogression. Review histologic and conventional imaging findings radiation necrosis and tumor progression. Discussion role of advanced MR sequences to improve confidence in differentiating between treatment changes and progressive tumor, including spectroscopy, perfusion and delayed time point FDG-PET.

ROEE-1

Chemoradiation Complications in the Head and Neck: What the Oncologist Wants to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - RO

Awards
Certificate of Merit

Participants
Cameron Overfield, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Radiologists should be aware of current and novel oncologic treatment methods for head and neck cancer. After reviewing this presentation, the audience will understand the basics of the different oncologic treatment modalities for the head and neck. 2. Adverse effects with all treatment modalities may be early or delayed. It is imperative that these effects are recognized on imaging and not mistaken for residual, recurrent, or metastatic disease. The audience will be able to distinguish these entities in the head and neck as it relates to chemoradiation therapy and immunotherapy. 3. Treatment-induced malignancies are an unfortunate, but possible adverse delayed effect. An overview of the multimodality imaging characteristics of treatment-induced malignancies will be discussed.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Teaching Points and Target Audience 3. Principal Radiation and Systemic Therapies a. Radiation therapy b. Chemotherapy c. Immunotherapy (check-point inhibitors) 4. Early Adverse Effects a. Skin and soft tissue abnormalities b. Mucositis c. Inflammatory responses (salivary gland edema, laryngeal edema, retropharyngeal fluid) 5. Delayed Adverse Effects a. Salivary gland changes b. Thyroid gland injury c. Osseous and Cartilage abnormalities (osteonecrosis of the mandible, laryngeal chondronecrosis, fatty marrow replacement) d. Vasculopathy (accelerated atherosclerotic disease, "carotid blowout") e. Tissue necrosis (brain, cord) f. Cranial neuropathies (optic neuropathy, ototoxicity, facial neuropathy) 6. Treatment-induced Malignancies a. Most common associated neoplasms b. Multimodality imaging characteristics and most common anatomical locations 7. Conclusion

ROEE-2

MRI-Guided Pelvic Radiotherapy: A Primer for Radiologists

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - RO

Awards
Identified for RadioGraphics

Participants
Jim Zhong, MD, Leeds, United Kingdom (*Presenter*) Nothing to Disclose

TEACHING POINTS

• Discuss the rationale for Magnetic Resonance Imaging Guided Radiotherapy (MRIgRT), including external beam radiotherapy (EBRT), stereotactic ablative radiotherapy (SABR), brachytherapy, and highlight the current evidence base. • Describe the current clinical experience of MRI-guided workflow for prostate, cervical and bladder cancer • Describe translation of clinical workflow onto the Elekta Unity MR-Linac (MRL) and provide examples of treated cases • Highlight the potential benefits and limitations of adaptive MRIgRT in prostate, cervical and bladder cancer • Discuss opportunities for the development of biologically driven adapted radiotherapy (ART) using functional MRI sequences (e.g. DWI, DCE-MRI, T1 oxygen enhanced (OE) MRI)

TABLE OF CONTENTS/OUTLINE

Computed Tomography (CT) is the standard imaging modality for RT planning however due to poor tissue contrast, accurate delineation of pelvic tumors remains difficult with several limitations, including clear demarcation of tumors or normal structures, which influences dose delivered to surrounding organs. MRI is superior at visualising and staging pelvic malignancies. Using MRI in the therapeutic setting allows for comprehensive anatomic information to improve organ delineation and accurate RT delivery, particularly in the era of hypofractionated RT. The availability of hybrid systems incorporating MRI with a linear accelerator (MRL) offers the opportunity for real-time MRI at each radiotherapy fraction, with the ability of plan adaption while the patient is on the treatment table. This overview highlights the current evidence, workflow and future opportunities that this technology brings for treating pelvic tumors.

Dual Energy Metal Artifact Reduction for Iodine-125 Seed Identification of Prostate Brachytherapy Planning

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - RO

Participants
Chiaki Suzuki, (*Presenter*) Nothing to Disclose

TEACHING POINTS

In prostate brachytherapy, creating accurate post-planning dose distributions is important for defining the area to be treated. However, it was occasionally found on CT images that the exact number and location of sources could not be identified due to iodine-125 seed swelling and metal artifacts. In order to solve these problems, high-energy virtual monochromatic images (VMI) of dual-energy computed tomography (DECT) were used for treatment planning in combination with the metal artifact reduction processing technology (single energy metal artifact reduction: SEMER). To estimate iodine-125 seed swelling, the caliber of iodine-125 seed was calculated as the full width at half maximum. The metal artifacts were evaluated using the artifact index. The blooming artifacts were decreased at the higher keV levels. In addition, the SEMAR process markedly reduced the artifact index. As a result, the locations and number of iodine-125 seed were clearly identified in the dose distribution map of the treatment planning using high-energy (200keV) VMI with SEMAR. Reducing the overestimation of the high dose range helps us precisely reproduce the dose distribution near the urethra, which would be effective in reducing the risk of side effects.

TABLE OF CONTENTS/OUTLINE

1.Clinical problems with conventional CT. 2.Metal artifact reduction processing technology “SEMAR”. 3.Blooming artifact reduction using high-energy VMI. 4.Adaption of high-energy VMI with SEMAR to treatment planning 5.Effect on dose distribution

VAEE

Vascular Education Exhibits

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Sub-Events

VAEE-1 Vascular Applications of Photon Counting Detector CT

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Photon-counting detector (PCD) CT is a recent technical innovation that uses novel detectors directly converting x-ray photons into electrical signals without the generation of light. In this exhibit, we aim 1. To discuss the physics and principles of PCD CT 2. To review the advantages of PCD CT over conventional energy integrating detector (EID) CT. 3. To illustrate the clinical applications of PCD CT in vascular imaging using multiple case examples

TABLE OF CONTENTS/OUTLINE

1. PCD CT TECHNOLOGIES- Single source, Dual-source 2. ADVANTAGES OF PCD-CT a. High spatial resolution b. Multi energy (ME) imaging c. Increased vascular signal d. Decreased electronic noise e. Decreased artifacts f. Lower radiation and contrast doses g. Potential K-edge imaging - Gadolinium + Iodine 3. APPLICATIONS OF PCD CT IN VASCULAR IMAGING WITH CASE EXAMPLES a. Ultra-high resolution- Improved visualization of small vessels (Artery of Adamkiewicz; Flaps including DIEP, fibular; arteries of hand, feet, head), calcified plaques, stents b. High iodine CNR (low-energy VMI's)- Low dose of iodinated contrast, salvage of suboptimal studies c. Decreased artifacts- Calcium blooming, beam hardening, metal d. ME calcium separation- Improved lumen visualization e. ME bone subtraction f. ME lesion characterization g. Vascular perfusion h. Potential for multi-contrast and novel contrast media- e.g. iodine and gadolinium i. Advanced material separation j. Radiation dose reduction- Virtual noncontrast images in multiphasic studies, lower noise profile 4. LIMITATIONS, PITFALLS a. Increased data - storage and transfer issues b. Noise reduction in high resolution mode

VAEE-10 Applications of 4D Flow MRI from Head to Toe

Awards
Cum Laude

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe the principles and technique of 4D flow 2. To review the applications of 4D flow from head to toe 3. To illustrate the multi-systemic applications of 4D flow using case examples 4. To review common pitfalls and solutions in the use of 4D flow

TABLE OF CONTENTS/OUTLINE

1. 4D FLOW- Physics and principles 2. 4D FLOW PARAMETERS- Feraheme vs Gadolinium, spatial/ temporal resolution, plane, slice thickness, VENC, gating, flip angle 3. DISPLAY- Velocity MIPs, Streamlines, pathlines, vectors 4. ADVANCED PARAMETERS- Shear stress, pressure gradient, pulse wave velocity, turbulent kinetic energy 5. LIMITATIONS 6. ARTIFACTS 7. AI 8. REVIEW AND ILLUSTRATION OF THE FOLLOWING APPLICATIONS OF 4D FLOW FROM HEAD TO TOE A. Neurological - Vein of Galen malformations; Aneurysms- Pre and post procedure; AV malformations; Atherosclerotic stenosis B. Thoracic - Abnormal flow patterns- Novel biomarkers in aortopathies.e.g. bicuspid valve; Aortic dissection- Hemodynamics; Aortic coarctation- collateral blood flow; Vasculitis; Pulmonary hypertension C. Cardiac - Improved workflow in complex congenital heart diseases; Pre-surgical evaluation- E.g. Fontan shunt; Valvular heart disease; Detection of small shunts D. Abdominal - Dissection- False lumen Ejection fraction; Endoleak detection and characterization, type IIa vs IIb ; Mesenteric ischemia- Meal challenge; Portal hemodynamics in cirrhosis- shunting, AP fistula, vascular stenosis, Pre- and post TIPS; Splenic function; Pre transplant evaluation- Vascular anatomy, PV thrombus, portosystemic shunt; Uterine fibroid Pelvic venous congestion E. Peripheral - AV malformation; Lymphatic vessels

VAEE-11 US Of the Hemodialysis Patient: Mapping For Surgical And Percutaneous AVF, Grafts, And Postoperative US Evaluation, with Angiographic Correlation

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Kedar Sharbidre, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Patients with end stage renal disease (ESRD) requiring permanent hemodialysis (HD) access options of surgical creation of an

Patients with end-stage renal disease (ESRD) requiring permanent hemodialysis (HD) access options of surgical creation of an arteriovenous fistula (sAVF), percutaneous AVF (pAVF) creation, or surgical placement of synthetic arteriovenous graft. Superficial venous anatomy can be highly variable and hence accurate preoperative ultrasound (US) assessment is very important, particularly for pAVF planning. US can also help determine AVF maturity and evaluation for complications to guide management. After reviewing this exhibit, the learner will be able to: 1. Describe a typical US arterial and venous mapping protocol for upper extremity sAVF, pAVF, AVG, and thigh graft placement. 2. Understand postoperative US criteria for sAVF and pAVF maturation 3. Recognize abnormalities that may impede AVF maturation 4. Diagnose complications using the US including focal swelling or fluid collection at the fistula site, arterial steal, aneurysm, pseudoaneurysm, and graft degeneration

TABLE OF CONTENTS/OUTLINE

1. Venous and Arterial Anatomy of the Extremities for HD mapping a. Upper extremity arteries b. Upper extremity deep and superficial veins c. Groin arteries and veins for AVG 2. Preoperative vascular mapping a. Upper extremity protocol b. Specific mapping for pAVF c. Groin protocol 3. Postoperative assessment for fistula maturation a. sAVF b. pAVF 4. US assessment of complication with angiographic correlation showing treatment results as appropriate a. Abnormalities that prevent maturation i. stenosis (anastomotic, draining vein, central vein) ii. accessory draining veins b. Graft stenosis c. Thrombosis d. Fluid collections e. Arterial steal f. Pseudoaneurysm g. Graft degeneration.

VAEE-12 Thoracic Endovascular Aortic Repair: Past, Present, and Future

Participants
Jonathan Liu, MD, Palo Alto, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Knowledge of the nomenclature facilitates communication between radiologists and vascular/cardiothoracic surgeons.- Indications for TEVAR continues to evolve, with expanding indications. The proximal descending thoracic aorta, aortic arch, and even ascending aorta can be repaired endovascularly.- Awareness of the various types of repair will assist in the detection of repair complications.

TABLE OF CONTENTS/OUTLINE

I. Introduction/History and path to FDA approvalII. Indication for thoracic endovascular aortic repairIII. Anatomy for endovascular approacha. Aortic arch zonesb. Aortic arch typesIV. Historical and contemporary devicesV. Novel techniquesa. Petticoat techniqueb. Snorkel / Periscope techniquec. In-situ laser fenestrationVI. Investigational devicesVII. Complications of TEVARa. Birdbeakingb. Stent-graft induced new entry tearc. Endoleak / gutter leakd. Infectione. Fracture/migrationVIII. Conclusion

VAEE-13 Imaging Review and Management Update on Portal Vein Thrombosis

Participants
Maria Garcia, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Describe the anatomy of the portal vein (PV) and relevant anatomic relationships. 2) Describe the pathophysiology and common risk factors for portal vein thrombosis (PVT). 3) Identify the multimodality imaging features of acute, chronic and iatrogenic portal vein occlusion 4) Identify the role of imaging in diagnosis and management of PVT.

TABLE OF CONTENTS/OUTLINE

I. Background. II. Normal/Variant anatomy. III. Overview of PVT pathophysiology, broadly 3 etiologies: 1) Hereditary thrombophilia; 2) Acquired thrombophilia/hypercoagulable states, such as pregnancy and malignancy; 3) Intra-abdominal causes. IV. Definition and clinical manifestations of acute and chronic PVT. V. Imaging features of acute versus chronic PVT. VI. Illustration of PV occlusion: a) Bland thrombus: hematologic disorders, cirrhosis, pancreatitis, portal pyaemia, inflammatory bowel disease, pancreatic malignancy; b) Tumor thrombus: HCC and others such as sarcoma and NET; c) Intervention-related: Surgery/Liver transplant, TIPS stent thrombosis, Portal vein embolization; d) Chronic changes/complications: Cavernous transformation (adults/children), Portal hypertension, Portal biliopathy, Mesenteric ischemia; e) Mimics: Flow artifacts, Hepatic vein/IVC occlusion, Dilated bile duct. VII. Treatment: 1) Medical: Anticoagulation, highlight the reason for differential approach in the presence or absence of cirrhosis; 2) Endovascular: Two main interventions for portal vein recanalization (PVR) a) Thrombectomy +/- thrombolysis, b) PVR-TIPS stent placement. 3) Surgical: Bowel infarction or contraindication to thrombolytic therapy. VIII. Take home points.

VAEE-14 Ultrasound Evaluation of AV Fistulas for Hemodialysis: A Hands-on Approach

Participants
Mikel Elgezabal, MD, Barrika, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To understand the importance of Chronic Kidney Disease in healthcare.- To make the reader confident to perform ultrasound on patients with AV fistulas as a vascular access for hemodialysis, using a simple step-by-step approach that can cover all the bases for a satisfactory evaluation.

TABLE OF CONTENTS/OUTLINE

Chronic Kidney Disease (CKD) Contemporary significance of CKD: definition, prevalence, burden. Ultrasound findings of CKD. Therapeutic options for CKD: Renal Replacement Therapy with a focus on hemodialysis.Arteriovenous Fistulas for Hemodialysis What is an AV fistula? A quick, basic review slide to get the reader up to speed. The upper extremity: vascular anatomy: We include labeled anatomy images of the upper limb arterial and venous system and discuss key anatomical landmarks along with their corresponding clinical significance. Planning an AV fistula: pre-surgical ultrasound.Types of AVF: Native vs. prosthetic, typical locations.Sonographic assessment of an AV fistulaBefore scanning: clinical assessment, patient position, ultrasound probe choice. Ultrasound exam. Components of an AV fistula and individual sonographic properties of each component. The afferent artery, the anastomosis, the efferent vein. Properties of the mature and healthy AV Fistula: ready to needle! Complications: We detail key diagnostic points of each one of the most common complications and support them with clinical cases and images from our institution.

VAEE-15 How Will 320-Raw Multi Detector CT Change the Diagnosis of Pelvic Venous Congestion Syndrome?

Participants
Kazuto Sakamoto, RT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. Pelvic venous congestion syndrome (PVC) is a cause of chronic pelvic pain in female patients. The cause of PVCS may be structural. It is the regurgitation of the gonadal vein with venous valve insufficiency due to compression have the left renal vein or the iliac vein. 2. PVCS may not be accompanied by pelvic pain, and imaging by US or MRI may be useful. The most important reason for this is that US and MRI can determine the direction of blood flow in the refluxed gonadal vein. 3. The 320-raw multi detector CT can acquire cine images up to 160 mm wide with 4D imaging. In addition, 4DCT angiography cine images can be used to evaluate gonadal vein reflux.

TABLE OF CONTENTS/OUTLINE

Major headings:1. Describe PVCS. 2. Usefulness of 4DCT angiography in PVCS diagnosis.- 4DCT angiography cine imaging to evaluate gonadal vein reflux. - In all cases, the findings were comparable to catheter-based angiography. 3. Supporting imaging with 3DCT angiography in PVCS revascularization. - Supporting imaging with 3DCT is expected to reduce the total radiation dose to the patient. - In other words, a reduction in fluoroscopic time due to shorter operative time. 4. Quantification of edema by CT imaging in determining treatment efficacy.- CT images are a useful tool for convenient volumetric measurements. - Volumetric evaluation is important to determine the efficacy of treatment of PVCS with lower extremity edema.

VAEE-16 Arteriovenous Fistula For Hemodialysis: A Thorough Analysis

Participants
Sofia Maksoud, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The arteriovenous fistula is created from the anastomosis between native artery and vein, with the aim of providing chronic access for hemodialysis in patients with end-stage renal disease until they can receive a kidney transplant.- The most used are the anastomosis of the radial artery with the cephalic vein or brachial artery with the cephalic vein.- The structure created must be accessible and have the blood flow necessary to be cannulated repeatedly and thus allow adequate dialysis. For this, the minimum internal calibers must be 0.2 cm for the artery and 0.25 cm for the vein.- After the creation of the fistula, the blood vessels involved undergo a maturation process that can be evaluated by means of a color Doppler ultrasound study. The flow volume, calculated through the formula of the average velocity times the diameter of the opening, reaching 600 mL/minute is a parameter commonly associated with maturation.- Complications of arteriovenous fistula include failure of maturation, stenotic vascular lesions, thrombosis, aneurysms or pseudoaneurysms, and infection.

TABLE OF CONTENTS/OUTLINE

- Review expected ultrasound findings expected for a patent arteriovenous fistula for hemodialysis.- Evaluate the most common complications and their presentation on ultrasound.

VAEE-17 Beware of The Dislodged Devices

Participants
Marcus Nascimento, MD, Sao Paulo, Brazil (*Presenter*) Fellow, Hospital Israelita Albert Einstein

TEACHING POINTS

The purpose of this exhibit is:- To briefly review and recognize some of the cardiovascular devices used in patient care.- To describe how to recognize and define the position of some devices in different imaging modalities.- Show examples of medical dislodged devices or with some kind of complication.

TABLE OF CONTENTS/OUTLINE

1) Basic anatomy of the chest and cardiovascular system.2) Types and function of the devices3) How the devices are represented in the different images modalities and their primary function in patient care.4) Key Imaging Findings that define their malpositioning and/or deformation.5) Take home messages.

VAEE-18 Does Size Really Matter? Imaging in Visceral Artery Aneurysms

Participants
Tomas Lacerda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibition is to review the most recent guideline on visceral aneurysms and its recommendations towards treatment indications and modalities. Also, discuss most common sites for visceral aneurysms, symptoms and complications and imaging findings in diagnostic and post treatment situations.

TABLE OF CONTENTS/OUTLINE

Understand the most common sites for visceral aneurysms and its potential potential complications; Reviewing the latest guideline on visceral aneurysms, its recommendations towards when and how to repair; Illustrate through a series of radiological cases the most common sites, findings on possible complications and imaging during and after endovascular repair.

VAEE-19 Portal Vein Thrombosis: What a Radiologist Needs to Know In the Era of the Baveno VII Consensus Recommendations

Awards
Identified for RadioGraphics

Participants
Alessandro Bozzato, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Illustrate the recommended standardized nomenclature for the description of portal vein thrombosis (PVT) and portal cavernoma, according to the Baveno VII consensus definitions. -Describe diagnosis and management of acute and chronic PVT in absence and presence of cirrhosis.

TABLE OF CONTENTS/OUTLINE

Introduction PVT is characterized by the presence of a bland thrombus in the portal vein trunk and its branches. It occurs in non-cirrhotic patients, and, less frequently, in cirrhotic patients. Imaging methods should be used to diagnose PVT (ruling out malignant portal vein obstruction) and assess its extension.Recommended standardized nomenclature- Show typical imaging features illustrating the nomenclature:• Time course (acute and chronic thrombosis)• Percent occlusion of main portal vein (completely occlusive, partially occlusive, minimally occlusive thrombosis, and cavernous transformation)• Response to treatment or interval change (progressive, stable and regressive thrombosis)Portal vein thrombosis and portal cavernoma in the absence of cirrhosis- Illustrate acute and chronic PVT in the absence of cirrhosis: • Diagnosis and follow-up • Interventional management (image-guided interventions, thrombolysis, transjugular intrahepatic portosystemic shunt (TIPS), and other percutaneous recanalizations)Portal vein thrombosis and cirrhosis- Illustrate PVT in cirrhosis:• Diagnosis and follow-up• Interventional management ((TIPS), and other percutaneous recanalizations)

VAEE-2 Multimodality Imaging of Portal Vein Thrombosis: Diagnosis and Influence on Clinical Management

Participants
Catherine Naidoo, MBBS, FRANZCR, Randwick, Australia (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Learn how to diagnose portal vein thrombosis (PVT) on different imaging modalities 2- Determine the etiology (Benign vs. Malignant), onset (Acute vs. Chronic), and extent of PVT 3- Assess the acute and chronic complications of PVT

TABLE OF CONTENTS/OUTLINE

Thrombosis of the portal venous system is a frequent and potentially life-threatening condition that can take place in a number of different clinical settings including liver cirrhosis, hepatocellular carcinoma, other solid tumors, abdominal septic foci, acute pancreatitis, hematological malignancies, and congenital or acquired prothrombotic disorders. Imaging plays a pivotal role in the clinical decision-making process in patients with thrombosis of the portal venous system. In this article, we will discuss the familiar and uncommon imaging findings of PVT at the ultrasound, contrast-enhanced ultrasound, CT, and MRI and the role of imaging in determining the underlying etiology (benign versus malignant) and onset (acute versus chronic). We will learn the available classification systems that provide a treatment-oriented assessment of PVT extension and degree of occlusion. We will recognize the acute and chronic morphologic changes of the liver parenchyma, such as nodular regenerative hyperplasia, secondary to PVT nodular regenerative hyperplasia. We will also review the complications of PVT such as portal biliopathy.

VAEE-20 Ultrasound of Peripheral Arteries: An Update on Technique, Protocols, Interpretation and Applications

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the indications of ultrasound (USG) in peripheral arterial diseases 2. To review the normal and abnormal flow patterns in peripheral arteries 3. To illustrate imaging appearances of common peripheral arterial abnormalities.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION 2. ANATOMY 3. ROLE, ADVANTAGES, LIMITATIONS OF USG- Comparison with other invasive and non-invasive modalities 4. TECHNICAL REQUIREMENTS-B-mode, doppler, color, power 5. OPTIMIZATION OF TECHNICAL PARAMETERS 6. TRANSDUCER AND PATIENT POSITION 6. NORMAL VESSEL- Normal caliber, laminar flow 7. WAVEFORMS - Normal - Triphasic or biphasic with sharp systolic upstroke; -Abnormal - Monophasic or biphasic without sharp systolic upstroke 8. VELOCITIES- Normal and abnormal at, proximal and distal to stenosis; grading of stenosis 9. ILLUSTRATION OF THE FOLLOWING ABNORMALITIES WITH SAMPLE CASES A. Atherosclerosis, native vessels- Indications; Diagnostic approach; Screening localization; Criteria for different grades of stenosis- Velocities, waveforms, pre and post stenotic vessels; Collaterals; Pitfalls, misses B. Bypass graft evaluation C. Stent evaluation D. Aneurysms E. Pseudoaneurysms- To-and-fro flow, guidance for management F. Popliteal artery entrapment G. Dissection H. Arteritis I. AV Fistula- High-velocity turbulent flow between vessels; low resistance proximal arterial waveforms; High, arterialized venous flow; vibration artifacts in perivascular tissues. J. Post-surgical/interventional follow-up- Grafts, thrombin injection

VAEE-21HC Evaluation of Lower Extremity Peripheral Arterial Disease Using Ultrasonography: What Everyone Should Know

Participants
Omair Ali, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To provide a clinical overview of peripheral arterial disease (PAD) of the lower extremities and its sequelae. 2. To examine the role of noninvasive imaging in the assessment of PAD 3. To provide a pictorial-based review of ultrasound (US) modalities and their utility in noninvasive evaluation of PAD 4. To discuss the role of US in unique clinical circumstances related to PAD

TABLE OF CONTENTS/OUTLINE

1) Introduction to PAD a) Natural history 2) Overview of Noninvasive evaluation of PAD a) Indications for US evaluation of PAD 3) Arterial ultrasonography (US) of PAD a) Overview and limitations of US techniques for arterial imaging b) Arterial mapping by segment i) Aortoiliac ii) Femoropopliteal iii) Infrapopliteal c) B-mode Doppler i) Visualization of vascular anatomy ii) Abnormal findings (plaque, stenosis, calcification) Spectral Doppler i) Purpose: characterization of blood flow based on waveforms ii) Peak systolic velocity (PSV) and PSV ratio iii) Abnormal findings (spectral broadening, increase in PSV, monophasicity e) Color Doppler i)

Assessment of direction and speed of flow ii) Abnormal findings (aliasing, color bruit) f) Power Doppler i) Examining flow based on quantity of red blood cells ii) Abnormal findings (decreased flow, occlusion) g) Contrast-enhanced US i) Assessment of perfusion ii) Abnormal findings h) Pedal acceleration time i) Role in evaluating CLI and predicting limb salvage 4) Special considerations for US evaluation of PAD a) Chronic total occlusion b) Critical limb ischemia c) Calcified PAD d) Post-revascularization surveillancePlease visit the Learning Center to also view this presentation in hardcopy format.

VAEE-22 Doppler US of Lower Limb Venous Insufficiency Made Simple

Participants
Montserrat Torrent, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chronic venous insufficiency of the lower limbs is very prevalent.Duplex ultrasound has the ability to demonstrate venous hemodynamic reflux, that why it become the method of choice to study this condition. We review the venous anatomy of the lower limbs, the pathophysiology of chronic venous insufficiency and explain the protocol for carrying out Duplex studies.These include venous mapping and a thorough evaluation of the superficial veins to identify all of the patterns of incompetence. We also evaluate patients with other treatment techniques such as thermal ablation, sclerotherapy.Therefore we can conclude the complications or the success of the applied procedure.

TABLE OF CONTENTS/OUTLINE

Learningobjectives:? Review the venous anatomy of the lower limbs, the pathophysiology of chronic venous insufficiency and explain the protocol for carrying out Duplex studies? Perform venous mapping with the patterns of incompetence.? Evaluate patients after treatment to identify success, complicationsand recurrence.

VAEE-23 Abernethy Malformation: What You Need to Know

Participants
Alexandra Panyukova, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the normal anatomy and embryology of the portal system. - To learn about Abernethy malformation - a rare congenital vascular pathology. - To illustrate the role of different imaging methods in diagnosis of Abernethy malformation. - To highlight the main points in radiology reports, which influence further patient evaluation and treatment.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Anatomy review 3. Embryology: portal venous system development 4. Abenethy malformation 4.1. Definition 4.2. Classification 4.3. Clinical manifestations, complications 4.4. Diagnostic methods 4.5. What else should you look for? 4.6. Follow-up and treatment 5. Take home points 6. Recommended bibliography

VAEE-24 Imaging in Hemodialysis: Role of Ultrasound in Assessment and Surveillance of Grafts and Fistulas

Awards
Certificate of Merit

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound (US) plays a major role in the assessment and surveillance of hemodialysis (HD) fistulas and grafts. Furthermore, it is essential in the evaluation of arterial and venous circulation before access creation. The complication rate of HD access is relatively high, and US is crucial for the accurate diagnosis of the different complications.(1) Discuss the role of US in preoperative planning; (2) Provide a step-by-step algorithm in the sonographic evaluation of the HD access;(3) Review the sonographic characteristic features of common and rare complications of HD access;(4) Briefly discuss the role of interventional radiology in the management of HD complications.

TABLE OF CONTENTS/OUTLINE

Preoperative planning: discuss anatomy, major criteria for suitability of vascular system in creation of HD access Discuss various types of HD access based on access location, and operative techniques (graft versus fistula) Provide optimal protocol and diagnostic criteria for HD access assessment Review sonographic findings of uncomplicated HD access Discuss algorithmic approach to assess HD access complications using US Doppler (thrombosis, stenosis, ischemic steal syndrome, aneurysms and pseudoaneurysms formation, bleeding, hematoma and infection, and structural problems) Briefly discuss causes of nonmaturing fistula Review management options for HD complications and findings post-intervention

VAEE-25 Assessment of Tissue Vascularity: Non-contrast Micro-vascular Flow Imaging in Assessment of Vascularity, With Contrast and/or Pathological Correlation - Expanding the Horizons

Participants
Muhammad Aziz, MBBS, Birmingham, AL (*Presenter*) Former Stockholder, Sorrento Therapeutics, Inc

TEACHING POINTS

Ultrasound vascular imaging with color and power Doppler is an important tool in the assessment of various disease processes, with assessment of blood flow in organs, neoplasms and vessels; from infarction and ischemia to hyperemia, and is used in almost all ultrasound examinations. Recent development of small vessel, slow velocity flow without the utilization of contrast agents is more sensitive to microvascularity on comparison with color, Power and spectral Doppler - termed as "MicroVascular Flow Imaging (MVFI)". This results in a decreased need for follow-up contrast examinations (US, CT, MR) in many conditions. After reviewing this exhibit, the learner will be able to:1 - Review the basics of physics of noncontrast MVFI.2 - Understand the various applications of this novel technique in different adult and pediatric conditions - including benign and malignant conditions.3 - Recognize different acute applications of MVFI; including in testes and gallbladder.4 - Understand the potential future applications of MVFI.5 - Review and diagnose many case examples of various conditions; including benign and malignant liver lesions, acute gallbladder and

testicular pathologies, benign and malignant renal lesions, role of MVFI in pre- and postsurgical cases.6- Describe the limitations of this technique

TABLE OF CONTENTS/OUTLINE

1 - Introduction to MVFI a. Background b. Physics of MVFI2 - Clinical Applications of US MVFI in Adults a. Liver b. Gallbladder c. Kidneys d. Superficial Organs - Testes, Lymph Nodes e. Vessel Disease3 - Clinical Applications of US MVFI in Pediatrics a. Liver b. Trauma4 - Future Potential and Direction5 - LImitations6 - Conclusion

VAEE-26 Imaging of Rare Intravascular Tumors and Tumorlike Lesions

Participants
Duygu Ekizalioglu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To overview rare miscellaneous intravascular tumors and tumorlike lesions that may pose difficulties for diagnosis. - To emphasize the imaging findings (US, CT, MRI, PET/CT) of rare neoplastic and nonneoplastic intravascular lesions. - To review the histopathological findings of neoplastic and nonneoplastic intravascular lesions.

TABLE OF CONTENTS/OUTLINE

Introduction. Overview of intravascular neoplastic lesions Primary Benign: Internal jugular vein hemangioma Primary Malign: Primary leiomyosarcoma of inferior vena cava (IVC) Secondary Benign: Renal angiomyolipoma extending into the renal vein Secondary Malign (Tumor Thrombus): Renal Ewing sarcoma with tumor thrombus in renal vein and IVC, Renal cell carcinoma with tumor thrombus in renal vein and IVC, Uterine sarcoma with tumor thrombus in ovarian vein and IVC, Hepatocellular carcinoma with tumor thrombus in IVC, Colon cancer liver metastasis and tumor thrombus in IVC.Overview of intravascular nonneoplastic lesions: Aortic hydatid cyst, Pyogenic granuloma of anguler vein, Bland thrombus (associated with COVID-19). Review of imaging findings on US, CT, MRI, PET/CT of rare intravascular tumors and tumorlike lesions. Description of histopathological findings. Differential diagnostic algorithm for intravascular neoplastic and nonneoplastic lesions. Conclusion. References.

VAEE-3 A Practical Approach to the Interpretation of Arterial Waveforms on Duplex Doppler, Made Ridiculously Simple

Participants
Dana Galvan, MD, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

Doppler US is the first line imaging modality for the evaluation of the vascular system. Various pathological processes affect vasculature and result in the characteristic appearance of the waveforms allowing to recognize the abnormality and correctly diagnose the disease process independent of its location. 1. Review normal appearance of the arterial and venous waveforms and underlying physiology 2. Discuss pathophysiology and waveform appearance of various pathological conditions affecting the vascular system 3. Discuss treatment management options and post treatment restoration of waveform pattern.

TABLE OF CONTENTS/OUTLINE

Outline: 1. Review normal arterial and venous waveform appearance on US and its physiology (dependance of waveform appearance on the cardiac cycle, principles of Doppler physics and Doppler technique of waveform acquisition) 2. Discuss correlation between the vascular process pathophysiology and waveform appearance (waveform pattern in the following conditions: stenosis (pre, at, and post stenosis, compensatory flow), thrombosis (proximal to occlusion, flow reversal), reconstitution (collateral waveform pattern), pseudoaneurysm, arteriovenous fistula, dissection, vascular torsion, neovascularity 3. Discuss management options (stent, angioplasty, bypass graft) and post-treatment waveform appearance (flow restoration).

VAEE-4 Diagnosis and Treatment of Iliac Artery Aneurysms: From A to Z

Participants
Ruben Guerrero Vara, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review the the main features of iliac artery aneurysms (IAA). 2) To highlight the importance of maintaining patency of the hypogastric artery during repair of IAA. 3) To describe the endovascular treatment options to preserve the hypogastric artery during endovascular repair.

TABLE OF CONTENTS/OUTLINE

1) IAA: definition and characteristics. 2) IAA: surgical indications 3) Description of the endovascular techniques developed to preserve internal iliac flow: Iliac branch device (IBD), bell bottom technique (BBT), sandwich technique (ST) and banana technique (BT). 4) Application of each procedure and anatomic limitations. 5) Potential complications of these methods. 6) Depiction of examples of every endovascular technique including preoperative CTA images, schematic illustrations, DSA images before and after stent implantation and control CTA pictures after the procedure. 7) Conclusions

VAEE-5 Vascular Ultrasound: A Primer on Arterial and Venous Doppler Waveforms, Interpretation, and Standardized Nomenclature

Awards
Certificate of Merit

Participants
Min Gyu Noh, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Learn standard terminology for describing arterial and venous waveforms according to the consensus statement from the Society for Vascular Medicine (SVM) and the Society for Vascular Ultrasound (SVU)2. Recognize normal arterial and venous waveforms and

understand how physiologic and disease states can alter waveforms3. Review pearls and pitfalls of Doppler optimization4. Case-based review of normal physiologic and pathologic vascular ultrasound cases

TABLE OF CONTENTS/OUTLINE

1) Learn standardized terminology for describing arterial waveforms according to SVM and SVU:a. Flow directionb. Phasicityc. Resistance2) Review standardized terminology for describing venous waveforms according to SVM and SVU:a. Flow directionb. Flow patternc. Spontaneity3) Recognize normal and abnormal arterial waveforms and velocities based on anatomic function, with a focus on:a. Peripheral arteriesb. Mesenteric and renal arteriesc. Common carotid, internal carotid, and external carotid arteries4) Recognize normal and abnormal venous waveforms based on anatomic function:a. Deep and superficial peripheral venous structures (upper and lower extremities)b. Central veins (upper extremities)c. Abdominal veins (IVC, iliac, renal, hepatoportal)5) Pearls and pitfalls of Doppler optimization:a. PRFb. Wall filterc. Angle of insonation6) Utilize understanding of arterial and venous vascular physiology to review normal physiologic and pathologic vascular ultrasound cases, including:a. Mesenteric artery stenosisb. Deep vein thrombosisc. ICA/ECA stenosisd. Subclavian vein thrombosis and steale. Vertebral artery stenosisf. Peripheral artery stenosis

VAEE-6 Demystifying Ultrasound of the Standard Dialysis Fistula

Participants
Sagar Desai, DO, Mountain Top, PA (*Presenter*) Nothing to Disclose

TEACHING POINTS

Describe the pathophysiology and anatomy of an arteriovenous dialysis fistula Discuss preoperative arterial and venous imaging required to support the high flow state Understand sonographic features indicative of a mature fistula Review the approach to a delayed or non-maturing fistula Describe the sonographic appearing of acute and chronic complications of dialysis fistulas with confirmatory angiography and treatment

TABLE OF CONTENTS/OUTLINE

Kidney Disease Outcomes Quality Initiative (KDOQI) Basic KDOQI guidelines pertaining to arteriovenous fistula (AVF) creation and management Pre-operative ultrasound planning Morphologic and functional data Arteries: course, relationship to vein, diameter, plaque, intimal medial thickness, waveforms and velocity Veins: anatomy, patency of superficial and deep veins including: depth, diameter, length, anomalies, fibrotic segments and waveforms Patency and perfusion of the palmar arch Examples of adequate and inadequate vessels US assessment of AVF maturity Physiologic requirements for adequate dialysis Evaluation of a delayed or non maturing fistula Ultrasound assessment Poor location (depth) Large or increased number of draining veins Stenosis Arterial inflow Venous outflow The interventional radiologist's approach Fundamental steps of a 'fistulogram' procedure Angiographic correlates and treatments to augment AVF maturation Complications: early and late Hematoma Thrombosis Stenosis (arterial and venous) Infection Aneurysm or pseudoaneurysm Steal Syndrome High output cardiac failure

VAEE-8 What to Do When the Aortic Aneurysm Keeps Growing After Endovascular Repair: An Illustrated Review of the CT Angiography Protocol and Most Important Complications of the Endoleaks

Participants
Estefania Gallego Diaz, MD, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

• The endoleak is defined as blood leak in an aneurysm sac excluded by stent-graft following endovascular aneurysm repair (EVAR), which means, flow outside the stent but into the aneurysm. • To explain the importance of a timely diagnosis in this group of patients. • To illustrate the detailed way to do an appropriate report. • To review the consequences of an endoleak and its implication in morbidity and mortality for the patient. • To simplify the imaging evaluation in patients with endoleaks.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. What is an endoleak a. Indications. b. Classification. 3. CTA protocol and technical Recommendations. 4. Follow up. 5. How to report it / Algorithm for evaluation. 6. Which are the consequences of an endoleak a. Complications. b. Prognosis depending on the type of endoleak. 7. Clinical Cases and pictorial review. 8. Conclusions.

VAEE-9 Phenotypic Diversity of Intravascular Mesenchymal Tumors and Visceral Mesenchymal Tumors with Angioinvasion: Cross-sectional Imaging Spectrum

Awards
Certificate of Merit

Participants
Ajaykumar C. Morani, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is a wide spectrum of primary intravascular mesenchymal neoplasms including smooth muscle tumors, intimal sarcomas and angiosarcomas. Diverse visceral mesenchymal tumors may demonstrate angio-invasion into contiguous veins. Cross-sectional imaging plays a critical role in accurate diagnosis and staging of these entities and guide management.

TABLE OF CONTENTS/OUTLINE

A. BackgroundB. Epidemiology, etio-pathogenesis, clinical findings and pathology of primary intravascular neoplasms as well as visceral mesenchymal tumors with angio-invasion.C. Classification with multimodality cross-sectional imaging illustrations:1. Primary vascular tumors a. Benign and intermediate biological aggressiveness - leiomyoma, intravenous leiomyomatosis, smooth muscle tumor of uncertain malignant potential b. Malignant - leiomyosarcoma, angiosarcoma2. Vascular invasion by mesenchymal tumors - Gynecological sarcomas, pelvic sarcomas, solitary fibrous tumorsD. Prognosis and management

VAEE-1

Vascular Applications of Photon Counting Detector CT

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

Photon-counting detector (PCD) CT is a recent technical innovation that uses novel detectors directly converting x-ray photons into electrical signals without the generation of light. In this exhibit, we aim 1. To discuss the physics and principles of PCD CT 2. To review the advantages of PCD CT over conventional energy integrating detector (EID) CT. 3. To illustrate the clinical applications of PCD CT in vascular imaging using multiple case examples

TABLE OF CONTENTS/OUTLINE

1. PCD CT TECHNOLOGIES- Single source, Dual-source 2. ADVANTAGES OF PCD-CT a. High spatial resolution b. Multi energy (ME) imaging c. Increased vascular signal d. Decreased electronic noise e. Decreased artifacts f. Lower radiation and contrast doses g. Potential K-edge imaging - Gadolinium + Iodine 3. APPLICATIONS OF PCD CT IN VASCULAR IMAGING WITH CASE EXAMPLES a. Ultra-high resolution- Improved visualization of small vessels (Artery of Adamkiewicz; Flaps including DIEP, fibular; arteries of hand, feet, head), calcified plaques, stents b. High iodine CNR (low-energy VMI's)- Low dose of iodinated contrast, salvage of suboptimal studies c. Decreased artifacts- Calcium blooming, beam hardening, metal d. ME calcium separation- Improved lumen visualization e. ME bone subtraction f. ME lesion characterization g. Vascular perfusion h. Potential for multi-contrast and novel contrast media- e.g. iodine and gadolinium i. Advanced material separation j. Radiation dose reduction- Virtual noncontrast images in multiphasic studies, lower noise profile 4. LIMITATIONS, PITFALLS a. Increased data - storage and transfer issues b. Noise reduction in high resolution mode

VAEE-10

Applications of 4D Flow MRI from Head to Toe

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Awards
Cum Laude

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To describe the principles and technique of 4D flow 2. To review the applications of 4D flow from head to toe 3. To illustrate the multi-systemic applications of 4D flow using case examples 4. To review common pitfalls and solutions in the use of 4D flow

TABLE OF CONTENTS/OUTLINE

1. 4D FLOW- Physics and principles 2. 4D FLOW PARAMETERS- Feraheme vs Gadolinium, spatial/ temporal resolution, plane, slice thickness, VENC, gating, flip angle 3. DISPLAY- Velocity MIPs, Streamlines, pathlines, vectors 4. ADVANCED PARAMETERS- Shear stress, pressure gradient, pulse wave velocity, turbulent kinetic energy 5. LIMITATIONS 6. ARTIFACTS 7. AI 8. REVIEW AND ILLUSTRATION OF THE FOLLOWING APPLICATIONS OF 4D FLOW FROM HEAD TO TOE A. Neurological - Vein of Galen malformations; Aneurysms- Pre and post procedure; AV malformations; Atherosclerotic stenosis B. Thoracic - Abnormal flow patterns- Novel biomarkers in aortopathies.e.g. bicuspid valve; Aortic dissection- Hemodynamics; Aortic coarctation- collateral blood flow; Vasculitis; Pulmonary hypertension C. Cardiac - Improved workflow in complex congenital heart diseases; Pre-surgical evaluation- E.g. Fontan shunt; Valvular heart disease; Detection of small shunts D. Abdominal - Dissection- False lumen Ejection fraction; Endoleak detection and characterization, type IIa vs IIb ; Mesenteric ischemia- Meal challenge; Portal hemodynamics in cirrhosis- shunting, AP fistula, vascular stenosis, Pre- and post TIPS; Splenic function; Pre transplant evaluation- Vascular anatomy, PV thrombus, portosystemic shunt; Uterine fibroid Pelvic venous congestion E. Peripheral - AV malformation; Lymphatic vessels

US Of the Hemodialysis Patient: Mapping For Surgical And Percutaneous AVF, Grafts, And Postoperative US Evaluation, with Angiographic Correlation

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Awards
Certificate of Merit
Identified for RadioGraphics

Participants
Kedar Sharbidre, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

TEACHING POINTS

Patients with end stage renal disease (ESRD) requiring permanent hemodialysis (HD) access options of surgical creation of an arteriovenous fistula (sAVF), percutaneous AVF (pAVF) creation, or surgical placement of synthetic arteriovenous graft. Superficial venous anatomy can be highly variable and hence accurate preoperative ultrasound (US) assessment is very important, particularly for pAVF planning. US can also help determine AVF maturity and evaluation for complications to guide management. After reviewing this exhibit, the learner will be able to: 1. Describe a typical US arterial and venous mapping protocol for upper extremity sAVF, pAVF, AVG, and thigh graft placement. 2. Understand postoperative US criteria for sAVF and pAVF maturation 3. Recognize abnormalities that may impede AVF maturation 4. Diagnose complications using the US including focal swelling or fluid collection at the fistula site, arterial steal, aneurysm, pseudoaneurysm, and graft degeneration

TABLE OF CONTENTS/OUTLINE

1. Venous and Arterial Anatomy of the Extremities for HD mapping a. Upper extremity arteries b. Upper extremity deep and superficial veins c. Groin arteries and veins for AVG 2. Preoperative vascular mapping a. Upper extremity protocol b. Specific mapping for pAVF c. Groin protocol 3. Postoperative assessment for fistula maturation a. sAVF b. pAVF 4. US assessment of complication with angiographic correlation showing treatment results as appropriate a. Abnormalities that prevent maturation i. stenosis (anastomotic, draining vein, central vein) ii. accessory draining veins b. Graft stenosis c. Thrombosis d. Fluid collections e. Arterial steal f. Pseudoaneurysm g. Graft degeneration.

Thoracic Endovascular Aortic Repair: Past, Present, and Future

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Jonathan Liu, MD, Palo Alto, CA (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Knowledge of the nomenclature facilitates communication between radiologists and vascular/cardiothoracic surgeons.- Indications for TEVAR continues to evolve, with expanding indications. The proximal descending thoracic aorta, aortic arch, and even ascending aorta can be repaired endovascularly.- Awareness of the various types of repair will assist in the detection of repair complications.

TABLE OF CONTENTS/OUTLINE

I. Introduction/History and path to FDA approvalII. Indication for thoracic endovascular aortic repairIII. Anatomy for endovascular approacha. Aortic arch zonesb. Aortic arch typesIV. Historical and contemporary devicesV. Novel techniquesa. Petticoat techniqueb. Snorkel / Periscope techniquec. In-situ laser fenestrationVI. Investigational devicesVII. Complications of TEVARa. Birdbeakingb. Stent-graft induced new entry tearc. Endoleak / gutter leakd. Infectione. Fracture/migrationVIII. Conclusion

VAEE-13

Imaging Review and Management Update on Portal Vein Thrombosis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Maria Garcia, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) Describe the anatomy of the portal vein (PV) and relevant anatomic relationships. 2) Describe the pathophysiology and common risk factors for portal vein thrombosis (PVT). 3) Identify the multimodality imaging features of acute, chronic and iatrogenic portal vein occlusion 4) Identify the role of imaging in diagnosis and management of PVT.

TABLE OF CONTENTS/OUTLINE

I. Background. II. Normal/Variant anatomy. III. Overview of PVT pathophysiology, broadly 3 etiologies: 1) Hereditary thrombophilia; 2) Acquired thrombophilia/hypercoagulable states, such as pregnancy and malignancy; 3) Intra-abdominal causes. IV. Definition and clinical manifestations of acute and chronic PVT. V. Imaging features of acute versus chronic PVT. VI. Illustration of PV occlusion: a) Bland thrombus: hematologic disorders, cirrhosis, pancreatitis, portal pyaemia, inflammatory bowel disease, pancreatic malignancy; b) Tumor thrombus: HCC and others such as sarcoma and NET; c) Intervention-related: Surgery/Liver transplant, TIPS stent thrombosis, Portal vein embolization; d) Chronic changes/complications: Cavernous transformation (adults/children), Portal hypertension, Portal biliopathy, Mesenteric ischemia; e) Mimics: Flow artifacts, Hepatic vein/IVC occlusion, Dilated bile duct. VII. Treatment: 1) Medical: Anticoagulation, highlight the reason for differential approach in the presence or absence of cirrhosis; 2) Endovascular: Two main interventions for portal vein recanalization (PVR) a) Thrombectomy +/- thrombolysis, b) PVR-TIPS stent placement. 3) Surgical: Bowel infarction or contraindication to thrombolytic therapy. VIII. Take home points.

Ultrasound Evaluation of AV Fistulas for Hemodialysis: A Hands-on Approach

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Mikel Elgezabal, MD, Barrika, Spain (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To understand the importance of Chronic Kidney Disease in healthcare.- To make the reader confident to perform ultrasound on patients with AV fistulas as a vascular access for hemodialysis, using a simple step-by-step approach that can cover all the bases for a satisfactory evaluation.

TABLE OF CONTENTS/OUTLINE

Chronic Kidney Disease (CKD) Contemporary significance of CKD: definition, prevalence, burden. Ultrasound findings of CKD. Therapeutic options for CKD: Renal Replacement Therapy with a focus on hemodialysis.Arteriovenous Fistulas for Hemodialysis What is an AV fistula? A quick, basic review slide to get the reader up to speed. The upper extremity: vascular anatomy: We include labeled anatomy images of the upper limb arterial and venous system and discuss key anatomical landmarks along with their corresponding clinical significance. Planning an AV fistula: pre-surgical ultrasound.Types of AVF: Native vs. prosthetic, typical locations.Sonographic assessment of an AV fistulaBefore scanning: clinical assessment, patient position, ultrasound probe choice. Ultrasound exam. Components of an AV fistula and individual sonographic properties of each component. The afferent artery, the anastomosis, the efferent vein. Properties of the mature and healthy AV Fistula: ready to needle! Complications: We detail key diagnostic points of each one of the most common complications and support them with clinical cases and images from our institution.

How Will 320-Raw Multi Detector CT Change the Diagnosis of Pelvic Venous Congestion Syndrome?

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Kazuto Sakamoto, RT, (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibit is: 1. Pelvic venous congestion syndrome (PVC) is a cause of chronic pelvic pain in female patients. The cause of PVCS may be structural. It is the regurgitation of the gonadal vein with venous valve insufficiency due to compression have the left renal vein or the iliac vein. 2. PVCS may not be accompanied by pelvic pain, and imaging by US or MRI may be useful. The most important reason for this is that US and MRI can determine the direction of blood flow in the refluxed gonadal vein. 3. The 320-raw multi detector CT can acquire cine images up to 160 mm wide with 4D imaging. In addition, 4DCT angiography cine images can be used to evaluate gonadal vein reflux.

TABLE OF CONTENTS/OUTLINE

Major headings:1. Describe PVCS. 2. Usefulness of 4DCT angiography in PVCS diagnosis.- 4DCT angiography cine imaging to evaluate gonadal vein reflux. - In all cases, the findings were comparable to catheter-based angiography. 3. Supporting imaging with 3DCT angiography in PVCS revascularization. - Supporting imaging with 3DCT is expected to reduce the total radiation dose to the patient. - In other words, a reduction in fluoroscopic time due to shorter operative time. 4. Quantification of edema by CT imaging in determining treatment efficacy.- CT images are a useful tool for convenient volumetric measurements. - Volumetric evaluation is important to determine the efficacy of treatment of PVCS with lower extremity edema.

Arteriovenous Fistula For Hemodialysis: A Thorough Analysis

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Sofia Maksoud, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

- The arteriovenous fistula is created from the anastomosis between native artery and vein, with the aim of providing chronic access for hemodialysis in patients with end-stage renal disease until they can receive a kidney transplant.- The most used are the anastomosis of the radial artery with the cephalic vein or brachial artery with the cephalic vein.- The structure created must be accessible and have the blood flow necessary to be cannulated repeatedly and thus allow adequate dialysis. For this, the minimum internal calibers must be 0.2 cm for the artery and 0.25 cm for the vein.- After the creation of the fistula, the blood vessels involved undergo a maturation process that can be evaluated by means of a color Doppler ultrasound study. The flow volume, calculated through the formula of the average velocity times the diameter of the opening, reaching 600 mL/minute is a parameter commonly associated with maturation.- Complications of arteriovenous fistula include failure of maturation, stenotic vascular lesions, thrombosis, aneurysms or pseudoaneurysms, and infection.

TABLE OF CONTENTS/OUTLINE

- Review expected ultrasound findings expected for a patent arteriovenous fistula for hemodialysis.- Evaluate the most common complications and their presentation on ultrasound.

Beware of The Dislodged Devices

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Marcus Nascimento, MD, Sao Paulo, Brazil (*Presenter*) Fellow, Hospital Israelita Albert Einstein

TEACHING POINTS

The purpose of this exhibit is:- To briefly review and recognize some of the cardiovascular devices used in patient care.- To describe how to recognize and define the position of some devices in different imaging modalities.- Show examples of medical dislodged devices or with some kind of complication.

TABLE OF CONTENTS/OUTLINE

1) Basic anatomy of the chest and cardiovascular system.2) Types and function of the devices3) How the devices are represented in the different images modalities and their primary function in patient care.4) Key Imaging Findings that define their malpositioning and/or deformation.5) Take home messages.

Does Size Really Matter? Imaging in Visceral Artery Aneurysms

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Tomas Lacerda, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

TEACHING POINTS

The purpose of this exhibition is to review the most recent guideline on visceral aneurysms and its recommendations towards treatment indications and modalities. Also, discuss most common sites for visceral aneurysms, symptoms and complications and imaging findings in diagnostic and post treatment situations.

TABLE OF CONTENTS/OUTLINE

Understand the most common sites for visceral aneurysms and its potential potential complications; Reviewing the latest guideline on visceral aneurysms, its recommendations towards when and how to repair; Illustrate through a series of radiological cases the most common sites, findings on possible complications and imaging during and after endovascular repair.

Portal Vein Thrombosis: What a Radiologist Needs to Know In the Era of the Baveno VII Consensus Recommendations

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Awards
Identified for RadioGraphics

Participants
Alessandro Bozzato, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

-Illustrate the recommended standardized nomenclature for the description of portal vein thrombosis (PVT) and portal cavernoma, according to the Baveno VII consensus definitions. -Describe diagnosis and management of acute and chronic PVT in absence and presence of cirrhosis.

TABLE OF CONTENTS/OUTLINE

Introduction PVT is characterized by the presence of a bland thrombus in the portal vein trunk and its branches. It occurs in non-cirrhotic patients, and, less frequently, in cirrhotic patients. Imaging methods should be used to diagnose PVT (ruling out malignant portal vein obstruction) and assess its extension.Recommended standardized nomenclature- Show typical imaging features illustrating the nomenclature:• Time course (acute and chronic thrombosis)• Percent occlusion of main portal vein (completely occlusive, partially occlusive, minimally occlusive thrombosis, and cavernous transformation)• Response to treatment or interval change (progressive, stable and regressive thrombosis)Portal vein thrombosis and portal cavernoma in the absence of cirrhosis- Illustrate acute and chronic PVT in the absence of cirrhosis: • Diagnosis and follow-up • Interventional management (image-guided interventions, thrombolysis, transjugular intrahepatic portosystemic shunt (TIPS), and other percutaneous recanalizations)Portal vein thrombosis and cirrhosis- Illustrate PVT in cirrhosis:• Diagnosis and follow-up• Interventional management ((TIPS), and other percutaneous recanalizations)

Multimodality Imaging of Portal Vein Thrombosis: Diagnosis and Influence on Clinical Management

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Catherine Naidoo, MBBS, FRANZCR, Randwick, Australia (*Presenter*) Nothing to Disclose

TEACHING POINTS

1- Learn how to diagnose portal vein thrombosis (PVT) on different imaging modalities 2- Determine the etiology (Benign vs. Malignant), onset (Acute vs. Chronic), and extent of PVT 3- Assess the acute and chronic complications of PVT

TABLE OF CONTENTS/OUTLINE

Thrombosis of the portal venous system is a frequent and potentially life-threatening condition that can take place in a number of different clinical settings including liver cirrhosis, hepatocellular carcinoma, other solid tumors, abdominal septic foci, acute pancreatitis, hematological malignancies, and congenital or acquired prothrombotic disorders. Imaging plays a pivotal role in the clinical decision-making process in patients with thrombosis of the portal venous system. In this article, we will discuss the familiar and uncommon imaging findings of PVT at the ultrasound, contrast-enhanced ultrasound, CT, and MRI and the role of imaging in determining the underlying etiology (benign versus malignant) and onset (acute versus chronic). We will learn the available classification systems that provide a treatment-oriented assessment of PVT extension and degree of occlusion. We will recognize the acute and chronic morphologic changes of the liver parenchyma, such as nodular regenerative hyperplasia, secondary to PVT nodular regenerative hyperplasia. We will also review the complications of PVT such as portal biliopathy.

Ultrasound of Peripheral Arteries: An Update on Technique, Protocols, Interpretation and Applications

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Prabhakar Rajiah, MD, FRCR, Rochester, MN (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To review the indications of ultrasound (USG) in peripheral arterial diseases 2. To review the normal and abnormal flow patterns in peripheral arteries 3. To illustrate imaging appearances of common peripheral arterial abnormalities.

TABLE OF CONTENTS/OUTLINE

1. INTRODUCTION 2. ANATOMY 3. ROLE, ADVANTAGES, LIMITATIONS OF USG- Comparison with other invasive and non-invasive modalities 4. TECHNICAL REQUIREMENTS-B-mode, doppler, color, power 5. OPTIMIZATION OF TECHNICAL PARAMETERS 6. TRANSDUCER AND PATIENT POSITION 6. NORMAL VESSEL- Normal caliber, laminar flow 7. WAVEFORMS - Normal - Triphasic or biphasic with sharp systolic upstroke; -Abnormal - Monophasic or biphasic without sharp systolic upstroke 8. VELOCITIES- Normal and abnormal at, proximal and distal to stenosis; grading of stenosis 9. ILLUSTRATION OF THE FOLLOWING ABNORMALITIES WITH SAMPLE CASES A. Atherosclerosis, native vessels- Indications; Diagnostic approach; Screening localization; Criteria for different grades of stenosis- Velocities, waveforms, pre and post stenotic vessels; Collaterals; Pitfalls, misses B. Bypass graft evaluation C. Stent evaluation D. Aneurysms E. Pseudoaneurysms- To-and-fro flow, guidance for management F. Popliteal artery entrapment G. Dissection H. Arteritis I. AV Fistula- High-velocity turbulent flow between vessels; low resistance proximal arterial waveforms; High, arterialized venous flow; vibration artifacts in perivascular tissues. J. Post-surgical/interventional follow-up- Grafts, thrombin injection

Evaluation of Lower Extremity Peripheral Arterial Disease Using Ultrasonography: What Everyone Should Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Omair Ali, BS, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. To provide a clinical overview of peripheral arterial disease (PAD) of the lower extremities and its sequelae. 2. To examine the role of noninvasive imaging in the assessment of PAD 3. To provide a pictorial-based review of ultrasound (US) modalities and their utility in noninvasive evaluation of PAD 4. To discuss the role of US in unique clinical circumstances related to PAD

TABLE OF CONTENTS/OUTLINE

1) Introduction to PAD a) Natural history 2) Overview of Noninvasive evaluation of PAD a) Indications for US evaluation of PAD 3) Arterial ultrasonography (US) of PAD a) Overview and limitations of US techniques for arterial imaging b) Arterial mapping by segment i) Aortoiliac ii) Femoropopliteal iii) Infrapopliteal c) B-mode Doppler i) Visualization of vascular anatomy ii) Abnormal findings (plaque, stenosis, calcification) Spectral Doppler i) Purpose: characterization of blood flow based on waveforms ii) Peak systolic velocity (PSV) and PSV ratio iii) Abnormal findings (spectral broadening, increase in PSV, monophasicity e) Color Doppler i) Assessment of direction and speed of flow ii) Abnormal findings (aliasing, color bruit) f) Power Doppler i) Examining flow based on quantity of red blood cells ii) Abnormal findings (decreased flow, occlusion) g) Contrast-enhanced US i) Assessment of perfusion ii) Abnormal findings h) Pedal acceleration time i) Role in evaluating CLI and predicting limb salvage 4) Special considerations for US evaluation of PAD a) Chronic total occlusion b) Critical limb ischemia c) Calcified PAD d) Post-revascularization surveillancePlease visit the Learning Center to also view this presentation in hardcopy format.

Doppler US of Lower Limb Venous Insufficiency Made Simple

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Montserrat Torrent, (*Presenter*) Nothing to Disclose

TEACHING POINTS

Chronic venous insufficiency of the lower limbs is very prevalent.Duplex ultrasound has the ability to demonstrate venous hemodynamic reflux, that why it become the method of choice to study this condition. We review the venous anatomy of the lower limbs, the pathophysiology of chronic venous insufficiency and explain the protocol for carrying out Duplex studies.These include venous mapping and a thorough evaluation of the superficial veins to identify all of the patterns of incompetence. We also evaluate patients with other treatment techniques such as thermal ablation, sclerotherapy.Therefore we can conclude the complications or the success of the applied procedure.

TABLE OF CONTENTS/OUTLINE

Learningobjectives:? Review the venous anatomy of the lower limbs, the pathophysiology of chronic venous insufficiency and explain the protocol for carrying out Duplex studies? Perform venous mapping with the patterns of incompetence.? Evaluate patients after treatment to identify success, complicationsand recurrence.

Abernethy Malformation: What You Need to Know

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Alexandra Panyukova, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To review the normal anatomy and embryology of the portal system. - To learn about Abernethy malformation - a rare congenital vascular pathology. - To illustrate the role of different imaging methods in diagnosis of Abernethy malformation. - To highlight the main points in radiology reports, which influence further patient evaluation and treatment.

TABLE OF CONTENTS/OUTLINE

1. Introduction 2. Anatomy review 3. Embryology: portal venous system development 4. Abenethy malformation 4.1. Definition 4.2. Classification 4.3. Clinical manifestations, complications 4.4. Diagnostic methods 4.5. What else should you look for? 4.6. Follow-up and treatment 5. Take home points 6. Recommended bibliography

Imaging in Hemodialysis: Role of Ultrasound in Assessment and Surveillance of Grafts and Fistulas

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Awards
Certificate of Merit

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

TEACHING POINTS

Ultrasound (US) plays a major role in the assessment and surveillance of hemodialysis (HD) fistulas and grafts. Furthermore, it is essential in the evaluation of arterial and venous circulation before access creation. The complication rate of HD access is relatively high, and US is crucial for the accurate diagnosis of the different complications.(1) Discuss the role of US in preoperative planning; (2) Provide a step-by-step algorithm in the sonographic evaluation of the HD access;(3) Review the sonographic characteristic features of common and rare complications of HD access;(4) Briefly discuss the role of interventional radiology in the management of HD complications.

TABLE OF CONTENTS/OUTLINE

Preoperative planning: discuss anatomy, major criteria for suitability of vascular system in creation of HD access Discuss various types of HD access based on access location, and operative techniques (graft versus fistula) Provide optimal protocol and diagnostic criteria for HD access assessment Review sonographic findings of uncomplicated HD access Discuss algorithmic approach to assess HD access complications using US Doppler (thrombosis, stenosis, ischemic steal syndrome, aneurysms and pseudoaneurysms formation, bleeding, hematoma and infection, and structural problems) Briefly discuss causes of nonmaturing fistula Review management options for HD complications and findings post-intervention

Assessment of Tissue Vascularity: Non-contrast Micro-vascular Flow Imaging in Assessment of Vascularity, With Contrast and/or Pathological Correlation - Expanding the Horizons

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Muhammad Aziz, MBBS, Birmingham, AL (*Presenter*) Former Stockholder, Sorrento Therapeutics, Inc

TEACHING POINTS

Ultrasound vascular imaging with color and power Doppler is an important tool in the assessment of various disease processes, with assessment of blood flow in organs, neoplasms and vessels; from infarction and ischemia to hyperemia, and is used in almost all ultrasound examinations. Recent development of small vessel, slow velocity flow without the utilization of contrast agents is more sensitive to microvascularity on comparison with color, Power and spectral Doppler - termed as "MicroVascular Flow Imaging (MVFI)". This results in a decreased need for follow-up contrast examinations (US, CT, MR) in many conditions. After reviewing this exhibit, the learner will be able to:1 - Review the basics of physics of noncontrast MVFI.2 - Understand the various applications of this novel technique in different adult and pediatric conditions - including benign and malignant conditions.3 - Recognize different acute applications of MVFI; including in testes and gallbladder.4 - Understand the potential future applications of MVFI.5 - Review and diagnose many case examples of various conditions; including benign and malignant liver lesions, acute gallbladder and testicular pathologies, benign and malignant renal lesions, role of MVFI in pre- and postsurgical cases.6- Describe the limitations of this technique

TABLE OF CONTENTS/OUTLINE

1 - Introduction to MVFI a. Background b. Physics of MVFI2 - Clinical Applications of US MVFI in Adults a. Liver b. Gallbladder c. Kidneys d. Superficial Organs - Testes, Lymph Nodes e. Vessel Disease3 - Clinical Applications of US MVFI in Pediatrics a. Liver b. Trauma4 - Future Potential and Direction5 - LImitations6 - Conclusion

Imaging of Rare Intravascular Tumors and Tumorlike Lesions

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Duygu Ekizalioglu, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

- To overview rare miscellaneous intravascular tumors and tumorlike lesions that may pose difficulties for diagnosis. - To emphasize the imaging findings (US, CT, MRI, PET/CT) of rare neoplastic and nonneoplastic intravascular lesions. - To review the histopathological findings of neoplastic and nonneoplastic intravascular lesions.

TABLE OF CONTENTS/OUTLINE

Introduction. Overview of intravascular neoplastic lesions Primary Benign: Internal jugular vein hemangioma Primary Malign: Primary leiomyosarcoma of inferior vena cava (IVC) Secondary Benign: Renal angiomyolipoma extending into the renal vein Secondary Malign (Tumor Thrombus): Renal Ewing sarcoma with tumor thrombus in renal vein and IVC, Renal cell carcinoma with tumor thrombus in renal vein and IVC, Uterine sarcoma with tumor thrombus in ovarian vein and IVC, Hepatocellular carcinoma with tumor thrombus in IVC, Colon cancer liver metastasis and tumor thrombus in IVC.Overview of intravascular nonneoplastic lesions: Aortic hydatid cyst, Pyogenic granuloma of anguler vein, Bland thrombus (associated with COVID-19). Review of imaging findings on US, CT, MRI, PET/CT of rare intravascular tumors and tumorlike lesions. Description of histopathological findings. Differential diagnostic algorithm for intravascular neoplastic and nonneoplastic lesions. Conclusion. References.

A Practical Approach to the Interpretation of Arterial Waveforms on Duplex Doppler, Made Ridiculously Simple

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Dana Galvan, MD, Albuquerque, NM (*Presenter*) Nothing to Disclose

TEACHING POINTS

Doppler US is the first line imaging modality for the evaluation of the vascular system. Various pathological processes affect vasculature and result in the characteristic appearance of the waveforms allowing to recognize the abnormality and correctly diagnose the disease process independent of its location. 1. Review normal appearance of the arterial and venous waveforms and underlying physiology 2. Discuss pathophysiology and waveform appearance of various pathological conditions affecting the vascular system 3. Discuss treatment management options and post treatment restoration of waveform pattern.

TABLE OF CONTENTS/OUTLINE

Outline: 1. Review normal arterial and venous waveform appearance on US and its physiology (dependance of waveform appearance on the cardiac cycle, principles of Doppler physics and Doppler technique of waveform acquisition) 2. Discuss correlation between the vascular process pathophysiology and waveform appearance (waveform pattern in the following conditions: stenosis (pre, at, and post stenosis, compensatory flow), thrombosis (proximal to occlusion, flow reversal), reconstitution (collateral waveform pattern), pseudoaneurysm, arteriovenous fistula, dissection, vascular torsion, neovascularity 3. Discuss management options (stent, angioplasty, bypass graft) and post-treatment waveform appearance (flow restoration).

Diagnosis and Treatment of Iliac Artery Aneurysms: From A to Z

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Ruben Guerrero Vara, MD, (*Presenter*) Nothing to Disclose

TEACHING POINTS

1) To review the the main features of iliac artery aneurysms (IAA). 2) To highlight the importance of maintaining patency of the hypogastric artery during repair of IAA. 3) To describe the endovascular treatment options to preserve the hypogastric artery during endovascular repair.

TABLE OF CONTENTS/OUTLINE

1) IAA: definition and characteristics. 2) IAA: surgical indications 3) Description of the endovascular techniques developed to preserve internal iliac flow: Iliac branch device (IBD), bell bottom technique (BBT), sandwich technique (ST) and banana technique (BT). 4) Application of each procedure and anatomic limitations. 5) Potential complications of these methods. 6) Depiction of examples of every endovascular technique including preoperative CTA images, schematic illustrations, DSA images before and after stent implantation and control CTA pictures after the procedure. 7) Conclusions

Vascular Ultrasound: A Primer on Arterial and Venous Doppler Waveforms, Interpretation, and Standardized Nomenclature

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Awards
Certificate of Merit

Participants
Min Gyu Noh, MD, Seattle, WA (*Presenter*) Nothing to Disclose

TEACHING POINTS

1. Learn standard terminology for describing arterial and venous waveforms according to the consensus statement from the Society for Vascular Medicine (SVM) and the Society for Vascular Ultrasound (SVU)2. Recognize normal arterial and venous waveforms and understand how physiologic and disease states can alter waveforms3. Review pearls and pitfalls of Doppler optimization4. Case-based review of normal physiologic and pathologic vascular ultrasound cases

TABLE OF CONTENTS/OUTLINE

1) Learn standardized terminology for describing arterial waveforms according to SVM and SVU:a. Flow directionb. Phasicityc. Resistance2) Review standardized terminology for describing venous waveforms according to SVM and SVU:a. Flow directionb. Flow patternc. Spontaneity3) Recognize normal and abnormal arterial waveforms and velocities based on anatomic function, with a focus on:a. Peripheral arteriesb. Mesenteric and renal arteriesc. Common carotid, internal carotid, and external carotid arteries4) Recognize normal and abnormal venous waveforms based on anatomic function:a. Deep and superficial peripheral venous structures (upper and lower extremities)b. Central veins (upper extremities)c. Abdominal veins (IVC, iliac, renal, hepatoportal)5) Pearls and pitfalls of Doppler optimization:a. PRFb. Wall filterc. Angle of insonation6) Utilize understanding of arterial and venous vascular physiology to review normal physiologic and pathologic vascular ultrasound cases, including:a. Mesenteric artery stenosisb. Deep vein thrombosisc. ICA/ECA stenosisd. Subclavian vein thrombosis and steale. Vertebral artery stenosisf. Peripheral artery stenosis

What to Do When the Aortic Aneurysm Keeps Growing After Endovascular Repair: An Illustrated Review of the CT Angiography Protocol and Most Important Complications of the Endoleaks

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Participants
Estefania Gallego Diaz, MD, MD, Mexico City, Mexico (*Presenter*) Nothing to Disclose

TEACHING POINTS

• The endoleak is defined as blood leak in an aneurysm sac excluded by stent-graft following endovascular aneurysm repair (EVAR), which means, flow outside the stent but into the aneurysm. • To explain the importance of a timely diagnosis in this group of patients. • To illustrate the detailed way to do an appropriate report. • To review the consequences of an endoleak and its implication in morbidity and mortality for the patient. • To simplify the imaging evaluation in patients with endoleaks.

TABLE OF CONTENTS/OUTLINE

1. Introduction. 2. What is an endoleak a. Indications. b. Classification. 3. CTA protocol and technical Recommendations. 4. Follow up. 5. How to report it / Algorithm for evaluation. 6. Which are the consequences of an endoleak a. Complications. b. Prognosis depending on the type of endoleak. 7. Clinical Cases and pictorial review. 8. Conclusions.

Phenotypic Diversity of Intravascular Mesenchymal Tumors and Visceral Mesenchymal Tumors with Angioinvasion: Cross-sectional Imaging Spectrum

Sunday, Nov. 27 8:00AM - 9:00AM Room: Learning Center - VA

Awards
Certificate of Merit

Participants
Ajaykumar C. Morani, MD, Houston, TX (*Presenter*) Nothing to Disclose

TEACHING POINTS

There is a wide spectrum of primary intravascular mesenchymal neoplasms including smooth muscle tumors, intimal sarcomas and angiosarcomas. Diverse visceral mesenchymal tumors may demonstrate angio-invasion into contiguous veins. Cross-sectional imaging plays a critical role in accurate diagnosis and staging of these entities and guide management.

TABLE OF CONTENTS/OUTLINE

A. BackgroundB. Epidemiology, etio-pathogenesis, clinical findings and pathology of primary intravascular neoplasms as well as visceral mesenchymal tumors with angio-invasion.C. Classification with multimodality cross-sectional imaging illustrations:1. Primary vascular tumors a. Benign and intermediate biological aggressiveness - leiomyoma, intravenous leiomyomatosis, smooth muscle tumor of uncertain malignant potential b. Malignant - leiomyosarcoma, angiosarcoma2. Vascular invasion by mesenchymal tumors - Gynecological sarcomas, pelvic sarcomas, solitary fibrous tumorsD. Prognosis and management

Deep Learning Lab: DICOM Data Wrangling with Python

Sunday, Nov. 27 10:30AM - 11:30AM Room: NA

Participants
Katherine Andriole, PhD, Branford, CT (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

In Person Session Only. On-demand beginning on December 5.This introductory hands-on course will demonstrate the importance of fully understanding the data cohort used to train a machine learning model by stepping through a Jupyter Notebook in CoLab. Processes known as data wrangling will be used to investigate the data. Tools and libraries to perform textual and pixel/image data wrangling including pandas, NumPy, pydicom, and Seaborn libraries will be explored.

LEARNING OBJECTIVES

1) To understand the need for data wrangling of large data sets used in machine learning 2) To become familiar with the tools used for textual data wrangling 3) To become familiar with the tools used for image pixel data wrangling*Course Description In Person Session Only. On-demand beginning on December 5.This introductory hands-on course will demonstrate the importance of fully understanding the data cohort used to train a machine learning model by stepping through a Jupyter Notebook in CoLab. Jae Ho Sohn, MD, San Francisco, CA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

In Person Session Only. On-demand beginning on December 5th. This session will feature a brief lecture introducing the basics of natural language processing (NLP) and highlight potential uses for it in radiology. The goal is to survey standard text preprocessing techniques and traditional NLP approaches as well as modern neural network based approaches. We will follow up the didactic portion with a hands-on Google Colab demo implementing discussed concepts for a text classification task. For best experience, we highly recommend attendees bring a laptop with a keyboard as well as have a Gmail account to access Google Colab.

LEARNING OBJECTIVES

1) Understand common terminology and preprocessing techniques in NLP 2) Identify several classic and modern approaches used to capture semantic meaning in text 3) Learn how to implement a basic NLP pipeline from preprocessing to performance evaluation*Course Description In Person Session Only. On-demand beginning on December 5th. This session will feature a brief lecture introducing the basics of natural language processing (NLP) and highlight potential uses for it in radiology. Deep Learning Lab: NCI Imaging Data Commons-Curated Data and Reproducible AI Workflows

Monday, Nov. 28 9:00AM - 10:00AM Room: NA

Participants
Andriy Fedorov, PhD, Arlington, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

In Person Session Only. On-demand beginning on December 5th.NCI Imaging Data Commons (IDC), https://imaging.datacommons.cancer.gov, is a cloud-based repository of publicly available cancer imaging data co-located with the analysis and exploration tools and resources. IDC contains over 35TB of publicly available images and image annotations spanning a variety of cancer types and modalities. Attendees of this course will learn how to search, visualize and download IDC data, and how to build reproducible and shareable analysis workflows using Google Colab. The educational format will combine a lecture followed by a hands-on component and interactive discussions to gain familiarity with this resource.

LEARNING OBJECTIVES

1) Learn about the functionality of NCI Imaging Data Commons related to selection and preparation of data cohorts for developing AI workflows 2) Introduce the basic capabilities of IDC in support of development of reproducible AI workflows 3) Experiment with the application of open source AI tools to public imaging datasets*Course Description In Person Session Only. On-demand beginning on December 5th.NCI Imaging Data Commons (IDC), https://imaging.datacommons.cancer.gov, is a cloud-based repository of publicly available cancer imaging data co-located with the analysis and exploration tools and resources. Deep Learning Lab: Accessing Freely Available Public Datasets from The Cancer Imaging Archive (TCIA)

Monday, Nov. 28 10:30AM - 11:30AM Room: NA

Participants
Justin Kirby, Rockville, MD (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

In Person Session Only. On-demand beginning on December 5th.Access to large, high quality data is essential for researchers to understand disease and precision medicine pathways, especially in cancer. However HIPAA constraints make sharing medical images outside an individual institution a complex process. The Cancer Imaging Archive (TCIA) (TCIA) is a free public service funded by the National Cancer Institute which addresses this challenge by providing hosting and de-identification services to take major burdens of data sharing off researchers. TCIA has published over 170 unique data collections containing more than 70 million images. Recognizing that images alone are not enough to conduct meaningful research, most collections are linked to rich supporting data including patient outcomes, treatment information, genomic / proteomic analyses, and expert image analyses (segmentations, annotations, and radiomic / radiogenomic features). This deep learning lab will teach the skills needed to fully access our existing data as well as learn how to submit new data for potential inclusion in TCIA so that it can be used for artificial intelligence research.

LEARNING OBJECTIVES

1) Learn how TCIA makes data sharing easier for researchers, and hear a summary of existing datsets that are freely available for download 2) Practice utilizing TCIA for data exploration, cohort definition, and downloading of data 3) Learn how to access public and restricted access datasets using TCIA's REST APIs and other command line tools via Google Colab*Course Description In Person Session Only. Deep Learning Lab: MedNIST Exam Classification with MONAI

Monday, Nov. 28 12:00PM - 1:00PM Room: NA

Participants
Bradley Erickson, MD, PhD, Rochester, MN (*Presenter*) Board of Directors, VoiceIt Technologies, LLC;Stockholder, VoiceIt Technologies, LLC;Board of Directors, FLOWSIGMA Inc;Officer, FLOWSIGMA Inc;Stockholder, FLOWSIGMA Inc;Officer, Yunu Inc;Stockholder, Yunu Inc
Kuan Zhang, PhD, , MN (*Presenter*) Nothing to Disclose
Jayashree Kalpathy-Cramer, MS, PhD, Charlestown, MA (*Presenter*) Institutional Research Grant, General Electric Company;Institutional Research Grant, F. Hoffmann-La Roche Ltd;Institutional Research Grant, Bayer AG

COURSE DESCRIPTION

In Person Session Only. On-demand beginning on December 5th.Medical image classification plays an essential role in aiding clinical diagnosis and treatment. With the rapid development of artificial intelligence (AI) and computer vision (CV), deep learning-based methods become more accurate and applicable to a variety of clinical tasks ---- potentially serving as a valuable ally for radiologists and pathologists. In this course, learners will get a hands-on practical introduction to deep learning for radiology and medical imaging. An end-to-end training and evaluation example based on the MedNIST dataset will be covered. We will introduce the "MONAI" deep learning platform, which is a Pytorch-based, open-source framework for deep learning in healthcare imaging.

LEARNING OBJECTIVES

1) Learn how to collect, format, and standardize medical image data 2) Use MONAI transforms to pre-process data 3) Learn to architect and train a convolutional neural network (CNN) in Pytorch for classification 4) Learn how to evaluate the trained model on test dataset*Course Description In Person Session Only. Deep Learning Lab: NLP - Text Classification with RNNs & Transformers

Monday, Nov. 28 3:00PM - 4:00PM Room: NA

Participants
Kirti Magudia, MD,PhD, Durham, NC (*Presenter*) Nothing to Disclose
Walter Wiggins, MD, PhD, Durham, NC (*Presenter*) Advisor, Qure.ai;

COURSE DESCRIPTION

In Person Session Only. On-demand beginning on December 5th.This interactive course will provide participants with the opportunity to learn the basic principles of information extraction from radiology reports by working through a step-by-step example using radiology reports from a chest radiograph data set. Learners will train a model to classify radiology reports as positive or negative for opacity. This session will cover basics of text analysis and concepts in preprocessing and model training. No prior coding or machine learning experience is necessary.

LEARNING OBJECTIVES

1) Understand the basic steps required to prepare data for information extraction with natural language processing (NLP) tools. 2) Define the basic terminology of NLP for text analysis (e.g. preprocessing, tokenization). 3) Train an NLP model to classify chest radiograph reports as 'positive' or 'negative' for abnormal findings.*Course Description In Person Session Only. Deep Learning Lab: YOLO-Bounding Box Segmentation & Classification (Part 1)

Tuesday, Nov. 29 10:00AM - 11:00AM Room: NA

Participants
Bradley Erickson, MD, PhD, Rochester, MN (*Presenter*) Board of Directors, VoiceIt Technologies, LLC;Stockholder, VoiceIt Technologies, LLC;Board of Directors, FLOWSIGMA Inc;Officer, FLOWSIGMA Inc;Stockholder, FLOWSIGMA Inc;Officer, Yunu Inc;Stockholder, Yunu Inc
Pouria Rouzrokh, MD, MPH, Rochester, MN (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

In Person Session Only. On-demand beginning on December 5th.Deep learning is attracting more and more attention in all medical fields, especially medical imaging. Nowadays we have access to many valid and reliable deep learning models that can help radiologists in detecting pathologies, differentiating benign and malignant masses, segmenting organs, or even enhancing the quality of different imaging modalities. This course aims to further improve the toolbox diversity of those interested in applying deep learning to medical imaging by introducing an easy way to train and apply object detection deep learning models. These models are used to detect objects of interest in given images and put bounding boxes around them. We will start our course with a brief review of the field of object detection and then proceed to introduce You Look Only Once (YOLO) which is probably the most recognized and easy-to-use object detection model. This training workshop covers the theories of the object detection models and introduces the different components of a modern YOLO architecture. However, it is worth mentioning that immediately after the current workshop, we will hold another session that is hands-on, and will let you practice training and applying the YOLO model in Python and using Google Colab notebooks. So, we recommend you take part in both workshops together.

LEARNING OBJECTIVES

1) Define object detection deep learning models, their scope, and applications in medical imaging 2) Introduce the object detection model "You Look Only Once (YOLO)" and explain its general underlying principles, different versions, and recent advancements*Course Description In Person Session Only. Deep Learning Lab: Accelerate your AI-based Medical Imaging Research with MONAI Core on SageMaker

Thursday, Dec. 1 9:00AM - 10:00AM Room: NA

Participants
Steve Fu, East Palo Alto, CA (*Presenter*) Nothing to Disclose
Christoph Russ, CH-8002 Zurich, Switzerland (*Presenter*) Nothing to Disclose
Christopher Austin, MD,MSc, Sammamish, WA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

In Person Session Only. On-demand beginning on December 5th.Artificial Intelligence has been proven to support radiologist clinical decision making and to help reduce doctor burnout. Amazon SageMaker is end-to-end data science platform to build, train, and run machine learning models. MONAI Core is a PyTorch-based, open-source library for deep learning training of medical imaging models. In this workshop, researchers and data scientists will learn how MONAI Core running on SageMaker lets them explore more deep neural network architectures, more hyperparameters, and more hypotheses compared to static on-prem infrastructure for medical imaging workloads. They will also learn how to use the open source ITKWidgets library as part of the data science preprocessing phase to to create interactive 3D medical image visualizations directly in Jupyter notebooks.

LEARNING OBJECTIVES

1) Running managed training and hyperparameter tuning jobs on Amazon SageMaker in combination with MONAI Core. 2) Creating interactive visualizations of medical images using ITKWidgets in SageMaker Notebooks.*Course Description In Person Session Only. Mars Huang, PhD, Stanford, CA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

In Person Session Only. On-demand beginning on December 5th.The practice of modern medicine relies heavily on the synthesis of information from multiple sources. Yet most deep learning models for medical imaging applications consider only pixel-value without data informing clinical context. As with human physicians, automated detection and classification systems that can successfully utilize both medical imaging data together with clinical data from the EHR (multimodal fusion), such as patient demographics, previous diagnoses, and laboratory values, may lead to better performing and more clinically relevant models. In this course, you will learn the fundamentals of different data fusion strategies and gain hands-on experience applying them for the task of pulmonary embolism detection.

LEARNING OBJECTIVES

1) Understand key terminologies and techniques for multimodal fusion (early, late, joint) and learn the pros and cons of each strategy. 2) Gain practical experiences applying different fusion strategies to a real-world dataset for the task of Pulmonary Embolism detection. *Course Description In Person Session Only. On-demand beginning on December 5th.The practice of modern medicine relies heavily on the synthesis of information from multiple sources. Nisha Sharma, MBChB, FRCR, Leeds, United Kingdom (*Presenter*) Nothing to Disclose
Rudolf Pijnappel, MD,PhD, Huis ter Heide, Netherlands (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This Game Show "USA Versus Europe" is a highly entertaining image interpretation quiz focused on breast imaging cases in an intriguing competitive format between two teams. A delegation of a junior and a senior breast imaging expert as well as the respective president, from the Society of Breast Imaging (SBI) and the European Society of Breast Imaging (EUSOBI), will "clash" in a friendly contention. Based on clinical information and images, intermediate and expert breast cases will be discussed and solved beyond BI-RADS and management recommendations. All of this will be happening in an highly interactive format involving the audience. In case of an official draw, a tiebreak will be considered. Don't miss out on this greatest of radiology shows!

LEARNING OBJECTIVES

1) To appreciate expert stepwise approach to solving breast imaging cases 2) To understand linking imaging features to potential histopathology diagnosis 3) To enjoy radiology beyond image interpretation*Course Description This Game Show "USA Versus Europe" is a highly entertaining image interpretation quiz focused on breast imaging cases in an intriguing competitive format between two teams. Pulmonary Vascular Imaging: CTEPH/Pulmonary Hypertension

Monday, Nov. 28 8:00AM - 9:00AM Room: NA

Participants
Martine J. Remy-Jardin, MD, PhD, Lille, France (*Presenter*) Research Grant, Siemens AG;Speaker, Siemens AG
Seth J. Kligerman, MD, La Jolla, CA (*Presenter*) Speakers Bureau, Boehringer Ingelheim GmbH Consultant, Riverain Technologies, LLC Consultant, Bayer AG
Ann N. Leung, MD, Stanford, CA (*Presenter*) Nothing to Disclose
Deepa Gopalan, MRCP, FRCR, Stockholm, Sweden (*Presenter*) Speakers Bureau, Bayer AG;Speakers Bureau, Actelion Ltd

COURSE DESCRIPTION

Chronic thromboembolic pulmonary hypertension (CTEPH) is a potentially curable form of pulmonary hypertension that develops in approximately 3% of patients with pulmonary embolism. CTEPH is a dual vascular disorder characterized by obstruction of the pulmonary vasculature by organized thromboembolic material and a secondary arteriopathic process affecting small resistance vessels. Untreated, CTEPH can lead to right heart failure and death. Diagnosis of CTEPH is made on the basis of imaging. This course presented in lecture-style format will discuss the relative strengths and weaknesses of the different diagnostic modality options as well as the characteristic imaging features of CTEPH on each. The session will include a case-based review to reinforce the imaging appearance of CTEPH and allow its differentiation from mimics.

LEARNING OBJECTIVES

1) Recognize and diagnose CTEPH on imaging studies 2) Distinguish CTEPH from other conditions that affect the pulmonary vasculature*Course Description Chronic thromboembolic pulmonary hypertension (CTEPH) is a potentially curable form of pulmonary hypertension that develops in approximately 3% of patients with pulmonary embolism. CTEPH is a dual vascular disorder characterized by obstruction of the pulmonary vasculature by organized thromboembolic material and a secondary arteriopathic process affecting small resistance vessels. Untreated, CTEPH can lead to right heart failure and death. Diagnosis of CTEPH is made on the basis of imaging. This course presented in lecture-style format will discuss the relative strengths and weaknesses of the different diagnostic modality options as well as the characteristic imaging features of CTEPH on each. Prostate MRI and Molecular Imaging: Core and Advanced Applications

Monday, Nov. 28 8:00AM - 9:00AM Room: NA

Participants

Aytekin Oto, MD, Crete, IL (*Presenter*) Research Grant, Koninklijke Philips NV;Medical Advisory Board, Profound Medical Inc;Consultant, IBM Corporation;Co-founder, Qmis LLC;Co-owner, Qmis LLC
Baris Turkbey, MD, Rockville, MD (*Presenter*) Nothing to Disclose
Delphine Chen, MD, Seattle, WA (*Presenter*) Grant, Telix Pharmaceuticals Limited;Speaker, Telix Pharmaceuticals Limited
Anwar Padhani, MD,FRCR, Northwood, United Kingdom (*Presenter*) Advisory Board, Siemens AG;Speakers Bureau, Siemens AG;Advisory Board, Lucida Medical Ltd;Stockholder, Lucida Medical Ltd

COURSE DESCRIPTION

This session aims to provide a comprehensive update on the latest developments on prostate imaging with a special focus on MR and PET imaging. The presentations cover a well-balanced, broad scope from practical, updated tips for optimized prostate MR acquisition and interpretation to new techniques such as PET MRI. PSMA PET imaging. Their role in the management of prostate cancer will be reviewed in addition to other hot topics in prostate MR including disparities in imaging access, quality control efforts and artificial intelligence.

LEARNING OBJECTIVES

1) Learn about the latest updates on prostate imaging with special emphasis on MRI and PET imaging 2) Review the quality control efforts for prostate MR and explain the current and future applications of artificial intelligence on prostate imaging 3) Understand the potential roles and added value of PSMA PET and PET MR in the management of patients with prostate cancer 4) Identify the basics of healthcare disparities in prostate imaging and review ways for mitigating them.*Course Description This session aims to provide a comprehensive update on the latest developments on prostate imaging with a special focus on MR and PET imaging. The presentations cover a well-balanced, broad scope from practical, updated tips for optimized prostate MR acquisition and interpretation to new techniques such as PET MRI. PSMA PET imaging. Artificial Intelligence and Cybersecurity in Healthcare

Monday, Nov. 28 8:00AM - 9:00AM Room: NA

Participants
Benoit Desjardins, MD, PhD, Philadelphia, PA (*Presenter*) Nothing to Disclose
Shandong Wu, PhD, Pittsburgh, PA (*Presenter*) Nothing to Disclose
Richard Staynings, New York, NY (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Cybercrime against healthcare institutions has exploded in recent years. In 2021, more than 1 in 3 healthcare organizations reported being hit by ransomware. The situation has been considerably worsened by the pandemic, which produced a triple threat for healthcare systems: a rapid expansion of internet-connected technologies and services causing an expanded attack surface, an increase in many types of cyberattacks, and fewer available resources to defend against cyberattacks. Cybersecurity has become an important part of healthcare, and every radiology practice can become a victim of a cyber-attack. Artificial Intelligence (AI) is now extensively used by both attackers ("Offensive AI") and defenders ("Defensive AI"). In this refresher course, we will explore three forms of interaction between AI and cybersecurity that affect healthcare: (1) Offensive AI: how cybercriminals are weaponizing artificial intelligence to improve their attacks against medical institutions. This will be discussed by Richard Staynings, a cybersecurity guru and consultant for multiple companies. He will provide a cutting-edge picture of how cyber-criminals are currently using AI to improve success of different types of attacks, such as phishing, scanning, and intrusions of medical centers. (2) Defensive AI: how cyber-defense teams at medical centers are using artificial intelligence to supplement the limited capabilities of humans to detect and defend against cyberattacks, especially now that many of those cyberattacks are controlled by artificial intelligence. This will be discussed by Benoit Desjardins, a radiologist and world leader in cybersecurity in healthcare, recently a Visiting Professor in artificial intelligence at Stanford. (3) AI model safety: how cyber-threats can disrupt the integrity of medical images, and how this affects diagnosis by AI and humans. This provides an overview of the multiple ways in which data can be modified to fool AI algorithms. This will be discussed by Shandong Wu, a top leader in artificial intelligence. This will be followed by a panel combining our three experts, to discuss the practical implications for radiology practices. This refresher course will bring the radiology community up to date on the latest interaction between artificial intelligence and cybersecurity affecting healthcare, including recent attacks, and techniques of defense. The course will be presented by radiologists and top cybersecurity and artificial intelligence experts. The information technology issues will be addressed at a technical level appropriate for the radiology community at large, to make the community aware of this growing era of digital warfare and its implications for radiology practices. Our refresher course will have practical, actionable suggestions that radiologists and IT administrators could act on now.

LEARNING OBJECTIVES

1) Identify how cybercriminals are using offensive artificial intelligence (AI) to attack medical centers 2) Explain how defensive AI can be used to protect healthcare systems from cyberattacks 3) Illustrate how cyber-manipulations of images can affect outcomes of AI algorithms*Course Description Cybercrime against healthcare institutions has exploded in recent years. In 2021, more than 1 in 3 healthcare organizations reported being hit by ransomware. The situation has been considerably worsened by the pandemic, which produced a triple threat for healthcare systems: a rapid expansion of internet-connected technologies and services causing an expanded attack surface, an increase in many types of cyberattacks, and fewer available resources to defend against cyberattacks. Cybersecurity has become an important part of healthcare, and every radiology practice can become a victim of a cyber-attack. Artificial Intelligence (AI) is now extensively used by both attackers ("Offensive AI") and defenders ("Defensive AI"). In this refresher course, we will explore three forms of interaction between AI and cybersecurity that affect healthcare: (1) Offensive AI: how cybercriminals are weaponizing artificial intelligence to improve their attacks against medical institutions. Imaging of Spinal CSF Leaks

Monday, Nov. 28 8:00AM - 9:00AM Room: NA

Participants
Wende Gibbs, MD, MA, Scottsdale, AZ (*Presenter*) Nothing to Disclose
Wouter I. Schievink, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose
Timothy Amrhein, MD, Durham, NC (*Presenter*) Nothing to Disclose
Joseph Chazen, MD, New York, NY (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This diagnostic and interventional spine session will focus on current advances in the diagnosis and treatment of spinal CSF leaks. Diagnosis of SIH based on brain MRI findings will be reviewed along with noninvasive spinal MRI. Current advances in myelography including digital subtraction myelography and decubitus CT myelography will be reviewed. Treatment options including epidural blood patch, fibrin glue injections, and an overview of surgical management will be presented. This course will give Neuroradiologists an understanding of the latest advances in diagnostic and therapeutic options for this complex condition.

LEARNING OBJECTIVES

1) Identify the core diagnostic criteria for spinal CSF leak on MRI and myelography 2) Highlight the treatment options for spinal CSF leak including percutaneous and surgical strategies*Course Description This diagnostic and interventional spine session will focus on current advances in the diagnosis and treatment of spinal CSF leaks. Diagnosis of SIH based on brain MRI findings will be reviewed along with noninvasive spinal MRI. Current advances in myelography including digital subtraction myelography and decubitus CT myelography will be reviewed. The Leiomyosarcoma vs Leiomyoma: The Case for Multiparametric MRI

Monday, Nov. 28 8:00AM - 9:00AM Room: NA

Participants
Nicole M. Hindman, MD, New York, NY (*Presenter*) Nothing to Disclose
Angela Tong, MD, New York, NY (*Presenter*) Equipment support, Siemens AG
Annie Leung, MD, Montreal, QC (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This session will review the current challenges in the MRI evaluation of uterine masses, with focus on assessing for risk of leiomyosarcoma. This is a current hot topic in gynecologic oncology since 2014 after a physician was treated for symptomatic leiomyomata and an unsuspected uterine leiomyosarcoma was disseminated throughout her pelvis. Since that time, new research has given insight into MR protocols for predicting these tumors with a sensitivity of at least 83% and a specificity of at least 88%. Through a combination of didactic lectures and case based review, this course will review the literature to date on this topic, cover the seminal papers, discuss an algorithmic approach to evaluation and show case-based review of these masses. Attendees will have improved understanding of using MRI to accurately predict leiomyosarcoma, and understand the ability of MRI to serve a key role in helping gynecology-oncologists manage risk with this patient population.

LEARNING OBJECTIVES

1) Learn about the increasing prevalence of unsuspected uterine leiomyosarcoma in the general population 2) Learn about the role of various modalities in screening for uterine leiomyosarcoma in a symptomatic population, with focus on MRI 3) Evaluate the literature to date on proposed screening algorithms to predict uterine leiomyosarcoma 4) Review cases of uterine leiomyosarcoma and its mimickers*Course Description This session will review the current challenges in the MRI evaluation of uterine masses, with focus on assessing for risk of leiomyosarcoma. This is a current hot topic in gynecologic oncology since 2014 after a physician was treated for symptomatic leiomyomata and an unsuspected uterine leiomyosarcoma was disseminated throughout her pelvis. Contrast Use and Abuse in Pediatric Imaging

Monday, Nov. 28 8:00AM - 9:00AM Room: NA

Participants
Judy Squires, MD, Pittsburgh, PA (*Presenter*) Nothing to Disclose
Helen Hye Ryong Kim, MD, Seattle, WA (*Presenter*) Nothing to Disclose
Lindsay Griffin, MD, Chicago, IL (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Many studies in diagnostic imaging require the use of IV and/or enteric contrast media for optimal quality. However, there are many different types of contrast media to be best utilized in certain clinical scenarios, and there are variable supply chain constraints. Additionally, there are many important short and long term safety considerations for use of certain types of contrast media, as well as many myths about effects of different contrast media. This course will review common contrast media available for use in ultrasound, CT, and MRI, including possible alternatives, safety considerations, and controversies.

LEARNING OBJECTIVES

1. Review available contrast media in ultrasound, CT, and MRI, as well as availability and possible substitutions.2. Review safety considerations for different contrast media, including need for clinical and biochemical monitoring before, during, and after contrast administration.3. Review appropriate dosing and re-dosing of contrast media.4. Debunk common misperceptions about harmful effects of different contrast media.*Course Description Many studies in diagnostic imaging require the use of IV and/or enteric contrast media for optimal quality. However, there are many different types of contrast media to be best utilized in certain clinical scenarios, and there are variable supply chain constraints. Additionally, there are many important short and long term safety considerations for use of certain types of contrast media, as well as many myths about effects of different contrast media. Digital PET in Current Radiology Practices

Monday, Nov. 28 8:00AM - 9:00AM Room: NA

Participants
Dustin Osborne, PhD, Knoxville, TN (*Presenter*) Consultant, Siemens AG
Osama R. Mawlawi, PhD, Houston, TX (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

PET scanners with digital detectors are one of the latest innovations in PET scanner system designs. This course will cover the detector design and system performance of digital PET scanners from various manufacturers. The course will also cover the resultant image quality for these systems as well as the various capabilities of these commercial systems.

LEARNING OBJECTIVES

At the end of this session, the audience should have gained knowledge of: 1) The design characteristics of digital PET detectors and systems from various manufacturers 2) The performance characterizations of PET systems from various manufacturers 3) PET systems options and clinical examples from the various manufacturers*Course Description PET scanners with digital detectors are one of the latest innovations in PET scanner system designs. This course will cover the detector design and system performance of digital PET scanners from various manufacturers. The course will also cover the resultant image quality for these systems as well as the various capabilities of these commercial systems.

MESH Core: Healthcare Innovation and Medical Technology Bootcamp (Part 1)

Monday, Nov. 28 8:00AM - 12:00PM Room: NA

Participants
Chris Coburn, Boston, MA (*Presenter*) Nothing to Disclose
Carl Berke, PhD, Boston, MA (*Presenter*) Nothing to Disclose
Mike Freni, Boston, MA (*Presenter*) Nothing to Disclose
Marc Succi, MD, Boston, MA (*Presenter*) Inventor, Frequency Therapeutics
Raul N. Uppot, MD, Boston, MA (*Presenter*) Consultant, Boston Scientific Corporation;Consultant, Koninklijke Philips NV

COURSE DESCRIPTION

MESH Core addresses the lack of training in medical technological innovation in residency and faculty radiologists. In Core, We run short innovation bootcamps and train radiologists, residents, and other non-radiology physicians. After attending MESH Core, the participant will be able to understand the fundamentals of informatics, prototyping, corporate business structures, artificial intelligence, machine learning, research grants, research lab creation, and entrepreneurship. They will know how to progress an idea to prototype, and talk intelligently at conferences, network with innovators, and interact with vendors such as at RSNA.

LEARNING OBJECTIVES

Attendees will learn: 1)Fundamentals of artificial intelligence and machine learning, including real demos and algorithm development 2)Fundamentals of Digital Health 3) Fundamentals of Augmented and Mixed Reality 4) Intellectual Property and Patent basics with interactive case-based problems 5) Hands-on programming in C and C++ and prototyping -Importance of Equity in Technology 6) Fundamentals of startups, corporations, investing 7) How to start your own research lab (including the lesser known things no-one tells you! 8) How to excel at getting grants, federal, private, and industry*Course Description MESH Core addresses the lack of training in medical technological innovation in residency and faculty radiologists. In Core, We run short innovation bootcamps and train radiologists, residents, and other non-radiology physicians. United Kingdom Presents: Building and Sustaining Imaging Services in the UK

Monday, Nov. 28 8:00AM - 9:30AM Room: NA

Participants
Kath Halliday, MD, London, United Kingdom (*Presenter*) Nothing to Disclose
Julian Elford, FRCR,MBBS, Winchester, United Kingdom (*Presenter*) Nothing to Disclose
Raman Uberoi, MBChB, FRCR, Oxford, United Kingdom (*Presenter*) Nothing to Disclose
Priya Suresh, Plymouth, United Kingdom (*Presenter*) Nothing to Disclose
William Ramsden, MD, London, United Kingdom (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This course describes current U.K. initiatives to build the imaging workforce, improve service quality and ensure the optimal utilisation of radiological resources in the face of ever-increasing demands for complex imaging. Many of these issues were addressed in the Getting it Right First Time (GIRFT) programme and its recommendations and potential impact upon U.K. radiology will be discussed. Allied to this is the development of the Royal College of Radiologists' iRefer guidelines, designed to provide evidence-based recommendations to ensure referrers request the most appropriate imaging investigations for their patients' clinical presentation. Departmental delivery of imaging is covered by the Quality Standard for Imaging - an overarching quality framework which enables both hospital departments and imaging networks to develop their services to the highest standards. The provision of sufficient trained personnel is a critical part of delivering a quality service, and initiatives which have been used to increase and upskill the U.K. imaging workforce will also be described.

LEARNING OBJECTIVES

1) Explain methods being used in the UK to ensure that imaging is utilised efficiently and appropriately 2) Appreciate how the Quality Standard for Imaging is being used to drive service improvement 3) Understand current initiatives to expand and develop the UK imaging workforce*Course Description This course describes current U.K. initiatives to build the imaging workforce, improve service quality and ensure the optimal utilisation of radiological resources in the face of ever-increasing demands for complex imaging. Pearl McElfish, PhD, MBA, Little Rock, AR (*Presenter*) Nothing to Disclose
Jinel A. Scott, MD, Brooklyn, NY (*Presenter*) Nothing to Disclose
Jorge Soto, MD, Boston, MA (*Moderator*) Nothing to Disclose
Gwendolyn M. Bryant-Smith, MD, Little Rock, AR (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This course will spotlight safety net hospitals, health disparities, and unique barriers to care. Many physicians and other members of the health care team are unaware of the unique barriers to care that marginalized, diverse, and rural populations endure and have limited understanding of how safety net hospitals and rural programs meet these challenges. This course will address many of these challenges and will provide strategies to mitigate some of these unique barriers to care.

LEARNING OBJECTIVES

1) Explain the history of safety net hospitals in the United States and the role of these hospitals in current day healthcare 2) Discuss the unique challenges to person centered care delivery in the rural setting 3) Identify strategies to access and reach rural and diverse populations*Course Description This course will spotlight safety net hospitals, health disparities, and unique barriers to care. Many physicians and other members of the health care team are unaware of the unique barriers to care that marginalized, diverse, and rural populations endure and have limited understanding of how safety net hospitals and rural programs meet these challenges. Navigating the Job Market (Sponsored by the RSNA Resident and Fellow Committee)

Monday, Nov. 28 8:00AM - 9:00AM Room: NA

Participants
Jeremy Heit, MD,PhD, Los Altos, CA (*Presenter*) Consultant, Medtronic plc;Consultant, Terumo Corporation;Consultant, iSchemaView, Inc;Scientific Advisory Board, iSchemaView, Inc;Medical Advisory Board, iSchemaView, Inc;Committee Member, Vesalio
Timothy T. Klostermeier, MD, Lebanon, OH (*Presenter*) Nothing to Disclose
Kurt Schoppe, MD, Grapevine, TX (*Presenter*) Nothing to Disclose
Brandon K-K. Fields, MD, San Francisco, CA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The RSNA Resident & Fellow Committee will host a session of lectures on evaluating different practice settings, the current job market, and how the Radiology marketplace is changing, followed by a career panel Q&A with panelists from academics, private practice, hybrid models, and teleradiology practices. This session will provide participants, particularly trainees, with the knowledge needed to navigate the current job market.

LEARNING OBJECTIVES

1) Learn how to evaluate and compare different practice settings and jobs 2) Understand how the shifts in the Radiology marketplace are affecting the job market*Course Description The RSNA Resident & Fellow Committee will host a session of lectures on evaluating different practice settings, the current job market, and how the Radiology marketplace is changing, followed by a career panel Q&A with panelists from academics, private practice, hybrid models, and teleradiology practices. This session will provide participants, particularly trainees, with the knowledge needed to navigate the current job market.

Design Insights Drive the Patient Experience (Sponsored by the Associated Sciences Consortium)

Monday, Nov. 28 9:30AM - 10:30AM Room: NA

Participants
Morris Stein, BArch, Phoenix, AZ (*Presenter*) Nothing to Disclose
Carlos Amato, Los Angeles, CA (*Presenter*) Nothing to Disclose
Susie Moseley, MS, RT, Albuquerque, NM (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

Learn how to use research insights to define and model the patient experience. The presentation will describe physical, social and digital design innovations that change the way we work.

LEARNING OBJECTIVES

1) Describe how digital and practice transformation will influence the patient experience 2) Recognize transformational design examples driving the future of healthcare environments 3) Explore the interface of personal technology and mobile devices to improve patient and staff satisfaction*Course Description Learn how to use research insights to define and model the patient experience. The presentation will describe physical, social and digital design innovations that change the way we work.

Cardiac Imaging in Private Practice: Lessons Learned

Monday, Nov. 28 9:30AM - 10:30AM Room: NA

Participants
Richard L. Hallett II, MD, Carmel, IN (*Presenter*) Consultant, Bracco Group
Michael F. Morris, MD, Paradise Valley, AZ (*Moderator*) Educator, Medtronic plc

COURSE DESCRIPTION

The impact of cardiac imaging in optimizing patient care has never been greater. Although cardiac imaging techniques have matured and exam volumes have rapidly increased, development and implementation of cardiovascular imaging into radiology practices has been challenging. This session will present lectures highlighting the challenges, risks, and benefits involved in the private practice of cardiac imaging. Specifically, methods to start up and grow the practice will be discussed, as well as challenges related to equipment selection, referring clinician education, turf battles, group buy-in, and mentoring. Real-life examples from successful cardiac imagers' practices will be discussed. The importance of collaboration and sub-specialization will be emphasized. Ample opportunity for in-person and online questions will be provided.

LEARNING OBJECTIVES

1) Explain techniques and challenges to implement and expand a cardiac imaging program in private practice.2) Explain methods to grow the cardiac imaging program to enhance patient care and clinician satisfaction.3) Explain potential conflicts /barriers to progress in cardiac imaging and possible solutions.*Course Description The impact of cardiac imaging in optimizing patient care has never been greater. Although cardiac imaging techniques have matured and exam volumes have rapidly increased, development and implementation of cardiovascular imaging into radiology practices has been challenging. This session will present lectures highlighting the challenges, risks, and benefits involved in the private practice of cardiac imaging. Mentored Cardiac Case Review: Imaging of Coronary Atherosclerotic Disease: From Straight Forward to Most Complicated

Monday, Nov. 28 9:30AM - 10:30AM Room: NA

Participants
Prachi P. Agarwal, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose
Brian B. Ghoshhajra, MD, Boston, MA (*Presenter*) Research Grant, Siemens AG;Consultant, Koninklijke Philips NV;Consultant, Siemens AG
Elsie Nguyen, MD, Toronto, ON (*Presenter*) Nothing to Disclose
U. Joseph Schoepf, MD, Charleston, SC (*Presenter*) Research Grant, Bayer AG;Research Grant, Bracco Group;Research Grant, Elucid BioImaging Inc;Consultant, Elucid BioImaging Inc;Research Grant: General Electric Company;Research Grant, Guerbet SA;Research Grant, Heartflow, Inc;Speakers Bureau, Heartflow Inc
Michelle Williams, MBChB, PhD, Kelso, United Kingdom (*Moderator*) Speakers Bureau, Canon Medical Systems Corporation;Speakers Bureau, Siemens AG

COURSE DESCRIPTION

This course will feature lectures and discussion around imaging cases of coronary artery disease, including a range of complexity from basic to advanced.

LEARNING OBJECTIVES

1) Understand how different imaging modalities can be used in risk stratification, diagnosis, and management optimisation of patients 2) Learn how current guidelines guide the assessment of individual patients with suspected or known coronary artery disease 3) Develop skills to identify and interpret coronary artery disease findings on cardiac imaging*Course Description This course will feature lectures and discussion around imaging cases of coronary artery disease, including a range of complexity from basic to advanced.

Medicolegal Issues and Managing Risk

Monday, Nov. 28 9:30AM - 10:30AM Room: NA

Participants
Jonathan Mezrich, MD, Guilford, CT (*Presenter*) Nothing to Disclose
Stephen D. Brown, MD, Boston, MA (*Presenter*) Stockholder, GSK plc ;Stockholder, Johnson & Johnson;Stockholder, AbbVie Inc;Stockholder, Merck & Co, Inc;Stockholder, CVS Health Corporation;Stockholder, Pfizer Inc
Kelly Yousem, JD, Owings Mills, MD (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will explore timely medicolegal issues relevant to radiologic practice:1) Medicolegal issues in Emergency Radiology: Emergency Radiology is a subspecialty which is disproportionately impacted by liability risk given the pace, hours and patient acuity. The speaker is an Emergency Radiologist with a background as a practicing attorney, and who has published extensively on medicolegal topics.2) Error Disclosure – Systems Considerations: Responsibly discussing medical errors with patients and families requires the implementation of principled, coordinated, enterprise-wide processes that support both patients and providers. This presentation, by a pediatric radiologist with extensive experience speaking on ethics, communication, professionalism and error disclosure, will discuss systems processes that facilitate open communication with patients and families about medical errors.3) Error Disclosure - Reality Check: Lofty ideals about "doing the right thing" in communicating honestly and transparently with patients and families about preventable adverse events feel unattainable to many radiologists fearful of the legal consequences. This presentation, by an attorney with extensive malpractice expertise, will offer perspectives about the practical realities involved and consequences for physicians when considering whether and how to bring open communication about errors to patients and families.

LEARNING OBJECTIVES

1) Describe medicolegal issues in emergency radiology 2) Identify systems processes that facilitate open communication with patients and families about medical errors 3) Understand the laws, obligations, and risks and benefits regarding open communication with patients and families about medical errors*Course Description This course will explore timely medicolegal issues relevant to radiologic practice:1) Medicolegal issues in Emergency Radiology: Emergency Radiology is a subspecialty which is disproportionately impacted by liability risk given the pace, hours and patient acuity. The speaker is an Emergency Radiologist with a background as a practicing attorney, and who has published extensively on medicolegal topics.2) Error Disclosure – Systems Considerations: Responsibly discussing medical errors with patients and families requires the implementation of principled, coordinated, enterprise-wide processes that support both patients and providers. AI: Intelligent Clinical Neuroimaging On the Horizon

Monday, Nov. 28 9:30AM - 10:30AM Room: NA

Participants
Mai-Lan Ho, MD, Columbus, OH (*Presenter*) Research Grant, Siemens AG;Research Grant, Cardinal Health, Inc;Research Grant, Italfarmaco SpA
Christopher Filippi, MD, Boston, MA (*Presenter*) Research Consultant, Syntactx, LLC;Stockholder, Avicenna.ai;
Daniel S. Chow, MD, Irvine, CA (*Presenter*) Shareholder, Avicenna.ai;Consultant, Canon Medical Systems Corporation;Grant, Canon Medical Systems Corporation;Consultant, Cullen & Grandy;Grant, NovoCure Ltd
Yvonne Lui, MD, New York, NY (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This course reviews the major neuroimaging applications of machine learning including CNS tumors, stroke and cerebrovascular disease, pediatric neurological disorders. We explore the research in machine learning that are altering the imaging field and the impact on clinical practice. We discuss some of the limitations and barriers to progress in this area and provide some potential solutions.

LEARNING OBJECTIVES

After attending this session, a participant will 1) Understand the breadth of areas in neuroimaging where machine learning is making an impact 2) Know how machine learning is used to augment traditional neuroimaging approaches, and 3) Know some of the limitations of using a machine learning approach with limited datasets*Course Description This course reviews the major neuroimaging applications of machine learning including CNS tumors, stroke and cerebrovascular disease, pediatric neurological disorders. We explore the research in machine learning that are altering the imaging field and the impact on clinical practice. New Modeling Approaches for Radiology AI

Monday, Nov. 28 11:00AM - 12:00PM Room: NA

Participants
Maciej Mazurowski, MS, PhD, Durham, NC (*Presenter*) Nothing to Disclose
Akshay Chaudhari, PhD, Stanford, CA (*Presenter*) Research support, General Electric Company;Research support, Koninklijke Philips NV;Research Consultant, Subtle Medical, Inc
Valentina Pedoia, PhD, San Francisco, CA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Despite the rapid advances that artificial intelligence (AI) has the potential to make in radiology, several challenges still persist in building techniques that transition from research studies to clinical practice. Such challenges revolve around contending with the scale of data required to train robust models, especially in light of the heterogeneity of data distributions across healthcare practices. Moreover, while many AI techniques can provide insights at a group-level, can some of these methods be as efficacious at the individual level? In this lecture-based session, we will address these questions revolving around building robust AI models for implementing new personalized solutions to critical healthcare problems.

LEARNING OBJECTIVES

1) Identify methods to overcome the paucity and heterogeneity of data for training radiology AI models 2) Discover how to leverage large research repositories to uncover new disease mechanisms 3) Learn how AI can personalize healthcare delivery*Course Description Despite the rapid advances that artificial intelligence (AI) has the potential to make in radiology, several challenges still persist in building techniques that transition from research studies to clinical practice. Such challenges revolve around contending with the scale of data required to train robust models, especially in light of the heterogeneity of data distributions across healthcare practices. Horse/Zebra Head and Neck Case Based Session

Monday, Nov. 28 1:30PM - 2:30PM Room: NA

Participants

Paul Bunch, MD, Winston Salem, NC (*Presenter*) Research Grant, General Electric Company
Elizabeth George, MD, San Francisco, MA (*Presenter*) Nothing to Disclose
Jennifer Gillespie, MBBS, Brisbane, (*Presenter*) Speakers Bureau, Philips Australia 2021 (past). Speakers Bureau, Radiopaedia 2021, 2022 (past).
Mark D. Mamlouk, MD, Santa Clara, CA (*Presenter*) Nothing to Disclose
Salman Qureshi, MBChB, Doha, (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

In this case-based head and neck imaging session, attendees will be presented with typical and atypical imaging examples of squamous cell carcinoma, parathyroid adenoma, invasive fungal sinusitis, and vascular malformations. Speakers will emphasize pearls for differentiating each entity from common mimics, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. This session offers attendees the opportunity to refine their interpretation of complex head and neck imaging studies by incorporating tips from world experts.

LEARNING OBJECTIVES

1) Recognize typical and atypical imaging features of squamous cell carcinoma, parathyroid adenoma, invasive fungal sinusitis, and vascular malformations 2) Differentiate squamous cell carcinoma, parathyroid adenoma, invasive fungal sinusitis, and vascular malformations from relevant mimics*Course Description In this case-based head and neck imaging session, attendees will be presented with typical and atypical imaging examples of squamous cell carcinoma, parathyroid adenoma, invasive fungal sinusitis, and vascular malformations. Monday, Nov. 28 1:30PM - 2:30PM Room: NA

Participants
Jayashree Kalpathy-Cramer, MS, PhD, Charlestown, MA (*Presenter*) Institutional Research Grant, General Electric Company;Institutional Research Grant, F. Hoffmann-La Roche Ltd;Institutional Research Grant, Bayer AG
Paul Yi, MD, Baltimore, MD (*Presenter*) Consultant, FH Orthopedics SAS;Consultant, BunkerHill Health
Paras Lakhani, MD, Media, PA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This is a refresher course that will cover the benefits and pitfalls of using artificial intelligence (AI) in radiology, showing real-world examples of AI successes and failures, current needs, and future directions.

LEARNING OBJECTIVES

1) Show the benefits of using artificial intelligence (AI) in radiology via a cased-based review 2) Demonstrate pitfalls and current limitations of AI in radiology with real-world examples in clinical practice*Course Description This is a refresher course that will cover the benefits and pitfalls of using artificial intelligence (AI) in radiology, showing real-world examples of AI successes and failures, current needs, and future directions.

Global IR and Practice Development

Monday, Nov. 28 1:30PM - 2:30PM Room: NA

Participants
Erik Mbuguje, MD, Dar es Salaam, Tanzania, United Republic Of (*Presenter*) Nothing to Disclose
Moritz Wildgruber, MD, PhD, Iffeldorf, Germany (*Presenter*) Consultant, Sirtex Medical Ltd;Consultant, iThera Medical GmbH;Consultant, Bayer AG
Maija Cheung, MD, New Haven, CT (*Presenter*) Consultant, Medtronic plc
Charles Sanyika, MD, Johannesburg, South Africa (*Presenter*) Speaker, Cook Group Incorporated;Speaker, Boston Scientific Corporation
Vijay Ramalingam, MD, Boston, MA (*Presenter*) Nothing to Disclose
Ofonime Ukweh, MBBCh, Calabar, Nigeria (*Presenter*) Nothing to Disclose
Fabian Laage Gaupp, MD, New Haven, CT (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The evolution of Interventional Radiology over the past 50 years was based on international collaboration with exchange of techniques, ideas, and research. However, most of the global population did not benefit from the rapid advances made in high-income countries. Over the past five years, new strategies to address these disparities have been implemented and there is renewed understanding that Interventional Radiologists need to collaborate closely across borders to advance the specialty to the benefit of all patients, irrespective of location, gender, ethnicity, age, finances, politics, wars, and other factors. This session will feature lectures and discussions on global IR and practice development by international leaders from Africa, Europe, and North America.

LEARNING OBJECTIVES

1) Explain the status, availability, challenges, and evolution of Interventional Radiology globally 2) Discuss strategies to build an Interventional Radiology practice in a variety of settings 3) Identify strategies for a successful career as a clinician-scientist in Interventional Radiology*Course Description The evolution of Interventional Radiology over the past 50 years was based on international collaboration with exchange of techniques, ideas, and research. However, most of the global population did not benefit from the rapid advances made in high-income countries. Over the past five years, new strategies to address these disparities have been implemented and there is renewed understanding that Interventional Radiologists need to collaborate closely across borders to advance the specialty to the benefit of all patients, irrespective of location, gender, ethnicity, age, finances, politics, wars, and other factors. Musculoskeletal Ultrasound: Normal Appearances, Pathologic Conditions and Hands-on Demo

Monday, Nov. 28 1:30PM - 3:00PM Room: NA

Participants
Linda Probyn, MD, Toronto, ON (*Presenter*) Nothing to Disclose
Viviane Khoury, MD, Laval, QC (*Presenter*) Nothing to Disclose
Marnix Van Holsbeeck, MD, Northville, MI (*Presenter*) Stockholder, Koninklijke Philips NV;Stockholder, General Electric Company;Stockholder, MedEd3D
Jon Jacobson, MD, Ann Arbor, MI (*Presenter*) Research Consultant, BioClinica, Inc;Advisory Board, Koninklijke Philips NV;Royalties, RELX;Contactor, POCUS PRO
Rob Campbell, MBBCh, Liverpool, United Kingdom (*Presenter*) Nothing to Disclose
Luca Maria Sconfienza, MD, PhD, Milano, MI (*Presenter*) Travel support, Bracco Group;Travel support, Esaote SpA;Speakers Bureau, Esaote SpA;Travel support, ABIOGEN PHARMA SpA;Speakers Bureau, P&R Holding;Speakers Bureau, Pfizer Inc ;Speaker, Novartis AG;Speaker, Merck KGaA;Speaker, MSDF
Mark Cresswell, MBBCh, Vancouver, BC (*Presenter*) Consultant, Koninklijke Philips NV

COURSE DESCRIPTION

This session will review US of normal anatomy, normal variants and appearances of the pathologic conditions that commonly affect the Wrist, Hip & Knee, with tips on how to optimize US imaging to best evaluate the most important MSK structures. The hands-on demonstration will illustrate the standard US protocols, with further guidance on techniques that are utilised for dynamic US assessment as problem-solving tools to enhance image interpretation and increase diagnostic confidence. At the end of the session, participants will improve their approach to US assessment of MSK structures and diagnosis of common musculoskeletal pathology.

LEARNING OBJECTIVES

1) Improve knowledge of the anatomy and US imaging techniques for evaluation of the Wrist, Hip, and Knee and recognise the normal appearances of MSK structures and common image artefacts relevant to those body areas 2) Become familiar with the standard US image planes and useful dynamic imaging techniques that can enhance diagnosis of musculoskeletal conditions 3) Improve competency of US imaging of the common MSK pathologies and compare the relative merits of utilisation of US vs MRI*Course Description This session will review US of normal anatomy, normal variants and appearances of the pathologic conditions that commonly affect the Wrist, Hip & Knee, with tips on how to optimize US imaging to best evaluate the most important MSK structures. The hands-on demonstration will illustrate the standard US protocols, with further guidance on techniques that are utilised for dynamic US assessment as problem-solving tools to enhance image interpretation and increase diagnostic confidence. Acute Ultrasound Pearls and Pitfalls: Case-based Review

Monday, Nov. 28 1:30PM - 2:30PM Room: NA

Participants
Michael R. Aquino, MD, MS, Cleveland, OH (*Presenter*) Co-author with royalties, RELX
Shweta Bhatt, MD, Jacksonville, FL (*Presenter*) Nothing to Disclose
Akshya Gupta, MD, Pittsford, NY (*Presenter*) Nothing to Disclose
Luck J. Louis, MD, Vancouver, BC (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course is designed to highlight the vital role ultrasound plays in imaging and diagnosis throughout the body with a focus on challenging emergent cases. A wide range of applications will be covered including vascular, pelvic, pediatric, and musculoskeletal. Attendees will have the opportunity to test their knowledge in real time as interesting unknown cases are presented in a vase based format with topic review by the speakers. Our goal is to provide a broad update in the field while addressing new opportunities and challenges for everyday practice

LEARNING OBJECTIVES

1) Identify the role of ultrasound in common and uncommon pediatric and musculoskeletal emergencies 2) Understand some common and uncommon causes of acute pelvic pain in women 3) Identify the Doppler findings of abdominal and pelvic vascular pathologies presenting in the acute setting*Course Description This course is designed to highlight the vital role ultrasound plays in imaging and diagnosis throughout the body with a focus on challenging emergent cases. A wide range of applications will be covered including vascular, pelvic, pediatric, and musculoskeletal. Attendees will have the opportunity to test their knowledge in real time as interesting unknown cases are presented in a vase based format with topic review by the speakers. Pediatric Molecular Imaging: Read with the Experts

Monday, Nov. 28 1:30PM - 2:30PM Room: NA

Participants
Frederic H. Fahey, DSc, Boston, MA (*Presenter*) Nothing to Disclose
Neha Kwatra, MBBS, MD, Boston, MA (*Presenter*) Nothing to Disclose
Frederick Grant, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose
Susan E. Sharp, MD, Cincinnati, OH (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will provide an update on pediatric general nuclear medicine and PET. We will include an introduction including patient preparation, clinical indications for various studies, pearls and pitfalls and artifacts as well as a discussion of both oncologic and non-oncologic topics with illustrative cases. The course will include primarily core topics in pediatric nuclear medicine and PET with focus on the general radiologist, residents and fellows.

LEARNING OBJECTIVES

1) To discuss current practice and advances in pediatric general nuclear medicine and PET 2) To review patient preparation and clinical indications for nuclear medicine and PET studies in pediatrics 3) To illustrate pearls and pitfalls of imaging in the pediatric population*Course Description This course will provide an update on pediatric general nuclear medicine and PET. We will include an introduction including patient preparation, clinical indications for various studies, pearls and pitfalls and artifacts as well as a discussion of both oncologic and non-oncologic topics with illustrative cases. The course will include primarily core topics in pediatric nuclear medicine and PET with focus on the general radiologist, residents and fellows.

The Resonant Leader: Stories of Impactful Leaders

Monday, Nov. 28 1:30PM - 2:30PM Room: NA

Participants
Marta Heilbrun, MD,MS, Atlanta, GA (*Presenter*) Nothing to Disclose
Hernan Bello Velez, MD, Atlanta, GA (*Presenter*) Nothing to Disclose
Reed Omary, MD, Nashville, TN (*Presenter*) Nothing to Disclose
Christopher Hess, MD, PhD, San Francisco, CA (*Presenter*) Consultant, General Electric Company Consultant, Siemens AG DSMB, Focused Ultrasound Foundation DSMB, uniQure Biopharma DSMB, Asklepios BioPharmaceutical
Pari V. Pandharipande, MD, MPH, Chestnut Hill, MA (*Presenter*) I serve as a member of the Association of University Radiologists (AUR) General Electric (GE) Radiology Research Academic Fellowship (GERRAF) Board of Review (term: 7/1/22-2/28/23).

COURSE DESCRIPTION

Resonant leadership is described as a method of leading by designing and nurturing an environment where people work because they believe in the mission and feel united behind a common goal. Using a combination of vignettes and interactive conversation this session will explore challenges that exist and opportunities that arise to shape a department or practice when resonant leadership tools are leveraged.

LEARNING OBJECTIVES

1) Recognize pitfalls of leadership2) Develop insights to grow as a resonant leader3) Build skills in recognizing and addressing micro- and macroagressions*Course Description Resonant leadership is described as a method of leading by designing and nurturing an environment where people work because they believe in the mission and feel united behind a common goal. Using a combination of vignettes and interactive conversation this session will explore challenges that exist and opportunities that arise to shape a department or practice when resonant leadership tools are leveraged.

Pediatric GI/GU

Monday, Nov. 28 1:30PM - 2:30PM Room: NA

Participants
Shailee Lala, MD, New York, NY (*Presenter*) Editor, RELX
Rama Ayyala, MD, Cincinnati, OH (*Presenter*) Nothing to Disclose
Michael Callahan, MD, Boston, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Ultrasound is often the first line imaging modality for pediatric gastrointestinal (GI) and genitourinary (GU) indications. Although CT has historically served as an adjunctive and second line imaging modality, there is growing MRI utilization for common pediatric GI and GU pathologies due to increasing MRI availability and continual development of new and faster MRI pulse sequences. This session will highlight the imaging of pediatric inflammatory bowel disease, appendicitis and ovarian torsion with an emphasis on the after-hours approaches. This session will include a panel discussion of the different imaging approaches, with practical advice about implementation in pediatric and adult radiology departments.

LEARNING OBJECTIVES

1) Review the advantages and disadvantages of CT enterography and MR enterography and approaches to imaging and appropriate utilization in children with known or suspected inflammatory bowel disease 2) Understand the incidence and potential imaging approaches to suspected acute appendicitis in the pediatric population, and highlight evening/overnight imaging of suspected appendicitis at a large urban pediatric center 3) Summarize the incidence of ovarian torsion and review current approachs and highlight novel methods for imaging ovarian torsion, specifically after normal working hours, at a large academic pediatric center*Course Description Ultrasound is often the first line imaging modality for pediatric gastrointestinal (GI) and genitourinary (GU) indications. Although CT has historically served as an adjunctive and second line imaging modality, there is growing MRI utilization for common pediatric GI and GU pathologies due to increasing MRI availability and continual development of new and faster MRI pulse sequences. MESH Core: Healthcare Innovation and Medical Technology Bootcamp (Part 2)

Monday, Nov. 28 1:00PM - 4:30PM Room: NA

Participants
Efren J. Flores, MD, Boston, MA (*Presenter*) Speaker, WebMD LLC;Speaker, Consulting Medical Associates, Inc
Katherine Andriole, PhD, Branford, CT (*Presenter*) Nothing to Disclose
Marc Succi, MD, Boston, MA (*Presenter*) Inventor, Frequency Therapeutics
James Brink, MD, Boston, MA (*Presenter*) Board of Directors, Accumen Inc
Michael S. Gee, MD, PhD, Boston, MA (*Presenter*) Researcher, General Electric Company Researcher, Siemens AG Researcher, Motilent LLC

COURSE DESCRIPTION

MESH Core addresses the lack of training in medical technological innovation in residency and faculty radiologists. In Core, We run short innovation bootcamps and train radiologists, residents, and other non-radiology physicians. After attending MESH Core, the participant will be able to understand the fundamentals of informatics, prototyping, corporate business structures, artificial intelligence, machine learning, research grants, research lab creation, and entrepreneurship. They will know how to progress an idea to prototype, and talk intelligently at conferences, network with innovators, and interact with vendors such as at RSNA.

LEARNING OBJECTIVES

Attendees will learn: 1) Fundamentals of artificial intelligence and machine learning, including real demos and algorithm development 2) Fundamentals of Digital Health 3) Fundamentals of Augmented and Mixed Reality 4) Intellectual Property and Patent basics with interactive case-based problems. 5) Hands-on programming in C and C++ and prototyping -Importance of Equity in Technology 6) Fundamentals of startups, corporations, investing 7) How to start your own research lab (including the lesser known things no-one tells you!) 8) How to excel at getting grants, federal, private, and industry*Course Description MESH Core addresses the lack of training in medical technological innovation in residency and faculty radiologists. In Core, We run short innovation bootcamps and train radiologists, residents, and other non-radiology physicians. Shielding: The Continued Discussion (Sponsored by the Associated Sciences Consortium)

Monday, Nov. 28 3:00PM - 4:00PM Room: NA

Participants
Melissa Pergola, RT, Albuquerque, NM (*Presenter*) Former Employee, Siemens AG
Napapong Pongnapang, Salaya, Thailand (*Presenter*) Nothing to Disclose
Susie Moseley, MS, RT, Albuquerque, NM (*Moderator*) Nothing to Disclose
Sharon Wartenbee, RT, Sioux Falls, SD (*Moderator*) Nothing to Disclose
Donna E. Newman, BA, Fargo, ND (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

For over 7 decades, radiographers have been taught that shielding patients is one of the core principles of radiation safety. This all came into question with the 2019 American Association of Physicists in Medicine (AAPM) Position Statement (PP 32-A) and the U.S. Food and Drug Administration's action to rescind its longstanding gonadal shielding recommendation (21 CFR part 1000.50). In 2020, the British Institute of Radiology published Guidance on using shielding on patients for diagnostic radiology applications and in 2021, recommendations from the National Council on Radiation Protection and Measurements supported an end to shielding specifically during abdominal and pelvic radiography. While science may have new conclusions, this debate continues as stopping a practice that is so ingrained leaves radiographers feeling confused. This session will discuss the latest guidance on using shielding, explain the pros and cons and most importantly, identify resources to help practitioners understand and communicate the change to their patients.

LEARNING OBJECTIVES

1) Discuss the latest guidance on using shielding on patients during diagnostic radiography examinations 2) Explain the pros and cons of shielding 3) Identify resources for practitioners*Course Description For over 7 decades, radiographers have been taught that shielding patients is one of the core principles of radiation safety. This all came into question with the 2019 American Association of Physicists in Medicine (AAPM) Position Statement (PP 32-A) and the U.S. Food and Drug Administration's action to rescind its longstanding gonadal shielding recommendation (21 CFR part 1000.50). In 2020, the British Institute of Radiology published Guidance on using shielding on patients for diagnostic radiology applications and in 2021, recommendations from the National Council on Radiation Protection and Measurements supported an end to shielding specifically during abdominal and pelvic radiography. Imaging Quality Control in the Era of Artificial Intelligence

Monday, Nov. 28 3:00PM - 4:00PM Room: NA

Participants
Giridhar Dasegowda, MBBS, Boston, MA (*Presenter*) Nothing to Disclose
Myron A. Pozniak, MD, Waunakee, WI (*Presenter*) Support, General Electric Company
David Larson, MD, MBA, Portola Valley, CA (*Moderator*) Research Grant, Siemens AG ;Advisor, Bunkerhill Health;Shareholder, Bunkerhill Health

COURSE DESCRIPTION

Despite decades of effort, excessive CT radiation dose remains a widespread challenge. Since the limiting factor for minimizing dose is image quality, the problem of consistently optimized CT radiation doses has two parts: 1) image quality optimization and 2) process control. While artificial intelligence technology holds promise for lowering dose, without protocol management and other process controls, radiation doses will continue to remain higher than what is reasonably achievable. This session will focus on how AI might be used to lower dose as well as key aspects of protocol management and process control that AI alone will not solve.

LEARNING OBJECTIVES

1) Identify key elements of process control that enable image quality and dose optimization, 2) learn how to comprehensively manage protocols for an entire fleet, and 3) understand opportunities and limitations of AI in managing CT dose.*Course Description Despite decades of effort, excessive CT radiation dose remains a widespread challenge. Since the limiting factor for minimizing dose is image quality, the problem of consistently optimized CT radiation doses has two parts: 1) image quality optimization and 2) process control. While artificial intelligence technology holds promise for lowering dose, without protocol management and other process controls, radiation doses will continue to remain higher than what is reasonably achievable. J. Brian Fowlkes, PhD, Ann Arbor, MI (*Moderator*) Research Grant, Koninklijke Philips NV;Equipment support, General Electric Company

COURSE DESCRIPTION

While there are current RSNA courses on grant writing and various aspects of academic radiology, there is not an educational course for guiding the researchers to successfully translate research into clinical practice. This 1-hour session is designed to address this knowledge gap on the steps that need to be taken from developing the idea, assessing the clinical need, pharmaceutical and industrial demand, securing funding, making a team of collaborators to translate and commercialize the product and finally make it part of daily clinical practice. These topics will be covered by speakers with expertise on different aspects of translational imaging research. This inaugural TREC education session will focus on Total-Body (long axial FOV) PET devices and their use in research and clinical practice.

LEARNING OBJECTIVES

1) Describe the approach to translating new basic science discoveries to clinical trials and clinical practice. 2) List hurdles that may hinder translation and approaches to overcome these hurdles. 3) Discuss the role of industry partners in the translation of new radiology methods and technologies*Course Description While there are current RSNA courses on grant writing and various aspects of academic radiology, there is not an educational course for guiding the researchers to successfully translate research into clinical practice. This 1-hour session is designed to address this knowledge gap on the steps that need to be taken from developing the idea, assessing the clinical need, pharmaceutical and industrial demand, securing funding, making a team of collaborators to translate and commercialize the product and finally make it part of daily clinical practice. Stephanie Nougaret, MD, PhD, Montpellier, (*Presenter*) Nothing to Disclose
Yuliya Lakhman, MD, New York, NY (*Presenter*) Stockholder, Y-mAbs Therapeutics Inc;Consultant, Perceptive Informatics, LLC
Annie Leung, MD, Montreal, QC (*Presenter*) Nothing to Disclose
Evis Sala, MD, PhD, Cambridge, United Kingdom (*Presenter*) Co-founder, Lucida Medical Ltd

COURSE DESCRIPTION

This course will give a comprehensive view of the current and state of the art therapy for ovarian cancer patients. It will review the role of multimodality imaging in treatment selection and planning focusing on the added value of various imaging modalities for detection of peritoneal implants that change management. It will also provide a glimpse into the future of personalized care by highlighting the role of artificial intelligence and radiogenomics in improving prediction of response to neoadjuvant chemotherapy and early detection of treatment resistance which determines patient outcome.

LEARNING OBJECTIVES

1) Learn the current treatment paradigms available to patients with ovarian cancer 2) Review the the role of multi-modality imaging in treatment selection and planning of ovarian cancer patients 3) Highlight the potential added value of radiogenomics/AI in prediction of treatment response and outcome in patients with ovarian cancer*Course Description This course will give a comprehensive view of the current and state of the art therapy for ovarian cancer patients. It will review the role of multimodality imaging in treatment selection and planning focusing on the added value of various imaging modalities for detection of peritoneal implants that change management. It will also provide a glimpse into the future of personalized care by highlighting the role of artificial intelligence and radiogenomics in improving prediction of response to neoadjuvant chemotherapy and early detection of treatment resistance which determines patient outcome.

Recent Advances in PET/MRI and PET/CT Imaging

Monday, Nov. 28 3:00PM - 4:00PM Room: NA

Participants
Thomas Beyer, PhD, Vienna, Austria (*Presenter*) Co-founder, cmi-experts GmbH;Co-founder, Dedicaid GmbH
Ciprian Catana, MD, PhD, Charlestown, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This session will provide an overview of the recent developments in hybrid PET/CT and PET/MRI instrumentation. It will also present the latest progress in the integration of the multimodality information for research and clinical applications. Finally, the use of artificial intelligence for addressing remaining challenges in hybrid imaging and for performing advanced analyses of the multimodal datasets will be discussed.

LEARNING OBJECTIVES

1) Describe the state-of-the-art hardware for hybrid imaging 2) Explain software innovations in combining the multimodality information3) Identify current applications of artificial intelligence in hybrid imaging *Course Description This session will provide an overview of the recent developments in hybrid PET/CT and PET/MRI instrumentation. It will also present the latest progress in the integration of the multimodality information for research and clinical applications. Finally, the use of artificial intelligence for addressing remaining challenges in hybrid imaging and for performing advanced analyses of the multimodal datasets will be discussed.

Physics Symposium: Highlights of Physics Summer School: Practical Medical Image Analysis

Monday, Nov. 28 3:00PM - 4:00PM Room: NA

Participants
Ingrid Reiser, PhD, Chicago, IL (*Presenter*) Family member, Employee, Clarix Imaging
Samuel G. Armato III, PhD, Chicago, IL (*Presenter*) Nothing to Disclose
William Sensakovic, PhD, Cave Creek, AZ (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Computer processing and analysis of medical imaging data has seen a resurgence in recent years, fueled by rapidly improving hardware and advances in computational techniques. Major medical imaging and therapy vendors emphasize their post-processing and software packages when selling their systems, and start-ups are aiming to alter the medical establishment with advanced algorithms and data-intensive products. This session will highlight selected topics from the 2019 American Association of Physicists in Medicine (AAPM) Summer School. Lectures will review key messages and concepts related to assessment, quality control, data commons, responsible use, basic informatics, and related topics.

LEARNING OBJECTIVES

1) Identify data repository and grand challenge resources 2) Discuss responsible use and ethics of AI 3) Understand methods to assess algorithms 4) Explain basic informatics standards and image processing methods*Course Description Computer processing and analysis of medical imaging data has seen a resurgence in recent years, fueled by rapidly improving hardware and advances in computational techniques. Major medical imaging and therapy vendors emphasize their post-processing and software packages when selling their systems, and start-ups are aiming to alter the medical establishment with advanced algorithms and data-intensive products. Gastrointestinal Case-based Multidisciplinary Review

Monday, Nov. 28 3:00PM - 4:00PM Room: NA

Participants
Noelle LoConte, MD, Madison, WI (*Presenter*) Advisory Board, AbbVie Inc;Advisory Board, Personal Genome Diagnostics Inc
Jennifer Wo, MD, Boston, MA (*Presenter*) Research funded, F. Hoffmann-La Roche Ltd
Vitaliy Poylin, MD, Chicago, IL (*Presenter*) Nothing to Disclose
Ann Raldow, MD, MPH, Los Angeles, CA (*Presenter*) Consultant, ViewRay, Inc
Spencer C. Behr, MD, San Francisco, CA (*Presenter*) Grant, Cancer Targeted Technology;Scientific Advisory Board, Novartis AG;Research Consultant, GenVivo

COURSE DESCRIPTION

This course will be a case-based multidisciplinary tumor board to explore emerging treatment paradigms, and the critical role of imaging in these discussions. Within patterns of care, there has been increasing focus on total neoadjuvant therapy and non-operative management as treatment paradigms. This course will further highlight important imaging characteristics that help guide these conversations.

LEARNING OBJECTIVES

1) Develop an understanding of evolving treatment paradigms of multimodality care for colorectal cancer 2) Identify key radiographic features which are critical for clinical decision making 3) Define imaging characteristics that are predictive for clinical complete response for rectal cancer in the setting non-operative management*Course Description This course will be a case-based multidisciplinary tumor board to explore emerging treatment paradigms, and the critical role of imaging in these discussions. Within patterns of care, there has been increasing focus on total neoadjuvant therapy and non-operative management as treatment paradigms. Humanism in Radiology - Combatting Burnout and Robots (Sponsored by the RSNA Public Information Committee)

Monday, Nov. 28 3:00PM - 4:00PM Room: NA

Participants
Nicole Restauri, MD, Denver, CO (*Presenter*) Nothing to Disclose
Bettina Siewert, MD, Brookline, MA (*Presenter*) Editor, Wolters Kluwer nv;Reviewer, Wolters Kluwer nv
Jennifer Kemp, MD, Denver, CO (*Moderator*) Stockholder, Scanslated, Inc

COURSE DESCRIPTION

Medical literature and lay news media have portrayed the growing challenges of burnout among physicians, including radiologists. Reports of impending displacement of radiologists by advanced computers and machine learning have added to stress in our specialty and may be discouraging medical students from pursuing diagnostic radiology as a career. Loss of autonomy, isolation, and dehumanization are important contributors to the burnout epidemic, and loss of professional identity and diminished engagement in patient care give credence to the rumors of radiology's demise. Creation of a more humanistic culture in radiology is one way to avert the crisis.Strategies to increase humanism in radiology involve finding ways to increase empathy, foster connectedness, and restore meaning in the workplace. This course will present methods that have been shown to improve radiologist engagement and joy in the work. Using narrative to share experiences, developing gratitude practices, and developing a focus on personal and organizational values and fulfilling work tasks will be presented as methods to mitigate burnout and demonstrate value in radiology.Facilitators will engage participants in the process of exploring self, the culture of the healthcare system, and the role of the imagination in creating change. Objectives for the session include fostering connection with self and community using expressive arts and reflective writing as access points that inspire joy, facilitate cognitive reframing, and bring forth the texture of our individual and collective identities so that we may feel and be seen as more than "cogs in a wheel."

LEARNING OBJECTIVES

1) Explore the healing power of narrative to combat burnout. 2) Understand connection as an integral element of meaningful work.3) Foster connection with self and community using expressive arts and reflective writing.*Course Description Medical literature and lay news media have portrayed the growing challenges of burnout among physicians, including radiologists. Reports of impending displacement of radiologists by advanced computers and machine learning have added to stress in our specialty and may be discouraging medical students from pursuing diagnostic radiology as a career. Premal Trivedi, MD, Denver, CO (*Presenter*) Speakers Bureau, ForTec MedicalAdvisory Board, PneumoNIX Medical
Gelareh Sadigh, MD, Irvine, GA (*Moderator*) Research Grant, TailorMed Medical Ltd

COURSE DESCRIPTION

Observational “big data” research studying access, utilization, cost and outcomes are essential to providing evidence for, and improving the value of, imaging. Studies leveraging claims or registry data can advance the clinical sciences by offering real world, effectiveness data. This session serves as a primer on the use of large population data sets for high quality and clinically meaningful outcomes research. The objectives are to highlight methodologic best practices, to explore strengths and weaknesses of commonly used data sources and to provide attendees with a toolset to assess the quality of observational studies in the radiology literature.

LEARNING OBJECTIVES

1) Understand the strengths and weaknesses of big data observational research 2) Identify common data sources and understand their strengths and weaknesses 3) Understand common sources of bias in observational data research and how to deal with them*Course Description Observational “big data” research studying access, utilization, cost and outcomes are essential to providing evidence for, and improving the value of, imaging. Studies leveraging claims or registry data can advance the clinical sciences by offering real world, effectiveness data. COURSE DESCRIPTION

To learn some key elements in quality and safety management of a Radiology Department, with emphasis on the patient's journey with the support of new technologies.

LEARNING OBJECTIVES

1) Analyze the patient´s bumpy journey in the Radiology Department 2) Identify the strategies to improve the patient´s experience with the new technologies 3) Transform the role of the radiologist Keys for the radiologist empowerment 4) Be aware of the type and reasons of errors and adverse events in the radiological practice 5) Create a culture tht promotes error reporting 6) Develop strategies to learn from errors 7) Encourage the radiologist-patient relationship to reduce errors and improve safety 8) Make the radiolgist visible as a pillar in the diagnosis and guide for therapeutic management 9) Identify the best virtues of face -to-face radiology versus teleradiology from the medical and patient point of view 10) Analyze the options of both methodologies for the knowledge of our colleagues*Course Description To learn some key elements in quality and safety management of a Radiology Department, with emphasis on the patient's journey with the support of new technologies.

COURSE DESCRIPTION

An educational session, where 3 nominated Pitch Teams are chosen through a competitive process in advance. The chosen Pitch Teams, generally comprised of early-mid career investigators, then have a timed period during which the pitch their ideas to a panel consisting of representatives from industry, academia and venture capital, who in turn offer advice on each specific pitch. 2022 will mark the 7th session we've held at RSNA - this is a widely-attended event that becomes more and more popular each year, with a high level of engagement virtually in 2020 and a large hybrid audience both in-person and online in 2021.

LEARNING OBJECTIVES

1. Identifying strategies for bringing research to the competitive marketplace 2. Presenting a proposal in a way that elicits interest from potential investors 3. Taking steps to secure investor funding while developing and protecting their intellectual property 4. Identifying ways to generate business value through licensing and collaborations *Course Description An educational session, where 3 nominated Pitch Teams are chosen through a competitive process in advance. Jason Newmark, BA,MBA, Boston, MA (*Presenter*) Nothing to Disclose
Sandra Strycker, BS, Lake Oswego, OR (*Moderator*) Nothing to Disclose
Michelle Wall, MS, RT, Cincinnati, OH (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

One of the best parts about a career in imaging is having the opportunity to work with ever changing and improving technology. Faster scans, reduced radiation, new sources of energy, enhanced image quality, more patient comfort, and more efficient workflows for staff. All combined to provide the diagnostic backbone to support and enhance the overall care continuum/coordination of patient care for our referrers and patients.True, it can be overwhelming at times to keep up with all of the new innovations, the nuances of service agreements with vendors, and the constant demand from staff and providers to have the latest and greatest tools --- however, it is exciting. For imaging leaders, the use of the right methodologies and tools to proactively manage and plan for their organization’s imaging capital needs is essential.In this session we will present real life examples of the effectiveness and impact of proven tools and methodologies to develop a system-wide, multi-year, imaging capital plan. In addition, we will provide recommendations on building stronger and more innovative relationships with your vendor partners.

LEARNING OBJECTIVES

1) Learn about proven methodologies and tools to manage a highly visible and complex effort with multiple stakeholders and elements, proactive tracking and projecting and planning for imaging capital needs. 2) Understand key terms and considerations to incorporate into equipment and vendor assessments and negotiations. 3) How to develop, initiate, and complete a multi-year, system-wide imaging capital plan.*Course Description One of the best parts about a career in imaging is having the opportunity to work with ever changing and improving technology. Faster scans, reduced radiation, new sources of energy, enhanced image quality, more patient comfort, and more efficient workflows for staff. Kenneth Wang, MD, PhD, Ellicott City, MD (*Moderator*) Co-founder, DexNote, LLC

COURSE DESCRIPTION

This course brings together physicians and innovators from Radiology, Orthopaedic Surgery and Cardiology to interactively discuss the role of image-based 3D printing in providing personalized healthcare solutions to patients. Based on key clinical scenarios in cardiac and musculoskeletal disease, the panelists will describe approaches to diagnostic imaging, the clinical motivations for 3D printing, and the impact of 3D printing on the quality of care. Course attendees will be active participants, using multiple technologies to provide audience responses and ask questions in real time. By participating in this course, attendees can expect to gain important real-world insights into the tangible benefits of 3D printing for patient care.

LEARNING OBJECTIVES

1) Describe the fundamental role of imaging in patient-specific 3D printing 2) Explain the importance of 3D printing for key cardiac and musculoskeletal diseases 3) Compare the physical properties of 3D printing materials*Course Description This course brings together physicians and innovators from Radiology, Orthopaedic Surgery and Cardiology to interactively discuss the role of image-based 3D printing in providing personalized healthcare solutions to patients. Non-traumatic Thoracic Emergencies

Thursday, Dec. 1 8:00AM - 9:00AM Room: NA

Participants
Stephen Ledbetter, MD, Boston, MA (*Presenter*) Nothing to Disclose
Marianna Zagurovskaya, MD, Lexington, KY (*Presenter*) Nothing to Disclose
Diana Litmanovich, MD, Boston, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

The series of lectures in this session will review the most common use cases for thoracic CT angiography in the non-traumatic setting. Speakers will specifically address pulmonary embolus, acute aortic syndromes, and acute coronary syndrome. Attendees can expect to strengthen their skills in the interpretation of thoracic CT angiography in the setting of non-traumatic chest pain.

LEARNING OBJECTIVES

1) Review CT-based diagnostic criteria for acute pulmonary embolism and right ventricular dysfunction 2) Consider causes and imaging features of nonthrombotic pulmonary embolism and mimickers 3) Understand common and differentiating features among the acute aortic syndromes 4) Review common cardiac and coronary causes of acute chest pain in the ED. 5) Review the modern approach to non-invasive cardiac/coronary imaging in the ED*Course Description The series of lectures in this session will review the most common use cases for thoracic CT angiography in the non-traumatic setting. Speakers will specifically address pulmonary embolus, acute aortic syndromes, and acute coronary syndrome. Attendees can expect to strengthen their skills in the interpretation of thoracic CT angiography in the setting of non-traumatic chest pain.

Hugh Harvey, MBBS, London, United Kingdom (*Moderator*) Advisor, Segmed.ai;Advisor, AlgoMedica, Inc;Advisor, Regulatory Agency;Consultant, Qure.ai;Managing Director, Hardian Health

COURSE DESCRIPTION

As AI gains traction, the underlying regulatory framework is also maturing. This course will give participants insider knowledge on the current state of regulations, with tips on best practice for quality management, regulatory success and post market surveillance, with a look to what the future holds.

LEARNING OBJECTIVES

1) Learn about the current regulatory state in both the US and EU 2) Understand the principles of quality management related to AI software as a medical device 3) Understand how to conduct post market surveillance and identify bias and drift in deployed AI*Course Description As AI gains traction, the underlying regulatory framework is also maturing. This course will give participants insider knowledge on the current state of regulations, with tips on best practice for quality management, regulatory success and post market surveillance, with a look to what the future holds.

Thoracic Interventions

Thursday, Dec. 1 8:00AM - 9:00AM Room: NA

Participants
Maria Lucia Madariaga, Chicago, IL (*Presenter*) Nothing to Disclose
Michael Lanuti, MD, Boston, MA (*Presenter*) Consultant, Iovance Biotherapeutics, Inc;Consultant, AstraZeneca PLC;Consultant, Bristol-Myers Squibb Company
Robert Suh, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose
Shaunagh McDermott, FFR(RCSI), Boston, MA (*Presenter*) Nothing to Disclose
Afshin Gangi, MD,PhD, Strasbourg, France (*Presenter*) Patent holder, AprioMed AB;Consultant, Boston Scientific Corporation;Consultant, Medtronic plc
Elsie Nguyen, MD, Toronto, ON (*Presenter*) Nothing to Disclose
Florian Fintelmann, MD, Boston, MA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This session will cover the current status of thoracic interventions including fiducial placement, needle biopsy, thermal ablation (percutaneous and transbronchial), as well as the management of associated complications.

LEARNING OBJECTIVES

1) Explain the role of transbronchial ablation, percutaneous ablation, percutaneous needle biopsy, and fiducial placement in the management of thoracic neoplasms 2) Review associated complications and their management*Course Description This session will cover the current status of thoracic interventions including fiducial placement, needle biopsy, thermal ablation (percutaneous and transbronchial), as well as the management of associated complications.

Maximizing Your Career Trajectory: Negotiating and Refocusing

Thursday, Dec. 1 8:00AM - 9:00AM Room: NA

Participants
Jessica Wen, MD, PhD, Nashville, TN (*Presenter*) Nothing to Disclose
David M. Yousem, MD, Evergreen, CO (*Presenter*) Royalties, RELX;Speaker, MRI Online;Board Member, MRI Online;
Soonmee Cha, MD, San Francisco, CA (*Presenter*) Nothing to Disclose
Jay R. Parikh, MD, West University Place, TX (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The primary goal of this session is to underscore the importance of non-interpretive skills given the challenges facing radiologists today and going forward. Many radiologists currently experience job dissatisfaction and burnout in an environment dominated by the pandemic and demands for increased productivity. Because of current workforce shortages, radiologists are also being increasingly tasked with administrative duties and other non-clinical responsibilities. Radiologists are taking pause in their careers and considering different opportunities. As radiologists recalibrate their careers, non–interpretive skillsets may potentially assist with their next career step. In this didactic presentation followed by interactive panel discussion, three specific non-interpretive skills will be described to help attendees contemplating career options: additional formal education and training, negotiation, and fueling internal satisfaction.

LEARNING OBJECTIVES

1) Describe the benefits that formal business education and negotiation techniques may provide radiologists to help achieve their next career step 2) Identify strategies for radiologists to help self-fuel career satisfaction*Course Description The primary goal of this session is to underscore the importance of non-interpretive skills given the challenges facing radiologists today and going forward. Many radiologists currently experience job dissatisfaction and burnout in an environment dominated by the pandemic and demands for increased productivity. Because of current workforce shortages, radiologists are also being increasingly tasked with administrative duties and other non-clinical responsibilities. Don't Miss Subtle Emergency Neuroimaging Findings

Thursday, Dec. 1 8:00AM - 9:00AM Room: NA

Participants
Bruno P. Soares, MD, Burlington, VT (*Presenter*) Nothing to Disclose
Andrew Callen, MD, Aurora, CO (*Presenter*) Nothing to Disclose
Michele Johnson, MD, New Haven, CT (*Presenter*) Medical Advisory Board, iSchemaView, Inc
Jason F. Talbott, MD, PhD, Novato, CA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The radiologist plays a critical role in the evaluation of neuroradiology emergencies, both traumatic and nontraumatic. Often, subtle imaging findings on CT and MRI are important for accurate diagnosis, timely triage, and appropriate management of patients with neurological emergencies. The primary focus of this session is to familiarize the radiologist with the spectrum of subtle imaging findings that must be included in the search pattern for CT and MRI exams of the head and spine in the setting of neurologic emergency. A case-based approach will be utilized implementing up-to-date classification systems for a variety of neurological emergencies. Evidenced-based indications for obtaining follow-up and/or advanced imaging such as MRI for subtle CT findings will also be emphasized.

LEARNING OBJECTIVES

1) Gain familiarity with subtle CT findings which may suggest more significant soft tissue injury and need for MRI in the setting of known spinal trauma 2) Review appropriate indications for obtaining MRI and key MRI imagining findings in patients with traumatic brain injury 3) Review a systematic checklist for subtle spinal and cranial imaging findings in the setting of suspected non-traumatic spinal and cranial emergencies*Course Description The radiologist plays a critical role in the evaluation of neuroradiology emergencies, both traumatic and nontraumatic. Often, subtle imaging findings on CT and MRI are important for accurate diagnosis, timely triage, and appropriate management of patients with neurological emergencies. The primary focus of this session is to familiarize the radiologist with the spectrum of subtle imaging findings that must be included in the search pattern for CT and MRI exams of the head and spine in the setting of neurologic emergency. Endometriosis: Hiding in Plain Site

Thursday, Dec. 1 8:00AM - 9:00AM Room: NA

Participants
Scott Young, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose
Nancy Kim, MD, Washington, DC (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Endometriosis is a painful condition affecting about 10% of women of child-bearing age, yet its diagnosis is often delayed for 7 or more years. Both ultrasound and MRI play an increasing role in the detection and preoperative management of endometriosis. Reliance on laparoscopy to make the diagnosis is no longer the gold standard. Learners will be exposed to new information on how to detect endometriosis on routine ultrasound beyond endometrioma. The importance of MRI and ultrasound for preoperative surgical planning will be emphasized.

LEARNING OBJECTIVES

1) Identify patterns of Deep Endometriosis on MRI 2) Identify common locations of Deep Endometriosis on routine ultrasound and implement an ultrasound imaging protocol to increase endometriosis detection 3) Review imaging measurements and observations important to surgical planning for minimally invasive resection of deep endometriosis*Course Description Endometriosis is a painful condition affecting about 10% of women of child-bearing age, yet its diagnosis is often delayed for 7 or more years. Both ultrasound and MRI play an increasing role in the detection and preoperative management of endometriosis. Reliance on laparoscopy to make the diagnosis is no longer the gold standard. Lung/Mediastinum Case-based Multidisciplinary Review

Thursday, Dec. 1 8:00AM - 9:00AM Room: NA

Participants
Michelle S. Ginsberg, MD, New York, NY (*Presenter*) Speaker, Ultimate Opinions In Medicine LLC
Rafael Santana-Davila, Seattle, WA (*Presenter*) Nothing to Disclose
David Johnstone, Milwaukee, WI (*Presenter*) Nothing to Disclose
Stephen Chun, MD, Houston, TX (*Presenter*) Consultant, AstraZeneca PLC
Simon Lo, MD, Seattle, WA (*Presenter*) Committee member, Elekta AB

COURSE DESCRIPTION

This course will include imaging and multidisciplinary management of a case of advanced non-small cell lung cancer, a case of extensive stage small cell lung cancer, and a case of thymic tumor.

LEARNING OBJECTIVES

After the course, attendees should be able: 1) To describe the appropriate imaging and multidisciplinary management of locally advanced non-small cell lung cancer 2) To describe the appropriate imaging and multidisciplinary management of extensive stage small cell lung cancer 3) To describe the appropriate imaging and multidisciplinary management of thymic tumors*Course Description This course will include imaging and multidisciplinary management of a case of advanced non-small cell lung cancer, a case of extensive stage small cell lung cancer, and a case of thymic tumor.

An Introduction to the Learning Healthcare System & Tackling the Critical Data Hurdles (Sponsored by the RSNA Research Development Committee)

Thursday, Dec. 1 8:00AM - 9:00AM Room: NA

Participants
Joshua Yung, PhD, Houston, TX (*Presenter*) Nothing to Disclose
Safwan Halabi, MD, Chicago, IL (*Presenter*) Advisor, Change Healthcare
Jeremy Warner, MD,MS, Nashville, TN (*Presenter*) Consultant, Westat, Inc;Consultant, Melax Tech;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Flatiron Health, Inc;Owner, HemOnc.org LLC
Caroline Chung, MD, FRCPC, Houston, TX (*Moderator*) Research support, RaySearch Laboratories AB;Research support, Siemens AG;Clinical Advisory Board, CRnR

COURSE DESCRIPTION

As we aspire to deliver personalized health care, we will face growing volumes of increasingly complex care delivery options and decisions. In this introduction to the Learning Healthcare System, we will bring forward the value of effective integration of medical imaging data into a learning healthcare system and bring forward the foundational data challenges that we face today in medicine. Through several lectures including highlighted examples of large systemic data management and collaboration efforts, the course should provide a framework for starting to build this environment and culture as well as provide helpful key topics for interdisciplinary dialogue your teams within the institution including but not limited to radiologists, clinicians and clinical team members, radiology techs, imaging physics, data scientists, imaging scientists, trainees, health administrators, bioinformatics researchers and IT.

LEARNING OBJECTIVES

1) Review approaches and challenges of aggregating structured data to support a Learning Healthcare System (LHS) 2) Describe the value of generating quantitative imaging to support an LHS 3) Describe specific examples of data management approaches around medical imaging and highlight lessons learned*Course Description As we aspire to deliver personalized health care, we will face growing volumes of increasingly complex care delivery options and decisions. Optimizing Your 3D printing Workflow to Ensure Accurate Medical Models (Sponsored by the RSNA 3D Printing Special Interest Group)

Thursday, Dec. 1 8:00AM - 9:00AM Room: NA

Participants
Anish Ghodadra, MD, Pittsburgh, PA (*Presenter*) Nothing to Disclose
Peter Liacouras, PhD, North Potomac, MD (*Presenter*) Nothing to Disclose
Shannon Walters, RT, MS, Stanford, CA (*Presenter*) Advisor, MedVizi;Consultant, TeraRecon, Inc
Nicole Wake, PhD, Aurora, OH (*Presenter*) Employee, General Electric Company
Lumarie Santiago, MD, Houston, TX (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

3D printed anatomic models must reliably represent the patient's anatomy to be useful to the clinician, but the workflow required to create these models from medical imaging data is complex and time consuming. The inherent complexity of image-based 3D printing allows the possibility of errors at any stage of the workflow. These stages include imaging acquisition, fusion of multiple exam types, segmentation, computer aided design, 3D printing, and post processing of the final 3D printed product. In this educational course, the stages where variances in the 3D printing workflow can occur will be reviewed. Tips on how to assess quality as well as improve efficiency and address variances will be presented.

LEARNING OBJECTIVES

1) Describe the various stages in the 3D printing process 2) Develop imaging protocols for source exams used in the creation of 3D printed anatomical models 3) Compare segmentation tools and their impact on time management and model accuracy 4) Recognize factors associated with print failures 5) Review quality assurance interventions at the various steps of the 3D printing process*Course Description 3D printed anatomic models must reliably represent the patient's anatomy to be useful to the clinician, but the workflow required to create these models from medical imaging data is complex and time consuming. Fundamentals of Diffuse Lung Disease

Thursday, Dec. 1 9:30AM - 10:30AM Room: NA

Participants
Joanna Escalon, MD, New York, NY (*Presenter*) Research Consultant, Vingroup
David M. Naeger, MD, Denver, CO (*Presenter*) Nothing to Disclose
Brett M. Elicker, MD, San Francisco, CA (*Presenter*) Nothing to Disclose
Laura Heyneman, MD, Durham, NC (*Presenter*) Author, RELX

COURSE DESCRIPTION

This course will review four important topics needed to evaluate diffuse lung disease. The course is intended for radiologists re-reviewing the fundamentals of this important aspect of chest radiology. We will use didactic and case-based material to review how to evaluate consolidations and ground-glass opacities, cystic lung disease, mosaic lung attenuation, and micronodular lung disease.

LEARNING OBJECTIVES

1) Evaluate chest CT images for the presence of diffuse lung disease 2) Define key imaging features used to characterize diffuse lung diseases 3) Formulate a differential diagnosis based on the presence or absence of key chest CT imaging features*Course Description This course will review four important topics needed to evaluate diffuse lung disease. The course is intended for radiologists re-reviewing the fundamentals of this important aspect of chest radiology. Thursday, Dec. 1 9:30AM - 10:30AM Room: NA

Participants

Jonathan Mezrich, MD, Guilford, CT (*Presenter*) Nothing to Disclose
Laura Kulik, MD, Chicago, IL (*Presenter*) Speaker, Eisai Co, Ltd;Speaker, Peerview;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Bayer AG;Consultant, Exelixis, Inc;Consultant, Eisai Co, Ltd;Researcher, HCC Target;Researcher, Glycotest
Ivan Pedrosa, MD, Dallas, TX (*Presenter*) Scientific Advisor, Health Tech International;Scientific Advisor, Merck & Co, Inc
Hersh Chandarana, MD, Scarsdale, NY (*Presenter*) Institutional research agreement, Siemens AG;Equipment support, Siemens AG;Software support, Siemens AG
Pari V. Pandharipande, MD, MPH, Chestnut Hill, MA (*Presenter*) I serve as a member of the Association of University Radiologists (AUR) General Electric (GE) Radiology Research Academic Fellowship (GERRAF) Board of Review (term: 7/1/22-2/28/23).

COURSE DESCRIPTION

Indications for fast/focused MRI in abdomino-pelvic conditions continue to increase. We review challenges and opportunities to maximize the efficiency in the implementation of such protocols in a busy clinical practice.

LEARNING OBJECTIVES

1) Explain developments in artificial intelligence that enable fast acquisitions and opportunities to maximize efficiency in the reporting of abbreviated MRI exams2) Recognize the importance of engaging referring physicians in the use of abbreviated/fast MRI scans for screening of hepatocellular cancer 3) Identify the clinical, financial, and medico-legal implications of abbreviated MRI exams*Course Description Indications for fast/focused MRI in abdomino-pelvic conditions continue to increase. We review challenges and opportunities to maximize the efficiency in the implementation of such protocols in a busy clinical practice.

Jessica Robbins, MD, Madison, WI (*Presenter*) Nothing to Disclose
Petra Lewis, MBBS, Lebanon, NH (*Presenter*) Committee member, CairnSurgical IncEducator, MRI Online, LLC
David Sarkany, MD, Staten Island, NY (*Presenter*) Nothing to Disclose
Priscilla Slanetz, MD,MPH, Boston, MA (*Presenter*) Royalties, Wolters Kluwer nv
Joseph Philip, MD, Dallas, TX (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Over the past few decades, radiology education has transitioned from primarily passive didactic to more active learning. Although case-based teaching remains central to radiology, most educators have embraced newer techniques into their teaching, such as audience response, flipped classroom and design thinking. More recently, the COVID-19 pandemic acutely challenged educators to adapt their teaching to a virtual and now often hybrid environment. This session is designed to provide medical educators with the latest tips on how to effectively engage learners both in-person and virtually. Following a short introductory presentation and four brief presentations, the session will end with an open Q&A allowing attendees the opportunity to ask panelists about topics that may not have been covered and to share their own teaching tips.

LEARNING OBJECTIVES

By the end of this session, the attendee will be able to: 1) Envision how to interact with learners and educators across space and time 2) Incorporate effective evidence-based active learning techniques into workstation teaching and didactic hybrid presentations 3) Design creative sessions to teach non-interpretative skills*Course Description Over the past few decades, radiology education has transitioned from primarily passive didactic to more active learning. Although case-based teaching remains central to radiology, most educators have embraced newer techniques into their teaching, such as audience response, flipped classroom and design thinking. Developing a Quality Improvement (QI) Pipeline to Ensure Sustained Success: Approaches to Engage Medical Students, Trainees, and Junior Radiologists (Sponsored by the RSNA Quality Improvement Committee)

Thursday, Dec. 1 9:30AM - 10:30AM Room: NA

Participants
Nelly Tan, MD, Scottsdale, AZ (*Presenter*) Nothing to Disclose
Roman Shrestha, MD, Phoenix, AZ (*Presenter*) Nothing to Disclose
Marc Willis, DO, MMM, Stanford, CA (*Presenter*) Stockholder, Resonea, Inc.
Akriti Khanna, MD, Rochester, MN (*Presenter*) Nothing to Disclose
Richard E. Sharpe JR, MD, MBA, Scottsdale, AZ (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Quality improvement is a required component of radiology training, preparing learners for the professional practice and optimal patient care. Residents must complete a quality improvement project to demonstrate their competency. However, there is scant guidance and literature to prepare students or guide residents in their journey to complete this competency. This inherently provides many obstacles and may additionally impede development of future improvement leaders in both academic and private practice settings. This educational program will assist development of a pipeline to successfully attract improvement minded medical students, guide trainees on how to successfully complete a quality improvement project within the constraints of their program, and define a path for junior radiologists' professional development. This session will be helpful for those interested in pursuing quality along with those responsible to oversee a department, struggling to find ways to support junior faculty interested in a career in quality and safety.

LEARNING OBJECTIVES

1) Describe the educational elements of quality improvement and patient safety that are beneficial to trainees 2) Identify strategies to recruit and develop junior faculty interested in quality and safety 3) Describe a pathway to develop an academic career in quality and safety*Course Description Quality improvement is a required component of radiology training, preparing learners for the professional practice and optimal patient care. Residents must complete a quality improvement project to demonstrate their competency. However, there is scant guidance and literature to prepare students or guide residents in their journey to complete this competency. This inherently provides many obstacles and may additionally impede development of future improvement leaders in both academic and private practice settings. This educational program will assist development of a pipeline to successfully attract improvement minded medical students, guide trainees on how to successfully complete a quality improvement project within the constraints of their program, and define a path for junior radiologists' professional development. This session will be helpful for those interested in pursuing quality along with those responsible to oversee a department, struggling to find ways to support junior faculty interested in a career in quality and safety.

Implementing AI in Practice: A Demonstration of Interoperability Standards

Thursday, Dec. 1 9:30AM - 10:30AM Room: NA

Participants
Ali Tejani, MD, Frisco, TX (*Presenter*) Nothing to Disclose
Madhavi Duvvuri, MD, MPhil, San Francisco, CA (*Presenter*) Nothing to Disclose
Mohannad Hussain, Waterloo, ON (*Presenter*) Consultant, Techie Maestro Inc
Katherine Andriole, PhD, Branford, CT (*Moderator*) Nothing to Disclose
Kirti Magudia, MD,PhD, Durham, NC (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The Imaging AI in Practice demonstration project was started in 2020 to demonstrate the utility of AI applications throughout the radiology workflow to the benefit. Central to this mission are semantic and interoperability standards that allow different vendor products to seamlessly interact with each other for an optimal end user experience, namely for a clinical radiologist at his or her workstation. This session will share potential automation challenges.

LEARNING OBJECTIVES

1) Understand the future of AI applications throughout the entire radiology workflow2) Recognize practical implementation considerations, most importantly semantic and interoperability standards3) Consider model automation challenges4) Review the history of the Imaging AI in Practice demonstration project*Course Description The Imaging AI in Practice demonstration project was started in 2020 to demonstrate the utility of AI applications throughout the radiology workflow to the benefit. Central to this mission are semantic and interoperability standards that allow different vendor products to seamlessly interact with each other for an optimal end user experience, namely for a clinical radiologist at his or her workstation. Management of Elevated Risk (high-risk) Breast Lesions

Thursday, Dec. 1 11:00AM - 12:00PM Room: NA

Participants
Peter Eby, MD, Seattle, WA (*Presenter*) Nothing to Disclose
Nisha Sharma, MBChB, FRCR, Leeds, United Kingdom (*Presenter*) Nothing to Disclose
Husain Sattar, MD, Chicago, IL (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

3 talks are Management of elevated Risk (high-risk) Breast Lesions: European view.Management of elevated Risk (high-risk) Breast Lesions: Lessons learned from pathology.Management of elevated Risk (high-risk) Breast Lesions: USA view.This session will focus on high risk lesions which are diagnosed following a core biopsy and how these lesions are managed from a European and USA perspective. We will also highlight the challenges in diagnosing these high risk lesions and the lesions subtypes that are classified as high risk lesions

LEARNING OBJECTIVES

1) Gain a greater understanding of what high risk lesions are 2) Learn about the different strategies to manage to these high risk lesions from an international perspective*Course Description 3 talks are Management of elevated Risk (high-risk) Breast Lesions: European view.Management of elevated Risk (high-risk) Breast Lesions: Lessons learned from pathology.Management of elevated Risk (high-risk) Breast Lesions: USA view.This session will focus on high risk lesions which are diagnosed following a core biopsy and how these lesions are managed from a European and USA perspective. Abdominopelvic Trauma: The Essentials

Thursday, Dec. 1 11:00AM - 12:00PM Room: NA

Participants
Christina LeBedis, MD, Newton, MA (*Presenter*) Nothing to Disclose
Vincent M. Mellnick, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose
Jennifer Uyeda, MD, Lexington, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

In this didactic course on Abdominopelvic trauma, learn state-over-the-art imaging of hepatobiliary trauma, splenic trauma and bunt and penetrating bowel trauma from expert emergency radiologists. Radiologists at all levels of training will benefit from the material presented as it can be readily incorporated into their core knowledge base to care for acutely injured patients.

LEARNING OBJECTIVES

1) Explore the role of CT, including CT protocols, in the diagnosis of patients who have sustained abdominopelvic trauma specifically with respect to hepatobiliary trauma, splenic trauma and blunt and penetrating bowel trauma 2) Identify key CT imaging findings in these organ injury types through case examples 3) Discuss the imaging findings crucial to patient triage and management*Course Description In this didactic course on Abdominopelvic trauma, learn state-over-the-art imaging of hepatobiliary trauma, splenic trauma and bunt and penetrating bowel trauma from expert emergency radiologists. Radiologists at all levels of training will benefit from the material presented as it can be readily incorporated into their core knowledge base to care for acutely injured patients.

All About the Temporal Bone

Thursday, Dec. 1 11:00AM - 12:00PM Room: NA

Participants
Amy Juliano, MD, Boston, MA (*Presenter*) Nothing to Disclose
David Zander, MD, Englewood, CO (*Presenter*) Nothing to Disclose
Mohit Agarwal, MD, Milwaukee, WI (*Presenter*) Nothing to Disclose
Mai-Lan Ho, MD, Columbus, OH (*Presenter*) Research Grant, Siemens AG;Research Grant, Cardinal Health, Inc;Research Grant, Italfarmaco SpA

COURSE DESCRIPTION

In this Head and Neck session devoted to the temporal bone, attendees will be review the imaging approach and be presented with clinical case examples of patients with conductive hearing loss, sensorineural hearing loss, a temporal bone mass and suspected cholesteatoma. Speakers will emphasize pearls for imaging evaluation and differentiating each entity from common mimics, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. This session offers attendees the opportunity to refine their interpretation of complex head and neck imaging studies by incorporating tips from world experts.

LEARNING OBJECTIVES

1) Understand the imaging algorithm and search patterns for patients presenting with conductive hearing loss, sensorineural hearing loss, a temporal bone mass and suspected cholesteatoma.2) Differentiate between entities on the differential diagnosis that cause conductive hearing loss and sensorineural hearing loss3) Distinguish cholesteatoma and temporal bone masses from common mimics. *Course Description In this Head and Neck session devoted to the temporal bone, attendees will be review the imaging approach and be presented with clinical case examples of patients with conductive hearing loss, sensorineural hearing loss, a temporal bone mass and suspected cholesteatoma. Enhancing Patient Journeys Through Imaging: Leveraging Informatics (Supported in part by an unrestricted educational grant from Bayer)

Thursday, Dec. 1 11:00AM - 12:00PM Room: NA

Participants
Arun Krishnaraj, MD, MPH, Charlottesville, VA (*Presenter*) Nothing to Disclose
Dania Daye, MD, PhD, Medford, MA (*Presenter*) Research Consultant, Sigilon Therapeutics, Inc;Research Consultant, Medtronic plc
Namita S. Gandhi, MD, Cleveland, OH (*Presenter*) Nothing to Disclose
Marc Kohli, MD, San Francisco, CA (*Presenter*) Founder, Alara Imaging;Stockholder, Alara Imaging

COURSE DESCRIPTION

Patient journey refers to patient's experience throughout an episode of care; for radiology this begins at the time when an imaging order is placed and carries through till the patients receive their imaging reports with guidance for further care and an ability to consult on the imaging results.Traditionally, strategies to improve patient experience in radiology are focused on enhancing only the radiology encounter. This course will focus on the entire episode of care (pre and post radiology encounter) in a patient's imaging journey and discuss informatics strategies and initiatives which can enhance the entire journey.The session will be organized as short presentations by the speakers followed by a panel discussion at the end. There will be an opportunity of audience participation via interactive polling and in person questions.

LEARNING OBJECTIVES

1) Informatics strategy and initiatives to enhance the pre imaging exam journey 2)Informatics strategy and challenges with patient friendly report 3) Informatics strategies for patient friendly image exchange 4) Informatics considerations for establishing a virtual imaging consult program*Course Description Patient journey refers to patient's experience throughout an episode of care; for radiology this begins at the time when an imaging order is placed and carries through till the patients receive their imaging reports with guidance for further care and an ability to consult on the imaging results.Traditionally, strategies to improve patient experience in radiology are focused on enhancing only the radiology encounter. Nuclear Cardiology Update 2022: Read with the Experts

Thursday, Dec. 1 11:00AM - 12:00PM Room: NA

Participants
E. Gordon Depuey, MD, New York, NY (*Presenter*) Nothing to Disclose
Richard Weinberg, MD, Chicago, IL (*Presenter*) Ionetix Corporation: educational consulting (paid)

COURSE DESCRIPTION

This course will cover updates in cardiac SPECT and PET including new generation SPECT scanners, novel applications of PET myocardial perfusion and flow quantification, novel Tc-99m-PYP amyloidosis imaging, imaging of inflammation and infection with F-18 FDG PET/CT and more. A case based format will be used to make the discussion more interactive.

LEARNING OBJECTIVES

1) Explain current clinical applications of cardiac PET2) Identify strategies to accurately interpret SPECT and PET cardiac images3) List strategies to overcome artifacts on cardiac SPECT and PET imaging*Course Description This course will cover updates in cardiac SPECT and PET including new generation SPECT scanners, novel applications of PET myocardial perfusion and flow quantification, novel Tc-99m-PYP amyloidosis imaging, imaging of inflammation and infection with F-18 FDG PET/CT and more. Case-based Review of GI Imaging

Thursday, Dec. 1 1:30PM - 2:30PM Room: NA

Participants
Jessica Zarzour, MD, Vestavia, AL (*Presenter*) Nothing to Disclose
Jorge Soto, MD, Boston, MA (*Presenter*) Nothing to Disclose
Frank H. Miller, MD, Chicago, IL (*Presenter*) Advisory Board, Bayer AG;Advisory Board, Guerbet SA
Aarti Sekhar, MD, Atlanta, GA (*Presenter*) Nothing to Disclose
Khaled M. Elsayes, MD, Houston, TX (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will use an interactive, case-based format where the attendees will be presented with cases that will highlight important practical tips for the differential diagnosis of diseases affecting various organs of the gastrointestinal tract and organs. After each case, the presenters will ask questions and offer potential answers that will be followed by a discussion. The faculty for this course are experienced gastrointestinal and abdominal radiologists and they will present cases with varying degrees of complexity and difficulty.

LEARNING OBJECTIVES

1) To highlight important findings that help in the differential diagnosis of diseases affecting the gastrointestinal tract 2) To emphasize the importance of a careful and systematic review of all imaging modalities when evaluating complex cases 3) To illustrate, with representative cases, the characteristic appearance of important diseases affecting the gastrointestinal tract and solid organs*Course Description This course will use an interactive, case-based format where the attendees will be presented with cases that will highlight important practical tips for the differential diagnosis of diseases affecting various organs of the gastrointestinal tract and organs. After each case, the presenters will ask questions and offer potential answers that will be followed by a discussion. GU Essentials! A Case-Based Audience Participation Session

Thursday, Dec. 1 1:30PM - 2:30PM Room: NA

Participants
Lori Mankowski Gettle, MD, Madison, WI (*Presenter*) Stockholder, Elucent Medical;Research support, General Electric Company;Research support, HistoSonics, Inc;Royalties, RELX
Aradhana Venkatesan, MD, Houston, TX (*Presenter*) Research Grant, Siemens;Honorarium, Elsevier
Peter S. Liu, MD, Cleveland, OH (*Presenter*) Nothing to Disclose
Tharakeswara Bathala, MD, Houston, TX (*Presenter*) Nothing to Disclose
Tristan Barrett, MBBS, Cambridge, United Kingdom (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

GU Live! A Case-Based Audience Participation Session is an expert-moderated session featuring a series of interactive genitourinary case studies that will challenge radiologists' diagnostic skills and knowledge. In this session, participants will be automatically assigned to teams depending on the number of participants in the session. They will then use their mobile devices to test their knowledge of genitourinary radiology in a fast-paced session that will be both educational and entertaining.

LEARNING OBJECTIVES

1) To interpret interesting cases related to kidney, ureter, bladder, and gynecological pathologies to form a differential diagnosis and a definitive diagnosis via interactive audience participation.2) To apply the teaching points from the individual challenging cases to future clinical cases seen in the practice of genitourinary radiology.*Course Description GU Live! A Case-Based Audience Participation Session is an expert-moderated session featuring a series of interactive genitourinary case studies that will challenge radiologists' diagnostic skills and knowledge. In this session, participants will be automatically assigned to teams depending on the number of participants in the session. The Basics of AI: An Interactive Session to Test your Knowledge

Thursday, Dec. 1 1:30PM - 2:30PM Room: NA

Participants

Luciano M. Prevedello, MD, MPH, Columbus, OH (*Presenter*) Nothing to Disclose
Tara Retson, MD, PhD, San Diego, CA (*Presenter*) Research Consultant, CureMetrix, Inc;Stock options, CureMetrix, Inc
Ian Pan, MD, Brookline, MA (*Presenter*) Consultant, MD.ai, Inc;Consultant, Centaur Labs Inc;Consultant, Diagnosticos da America SA;Consultant, CoRead AI
Felipe C. Kitamura, MD, PhD, Sao Paulo, SP (*Moderator*) Consultant, MD.ai, Inc;Speaker, General Electric Company

COURSE DESCRIPTION

This session will cover basic concepts of artificial intelligence in radiology. Participants should bring their mobile devices with an internet connection to participate. Presenters will ask questions and display alternatives on slides, and participants will answer questions on their mobile devices. After each question, presenters will discuss the main concepts pertaining to the topic.

LEARNING OBJECTIVES

1) Describe the main concepts in artificial intelligence as they apply to the implementation of AI programs in clinical practice. 2) Understand pitfalls during training and the limitations they impose on clinical use.*Course Description This session will cover basic concepts of artificial intelligence in radiology. Participants should bring their mobile devices with an internet connection to participate. Presenters will ask questions and display alternatives on slides, and participants will answer questions on their mobile devices. Human Factors in Radiology (Sponsored by RSNA Professionalism Committee)

Thursday, Dec. 1 1:30PM - 2:30PM Room: NA

Participants
Michael K. Atalay, MD, PhD, Providence, RI (*Presenter*) Nothing to Disclose
Kate Hanneman, MD, FRCPC, Toronto, ON (*Presenter*) Speaker, Groupe Sanofi Speaker, Amicus Therapeutics, Inc
Grainne Murphy, MBBCh, MMedSc, Birmingham, United Kingdom (*Presenter*) Nothing to Disclose
Niall Downey, Newry, United Kingdom (*Presenter*) Nothing to Disclose
Bettina Siewert, MD, Brookline, MA (*Presenter*) Editor, Wolters Kluwer nv;Reviewer, Wolters Kluwer nv

COURSE DESCRIPTION

This course will take the form of lectures, with discussion.Human Factors are environmental, organisational and job factors, and human and individualcharacteristics which influence behaviour at work in a way which can affect health and safety. Humanfactors can encompass nature of the task, ergonomics, processes and procedures (e.g. interruptions),decision making and errors, as well as communication between team members and organisational culture, and are therefore crucial in healthcare in general, and very relevant to work in radiology.Aviation has been a leader in the topic of human factors, which has contributed to the excellent safetyrecord, and there are many commonalities between the aviation industry and medicine, allowing us tolearn from each other. The course will involve a talk from an airline captain who will discuss how we can learn from aviation, from an expert on perception, and from radiologists who will discuss the specific challenges in radiology, and what we can do to improve.

LEARNING OBJECTIVES

1) Identify human factors in radiology and learn how to recognise how they may impact clinical practice2) Develop strategies to minimize or prevent error in a variety of settings, and reduce risk of burnout. *Course Description This course will take the form of lectures, with discussion.Human Factors are environmental, organisational and job factors, and human and individualcharacteristics which influence behaviour at work in a way which can affect health and safety. Humanfactors can encompass nature of the task, ergonomics, processes and procedures (e.g. interruptions),decision making and errors, as well as communication between team members and organisational culture, and are therefore crucial in healthcare in general, and very relevant to work in radiology.Aviation has been a leader in the topic of human factors, which has contributed to the excellent safetyrecord, and there are many commonalities between the aviation industry and medicine, allowing us tolearn from each other. Stroke: Advances in Imaging for Stroke Prevention

Thursday, Dec. 1 1:30PM - 2:30PM Room: NA

Participants
Hediyeh Baradaran, MD, MS, Salt Lake City, UT (*Presenter*) Nothing to Disclose
Argye Hillis, MD, Baltimore, MD (*Presenter*) Nothing to Disclose
Ajay Gupta, MD, MS, New York, NY (*Presenter*) Nothing to Disclose
Mahmud Mossa-Basha, MD, Seattle, WA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This course will be comprised of didactic lectures, followed by a Q&A session, discussing imaging for stroke prevention. Specifically, we will cover the latest clinical and imaging approaches for stroke etiologic diagnosis, stroke risk stratification, and prognostic factors. This course will provide the latest evidence-based data on advanced neurovascular imaging techniques, and their role in current stroke assessment. We will also present updates on stroke prevention best practices. The contribution of burden of white matter hyperintensities to stroke outcomes and cognitive function will also be discussed.

LEARNING OBJECTIVES

1) Discuss updates in stroke prevention practices from the perspective of stroke neurology 2) Explain added value of vessel wall and plaque imaging to stroke etiology diagnosis and risk stratification, and best approaches to integrate these techniques into your practice 3) Explain the prognostic value of white matter hyperintensity burden on stroke on cognitive function outcomes*Course Description This course will be comprised of didactic lectures, followed by a Q&A session, discussing imaging for stroke prevention. Chest MRI, PET-CT and Photon Counting CT Updates

Thursday, Dec. 1 3:00PM - 4:00PM Room: NA

Participants
Shuai Leng, PHD, Rochester, MN (*Presenter*) License agreement, Siemens AG
Lea Azour, MD, Mamaroneck, NY (*Presenter*) Nothing to Disclose
Christopher Francois, MD, Rochester, MN (*Presenter*) Nothing to Disclose
Osama R. Mawlawi, PhD, Houston, TX (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will deliver a fast-paced dive into advanced thoracic imaging techniques including photon counting CT, non-vascular and vascular MRI, and PET-CT.

LEARNING OBJECTIVES

1) Describe applications of photon counting CT in thoracic imaging 2) Explain implementation of MRI for evaluation of pulmonary embolism 3) Explore pearls and pitfalls of MRI for mediastinal mass imaging 4) Present innovations in PET-CT integral to chest imaging*Course Description This course will deliver a fast-paced dive into advanced thoracic imaging techniques including photon counting CT, non-vascular and vascular MRI, and PET-CT.

Desiree Morgan, MD, Birmingham, AL (*Moderator*) Institutional Research Grant, General Electric Company

COURSE DESCRIPTION

The controversy over surveillance of pancreatic cysts remains heated, and care for patients heterogenous. In a course exploring evidence based data for pancreatic cyst risk assessment together with a discussion of the role of endoscopic ultrasound, the learners will be engaged in case discussion and debate among experts to help inform and develop strategies to meet the needs of patients in their individual practices.

LEARNING OBJECTIVES

1) Identify commonalities and differences in the spectrum of pancreatic cyst guidelines, capped by a debate on the pros and cons of following the ACR incidental pancreatic cyst surveillance recommendations 2) Explore the evidence for pancreatic cyst risk stratification and apply in conjunction with imaging features introduced in challenging case presentations 3) Explain the role of endoscopic ultrasound and cyst aspiration in surveillance and management*Course Description The controversy over surveillance of pancreatic cysts remains heated, and care for patients heterogenous. In a course exploring evidence based data for pancreatic cyst risk assessment together with a discussion of the role of endoscopic ultrasound, the learners will be engaged in case discussion and debate among experts to help inform and develop strategies to meet the needs of patients in their individual practices.

Practical Tips to Fine Tune Your Head and Neck Imaging Techniques

Thursday, Dec. 1 3:00PM - 4:00PM Room: NA

Participants
Greg Avey, MD, Madison, WI (*Presenter*) Research Consultant, General Electric Company
Remy Lobo, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose
Xin Wu, MD, Atlanta, GA (*Presenter*) Nothing to Disclose
Ashley H. Aiken, MD, Atlanta, GA (*Presenter*) Nothing to Disclose
Katie S. Traylor, DO, Pittsburgh, PA (*Presenter*) Nothing to Disclose
Claudia Kirsch, MD, New York, NY (*Moderator*) Consultant, Informa PLC;Royalties, Informa PLC

COURSE DESCRIPTION

Session ID/Title: CHN07: Practical Tips to Fine Tune Your Head and Neck Imaging Techniques: Moderator C. F. Kirsch; New York, NY. Moderator/Presenter A. H. Aiken Atlanta, GA; "Keeping it Steady" Optimizing techniques in MRI CISS sequences to identify Cranial Nerves and Skull Base Foramina Presenter: R. R. Lobo; Ann Arbor, MI. "In Therapy" Post-Treatment Neck Advanced CT & MRI Imaging" Presenter X. Wu; Atlanta, GA. "Got a Lot of Nerve", Head and Neck MRI Neurography Presenter: G. D. Avey; Madison, WI. "Teacher's PET", PET Advances in Head and Neck Cancer Presenter: K. S. Traylor; Mars, PA. "Twist and Shout", Advanced Techniques for Evaluating Neurovascular Compression in the Head and Neck Course Description: Likely a beautifully played string quintet, these 5 phenomenal lectures on "Practical Tips to Fine Tune Your Head and Neck Imaging Techniques" given by outstanding head and neck radiologists, teachers, and speakers, all recently published in their topic, are music to the radiologists' ears. Each lecture provides tips to fine tune imaging instruments and enhance head and neck imaging techniques. Dr. Aiken starts the session reviewing how MRI heavily T2 weighted CISS techniques improves visualization of cranial nerve and skull base foramina. Dr. Lobo presenting on advanced CT and MRI imaging highlights how these improve post treatment neck evaluation. Dr. Wu elaborates on tips for MRI neurography in the head and neck soft tissues, followed by Dr. Avey providing the latest PET advances in head and neck cancer imaging. The last lecture by Dr. Traylor provides tips to evaluate vessels and enhance visualization of neurovascular compression. At the outcome of this session, radiologists will have heard a beautiful medley of expert CT, MRI, PET head and neck imaging tips that fine tune imaging and improve identification of head and neck pathology.

LEARNING OBJECTIVES

1) Optimize head and neck protocols including diffusion weighted imaging, fat saturation techniques, biopsies, dual energy and PET/MRI 2) Circumvent common artifacts/pitfalls of diffusion weighted imaging, fat saturation techniques, biopsies, dual energy and PET/MRI*Course Description Session ID/Title: CHN07: Practical Tips to Fine Tune Your Head and Neck Imaging Techniques: Moderator C. F. Kirsch; New York, NY. Moderator/Presenter A. H. Aiken Atlanta, GA; "Keeping it Steady" Optimizing techniques in MRI CISS sequences to identify Cranial Nerves and Skull Base Foramina Presenter: R. Hepato-Bilio-Pancreatic Interventions

Thursday, Dec. 1 3:00PM - 4:00PM Room: NA

Participants

Ahsun Riaz, MD, Chicago, IL (*Presenter*) Consultant, Boston Scientific Corporation
Juan Camacho, MD, Sarasota, FL (*Presenter*) Research Grant, Elesta Echolaser
Eva Criado, MD, Sant Cugat del Valles, Spain (*Presenter*) Nothing to Disclose
Peter Park, MD, Duluth, GA (*Presenter*) Nothing to Disclose
Kevin W. Dickey, MD, Charleston, SC (*Presenter*) Nothing to Disclose
Govindarajan Narayanan, MD, Miami, FL (*Presenter*) Consultant, AngioDynamics, Inc;Consultant, Boston Scientific Corporation;Consultant, Stryker Corporation;Consultant, Agilent Technologies, Inc
Anne M. Covey, MD, New York, NY (*Moderator*) Stockholder, Amgen Inc

COURSE DESCRIPTION

Hepatobiliary and pancreatic procedures make up a large part of most busy interventional practices. Over the past decade there have been novel innovations (e.g. cholangioscopy, biodegradable stents) that improve our ability to treat these patients. Also utilization of standard equipment in new applications has also greatly improved patient care; as in total hepatic venous deprivation. In this session content experts will provide insight into the current and future treatment options to optimize the care of patients undergoing liver and pancreas interventions.

LEARNING OBJECTIVES

1) Learn advanced interventional techniques to manage patients with complex benign biliary disease 2) Understand the role of interventional radiology in patients with pancreatitis and pancreatic carcinoma 3) Discuss use of various hepatic venous deprivation techniques to optimize patients for major hepatic resection*Course Description Hepatobiliary and pancreatic procedures make up a large part of most busy interventional practices. Over the past decade there have been novel innovations (e.g. cholangioscopy, biodegradable stents) that improve our ability to treat these patients. Also utilization of standard equipment in new applications has also greatly improved patient care; as in total hepatic venous deprivation. Sports Imaging: Lessons Learned

Thursday, Dec. 1 3:00PM - 4:00PM Room: NA

Participants
Russell C. Fritz, MD, Mill Valley, CA (*Presenter*) Nothing to Disclose
Adam Zoga, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose
Kirkland Davis, MD, Madison, WI (*Presenter*) Nothing to Disclose
Soterios Gyftopoulos, MD, MBA, Scarsdale, NY (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This 60 minute course was designed to provide a practical update on MRI of sports-related conditions of the musculoskeletal system. The faculty consists of 5 experienced radiologists, all of whom are noted for their lecturing and teaching ability. There will be 5 separate 10 minute talks, with 10 additional minutes available for questions and discussion.

LEARNING OBJECTIVES

1) To provide the course registrants with a strategy to efficiently detect sports-related conditions of the musculoskeletal system with MRI 2) To provide the course registrants with the key points to evaluate and understand the most important sports-related orthopedic conditions in the spine, upper extremity, and lower extremity with MRI 3) To provide the course registrants with of up to date knowledge about diagnosing the most important sports-related orthopedic conditions*Course Description This 60 minute course was designed to provide a practical update on MRI of sports-related conditions of the musculoskeletal system. The faculty consists of 5 experienced radiologists, all of whom are noted for their lecturing and teaching ability. Shielding from Burnout with Financial Health: Fundamentals on Financial Literacy and Investments

Thursday, Dec. 1 3:00PM - 4:00PM Room: NA

Participants
Christopher M. Walker, MD, Fairway, KS (*Presenter*) Author, RELX;Speakers Bureau, Boehringer Ingelheim GmbH
Sherwin Chan, MD, PhD, Kansas City, MO (*Presenter*) Consultant, Jazz Pharmaceuticals plc;Research Grant, Jazz Pharmaceuticals plc;Research Grant, Hyperfine, Inc;Research Grant, General Electric Company
Grace S. Mitchell, MD, Fairway, KS (*Presenter*) Nothing to Disclose
Jenny K. Hoang, MBBS, Baltimore, MD (*Moderator*) Spouse, Employee, Merck & Co, Inc

COURSE DESCRIPTION

Many radiologists are unable to translate their high income into a high net worth. This is due to high student debt, poor financial literacy and lifestyle creep. High debt drives choices in career path for trainees and practicing radiologists, and contributes to physician burnout and mental health issues. Despite the importance of personal financial health, education on finances is absent from the majority of radiology training programs. Some highly successful and intelligent radiologists who contribute enormously to research, radiology education, and clinical care have not spent the necessary time learning about finances and preparing for retirement. The gap in financial literacy for women is even greater.

LEARNING OBJECTIVES

1) Understand the basics of budgeting, debt reduction, and planning for retirement 2) Recognize the importance of wealth building and advantages of major asset classes for radiologists 3) Gain insight into asset protection, insurance and loan forgiveness programs*Course Description Many radiologists are unable to translate their high income into a high net worth. This is due to high student debt, poor financial literacy and lifestyle creep. High debt drives choices in career path for trainees and practicing radiologists, and contributes to physician burnout and mental health issues. Imaging of AD (MRI Protocols and ARIA, PET, Amyloid/Tau biomarkers, Glymphatics, What the Radiologist Needs to Know)

Thursday, Dec. 1 3:00PM - 4:00PM Room: NA

Participants

Tammie Benzinger, MD, PhD, Saint Louis, MO (*Presenter*) Research Grant, Eli Lilly and Company;Investigator, Eli Lilly and Company;Investigator, F. Hoffmann-La Roche Ltd;Consultant, Siemens AG;Research Grant, Siemens AG;Consultant, ADM Diagnostics, LLC;Speakers Bureau, Biogen Idec Inc;Advisory Board, Biogen Idec Inc
Val J. Lowe, MD, Rochester, MN (*Presenter*) Research Grant, General Electric Company;Research Grant, Siemens AG;Research Grant, Eli Lilly and Company;Research Consultant, Eli Lilly and Company
Geir Ringstad, MD, Oslo, Norway (*Presenter*) Shareholder, BrainWideSolutions
Gloria C. Chiang, MD, New York, NY (*Moderator*) Advisory Board, Biogen Idec Inc;Consultant, Life Molecular Imaging;Speaker, Horizon CME

COURSE DESCRIPTION

This course will provide a comprehensive update on imaging biomarkers of Alzheimer's disease, based on the "ATN" framework put forth by the National Institutes on Aging and Alzheimer's Association. Through lectures, leading experts in the field will discuss qualitative and quantitative MR metrics of atrophy, imaging of amyloid-related imaging abnormalities (ARIA), PET imaging biomarkers, and imaging of glymphatics. Attendees will come away with a standard reporting algorithm to provide the most relevant clinical imaging findings to referring neurologists, as well as understand the role of imaging in identifying the underlying biology of Alzheimer's disease.

LEARNING OBJECTIVES

1) Understand the role of the radiologist in evaluating a patient presenting with cognitive impairment 2) Identify the types of amyloid-related imaging abnormalities in the setting of aducanumab therapy 3) Provide updates on PET imaging biomarkers of Alzheimer's disease, including amyloid, tau, and FDG. 4) Understand the potential role of glymphatic imaging in characterizing Alzheimer's disease*Course Description This course will provide a comprehensive update on imaging biomarkers of Alzheimer's disease, based on the "ATN" framework put forth by the National Institutes on Aging and Alzheimer's Association. Through lectures, leading experts in the field will discuss qualitative and quantitative MR metrics of atrophy, imaging of amyloid-related imaging abnormalities (ARIA), PET imaging biomarkers, and imaging of glymphatics. Adenomyosis Update 2022: Clinical, Diagnostic and Reporting Challenges

Thursday, Dec. 1 3:00PM - 4:00PM Room: NA

Participants
Mindy Horrow, MD, Philadelphia, PA (*Presenter*) Spouse, Employee, Bristol-Myers Squibb Company
Susan M. Ascher, MD, Washington, DC (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Adenomyosis is an often misunderstood and underdiagnosed uterine disorder that is frequently asymptomatic or unrelated to the symptoms experienced by the patient. Depending on the histological definition, the reported prevalence of adenomyosis has ranged from 8.85-61.5% underscoring the challenge in diagnosing and managing symptomatic patients. Dr. Malcolm Munro, Professor of Obstetrics and Gynecology at the David Geffen School of Medicine at UCLA and cofounder of FIGO's Committee on Menstrual Disorders and Related Health Impacts, will provide the latest information on the pathogenesis, clinical manifestations, and treatment options for patients with adenomyosis. He will highlight the imaging information needed by treating gynecologists to correlate symptoms with findings and, if necessary, craft a menu of treatment options for consideration by the patient. Dr. Mindy Horrow, Professor of Radiology and Vice Chair at Einstein-Jefferson Medical Center, and Dr. Susan Ascher, Professor of Radiology and Vice Chair (Research) at Georgetown University School of Medicine, will discuss current transvaginal and MR diagnostic criteria, respectively, to include pearls and pitfalls. Current reporting systems will also be provided. The course format is didactic, and at the conclusion, attendees will have enhanced knowledge of adenomyosis and be able to apply the latest TVS and MRI criteria to diagnose and report adenomyosis.

LEARNING OBJECTIVES

1) Describe our current understanding of the pathogenesis of adenomyosis and the varied clinical presentations - from symptomatic to asymptomatic 2) Diagnose adenomyosis on TVS and MRI using the latest criteria to include pearls and pitfalls/mimics 3) Report adenomyosis-related features useful for gynecologists for treatment planning and surveillance*Course Description Adenomyosis is an often misunderstood and underdiagnosed uterine disorder that is frequently asymptomatic or unrelated to the symptoms experienced by the patient. Depending on the histological definition, the reported prevalence of adenomyosis has ranged from 8.85-61.5% underscoring the challenge in diagnosing and managing symptomatic patients. CNS Case-based Multidisciplinary Review

Thursday, Dec. 1 3:00PM - 4:00PM Room: NA

Participants

Clark Chen, MD,PhD, Minneapolis, MN (*Presenter*) Consultant, Medtronic plc;Consultant, MRI Interventions, Inc;Consultant, GT Medical Technologies, Inc
Christina Tsien, MD, Washington, DC (*Presenter*) Advisory Board, Blue Earth Diagnostics Ltd;Speakers Bureau, Agilent Technologies, Inc;Consultant, Carl Zeiss AG
Soonmee Cha, MD, San Francisco, CA (*Presenter*) Nothing to Disclose
Roger Stupp, MD, Chicago, IL (*Presenter*) Research Consultant, Carthera;Research Grant, Carthera;Scientific Advisory Board, Alpheus Medical Inc;Scientific Advisory Board, Hemispherian AS;Consultant, GT Medical Technologies, Inc;Consultant, Triact Therapeutics Inc;Research Consultant, AstraZeneca PLC;Research Consultant, Boston Scientific Corporation

COURSE DESCRIPTION

In a rapid-fire CNS tumor board format, we will review recent CNS updates including the 5th edition WHO Classification of CNS tumors 2001. Significant progress has been made in the treatment of CNS tumors with an emphasis on molecular prognostic and predictive biomarkers that allow for appropriate treatment selection. The role of neuroimaging to help clinicians improve the diagnosis, treatment and response assessment for CNS tumors will be emphasized in the era of novel therapeutic approaches including immunotherapy. This session highlights the need for a multi-disciplinary treatment approach.

LEARNING OBJECTIVES

1. Review recent CNS updates including 5th edition WHO Classification of Tumors of the CNS 2021.2. Discuss key imaging modalities and features to differentiate recurrent tumor and treatment effect3. Explain the role of each modality including surgery, radiotherapy, and chemotherapy in the appropriate management of CNS tumors. *Course Description In a rapid-fire CNS tumor board format, we will review recent CNS updates including the 5th edition WHO Classification of CNS tumors 2001. Significant progress has been made in the treatment of CNS tumors with an emphasis on molecular prognostic and predictive biomarkers that allow for appropriate treatment selection. Robust AI Solutions: Essential Image Acquisition Requirements

Thursday, Dec. 1 3:00PM - 4:00PM Room: NA

Participants
Gudrun Zahlmann, PhD, Neumarkt, Germany (*Presenter*) Nothing to Disclose
Michael Boss, PhD, Philadelphia, PA (*Presenter*) Research Consultant, Psychology Software Tools, Inc;Research Consultant, CaliberMRI, Inc
Andrew J. Buckler, MS, PhD, Boston, MA (*Presenter*) Stockholder, Elucid Bioimaging Inc;President, Elucid Bioimaging Inc;Officer, Elucid Bioimaging Inc
Daniel Sullivan, MD, Chapel Hill, NC (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Many AI solutions are currently developed but only a limited number are ultimately robust enough to receive FDA approval or achieve widespread clinical use. Too often there is a disconnect between the imaging and the AI communities on data quality, relevant imaging biomarkers, reliable data bases and clinical decision making. The data within medical images is highly complex. Specialized knowledge is needed not only to generate such images, but also to segment and analyze the quantifiable data that can be extracted from them. QIBA (Quantitative Imaging Biomarker Alliance) describes in its profiles ways in which to generate reliable, reproducible and repeatable biomarkers from medical images. This lecture-based course aims to build a bridge between imaging scientists and clinicians in order to facilitate quantitative imaging biomarkers for AI solutions.

LEARNING OBJECTIVES

1) Learn what a quantitative imaging biomarker (QIB) is, and how they are generated and validated 2) Understand the relationship between QIBs and AI solutions 3) Learn why so few AI algorithms have become commercialized*Course Description Many AI solutions are currently developed but only a limited number are ultimately robust enough to receive FDA approval or achieve widespread clinical use. Too often there is a disconnect between the imaging and the AI communities on data quality, relevant imaging biomarkers, reliable data bases and clinical decision making. The data within medical images is highly complex. Gayle Woloschak, PhD, Chicago, IL (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

Please note: This workshop is being held as an in-person event and will not be live- streamed or recorded.The goal of this course is to help participants understand the basic approach of how to write a grant (particularly for NIH) including all of the components of the grant itself and how to approach funding agencies within NIH for advice on process. The course includes didactic lectures, a question and answer session, and a "mock study section" that allows participants to learn about the process of review.

LEARNING OBJECTIVES

1) Identify the parts of an NIH grant application. 2) Explain the current structure of the NIH and its agencies particularly focusing on grant reviews. 3) Examine a study section through an example mock study section*Course Description Please note: This workshop is being held as an in-person event and will not be live- streamed or recorded.The goal of this course is to help participants understand the basic approach of how to write a grant (particularly for NIH) including all of the components of the grant itself and how to approach funding agencies within NIH for advice on process. Reducing Overtreatment of Breast Cancer: Leveraging Insights from Imaging, Population Data, and Radiomics (Supported by an unrestricted educational grant from Hologic)

Sunday, Nov. 27 9:00AM - 10:00AM Room: NA

Participants
Marc Ryser, PhD, Durham, NC (*Presenter*) Nothing to Disclose
Lars Grimm, MD, Durham, NC (*Presenter*) Advisor, Hologic, Inc;Consultant, Hologic, Inc;Editorial Advisory Board, WebMD Health Corp (WebMD, Inc)
Despina Kontos, PhD, Philadelphia, PA (*Presenter*) Institutional Research Grant, Hologic, Inc;Institutional Research Grant, iCAD, Inc

COURSE DESCRIPTION

In this course, we will review current evidence surrounding early breast cancer diagnosis with a focus on insights from imaging and population data to describe biology and magnitude of overdiagnosis. We will also examine potential ways to decrease overdiagnosis and overtreatment using a combination of active surveillance and radiomics informed by artificial intelligence and mathematical modeling.

LEARNING OBJECTIVES

1) Describe imaging features that are associated with DCIS biology and the feasibility of radiology-guided active surveillance approaches 2) Discuss how population data can provide valuable insights on the magnitude of the breast cancer overdiagnosis problem and identification of potential solutions 3) Describe the current data surrounding the potential of radiomics to decrease unnecessary treatment of early breast cancer, including DCIS*Course Description In this course, we will review current evidence surrounding early breast cancer diagnosis with a focus on insights from imaging and population data to describe biology and magnitude of overdiagnosis. We will also examine potential ways to decrease overdiagnosis and overtreatment using a combination of active surveillance and radiomics informed by artificial intelligence and mathematical modeling.

Pediatric Trauma: A Case-based Session

Sunday, Nov. 27 9:00AM - 10:00AM Room: NA

Participants
Summer Kaplan, MD, MS, Philadelphia, PA (*Presenter*) Nothing to Disclose
Birgit Ertl-Wagner, MD, Toronto, ON (*Presenter*) Spouse, Employee, Siemens AG
Arnold Merrow JR, MD, Cincinnati, OH (*Presenter*) Consultant, RELX;Author with royalties, RELX
Sara E. Lay, MD, Fishers, IN (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This case-based session will highlight important findings of blunt and abusive trauma to the pediatric chest, abdomen, pelvis, and spine. The focus will be on findings that affect patient management, morbidity and mortality. Discussion will cover appropriate imaging strategies and protocols for pediatric trauma patients. Differences in the imaging findings and management of pediatric patients compared to adult patients will also be reviewed.

LEARNING OBJECTIVES

1) Become familiar with appropriate imaging work-up and protocols used in pediatric trauma patients 2) Understand how pediatric anatomy and mechanism of injury relate to imaging findings 3) Explain how specific imaging findings impact patient outcome and management*Course Description This case-based session will highlight important findings of blunt and abusive trauma to the pediatric chest, abdomen, pelvis, and spine. The focus will be on findings that affect patient management, morbidity and mortality. Discussion will cover appropriate imaging strategies and protocols for pediatric trauma patients. Michael Soulen, MD, Lafayette Hill, PA (*Presenter*) Consultant, F. Hoffmann-La Roche Ltd;Consultant, Guerbet SA;Consultant, AstraZeneca PLC;Research support, Guerbet SA;Research support, Sirtex Medical Ltd;Research support, Pfizer Inc

COURSE DESCRIPTION

RSNA's Clinical Trials Methodology Workshop (CTMW) has provided first-class education in clinical trials methodology and has greatly expanded interest and successful efforts in radiology and radiation oncology clinical research. While previously available exclusively to those accepted to the in-person CTMW, this course will make accessible to all RSNA annual meeting attendees the rigor and expertise of the CTMW in a lecture course format.We will spotlight two important radiology clinical trials from alumni of the CTMW. Each clinical trialist will present an overview of their trial, followed by methodological lessons learned by a CTMW course director and biostatistician. The session will conclude with Q&A from the audience.The CTMW faculty have considerable expertise in study design, conduct, and analysis. As expert discussants, they will utilize content developed from the CTMW curriculum to present focused examples of the strengths and limitations of the clinical trials under our spotlight.

LEARNING OBJECTIVES

1) Review important aspects of clinical trial design and conduct through presentations by original principal investigators (PIs) of successful trials initially "workshopped" at the RSNA Clinical Trials Methodology Workshop (CTMW).2) Learn key biostatistical lessons regarding trial design and data analysis directly from CTMW biostatisticians using the trials presented by the PIs*Course Description RSNA's Clinical Trials Methodology Workshop (CTMW) has provided first-class education in clinical trials methodology and has greatly expanded interest and successful efforts in radiology and radiation oncology clinical research. Advanced (But Not So New) MRI Techniques (Perfusion, Spectroscopy, DTI, fMRI): What Is the Role in Clinical Practice in 2022?

Sunday, Nov. 27 9:00AM - 10:00AM Room: NA

Participants
Eva-Maria Ratai, Charlestown, MA (*Presenter*) Nothing to Disclose
Jody L. Tanabe, MD, Aurora, CO (*Presenter*) Nothing to Disclose
Haris Sair, MD, Baltimore, MD (*Presenter*) Research Grant, Siemens AG
Pamela W. Schaefer, MD, Boston, MA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This course will address the basic physics behind and CNS clinical applications of perfusion imaging, diffusion tensor imaging, functional magnetic resonance imaging and spectroscopy. It is important that radiologists keep informed of new applications of these advanced imaging techniques. Attendees will have an improved understanding of the clinical utility of these four techniques and will be able to implement them in their individual practice settings. This course will include four lectures with time for questions.

LEARNING OBJECTIVES

1) Explain the current clinical applications of perfusion imaging in Neuroradiology, 2) Explain the current clinical applications of spectroscopy in Neuroradiology, 3) Explain the current clinical applications of fMRI in Neuroradiology, 4) Explain the current clinical applications of DTI in Neuroradiology*Course Description This course will address the basic physics behind and CNS clinical applications of perfusion imaging, diffusion tensor imaging, functional magnetic resonance imaging and spectroscopy. Placenta Accreta Spectrum: Tips and Tricks for Best Diagnosis

Sunday, Nov. 27 9:00AM - 10:00AM Room: NA

Participants
Catherine Spong, MD, Dallas, TX (*Presenter*) Nothing to Disclose
Diane M. Twickler, MD, Dallas, TX (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Caring for the patient with placenta accreta spectrum necessitates an understanding on how prior ob/gyn procedures, gestational age at diagnosis, and ultrasound and MR imaging findings affect prognosis of the current pregnancy and future reproductive outcomes. Pre-partum diagnosis is key for appropriate management delivery and improves obstetric outcome. Specialists in obstetrics, MR placental diagnosis and ultrasound obstetric imaging will share their expertise in clinical care and imaging diagnosis to aid body imagers (as well as US and MR specialists) in their care of patients with placenta accreta spectrum.

LEARNING OBJECTIVES

1) Understand risk factors for placenta accreta spectrum 2) Incorporate information from a perinatologist specialist on placenta accreta spectrum -- what the clinician needs to know from our imaging reports 3) Illustrate findings of placenta accreta, increta, and percreta on ultrasound and MRI including evaluation of the bladder serosal interface and first trimester evaluation of the implantation as it relates to the cesarean scar with pearls and pitfalls of imaging diagnosis 4) Discuss how the integration of obstetric/gynecologic surgical history, imaging findings, and gestational age affect counseling of patients, need for follow-up imaging, and timing of delivery*Course Description Caring for the patient with placenta accreta spectrum necessitates an understanding on how prior ob/gyn procedures, gestational age at diagnosis, and ultrasound and MR imaging findings affect prognosis of the current pregnancy and future reproductive outcomes. Pre-partum diagnosis is key for appropriate management delivery and improves obstetric outcome. Specialists in obstetrics, MR placental diagnosis and ultrasound obstetric imaging will share their expertise in clinical care and imaging diagnosis to aid body imagers (as well as US and MR specialists) in their care of patients with placenta accreta spectrum.

Photon Counting

Sunday, Nov. 27 9:00AM - 10:00AM Room: NA

Participants
Shuai Leng, PHD, Rochester, MN (*Presenter*) License agreement, Siemens AG
Ke Li, PhD, Madison, WI (*Presenter*) Research Consultant, Pulmera Inc.

COURSE DESCRIPTION

Photon counting detector (PCD) has been an active research area in recent years. Commercial PCD-CT has been available for routine clinical use since FDA cleared the first PCD-CT in late 2021, which represents a major imaging device advancement for CT. In this lecture, we will discuss fundamental principles of PCD and explain major benefits of this technology relative to energy integrating detector which are used on most commercial CT scanners. History and current status of PCD-CT will also be discussed. Potential clinical applications will be demonstrated using sample phantom and patient images. Challenges and opportunities will also be discussed.

LEARNING OBJECTIVES

1. Understand principles of photon counting detector2. Explain benefits of photon counting detector CT3. Identify potential clinical applications of photon counting detector CT*Course Description Photon counting detector (PCD) has been an active research area in recent years. Vasculitides: Imaging Findings and Complications

Sunday, Nov. 27 9:00AM - 10:00AM Room: NA

Participants
Constantine Raptis, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose
Linda C. Chu, MD, Lutherville, MD (*Presenter*) Nothing to Disclose
Anil Pillai, MD, Dallas, TX (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Vasculitides are diseases that involve inflammation of the blood vessel walls. Broadly, these can be divided into infectious vasculitides, in which a pathogen directly invades vessel walls, and non-infectious vasculitides, which are not caused by an infectious pathogen. Non-infectious vasculitides are further subdivided by the vessel size most commonly affected and whether they are associated with another disease or etiology. Patients with vasculitides have a wide range of presenting symptoms and can be encountered in outpatient, inpatient, or emergency settings. Furthermore, because the clinical signs and symptoms overlap with other diseases, they are often difficult to diagnose. A multidisciplinary approach in which imaging findings play a critical role is needed for diagnosis, follow-up, and management. As such, radiologists must be familiar with these conditions, their imaging features, and the features of potential complications. In this case-based didactic review, important considerations related to vasculitides that are applicable to radiologists in any practice setting will be presented in order to improve the care of this important patient group.

LEARNING OBJECTIVES

1) Review the diagnostic imaging findings of vasculitides 2) Discuss how these findings can be useful in developing differential diagnoses3) Identify imaging findings that have implications for patient management and prognosis*Course Description Vasculitides are diseases that involve inflammation of the blood vessel walls. Broadly, these can be divided into infectious vasculitides, in which a pathogen directly invades vessel walls, and non-infectious vasculitides, which are not caused by an infectious pathogen. Non-infectious vasculitides are further subdivided by the vessel size most commonly affected and whether they are associated with another disease or etiology. David Bluemke, MD,PhD, Madison, WI (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The journal RADIOLOGY has been published for 100 years and is the leading scientific journal in imaging. As we celebrate this anniversary accomplishment, this session looks back at key publications published in the journal that have shaped the practice of radiology, with emphasis on CT and MRI. Looking forward, this session will review dramatic changes expected to occur with the development of photon counting CT and artificial intelligence. Recent and key publications that have set the stage for the century going forward will be reviewed.

LEARNING OBJECTIVES

Identify key studies published in the journal Radiology that have influenced the field and that have established the role of imaging studies throughout the field of medicine.*Course Description The journal RADIOLOGY has been published for 100 years and is the leading scientific journal in imaging. Translational AI Science: Bringing Advances in Deep Learning into Clinical Practice

Sunday, Nov. 27 9:00AM - 10:00AM Room: NA

Participants
Mariam Aboian, MD, PhD, New Haven, CT (*Presenter*) Researcher, Blue Earth Diagnostics Ltd;Researcher, Fusion Pharmaceuticals;Research collaboration, Pro Medicus Limited
Spyridon Bakas, PhD, Philadelphia, PA (*Presenter*) Nothing to Disclose
Marius Linguraru, DPhil, MSc, Washington, DC (*Presenter*) Co-founder, PediaMetrix Inc
Charles Kahn JR, MD, MS, Philadelphia, PA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

Researchers have developed medical imaging AI systems and evaluated AI systems in clinical practice. A gap exists in the translation of imaging AI's scientific advances to allow them to be realized in clinical practice. This course will address the ways that radiologists and radiation oncologists can work with AI researchers to accelerate and improve the translation of AI systems into clinical practice. The panel of expert physicians and AI scientists will give brief presentations and engage in interactive discussion on: (1) image-based AI applications such as segmentation, diagnosis, and treatment response prediction; (2) AI techniques to reduce imaging time, radiation dose, and noise; (3) Treatment planning; and (4) natural language processing.

LEARNING OBJECTIVES

1) Define the goals and specific challenges of translational research in imaging AI. 2) Describe the current state of translational imaging AI research and highlight recent advances. 3) Identify opportunities for radiologists to work with imaging AI scientists. 4) Describe learning resources to help radiologists contribute to translational AI research.*Course Description Researchers have developed medical imaging AI systems and evaluated AI systems in clinical practice. Nina S. Vincoff, MD, New York, NY (*Presenter*) Nothing to Disclose
Jennifer Kemp, MD, Denver, CO (*Presenter*) Stockholder, Scanslated, Inc

COURSE DESCRIPTION

This course will center on patient preferences regarding patient portals, radiology reports, price transparency, and quality in radiology. Each speaker will give a short talk that addresses patients comments with examples of implementation and success measurement. The 21st Century Cures Act unique challenges and opportunities will also be discussed.

LEARNING OBJECTIVES

1) Identify methods to continue to optimize patient portal usage and function while addressing new challenges brought on by 21st Century CURES Act 2) Understand patient desires when viewing their radiology report with methods to address report comprehension and patient engagement 3) Give examples of price transparency initiatives and describe implementation and outcome measurement 4) Describe unique role of radiologists in alleviating some of the unforeseen consequences of 21st Century Cures act on referring clinician workload while still embracing health record transparency*Course Description This course will center on patient preferences regarding patient portals, radiology reports, price transparency, and quality in radiology. Each speaker will give a short talk that addresses patients comments with examples of implementation and success measurement. The 21st Century Cures Act unique challenges and opportunities will also be discussed.

Liver Cancer Interventions

Sunday, Nov. 27 10:30AM - 11:30AM Room: NA

Participants
Jens Ricke, MD,PhD, Berlin, Germany (*Presenter*) Research Grant, Sirtex Medical Ltd;Research Grant, Bayer AG;Research Grant, Terumo Corporation;Research Grant, Boston Scientific Corporation
Parissa Tabrizian, New York, NY (*Presenter*) Research Consultant, Boston Scientific Corporation;Research Consultant, Bayer AG;Research Consultant, AstraZeneca PLC
Riad Salem, MD, MBA, Chicago, IL (*Presenter*) Consultant, Boston Scientific Corporation;Consultant, Eisai Co, Ltd;Consultant, Sirtex Medical Ltd;Consultant, Cook Group Incorporated;Consultant, Siemens AG
Gregory J. Nadolski II, MD, Fort Washington, PA (*Presenter*) Research Grant, Sirtex Medical Ltd;Research Grant, Instylla, Inc
Irene Bargellini, MD, Viareggio, Italy (*Presenter*) Consulting fees from: AstraZeneca, EISAI, Ge Healthcare, Guerbet, Merck, Sirtex, Terumo Lecture fees from: AstraZeneca, Bayer, Boston Scientific, Eisai, Guerbet, Merck, Sirtex, Sobi, Terumo Institutional research grant from: Boston Scientific Serves on Independent Data Safety Monitoring Board for: AstraZeneca

COURSE DESCRIPTION

This is a course that reviews contemporary surgical, locoregional and systemic options for HCC.

LEARNING OBJECTIVES

1) To learn about indications for locoregional and surgical approaches for HCC, 2-to learn about systemic therapy for HCC*Course Description This is a course that reviews contemporary surgical, locoregional and systemic options for HCC.

Hip Pre-op and Post-op: Impingements and Other Hot Topics

Sunday, Nov. 27 10:30AM - 11:30AM Room: NA

Participants
Philip Robinson, MBChB, Leeds, United Kingdom (*Presenter*) Advisory Board, Pfizer Inc;Advisory Board, General Electric Company;
Donna Blankenbaker, MD, Fitchburg, WI (*Presenter*) Nothing to Disclose
Reto Sutter, MD, Zurich, (*Presenter*) Nothing to Disclose
Eric A. Bogner, MD, Boca Raton, FL (*Presenter*) Research Consultant, Globus Medical, Inc
Guillaume Bierry, MD,PhD, Strasbourg, France (*Presenter*) Consultant, Koninklijke Philips NV;Consultant, Bracco Group

COURSE DESCRIPTION

This session covers several important topics in hip imaging: pathomechanisms and imaging features of femoroacetabular impingement, extraarticular impingement as well as groin pain are discussed. In addition, imaging pearls for pre- and postoperative imaging of hip preservation surgery and total hip arthroplasty are presented.

LEARNING OBJECTIVES

1) Explain the mechanism and imaging features of extraarticular impingement 2) Describe the current controversies concerning FAI and differentiate injury patterns in core muscle injury 3) Recognize imaging features in the post-operative hip*Course Description

Pitfalls and Mimics in Oncologic Imaging

Sunday, Nov. 27 10:30AM - 11:30AM Room: NA

Participants
John Heymann, MD, Galveston, TX (*Presenter*) Nothing to Disclose
Cristina Fuss, MD, Portland, OR (*Presenter*) Nothing to Disclose
Maria Zulfiqar, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose
Khaled M. Elsayes, MD, Houston, TX (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

The purpose of this course is to illustrate the various pitfalls, mimics, and atypical features that can lead to inaccurate diagnosis in cancer patients. The content includes relevant pathogenesis and background as well as specific clues that can be used to reach an accurate diagnosis. it is important to avoid pitfalls and misdiagnoses that can alter the management plan. Helpful strategies for avoiding pitfalls include paying close attention to the clinical history of the patient, carefully evaluating all of the available imaging studies, and being aware of the various radiologic mimics.

LEARNING OBJECTIVES

1) Identify various pitfalls in Oncological imaging that can lead to erroneous diagnoses 2) Describe relevant technical background, pathophysiology and hemodynamics of these pitfall 3) Be familiar with various clues to reach a specific diagnosis*Course Description The purpose of this course is to illustrate the various pitfalls, mimics, and atypical features that can lead to inaccurate diagnosis in cancer patients. Professional Disruptions in the Workplace

Sunday, Nov. 27 10:30AM - 11:30AM Room: NA

Participants
Jessica Leschied, MD, Detroit, MI (*Presenter*) Nothing to Disclose
Marika Pitot, MD, Rochester, MN (*Presenter*) Nothing to Disclose
Vikas Gulani, MD, PhD, Ann Arbor, MI (*Presenter*) Research support, Siemens AG;Consulting, Cook Group Incorporated
Jessica Robbins, MD, Madison, WI (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

Unprofessional and disruptive behavior in the radiology workplace can be on the spectrum of overt to insidious. In this course, we will explore microagressions, sexual harassment, professionalism transgressions, and disruptive behaviors due to mental illness. We will discuss how these behaviors may manifest themselves and provide examples of mitigation strategies.

LEARNING OBJECTIVES

1) Recognize the manifestations of professional disruptions in the workplace 2. Identify mitigation strategies for professional disruptions in the workplace*Course Description Unprofessional and disruptive behavior in the radiology workplace can be on the spectrum of overt to insidious. Pediatric Neuroradiology

Sunday, Nov. 27 10:30AM - 11:30AM Room: NA

Participants
David M. Mirsky, MD, Aurora, CO (*Presenter*) Nothing to Disclose
Carolina Guimaraes, MD, Woodside, CA (*Presenter*) Nothing to Disclose
Suzanne Laughlin, MD, Etobicoke, ON (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This action-packed overview of Pediatric Neuroradiology in the Emergency Department setting will breakdown the ABCs of demyelinating diseases (MS, NMO, and MOG, oh my!), shine a light on all of the hypo- and hyperdensities of emergent head CT imaging, and provide a 'who's who' of the 2021 pediatric brain tumor classification. The format will be didactic lectures and the expected outcome will be enlightenment!

LEARNING OBJECTIVES

1. Differentiate imaging features of MOG antibody–associated disease, AQP4 antibody NMOSD, and MS according to brain, optic nerve, and spinal cord MRI findings.2. Become familiar with the common findings on emergency head CT in the pediatric population.3. Understand some of the major updates within the 2021 WHO classification of pediatric brain tumors.*Course Description This action-packed overview of Pediatric Neuroradiology in the Emergency Department setting will breakdown the ABCs of demyelinating diseases (MS, NMO, and MOG, oh my!), shine a light on all of the hypo- and hyperdensities of emergent head CT imaging, and provide a 'who's who' of the 2021 pediatric brain tumor classification. COURSE DESCRIPTION

The purpose of this educational session is to provide trainees an opportunity to discuss experiences of unconscious bias, microaggression, and harassment in training and learn strategies to manage these situations, and cope with and overcome such experiences. This session will begin with a brief review of the concepts of unconscious bias, microaggression, and harassment followed by an in-depth discussion on these topics including first-hand experiences from trainees. The second part of the session will include an overview of different toolkits and strategies to manage these situations, including specific scenario examples. After a brief introduction, the educational format will include trainees and faculty discussion of personal experiences and additional faculty and trainee panel discussion. The course will conclude with an opportunity for open audience discussion.

LEARNING OBJECTIVES

1) Learn strategies to manage situations of unconscious bias, microaggression, and harassment as a trainee 2) Learn strategies to cope with and overcome experiences of unconscious bias, microaggression, and harassment while in training 3) Identify ways to help support trainees who have experienced unconscious bias, microaggression, and harassment*Course Description The purpose of this educational session is to provide trainees an opportunity to discuss experiences of unconscious bias, microaggression, and harassment in training and learn strategies to manage these situations, and cope with and overcome such experiences. This session will begin with a brief review of the concepts of unconscious bias, microaggression, and harassment followed by an in-depth discussion on these topics including first-hand experiences from trainees. Factors Influencing Breast Risk

Sunday, Nov. 27 1:00PM - 2:00PM Room: NA

Participants
Jennifer A. Harvey, MD, Rochester, NY (*Presenter*) Stockholder, Volpara Health Technologies Limited;Research Consultant, Besins Healthcare SA;Advisory Board, Sharepoint Medical
Christiane Kuhl, MD, PhD, Bonn, Germany (*Presenter*) Advisory Board, Guerbet SA;Speaker, Bracco Group;Speaker, Bayer AG
Wendie A. Berg, MD, PhD, Gibsonia, PA (*Presenter*) Institutional Research Grant, Koios Medical, Inc

COURSE DESCRIPTION

Mammographic screening is proven to reduce deaths due to breast cancer, but not all women benefit equally. This session will detail how to assess risk and which women may benefit from supplemental screening in addition to (or even instead of) mammography. The superior performance of MRI will be detailed, but not every woman can have screening MRI. Ultrasound is an alternative when MRI is indicated but cannot be performed. At the conclusion of this session, participants will be knowledgeable of tailored screening approaches and appropriate implementation in practice.

LEARNING OBJECTIVES

1) Understand the influence of breast density, family history, biopsy history, and genetic factors on personal risk assessment and interval cancer rate, and how the use of AI may impact our metrics 2) Describe indications for screening MRI and expected outcomes 3) Describe indications for screening US and expected outcomes*Course Description Mammographic screening is proven to reduce deaths due to breast cancer, but not all women benefit equally. Non-traumatic Musculoskeletal Emergencies

Sunday, Nov. 27 1:00PM - 2:00PM Room: NA

Participants
Corrie M. Yablon, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose
Behrang Amini, MD, PhD, Houston, TX (*Presenter*) Nothing to Disclose
Susanna C. Spence, MD, Houston, TX (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Challenging cases of nontraumatic musculoskeletal emergencies will be reviewed in this session, with emphasis on difficult diagnoses that change patient management, including whether osteomyelitis is present (or not), whether a fracture is truly concerning for a pathologic fracture or an impending fracture is present, as well as review of complications of arthroplasties in which imaging is key to directing patient management.

LEARNING OBJECTIVES

1) Identify key features that differentiate osteomyelitis from other conditions 2) Identify and classify findings suspicious for pathologic fracture 3) Identify key arthroplasty complications that present emergently*Course Description Challenging cases of nontraumatic musculoskeletal emergencies will be reviewed in this session, with emphasis on difficult diagnoses that change patient management, including whether osteomyelitis is present (or not), whether a fracture is truly concerning for a pathologic fracture or an impending fracture is present, as well as review of complications of arthroplasties in which imaging is key to directing patient management.

Dual- and Multi-energy CT of the Abdomen and Pelvis

Sunday, Nov. 27 1:00PM - 2:00PM Room: NA

Participants
Joel Fletcher, MD, Rochester, MN (*Presenter*) Research Grant, Siemens AG;Research Grant, Pfizer Inc;Research Grant, Takeda Pharmaceutical Company Limited;Consultant, Takeda Pharmaceutical Company Limited;Research Grant, Nextrast, Inc;Consultant, Medtronic plc
Alvin C. Silva, MD, Scottsdale, AZ (*Presenter*) Scientific Advisory Committee, HealthMyne, Inc;Consultant, Exact Sciences Corporation;Research Grant, Ascelia Pharma AB
Bari Dane, MD, New York, NY (*Presenter*) Nothing to Disclose
Benjamin M. Yeh, MD, Hillsborough, CA (*Presenter*) Grant, Koninklijke Philips NV;Grant, General Electric Company;Consultant, Canon Medical Systems Corporation;Speaker, Canon Medical Systems Corporation;Royalties, Oxford University Press;Shareholder, Nextrast, Inc;Board Member, Nextrast, Inc
Cynthia McCollough, PhD, Byron, MN (*Presenter*) Research Grant, Siemens AG

COURSE DESCRIPTION

Multi-energy CT imaging continues to evolve rapidly and provides numerous benefits over conventional CT for the evaluation of common abdominopelvic disease. This course will review the basics of multi-energy CT, including an emphasis on photon counting CT and contrast agent usage. Practical tips on how to implement dual-energy and photon counting CT into daily practice as well as review of how to interpret such images will be discussed.

LEARNING OBJECTIVES

1) Explain the capabilites of dual energy and photon counting CT for daily abdominopelvic imaigng 2) Describe strategies for effective implementation of multi-energy CT in daily practice*Course Description Multi-energy CT imaging continues to evolve rapidly and provides numerous benefits over conventional CT for the evaluation of common abdominopelvic disease. This course will review the basics of multi-energy CT, including an emphasis on photon counting CT and contrast agent usage. GU Tumor Boards: How to Bring Value and Become Indispensable

Sunday, Nov. 27 1:00PM - 2:00PM Room: NA

Participants
Krupa Patel-Lippmann, MD, Nashville, TN (*Presenter*) Nothing to Disclose
Antonio Westphalen, MD, Kirkland, WA (*Presenter*) Shareholder, ScanMed, LLC;Research funded, BotImage, Inc
Atul Shinagare, MD, Boston, MA (*Presenter*) Consultant, VirtualScopics, Inc;Consultant, Imaging Endpoints
Matthew Davenport, MD, Ann Arbor, MI (*Presenter*) Royalties, Wolters Kluwer nv

COURSE DESCRIPTION

With advances in oncology, the role of radiologist in management of GU cancers is rapidly evolving. At GU tumor boards, the radiologist plays a key role in diagnosis, staging, and clinical decision-making. This course guides the attendees through the various challenges and pitfalls faced by the radiologist at the GU tumor boards to successfully guide patient management.

LEARNING OBJECTIVES

1) Use case-based format to identify key imaging features that significantly impact management 2) Understand the common pitfalls in imaging assessment of GU tumors 3) Improve communication with referring providers to help improve outcomes*Course Description With advances in oncology, the role of radiologist in management of GU cancers is rapidly evolving. At GU tumor boards, the radiologist plays a key role in diagnosis, staging, and clinical decision-making. This course guides the attendees through the various challenges and pitfalls faced by the radiologist at the GU tumor boards to successfully guide patient management.

Radiology AI Innovation: Academics vs Industry

Sunday, Nov. 27 1:00PM - 2:00PM Room: NA

Participants
Nickolas Papanikolaou, PhD, Lisbon, Portugal (*Presenter*) Stockholder, MRIcons Ltd;Stockholder, Advantis Medical Imaging
Mona Flores, MD,MBA, Santa Clara, CA (*Presenter*) Employee, NVIDIA Corporation
Rowland O. Illing, BMBCh, FRCR, Arlington, VA (*Presenter*) Officer, Amazon Web Services, Inc;Director, Amazon Web Services, Inc

COURSE DESCRIPTION

This panel discussion will include Dr Mona Flores, Global Head of Medical AI at NVIDIA, and Dr Nikos Papanikolaou, Computational Clinical Imaging Group Lead at the Champalimaud Foundation & Machine Learning Imaging Lead at the Royal Marsden Hospital, London. It will be chaired by Dr Rowland Illing, Director & Chief Medical Officer, International Public Sector Health at AWS & Hon Assoc Prof at UCL, London. The panel will describe how researchers and radiologists can best leverage tech industry partners to accelerate their research, providing real-world examples of how this has taken place internationally. They will describe the next generation of imaging AI capabilities that will be coming to market, and how the audience will be able to leverage these in the future.

LEARNING OBJECTIVES

1) Understand how engaging directly with industry can help you achieve your research objectives 2) Learn from real-world examples where Radiology Researchers and Industry have successfully collaborated around AI 3) Apply the next set of Industry capabilities that are being delivered to Researchers in 2023*Course Description This panel discussion will include Dr Mona Flores, Global Head of Medical AI at NVIDIA, and Dr Nikos Papanikolaou, Computational Clinical Imaging Group Lead at the Champalimaud Foundation & Machine Learning Imaging Lead at the Royal Marsden Hospital, London. It will be chaired by Dr Rowland Illing, Director & Chief Medical Officer, International Public Sector Health at AWS & Hon Assoc Prof at UCL, London. Innovations for Follow-up and Tracking Communications

Sunday, Nov. 27 1:00PM - 2:00PM Room: NA

Participants
Ella Kazerooni, MD, Ann Arbor, MI (*Presenter*) Nothing to Disclose
Christopher Gange JR, MD, MMedSc, New Haven, CT (*Presenter*) Stockholder, Pfizer Inc Stockholder, Bristol-Myers Squibb Company Research Consultant, Bayer AG Medical Advisory Board, AIxSCAN, Inc Shareholder, AIxSCAN, Inc
Dorothy Sippo, MD, Westport, CT (*Presenter*) Nothing to Disclose
Stacy D. O'Connor, MD, MPH, Wauwatosa, WI (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will explore innovations in communicating significant findings and management of follow up recommendations. Topics will include: (1) creating a communications center to deliver critical results and track follow up recommendations within the Electronic Health Record (EHR), (2) a "how to" example of an EHR-based incidental lung nodule management program, (3) non-EHR-based follow-up recommendation informatics tools, and (4) measures of success for these types of programs. With a lecture format, followed by question-and-answer discussion, presenters will share innovative approaches and pearls learned from their experiences implementing and maintaining communication and follow up management systems.

LEARNING OBJECTIVES

1) Understand methods of communicating radiology findings with a focus on the pros and cons of using messaging within the EHR 2) Describe clinical and financial justifications for an EHR-based incidental lung nodule tracking and management tool 3) Describe non-EHR-based follow-up recommendation informatics tools 4) Review measures of success for follow up communication and tracking management systems*Course Description This course will explore innovations in communicating significant findings and management of follow up recommendations. Topics will include: (1) creating a communications center to deliver critical results and track follow up recommendations within the Electronic Health Record (EHR), (2) a "how to" example of an EHR-based incidental lung nodule management program, (3) non-EHR-based follow-up recommendation informatics tools, and (4) measures of success for these types of programs. Pediatric Neuroimaging (Practical Questions Faced in Clinical Practice)

Sunday, Nov. 27 1:00PM - 2:00PM Room: NA

Participants
Manohar Shroff, MD, Toronto, ON (*Presenter*) Nothing to Disclose
Judith Gadde, DO, Chicago, IL (*Presenter*) Nothing to Disclose
Tina Y. Poussaint, MD, Boston, MA (*Presenter*) Nothing to Disclose
Rupa Radhakrishnan, MS,MBBS, Indianapolis, IN (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

Course Title: Pediatric CNS Tumors and cancer predisposition syndromes – The experts speak. This practical lecture session will provide information on how to approach pediatric tumors and tumor like conditions of the central nervous system. The speakers will focus on common pediatric CNS cancer predisposition syndromes, pediatric posterior fossa tumors, pediatric spine neoplasms, and recent WHO 2021 Tumor Classification updates with how these updates impact the radiologist's report. At the end of the course, the audience will gain insight into 1) imaging techniques and sequences that will help in appropriate work up of a child with suspected CNS tumor or tumor predisposition syndrome 2) common CNS tumor and non-tumor conditions in the pediatric population, and 3) understanding the updated classification of pediatric CNS tumors. Manohar Meghraj Shroff – Tumor or not? Pediatric posterior fossa tumors and non-tumor conditions Tina Young Poussaint – How does the WHO 2021 Tumor Classification Impact Radiological Practice? Rupa Radhakrishnan – Common CNS cancer predisposition syndromes – what should I be looking for? Judith A. Gadde – Pediatric spine tumors – how to arrive at a diagnosis

LEARNING OBJECTIVES

1) Provide strategies for imaging work up of common and challenging pediatric CNS tumors and tumor like conditions 2) Review the latest updates in pediatric CNS Tumor classification and how they impact radiological practice*Course Description Course Title: Pediatric CNS Tumors and cancer predisposition syndromes – The experts speak. This practical lecture session will provide information on how to approach pediatric tumors and tumor like conditions of the central nervous system. Interactive Case-based Review of Crazy OB/GYN Cases

Sunday, Nov. 27 1:00PM - 2:00PM Room: NA

Participants
Anne M. Kennedy, MD, Salt Lake City, UT (*Presenter*) Author with royalties, RELX
Roya Sohaey, MD, Portland, OR (*Presenter*) Nothing to Disclose
Paula J. Woodward, MD, Salt Lake City, UT (*Presenter*) Royalties, RELX

COURSE DESCRIPTION

This will be an interactive session reviewing complex OBGYN cases. We will demonstrate problem solving using "radiology rules" such as - You see what you look for and you look for what you know- Common things are commonest - The easiest way to miss a finding is to find a finding.

LEARNING OBJECTIVES

1) Develop a logical, systematic approach to complex cases 2) Identify strategies to reduce a broad differential to a specific diagnosis or a short list of likely options*Course Description This will be an interactive session reviewing complex OBGYN cases. We will demonstrate problem solving using "radiology rules" such as - You see what you look for and you look for what you know- Common things are commonest - The easiest way to miss a finding is to find a finding.

Victor M. Ho-Fung, MD, Philadelphia, PA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This course will focus on musculoskeletal imaging in pediatric patients focusing on imaging techniques, common pathology, pitfalls and differential diagnosis some of which are unique to children.

LEARNING OBJECTIVES

1- To discuss the imaging techniques used to evaluate the synovium in pediatric patients, the imaging appearance of normal synovium and different pathologies that can lead to synovitis and their differential diagnosis in the pediatric population2- To discuss the imaging techniques (mainly MRI) to evaluate articular cartilage in children, the imaging appearance of the developing articular surface and pathology that is commonly seen in the pediatric population. 3- To recognize the normal pattern of bone marrow development from neonates to adulthood, the process of conversion from red to yellow marrow as well as to recognize pathologic bone marrow processes, including infiltrative disease and nutritional abnormalities. *Course Description This course will focus on musculoskeletal imaging in pediatric patients focusing on imaging techniques, common pathology, pitfalls and differential diagnosis some of which are unique to children.

COURSE DESCRIPTION

This is a case-based review of head and neck cancer cases. The format replicates a multidisciplinary tumor board. The attendee with be exposed to how their image interpretation directly affects staging, treatment and management. The session will be interactive and focus on key elements that should be included in the radiologists when interpreting head and neck oncologic imaging.

LEARNING OBJECTIVES

1) Review various oncology case which show how imaging directly afftects treatment and management 2) Discuss key elemtns that should be included in your report that directly affects staging, treatment and management*Course Description This is a case-based review of head and neck cancer cases. The format replicates a multidisciplinary tumor board. The attendee with be exposed to how their image interpretation directly affects staging, treatment and management. The session will be interactive and focus on key elements that should be included in the radiologists when interpreting head and neck oncologic imaging.

State of the Art Coronary CT

Sunday, Nov. 27 2:30PM - 3:30PM Room: NA

Participants
Jonathan Weir-McCall, MBBCh, FRCR, Cambridge, (*Presenter*) Nothing to Disclose
Michelle Williams, MBChB, PhD, Kelso, United Kingdom (*Presenter*) Speakers Bureau, Canon Medical Systems Corporation;Speakers Bureau, Siemens AG
Kristopher W. Cummings, MD, Phoenix, AZ (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This didactic session on state of the art coronary CT imaging will focus on newer advanced applications, including incorporation of CT fractional flow reserve in the evaluation of coronary ischemia and methods of quantification of atherosclerotic plaque and epicardial fat. Emphasis will be placed on current literature, clinical application and prognostic benefits of newer techniques.

LEARNING OBJECTIVES

1) Explain the primary benefits of adding CT Fractional Flow Reserve (FFRCT) to CT Coronary imaging 2) Understand the methods for and prognostic importance of quantitative plaque assessment from CT Coronary imaging 3) Explain the prognostic significance of epicardial fat and how to quantitate from CT Coronary imaging*Course Description This didactic session on state of the art coronary CT imaging will focus on newer advanced applications, including incorporation of CT fractional flow reserve in the evaluation of coronary ischemia and methods of quantification of atherosclerotic plaque and epicardial fat. Pearls and Pitfalls in Chest Radiography

Sunday, Nov. 27 2:30PM - 3:30PM Room: NA

Participants
Gerald F. Abbott, MD, Boston, MA (*Presenter*) Nothing to Disclose
H. Page McAdams, MD, Durham, NC (*Presenter*) Consultant, MedQIA;Author, RELX;Research Consultant, Novartis AG;Stockholder, Novartis AG;Stockholder, Abbott Laboratories;Stockholder, AbbVie Inc;Stockholder, Bristol-Myers Squibb Company;Stockholder, CVS Health Corporation
Andetta R. Hunsaker, MD, Boston, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

The chest radiograph is one of the most, if not the most, commonly performed imaging examinations. Nevertheless, accurate interpretation of the chest radiograph remains one of the most challenging tasks for radiologists. This course is designed to improve the proficiency of all radiologists for accurate interpretation of chest radiographs. This course is also designed to improve understanding of the role of chest radiographs for diagnosis and management of common clinical scenarios.

LEARNING OBJECTIVES

1) Improve proficiency in interpretation of the lateral chest radiograph to improve diagnostic accuracy 2) Improve understanding of role of the chest radiograph in diagnosis and management of pulmonary infection 3) Be familiar with important signs on the chest radiograph that can indicate a specific diagnosis 4) Improve ability to recognize various manifestations of atelectasis on the chest radiograph*Course Description The chest radiograph is one of the most, if not the most, commonly performed imaging examinations. Nevertheless, accurate interpretation of the chest radiograph remains one of the most challenging tasks for radiologists. This course is designed to improve the proficiency of all radiologists for accurate interpretation of chest radiographs. Head and Neck Masses: Case-based Review

Sunday, Nov. 27 2:30PM - 3:30PM Room: NA

Participants
Tabassum A. Kennedy, MD, Madison, WI (*Presenter*) Nothing to Disclose
Asha Sarma, MD, Nashville, TN (*Presenter*) Nothing to Disclose
Marin McDonald, MD,PhD, San Diego, CA (*Presenter*) Speakers Bureau, Canon Medical Systems Corporation
Kathryn Dean, MD, Brooklyn, NY (*Presenter*) Nothing to Disclose
Mariah Bashir, MD, Oak Brook, IL (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

Course Description: In this case-based Head and Neck session, attendees will be presented with typical and atypical imaging examples of masses in the adult neck, sinuses, teeth/jaw and pediatric neck. Speakers will emphasize pearls for differentiating each entity from common mimics, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. This session offers attendees the opportunity to refine their interpretation of complex head and neck imaging studies by incorporating tips from world experts.

LEARNING OBJECTIVES

1) Recognize typical and atypical imaging features of masses in the adult neck, sinuses, teeth/jaw and pediatric neck2) Differentiate between entities on the differential diagnosis of masses in the neck, sinuses and teeth/jaw based on imaging features, location and age. *Course Description Course Description: In this case-based Head and Neck session, attendees will be presented with typical and atypical imaging examples of masses in the adult neck, sinuses, teeth/jaw and pediatric neck. Speakers will emphasize pearls for differentiating each entity from common mimics, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. Multimodal Data Model Development in Radiology: Beyond the Pixel Data

Sunday, Nov. 27 2:30PM - 3:30PM Room: NA

Participants
Yifan Peng, New York, NY (*Presenter*) Nothing to Disclose
Christoph Lee, MD, Mercer Island, WA (*Presenter*) Royalites, The McGraw-Hill Companies;Royalties, Oxford University Press;Royalties, Wolters Kluwer nv;Research Consultant, GRAIL, LLC
Jayashree Kalpathy-Cramer, MS, PhD, Charlestown, MA (*Presenter*) Institutional Research Grant, General Electric Company;Institutional Research Grant, F. Hoffmann-La Roche Ltd;Institutional Research Grant, Bayer AG
Maciej Mazurowski, MS, PhD, Durham, NC (*Presenter*) Nothing to Disclose
Imon Banerjee, Stanford, GA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

One of the primary limitations of the state-of-the-art deep learning models for radiology applications is that they consider only pixel-value information without data informing clinical context. This session will focused on analyzing recent developments related to multimodal deep learning methodologies using radiology images. We will have an interactive session with extremely knowledgeable speakers to present the views from both clinical and technical sides - Dr. Christoph Lee (UW Radiology), Maciej Mazurowski (Duke Radiology), Jayashree Kalpathy-Cramer (University of Colorado) and Dr. Yifan Peng (Cornell Radiology). Dr. Imon Banerjee (Mayo Clinic) will moderate the session.

LEARNING OBJECTIVES

1) Identify learning strategy to process contextual data from electronic health records (EHR) in addition to pixel data from radiology images for developing deep learning model 2) Explain important results and provide implementation guidelines to serve as a reference for researchers interested in the application of multimodal fusion in medical imaging*Course Description One of the primary limitations of the state-of-the-art deep learning models for radiology applications is that they consider only pixel-value information without data informing clinical context. Nadine Abi-Jaoudeh, MD, Orange, CA (*Moderator*) Institutional research collaboration, Koninklijke Philips NV;Institutional research collaboration, Teclison Limited;Intellectual property, Bruin Biosciences Inc;Owner, Bruin Biosciences Inc;Institutional research collaboration, Sirtex Medical Ltd

COURSE DESCRIPTION

This session consists of lecture series divided into two topics. The first part of the session will cover upcoming technologies, controversies, and novel development in the entire spectrum of interventional radiology including ablation, embolization, arterial and venous interventions as well as pain and musculoskeletal procedures. The second part of the session will discuss career growth with the help of mentors and advisors as well as tips and tricks on how to grow practice and diversity in interventional radiology particularly in the hiring process. Although different, both topics have a vital importance. There are several exciting ablative and embolic technologies and innovation in existing technologies that are quite transformative that will be reviewed in this session. Moreover, deep vein arterialization, endo-venous fistula creation have been developed in recent years just to name a few. This session will provide an overview and understanding of the changing landscape. The second portion is equally important as it provides very concrete tools for professional success.

LEARNING OBJECTIVES

1) Identify novel developments in IR specifically upcoming ablative technologies, new embolic materials, novel interventions in venous disease as well as newer techniques to treat peripheral arterial disease as well as MSK interventions 2) Explain the importance of diversity during recruitment and the role of mentor for career and practice growth*Course Description This session consists of lecture series divided into two topics. The first part of the session will cover upcoming technologies, controversies, and novel development in the entire spectrum of interventional radiology including ablation, embolization, arterial and venous interventions as well as pain and musculoskeletal procedures. Cost Effectiveness Analysis: Principles and Update on Applications

Sunday, Nov. 27 2:30PM - 3:30PM Room: NA

Participants
Stella Kang, MD,MSc, New York, NY (*Presenter*) Nothing to Disclose
Bart Ferket, MD, PhD, New York, NY (*Presenter*) Nothing to Disclose
Pari V. Pandharipande, MD, MPH, Chestnut Hill, MA (*Presenter*) I serve as a member of the Association of University Radiologists (AUR) General Electric (GE) Radiology Research Academic Fellowship (GERRAF) Board of Review (term: 7/1/22-2/28/23).

COURSE DESCRIPTION

Economic evaluation serves a major purpose in health care policy, guiding the adoption and assessment of clinical interventions. An important form of economic evaluation is cost-effectiveness analysis, which compares alternative strategies in terms of both the cumulative costs as well as differences in health outcomes. To guide imaging-related policy, clinical practice, and research prioritization, this course will address principles and applications of cost-effectiveness analysis. Participants will learn about basic principles of cost-effectiveness analysis, review recent applications of economic evaluation in imaging research and policy, and explore the implications of cost-effectiveness analysis through a software demonstration.

LEARNING OBJECTIVES

1) Define how the long-term costs, effectiveness, and cost-effectiveness of imaging can be measured 2) Understand how policymakers utilize data from cost-effectiveness analyses, both within the U.S. and internationally 3) Gain insight into the strengths and drawbacks of cost-effectiveness analysis as a means for judging value 4) Understand current applications of cost-effectiveness analysis in imaging research and policy through clinical examples and a software demonstration*Course Description Economic evaluation serves a major purpose in health care policy, guiding the adoption and assessment of clinical interventions. Principles of Health Care Delivery & Safety

Sunday, Nov. 27 2:30PM - 3:30PM Room: NA

Participants
Lane F. Donnelly, MD, Chapel Hill, NC (*Presenter*) Nothing to Disclose
David Larson, MD, MBA, Portola Valley, CA (*Presenter*) Research Grant, Siemens AG ;Advisor, Bunkerhill Health;Shareholder, Bunkerhill Health
Arun Krishnaraj, MD, MPH, Charlottesville, VA (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The organization and delivery of health care in the United States is haphazard at best. Costs for healthcare delivery in the US far out pace comparable industrialized nations yet health outcomes consistently fall well below peers. More recent efforts to curb costs and improve outcomes have focused on delivering greater value and improving margins of safety. In an era of big data and trends toward greater consumerism in health care, radiology has an opportunity to better define its value and grows its influence in the greater health care landscape.

LEARNING OBJECTIVES

1) Identify opportunities where radiology can add greater value and contribute to improved safety margins in the delivery of health care 2) Explore the role of radiology system leaders in impacting quality and safety in a health care organization 3) Evaluate the impact patients can have in contributing to a culture of safety*Course Description The organization and delivery of health care in the United States is haphazard at best. Costs for healthcare delivery in the US far out pace comparable industrialized nations yet health outcomes consistently fall well below peers. More recent efforts to curb costs and improve outcomes have focused on delivering greater value and improving margins of safety. AAPM/RSNA Physics Tutorial: Balancing Risks and Benefits in Pediatric Imaging

Sunday, Nov. 27 2:30PM - 3:30PM Room: NA

Participants
Christina Sammet, PhD, Manhattan, IL (*Presenter*) Nothing to Disclose
Cynthia K. Rigsby, MD, Chicago, IL (*Presenter*) Nothing to Disclose
Thaddeus Wilson, PhD, Memphis, TN (*Moderator*) Nothing to Disclose

LEARNING OBJECTIVES

1) The medical community has a heightened awareness of the risk associated with radiation exposure to children from medical imaging procedures. It is important for ordering providers to understand the full set of risks associated with each diagnostic modality. 2) X-ray, CT, fluoroscopy, ultrasound, nuclear medicine, and MRI have different levels of risk in not only radiation exposure, but also sedation/anesthesia exposure, contrast administration risks, and medical implant safety. 3) Ultimately, the ordering provider, radiologist, and medical physicist need to work together to balance all the risks associated with an imaging procedure with the clinical benefit to care management for optimal risk-benefit outcomes in pediatric imaging.*Course Description

Ryan K. Lee, MD, Philadelphia, PA (*Presenter*) Bayer, Speaker's BureauPhilips, Speaker's BureauBracco, Advisor
Kate Hanneman, MD, FRCPC, Toronto, ON (*Moderator*) Speaker, Groupe Sanofi Speaker, Amicus Therapeutics, Inc

COURSE DESCRIPTION

This course includes 4 lectures:1) A nutshell of radiology AI ethics: how to mitigate bias in radiology AI.This lecture will introduce the key concepts regarding radiology AI ethics. It will discuss a variety of bias in AI from clinically confounding attributes to technical factors, and how to minimize the bias from training data to over time use in clinical practice.2) Managing patient privacy in radiology AI: informed consent and potential safeguards. This lecture will cover the key areas in acquiring, managing, and assessing data, as well as discussing the resources to manage large data sets.3) Transparency in AI: balance between patient and provider trust and privacy.This lecture will discuss the development of interpretable AI systems for clinical radiology, and allow radiologists and patients to understand the elements of decision-making behind classification decisions.4) Clinical application and reimbursement of radiology AI.This lecture will discuss clinical application of AI, and possible models and frameworks for AI reimbursement.

LEARNING OBJECTIVES

Artificial intelligence (AI) is rapidly advancing and may dramatically reshape modern radiology practice. AI has multiple applications, from image acquisition and processing, to aided reporting, follow-up planning, data storage, data mining, and others. The application of AI can potentially reduce human labor, lower costs, and improve diagnostic accuracy that will ultimately benefit patient care. However, these changes pose many new professionalism related challenges for radiologists. The goal of this course is to discuss how to manage new professionalism challenges related to AI, including ethics, bias, data ownership, privacy and data protection, regulation, transparency, and reimbursement related issues.*Course Description This course includes 4 lectures:1) A nutshell of radiology AI ethics: how to mitigate bias in radiology AI.This lecture will introduce the key concepts regarding radiology AI ethics. It will discuss a variety of bias in AI from clinically confounding attributes to technical factors, and how to minimize the bias from training data to over time use in clinical practice.2) Managing patient privacy in radiology AI: informed consent and potential safeguards. This lecture will cover the key areas in acquiring, managing, and assessing data, as well as discussing the resources to manage large data sets.3) Transparency in AI: balance between patient and provider trust and privacy.This lecture will discuss the development of interpretable AI systems for clinical radiology, and allow radiologists and patients to understand the elements of decision-making behind classification decisions.4) Clinical application and reimbursement of radiology AI.This lecture will discuss clinical application of AI, and possible models and frameworks for AI reimbursement.

Learning From the Pandemic Using Simulation Tools to Support Excellence in Training (Sponsored by the Associated Sciences Consortium)

Tuesday, Nov. 29 8:00AM - 9:00AM Room: NA

Participants
Caroline Khazei, Vancouver, BC (*Presenter*) Nothing to Disclose
Naomi Shiner, Derby, United Kingdom (*Presenter*) Nothing to Disclose
Charlotte Beardmore, MBA, London, United Kingdom (*Moderator*) Nothing to Disclose
Catherine Gunn, MBA,RT, Halifax, NS (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This course aims to discuss the opportunities for the use of simulation in the education and training of radiological technologists/ radiographers and considers how programmes can be adapted to support deep learning from simulation. It will take learning from the pandemic. Two expert educators from the profession will share their experiences, and research, and will offer practical solutions to support robust and innovative education and training for professionals in the 21st Century.

LEARNING OBJECTIVES

1) The Role of Simulation in Radiography Education 2) Recognize the value of simulation in promoting deep learning within radiography education 3) Consider how to embed various simulation modalities into your curriculum 4) Adapt existing clinical/practical placement using simulation to expand radiography workforce*Course Description This course aims to discuss the opportunities for the use of simulation in the education and training of radiological technologists/ radiographers and considers how programmes can be adapted to support deep learning from simulation. Imaging Guided Localization Procedures

Tuesday, Nov. 29 8:00AM - 9:00AM Room: NA

Participants
Sarah M. Friedewald, MD, Marlborough, MA (*Presenter*) Consultant, Hologic, Inc;Research Grant, Alphabet Inc
Laurie Margolies, MD, New York, NY (*Presenter*) Stock options, Nuevozen Corporation Medical Advisory Board, Screenpoint Medical

COURSE DESCRIPTION

In this course, the attendee will learn the basics of tomosynthesis guided biopsies and image guided localizations. The most recent literature supporting these techniques will be reviewed. Additionally, through imaging examples, different scenarios will be presented that the radiologist may encounter during these procedures. A practical guide on how to troubleshoot various issues that might arise will be presented.

LEARNING OBJECTIVES

1) Identify different ways to optimize tomosynthesis guided biopsies 2) Understand the advantages and disadvantages of upright versus prone biopsies 3) Appreciate different methods of image guided localizations, and understand their strengths and limitations*Course Description In this course, the attendee will learn the basics of tomosynthesis guided biopsies and image guided localizations. The most recent literature supporting these techniques will be reviewed. Additionally, through imaging examples, different scenarios will be presented that the radiologist may encounter during these procedures. COURSE DESCRIPTION

Lecture based discussion where the audience will leave with a deeper understanding of the role of cross sectional imaging for planning transcatheter valve interventions

LEARNING OBJECTIVES

1) To describe the role of CT for the planning of transcatheter valve interventions 2) To review the evidence highlighting the use of CT to reduce complications related to transcatheter interventions 3) To discuss ongoing imaging advancements and novel modeling techniques to help further refine procedural planning and reduce complications*Course Description Lecture based discussion where the audience will leave with a deeper understanding of the role of cross sectional imaging for planning transcatheter valve interventions

Mylene T. Truong, MD, Houston, TX (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The lectures in this session will review current treatments for lung cancer including targeted therapy, immunotherapy and radiation therapy as well as discuss the imaging of various treatment complications. This session will address lung cancer in the setting of interstitial lung disease and provide an update on radiomics in lung cancer.

LEARNING OBJECTIVES

1) Discuss lung cancer in the setting of interstitial lung disease and update on use of radiomics 2) Review imaging of lung cancer treatment complications including targeted therapy, immunotherapy and radiation therapy*Course Description The lectures in this session will review current treatments for lung cancer including targeted therapy, immunotherapy and radiation therapy as well as discuss the imaging of various treatment complications. This session will address lung cancer in the setting of interstitial lung disease and provide an update on radiomics in lung cancer.

Emerging Technologies in GU Imaging

Tuesday, Nov. 29 8:00AM - 9:00AM Room: NA

Participants
Masoom A. Haider, MD, Toronto, ON (*Presenter*) Nothing to Disclose
Sadhna Verma, MD, Cincinnati, OH (*Presenter*) Nothing to Disclose
Spencer C. Behr, MD, San Francisco, CA (*Presenter*) Grant, Cancer Targeted Technology;Scientific Advisory Board, Novartis AG;Research Consultant, GenVivo

COURSE DESCRIPTION

The overall healthcare industry is striving to make healthcare more effective. In medical imaging, this translates to improving diagnosis while keeping dose as low as possible; and increasing efficiencies to minimize costs. This course discusses the emerging techniques in GU imaging. Recent technical advances and novel discoveries make this an exciting but challenging time for GU imaging.

LEARNING OBJECTIVES

In emerging GU technologies course, we explore five significant technology innovations They are: 1) Faster acquisition enables improved image quality 2) Gains in optimal dose efficiency 3) Biomarkers for Imaging Development 4) Targeted Imaging, biopsy and treatment 5) AI for medical image acquisition and analysis*Course Description The overall healthcare industry is striving to make healthcare more effective. In medical imaging, this translates to improving diagnosis while keeping dose as low as possible; and increasing efficiencies to minimize costs. Virtual Radiology: From Logistics to Impact on Radiology

Tuesday, Nov. 29 8:00AM - 9:00AM Room: NA

Participants
K. Elizabeth Hawk, MD,PhD, Studio City, CA (*Presenter*) Nothing to Disclose
Mindy Yang, MD, Philadelphia, PA (*Presenter*) Clinical Advisory Board, Solutionreach, Inc
Hannah L. Chung, MD, Houston, TX (*Presenter*) Nothing to Disclose
Samir S. Shah, MD, Gibsonia, PA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Teleradiology has rapidly expanded over the past few years, with a plethora of remote reading models now being utilized by various practices, both academic and private alike. This course will focus on the logistics of teleradiology from technological set-up and maintenance of home workstations, the balance of teleradiology with on-site duties within a practice, a focus on telemammography including the challenges and benefits, and the potential impact of teleradiology on our profession as radiologists.

LEARNING OBJECTIVES

1) Identify technical requirements for deployment of remote reading solutions2) Discuss how to optimally balance remote reading with on-site duties and maintain an equitable culture3) Discuss challenges and benefits of telemammography4) Discuss potential impacts of teleradiology on our profession as radiologists*Course Description Teleradiology has rapidly expanded over the past few years, with a plethora of remote reading models now being utilized by various practices, both academic and private alike. This course will focus on the logistics of teleradiology from technological set-up and maintenance of home workstations, the balance of teleradiology with on-site duties within a practice, a focus on telemammography including the challenges and benefits, and the potential impact of teleradiology on our profession as radiologists.

Case-based Review of Brain, Head, Neck: PET/CT Workshop (In Conjunction with SNMMI)

Tuesday, Nov. 29 8:00AM - 9:00AM Room: NA

Participants

Lawrence E. Ginsberg, MD, Houston, TX (*Presenter*) Nothing to Disclose
Phillip Kuo, MD,PhD, Tucson, AZ (*Presenter*) Consultant, Invicro Consultant, Amgen Inc Consultant, Blue Earth Diagnostics Ltd Research Grant, Blue Earth Diagnostics Ltd Consultant, Novartis AG Speaker, Novartis AG Consultant, Chimerix, Inc Consultant, Fusion Pharmaceuticals Inc Consultant, Bayer AG Consultant, General Electric Healthcare Company Speaker, General Electric Healthcare Company Research Grant, General Electric Company Speaker, Digital Science Press, Inc Consultant, Radionetics Former Employee, Invicro, Inc (ended employment October 2022)

COURSE DESCRIPTION

The head/neck is as area of high anatomic and metabolic complexity. In this session, experts on dementia imaging and PET/CT for head/neck malignancy will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of these studies.

LEARNING OBJECTIVES

1) Understand best clinical practices for use and interpretation of dementia PET imaging 2) Understand best clinical practices for use and interpretation of PET/CT in patients with head/neck cancer*Course Description The head/neck is as area of high anatomic and metabolic complexity. In this session, experts on dementia imaging and PET/CT for head/neck malignancy will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of these studies.

Post-op Spine: Tips and Tricks From the Experts

Tuesday, Nov. 29 8:00AM - 9:00AM Room: NA

Participants
Anousheh Sayah, MD, McLean, VA (*Presenter*) Nothing to Disclose
Marin McDonald, MD,PhD, San Diego, CA (*Presenter*) Speakers Bureau, Canon Medical Systems Corporation
Carlos H. Torres, MD,FRCPC, Ottawa, ON (*Presenter*) Nothing to Disclose
Lubdha Shah, MD, Salt Lake Cty, UT (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

Post-op Spine: Tips and Tricks From the Experts will be a comprehensive session on everything a radiologist needs to know about post-operative spine imaging. The number of spinal surgeries performed has been steadily increasing, and these procedures are being accompanied by a growing number of postoperative imaging studies to interpret. Accurate interpretation requires the identification of several critical points, including delineation of the location and integrity of surgical implants; evaluation of the success of decompression procedures; delineation of fusion status; and identification of complications. Knowledge of the numerous spinal surgery techniques and devices aids in differentiating expected postoperative findings from complications. The various types of spinal surgery instrumentation and commonly used spinal implants will be reviewed. It is important to be familiar with normal postoperative spine findings, signs of successful surgery, and the broad spectrum of postoperative complications. The key points to include in the radiology report that address issues that the surgeon needs to know for optimal patient management will be discussed.

LEARNING OBJECTIVES

1) Describe the different categories of spinal surgery and the various instrumentations and implants used in spinal procedures 2) Identify normal and abnormal imaging findings in the post-operative spine 3) Review the key points to include in the post-operative spine imaging report*Course Description Post-op Spine: Tips and Tricks From the Experts will be a comprehensive session on everything a radiologist needs to know about post-operative spine imaging. Obstetric Emergencies: Pearls and Pitfalls

Tuesday, Nov. 29 8:00AM - 9:00AM Room: NA

Participants
Tara A. Morgan, MD, San Francisco, CA (*Presenter*) Nothing to Disclose
Jill Langer, MD, Villanova, PA (*Presenter*) Nothing to Disclose
Mary C. Frates, MD, Sharon, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This lecture style presentation will review urgent and emergent conditions during pregnancy, divided by trimester. Attendees will become familiar with variants and abnormalities seen with ultrasound that indicate pregnancy complications and learn how they may alter the course of fetal management and delivery.

LEARNING OBJECTIVES

At the conclusion of this live activity, learners will be able to: 1) Identify sonographic abnormalities seen in the first trimester that are associated with fetal non-viability 2) Differentiate and assess second trimester fetal anomalies that require emergent care including hydrops, hypoplastic left heart, thoracic masses 3) Understand the role of ultrasound in third trimester obstetrical emergencies including abruption, cervical insufficiency, placenta accreta spectrum*Course Description This lecture style presentation will review urgent and emergent conditions during pregnancy, divided by trimester. Attendees will become familiar with variants and abnormalities seen with ultrasound that indicate pregnancy complications and learn how they may alter the course of fetal management and delivery.

Tuesday, Nov. 29 8:00AM - 9:00AM Room: NA

Participants
Susan Sotardi, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose
David Ebb, MD, Boston, MA (*Presenter*) Nothing to Disclose
Hesham Elhalawani, MD, MSc, Boston, MA (*Presenter*) Nothing to Disclose
Michael S. Gee, MD, PhD, Boston, MA (*Presenter*) Researcher, General Electric Company Researcher, Siemens AG Researcher, Motilent LLC

COURSE DESCRIPTION

The course will be a multidisciplinary review of pediatric oncology cases that will include radiation oncology, medical oncology, and radiology perspectives and considerations for clinical management of pediatric oncology patients. Issues related to relevant imaging anatomy, imaging modalities, radiation planning, and therapeutic options will be discussed. The format of the course will be a multidisciplinary case review and discussion mirroring that of a tumor board conference. This synopsis can be used as a marketing/promotional tool to gauge interest in the session. The expected outcome is that the audience will have familiarity with diagnostic imaging and treatment planning of pediatric cancer patients.

LEARNING OBJECTIVES

1) Identify important imaging anatomy relevant to pediatric tumors. 2) Explain the pros and cons of different imaging modalities in pediatric oncology staging.3) Understand imaging and clinical considerations related to the treatment decisions in pediatric cancer.*Course Description The course will be a multidisciplinary review of pediatric oncology cases that will include radiation oncology, medical oncology, and radiology perspectives and considerations for clinical management of pediatric oncology patients. Issues related to relevant imaging anatomy, imaging modalities, radiation planning, and therapeutic options will be discussed. Ximena Wortsman, MD, Santiago, Chile (*Presenter*) Speakers Bureau, AbbVie Inc;Royalties, Springer Nature
Christian P. Perez, MD, Santiago, Chile (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The Chile presents session is an educational program focused to radiologist all over the world interested in learning from the experience of colleagues developing local radiology in a small country far away from technological and professional centers, overcoming language and geographical barriers.In the course we highlight the role of women radiologist in achieving these goals, aiming to be a regional contribution on the radiological field.Course Description:An introductory module will give the attendants a background on cultural, geographical and radiological facts from Chile.In the main module attendants will receive from first-hand the experience, pitfalls, and barriers to overcome in developing a successful career, from recognized Chilean women radiologists with and outstanding contributions in their field of expertise, that have surpassed local geographical boundaries, reaching a global impact.The next module shows some of Chileans radiology contribution on direct and indirect fields dealing with the specialty.A final module will share with the assistant's new areas of development that are improving local radiological practice.

LEARNING OBJECTIVES

At the end of the course, you will be able to: 1) As radiologist ask yourself and reason about your daily clinical practice 2) Identify drivers of empowerment for women radiologist in your practice 3) By the shared experience avoid some of the problems in the process and deploy some of the solutions showed 4) Identify levers to implement and achieve local development in clinical practice and research as radiologist*Course Description The Chile presents session is an educational program focused to radiologist all over the world interested in learning from the experience of colleagues developing local radiology in a small country far away from technological and professional centers, overcoming language and geographical barriers.In the course we highlight the role of women radiologist in achieving these goals, aiming to be a regional contribution on the radiological field.Course Description:An introductory module will give the attendants a background on cultural, geographical and radiological facts from Chile.In the main module attendants will receive from first-hand the experience, pitfalls, and barriers to overcome in developing a successful career, from recognized Chilean women radiologists with and outstanding contributions in their field of expertise, that have surpassed local geographical boundaries, reaching a global impact.The next module shows some of Chileans radiology contribution on direct and indirect fields dealing with the specialty.A final module will share with the assistant's new areas of development that are improving local radiological practice.

Scott Reeder, MD,PhD, Madison, WI (*Presenter*) Owner, Calimetrix;Owner, Reveal Pharmaceuticals;Owner, Cellectar Biosciences, Inc;Owner, Elucent Medical;Owner, HeartVista, Inc;;

COURSE DESCRIPTION

MRI safety is a critical safety issue in radiology departments due to the inherent risks associated with the modality and the potential for harm to staff and patients in this environment. Many MRI safety courses focus only on the physics aspects of MRI safety. While critical, this only addresses one element of the many facets of an effective program. The purpose of this session is to describe how to build an effective MRI safety program from the ground up, including the motivation for a program, program structure overview, and review of each of the necessary staff members required to form a functioning program. This session will address the why and how to help your group develop or fine tune an effective MR safety program.

LEARNING OBJECTIVES

1) Review the importance and requirements of an MRI safety program 2) Describe strategies to effectively build a multidisciplinary MRI safety team and program 3) Identify the roles and responsibilities of MR Safety Program team members*Course Description MRI safety is a critical safety issue in radiology departments due to the inherent risks associated with the modality and the potential for harm to staff and patients in this environment. Many MRI safety courses focus only on the physics aspects of MRI safety. While critical, this only addresses one element of the many facets of an effective program. COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.A brief didactic lecture will be given on needle biopsy technique and the various equipment. The attendee at completion of course should have some familiarity of how to handle different biopsy devices under ultrasound guidance. Masses and cysts will be identified and biopsied or drained. Various wire localization equipment will also be available. Every attendee will have opportunity to use hands on biopsy equipment. Instruction will be given on how to perform procedure and before and after care. Various ultrasound equipment will be available for scanning and localizations of lesions.

LEARNING OBJECTIVES

1) Introduction of various tru cut and vacuum needle breast biopsy devices and their utilization within clinical practice 2) Utilization of different ultrasound technology to perform interventional procedures in the breast 3) Introduction of additional procedures in the breast such as cyst aspiration, fine needle aspiration, marker placement*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Hillary R. Kelly, MD, Cambridge, MA (*Presenter*) Investigator, Bayer AG;Institutional research agreement, Bayer AG
Karen K. Moeller, MD, Louisville, KY (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

In this clinical correlation didactic head and neck imaging session, speakers will review the imaging evaluation and common causes of diplopia, trigeminal neuralgia and facial weakness. Speakers will emphasize search patterns, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. This session offers attendees the opportunity to refine their interpretation of complex head and neck imaging studies by incorporating tips from world experts.

LEARNING OBJECTIVES

1) Select the appropriate imaging algorithm for patients presenting with diplopia, trigeminal neuralgia and facial weakness 2) Identify the common causes of diplopia, trigeminal neuralgia and facial weakness 3) Review the common diagnostic pitfalls in imaging evaluation of diplopia, trigeminal neuralgia and facial weakness*Course Description In this clinical correlation didactic head and neck imaging session, speakers will review the imaging evaluation and common causes of diplopia, trigeminal neuralgia and facial weakness. Speakers will emphasize search patterns, pitfalls of interpretation to avoid, and relevant clinical management considerations with which radiologists should be familiar. This session offers attendees the opportunity to refine their interpretation of complex head and neck imaging studies by incorporating tips from world experts.

Shoulder Pre-op and Post-op: Pearls and Pitfalls

Tuesday, Nov. 29 9:30AM - 10:30AM Room: NA

Participants
Miriam A. Bredella, MD, Boston, MA (*Presenter*) Nothing to Disclose
Erin F. Alaia, MD, New York, NY (*Presenter*) Biorez Inc, Consultant
Donald L. Resnick, MD, San Diego, CA (*Presenter*) Nothing to Disclose
David A. Rubin, MD, Saint Louis, MO (*Presenter*) Scientific Advisory Board, ImageBiopsy Lab
Michael J. Tuite, MD, Verona, WI (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Get Pearls and Pitfalls from five experts in shoulder MRI. These lectures will discuss MRI findings that surgeons want to know prior to arthroscopy about tendon delamination and the supraspinatus outlet, and atypical injuries after anterior dislocation. You will improve your accuracy in assessing patients with prior rotator cuff repair, as well as what to look for on imaging in the novel techniques performed for irreparable rotator cuff tears. You will be able to integrate these useful tips into your practice and read shoulder MRI like the experts.

LEARNING OBJECTIVES

1) Describe shoulder MRI features that will help the surgeon with pre-operative planning of the rotator cuff, supraspinatus outlet, and anterior labrocapsular complex 2) Explain the MRI findings of the intact and re-torn post-surgical rotator cuff, and the post-operative imaging of new techniques for irreparable cuff tears*Course Description Get Pearls and Pitfalls from five experts in shoulder MRI. These lectures will discuss MRI findings that surgeons want to know prior to arthroscopy about tendon delamination and the supraspinatus outlet, and atypical injuries after anterior dislocation. You will improve your accuracy in assessing patients with prior rotator cuff repair, as well as what to look for on imaging in the novel techniques performed for irreparable rotator cuff tears. Case-based Review of Chest: PET/CT Workshop (In Conjunction with SNMMI)

Tuesday, Nov. 29 9:30AM - 10:30AM Room: NA

Participants
Gary Ulaner, MD,PhD, Irvine, CA (*Presenter*) Speaker, Siemens AG;Speaker,Lantheus Holdings;Research support, General Electric Company;Research support, F. Hoffmann-La Roche Ltd;Research support, Lantheus Holdings;Research support, Novartis AG
Rathan M. Subramaniam, MD,PhD, Dunedin, (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

PET/CT has greatly impacted the imaging and therapy of chest malignancies, including longstanding value for staging of lung cancer, as well as novel Estrogen Receptor targeted imaging for breast cancer. In this session, experts on lung and breast cancers will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of FES (Cerianna) PET.

LEARNING OBJECTIVES

1) Understand best clinical practices for use and interpretation of PET imaging in patient with lung cancer 2) Understand best clinical practices for use and interpretation of FES PET/CT in patients with breast cancer*Course Description PET/CT has greatly impacted the imaging and therapy of chest malignancies, including longstanding value for staging of lung cancer, as well as novel Estrogen Receptor targeted imaging for breast cancer. William Sensakovic, PhD, Cave Creek, AZ (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

MRI safety is a multi-faceted issue that encompasses diverse issues ranging from acquisition parameter selection to off-label scanning decisions. Although guidance exists in multiple forms for each topic, real-world examples are not always available to ground abstract knowledge. This session will review several facets of MRI Safety and convey best practices through the lens of real-world situations encountered by the speakers.

LEARNING OBJECTIVES

1) Identify safety issues related to active implants 2) Describe strategies to meet implant scanning requirements 3) Review considerations when scanning off-label or during interventional procedures 4) Understand actions to take when a safety incident occurs*Course Description MRI safety is a multi-faceted issue that encompasses diverse issues ranging from acquisition parameter selection to off-label scanning decisions. Although guidance exists in multiple forms for each topic, real-world examples are not always available to ground abstract knowledge. COURSE DESCRIPTION

This session will provide a comprehensive review of the diagnostic imaging hallmarks of COVID-19 infection and related complications with emphasis on the organ-specific imaging features, complexity and multisystemic involvement of the disease, and evolution of imaging findings in patients post COVID-19. Pulmonary, cardiac, abdominopelvic and neurological systems will be discussed including neurological syndromes and cardiac imaging findings after vaccination.

LEARNING OBJECTIVES

The learner will: 1) gain awareness of the available imaging modalities and abbreviated protocols for multisystemic evaluation of the patients with COVID-19 infection 2) recognize organ-specific evolution of the imaging findings associated with COVID-19 infection from its initial presentation to long standing disease with special emphasis on the common and rare complications 3) discuss imaging findings associated with post-vaccination*Course Description This session will provide a comprehensive review of the diagnostic imaging hallmarks of COVID-19 infection and related complications with emphasis on the organ-specific imaging features, complexity and multisystemic involvement of the disease, and evolution of imaging findings in patients post COVID-19. Carol C. Wu, MD, Houston, TX (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Several entities, including the American College of Radiology and the Fleischner Society, provide best practice guidelines and recommendations for the imaging of various thoracic diseases. These recommendations are continually revised and updated, resulting in an evolving landscape that can be difficult for radiologists to follow. In this case-based review, guidelines for several important thoracic diseases will be presented. When available, important recent changes and ongoing research that serves as the basis for these recommendations will be highlighted. Furthermore, practical pearls that go beyond the recommendations will be identified. This information will be of value to radiologists in both specialized and general practice and improve attendees' confidence in managing patients with common thoracic conditions.

LEARNING OBJECTIVES

1) Review relevant practice guidelines for important conditions affecting the thorax 2) Discuss best practice suggestions for image interpretation and follow-up recommendations 3) Present relevant research related to the development of practice guidelines in the thorax*Course Description Several entities, including the American College of Radiology and the Fleischner Society, provide best practice guidelines and recommendations for the imaging of various thoracic diseases. These recommendations are continually revised and updated, resulting in an evolving landscape that can be difficult for radiologists to follow. COURSE DESCRIPTION

Interventional radiologists play an increasingly prominent role in the multidisciplinary management of portal hypertension, especially when vascular liver disease is present. This lecture-based course will review the pathophysiology, medical management, imaging workup, endovascular procedures, and periprocedural care required for adult and pediatric patients with thrombotic disorders of the portomesenteric system. The management of portal hypertension in the setting of malignancy will also be discussed.

LEARNING OBJECTIVES

1) Describe the pathophysiology, imaging features and medical management for patients with splanchnic thrombosis and portal hypertension 2) Review endovascular treatment options for splanchnic thrombosis and hepatic outflow vascular disease in the setting of portal hypertension 3) Define the role of IR in the management of extrahepatic portal vein obstruction and other causes of pediatric portal hypertension 4) Discuss how IR can provide impact in the management of portal hypertension in the setting of hepatic malignancy*Course Description Interventional radiologists play an increasingly prominent role in the multidisciplinary management of portal hypertension, especially when vascular liver disease is present. Jack A. Porrino JR, MD, New Haven, CT (*Presenter*) Nothing to Disclose
Rachna Madan, MD, Boston, MA (*Presenter*) Nothing to Disclose
Maria Manning, MD, Silver Spring, MD (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will use a case-based format and highlight the role of imaging in the diagnosis of challenging oncology cases using a multimodality approach. The session will focus on a variety of head and neck, pediatric, chest, musculoskeletal, and abdominal malignancies. Clinical presentation and pathological correlations will be provided when possible. Differential diagnoses will include infection, inflammation, neoplasm, ischemia, hemorrhage. The session will provide a broad update in imaging advances that help to make the correct diagnosis.

LEARNING OBJECTIVES

1) Understand key principles in radiologic-pathologic correlation as applicable to a variety of head & neck, thoracic, abdominal and musculoskeletal malignancies 2) Formulate a focused differential diagnosis for head & neck, thoracic, abdominal and musculoskeletal malignancies based on these principles 3) The differential diagnoses would cover cases with infection, inflammation and hemorrhage*Course Description This course will use a case-based format and highlight the role of imaging in the diagnosis of challenging oncology cases using a multimodality approach. The session will focus on a variety of head and neck, pediatric, chest, musculoskeletal, and abdominal malignancies. Nina E. Kottler, MD, MS, San Diego, CA (*Presenter*) Partner, Radiology Partners;Stockholder, Radiology Partners;Employee, Radiology Partners;Consultant, ES3;Consultant, W.L. Gore & Associates, Inc;Consultant, Synapsica Healthcare Pvt Ltd

COURSE DESCRIPTION

Artificial intelligence (AI) developers and researchers work toward realizing the potential of AI-driven improvements in health care effectiveness and efficiency. As radiologists collaborate with data scientists on AI evaluation, understanding study design and data collection will drive progress. This course will facilitate familiarity with the value proposition of AI, study design, and state of the art in evaluating AI impact on quality and health outcomes.

LEARNING OBJECTIVES

1) Describe the value proposition of AI for imaging 2) Consider important aspects of data collection and a high-impact analytic plan 3) Consider strategies for evaluating imaging AI at scale and for outcomes monitoring over time*Course Description Artificial intelligence (AI) developers and researchers work toward realizing the potential of AI-driven improvements in health care effectiveness and efficiency. As radiologists collaborate with data scientists on AI evaluation, understanding study design and data collection will drive progress. This course will facilitate familiarity with the value proposition of AI, study design, and state of the art in evaluating AI impact on quality and health outcomes.

COURSE DESCRIPTION

This course offers an overview of present deep learning (DL) techniques for MRI, including an introduction to DL principles in image acquisition, reconstruction, post-processing, and analysis. Speakers will deliver a review of current DL utility and impact in clinical MRI, and an outlook on challenges and future directions of DL in MRI translational and clinical applications.

LEARNING OBJECTIVES

1) Explain the current clinical applications of deep learning in MRI2) Understand the basic methods applied in MRI reconstruction, quantification, and image enhancement*Course Description This course offers an overview of present deep learning (DL) techniques for MRI, including an introduction to DL principles in image acquisition, reconstruction, post-processing, and analysis. Speakers will deliver a review of current DL utility and impact in clinical MRI, and an outlook on challenges and future directions of DL in MRI translational and clinical applications.

Musculoskeletal Case-based Multidisciplinary Review

Tuesday, Nov. 29 1:30PM - 2:30PM Room: NA

Participants
F. Joseph Simeone, MD, Boston, MA (*Presenter*) Nothing to Disclose
Seth Pollack, MD, Chicago, IL (*Presenter*) Consultant, Bayer AG;Consultant, Deciphera Pharmaceuticals, LLC;Consultant, Apexigen Inc;Consultant, T-Knife, GmbH;Consultant, Aadi Bioscience, Inc;Consultant, Epizyme, Inc;Consultant, Obsidian;Consultant, Sensei;Consultant, SpringWorks Therapeutics, Inc
Kevin Raskin, MD, Boston, MA (*Presenter*) Nothing to Disclose
Edward Y. Kim, MD, Seattle, WA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This multidisciplinary panel will discuss a series of challenging soft tissue and bone sarcoma cases. The session will highlight the importance of imaging in the diagnosis and treatment of these rare tumors. Panelists will represent radiology, orthopedic oncology, medical oncology, and radiation oncology.

LEARNING OBJECTIVES

1) Identify ways to incorporate imaging data into the management of soft tissue and bone sarcomas 2) Explain optimal management strategies for rare soft tissue tumors*Course Description This multidisciplinary panel will discuss a series of challenging soft tissue and bone sarcoma cases. The session will highlight the importance of imaging in the diagnosis and treatment of these rare tumors. Panelists will represent radiology, orthopedic oncology, medical oncology, and radiation oncology.

ASRT@RSNA: Imaging Transgender Patients: What the Radiologic Technologist Needs to Know

Tuesday, Nov. 29 1:30PM - 2:30PM Room: NA

Participants
Evelyn Carroll, MD, Rochester, NY (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Transgender and gender diverse (TGD) patients are a growing patient population who often experience health inequities both in the radiology department and throughout the healthcare system. Healthcare disparities in this population are compounded by a lack of knowledge and understanding of TGD persons and their healthcare related needs by well-intentioned health care providers. In this session, Dr. Evelyn Carroll will break down the basic terminology and concepts of gender diversity, provide a high-level overview of gender affirming medical care, and share strategies to create an inclusive environment for our TGD patients and colleagues in the radiology department. Dr. Carroll draws on both her years of lived experience and her expertise in imaging transgender patients to deliver an authentic presentation on a topic relevant to all radiologic technologists. Following the presentation, there will be a question and answer session open to all attendees.

LEARNING OBJECTIVES

1) Understand basic terminology and concepts of gender diversity 2) Become familiar with the healthcare disparities facing the transgender and gender diverse (TGD) patient population 3) Learn how to create an inclusive clinical practice and work environment for our TGD patients and colleagues*Course Description Transgender and gender diverse (TGD) patients are a growing patient population who often experience health inequities both in the radiology department and throughout the healthcare system. Healthcare disparities in this population are compounded by a lack of knowledge and understanding of TGD persons and their healthcare related needs by well-intentioned health care providers. Medicare and U.S. Healthcare Policy: A National Conversation

Tuesday, Nov. 29 1:30PM - 2:30PM Room: NA

Participants
Kavita Patel, MD, Bethesda, MD (*Presenter*) Board Member, Radiology Partners;Board Member, Strive Health Care;Board Member, Everside Health Care
Mark McClellan, MD, Durham, NC (*Presenter*) Director, Alignment Healthcare USA, LLC;Advisor, Arsenal Capital Partners;Advisor, Blackstone Inc ;Director, Cigna Corporation;Advisor, Health Care Payment Learning & Action Network ;Chairman, PrognomIQ, Inc;Director, Johnson & Johnson;Advisor, MITRE
Richard Heller III, MD, Chicago, IL (*Moderator*) Consultant, Gerson Lehrman Group, Inc;
Amanda Starc, Evanston, IL (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The economics of the United States health care system are under stress. Medicare, a central pillar of the US health care system, faces many challenges. This session features a discussion between two nationally respected authorities on Medicare policy. Moderated by a subject matter expert, the session will focus on US health care policy and the future of the Medicare system, paying special attention to diagnostic and interventional radiology and radiation oncology.

LEARNING OBJECTIVES

1) Distinguish between the different parts of Medicare, their roles in the US healthcare system, and the challenges facing them 2) Describe Medicare’s approach to medical imaging and radiologist reimbursement and expected future changes 3) Describe Medicare’s approach to radiation oncology reimbursement and expected future changes*Course Description The economics of the United States health care system are under stress. COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.A brief didactic lecture will be given at beginning of course to review types of needle biopsy equipment and technique. The attendee at completion of course should have some familiarity of how to handle different biopsy devices under ultrasound guidance. Masses and cysts will be identified and biopsied or drained. Various wire localization equipment will also be available. Every attendee will have opportunity to use hands on biopsy equipment. Instruction will be given on how to perform procedure and before and after care. Various ultrasound equipment will be available for scanning and localizations of lesions.

LEARNING OBJECTIVES

1) Introduction of various types and sizes of needle breast biopsy devices and their utilization within clinical practice 2) Utilization of different ultrasound technology to perform interventional procedures in the breast 3) Introduction of additional procedures in the breast such as cyst aspiration, fine needle aspiration, marker placement*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.A brief didactic lecture will be given at beginning of course to review types of needle biopsy equipment and technique. On Call Primer for Residents - Don't Miss Diagnoses: Tricky Trauma That Keeps You Up at Night

Tuesday, Nov. 29 3:00PM - 4:00PM Room: NA

Participants
Uttam Bodanapally, MD, Owings Mills, MD (*Presenter*) Speakers Bureau, Siemens AG;Travel support, Siemens AG;Research support, Siemens AG
Ashwin V. Asrani, MD, Short Hills, NJ (*Presenter*) Nothing to Disclose
Polina Kanj, MD, Boston, MA (*Presenter*) Nothing to Disclose
Laura L. Avery, MD, Boston, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Are night shifts in the ED causing you stress and anxiety? Does the sight of trauma surgeons make you want to run and hide in a stairwell? This course is your Xanax. The course is targeted at improving the time to recognition and diagnosis of various traumatic injuries. The information will be presented in a case-based format emphasizing problem-solving rather than grading systems. The learner will improve their chances of achieving a Zen state during their next call shift.

LEARNING OBJECTIVES

1) Identify clinically important traumatic injuries with speed and grace*Course Description Are night shifts in the ED causing you stress and anxiety? Does the sight of trauma surgeons make you want to run and hide in a stairwell? This course is your Xanax. The course is targeted at improving the time to recognition and diagnosis of various traumatic injuries. AI Isn't Just for Diagnosis: Example Applications Throughout the Radiological Imaging Chain

Tuesday, Nov. 29 3:00PM - 4:00PM Room: NA

Participants
Nabile Safdar, MD, MPH, Milton, GA (*Presenter*) Nothing to Disclose
Nina E. Kottler, MD, MS, San Diego, CA (*Presenter*) Partner, Radiology Partners;Stockholder, Radiology Partners;Employee, Radiology Partners;Consultant, ES3;Consultant, W.L. Gore & Associates, Inc;Consultant, Synapsica Healthcare Pvt Ltd
Katherine Andriole, PhD, Branford, CT (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The goal of many AI tools is to provide clinical decision support for radiology examination interpretation. But AI and machine learning can be applied at various points in the radiological imaging chain, including at examination ordering, imaging modality protocoling, image creation and quality assessment, study diagnosis, reporting, and billing. Such applications may improve workflow efficiency and reduce errors and cost. Example applications throughout the radiology workflow will be described along with integration standards necessary to implement AI tools clinically. AI workflow for both academic and private practice settings will be discussed.

LEARNING OBJECTIVES

1) Identify the points throughout the radiology imaging chain at which AI tools may be implemented and how they may impact workflow 2) Become familiar with the integration standards required to clinically implement AI tools 3) Learn about AI radiology workflow tools useful for the academic and private practice settings*Course Description The goal of many AI tools is to provide clinical decision support for radiology examination interpretation. But AI and machine learning can be applied at various points in the radiological imaging chain, including at examination ordering, imaging modality protocoling, image creation and quality assessment, study diagnosis, reporting, and billing. Doris E. Wenger, MD, Rochester, MN (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

In this educational course, we will review salient benign musculoskeletal lesions that are commonly encountered in clinical practice, in both pediatric and adult populations. In addition, what imaging features are associated with a potentially malignant lesion and what imaging modalities and techniques are important for radiologists to use to recognize clearly benign entities and avoid a referral for biopsy? Through five lectures from experienced musculoskeletal radiologists, examples and strategies will be presented that help the radiologist arrive at the decision "to touch" or "not to touch" a lesion.

LEARNING OBJECTIVES

1) To review the imaging appearance of common benign musculoskeletal lesions in children and adults 2) To identify imaging strategies for confidently diagnosing lesions that are benign or probably benign 3) To emphasize lesional features that suggest a potentially malignant nature*Course Description In this educational course, we will review salient benign musculoskeletal lesions that are commonly encountered in clinical practice, in both pediatric and adult populations. In addition, what imaging features are associated with a potentially malignant lesion and what imaging modalities and techniques are important for radiologists to use to recognize clearly benign entities and avoid a referral for biopsy? Case-based Review of Neuroendocrine: PET/CT Workshop (In Conjunction with SNMMI)

Tuesday, Nov. 29 3:00PM - 4:00PM Room: NA

Participants
Nadine Mallak, MD, Portland, OR (*Presenter*) Nothing to Disclose
Lisa Bodei, MD, PhD, New York, NY (*Presenter*) Consultant, Novartis AG ;Speaker, Novartis AG;Research Grant, Novartis AG;Consultant, Ipsen SA;Consultant, ITM Isotopen Technologien Muenchen AG;Speaker, ITM Isotopen Technologien Muenchen AG;Consultant, Clovis Oncology, Inc;Consultant, Ion Beam Applications, SA

COURSE DESCRIPTION

Course Description:PET/CT has greatly impacted the imaging and therapy of neuroendocrine malignancies, including continuing improvements in somatostatin receptor-targeted PET. In this session, experts on neuroendocrine tumors will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of PET studies.

LEARNING OBJECTIVES

1) Understand best clinical practices for use and interpretation of PET/CT in patients with neuroendocrine tumors 2) Compared and contrast Ga68-Dotatate with 64Cu-Dotatate*Course Description Course Description:PET/CT has greatly impacted the imaging and therapy of neuroendocrine malignancies, including continuing improvements in somatostatin receptor-targeted PET. In this session, experts on neuroendocrine tumors will use clinical cases to demonstrate fundamentals of interpretation, as well as pearls and pitfalls to help improve interpretation of PET studies.

Zi Zhang, MD, Fort Washington, PA (*Presenter*) Nothing to Disclose
Kate Hanneman, MD, FRCPC, Toronto, ON (*Moderator*) Speaker, Groupe Sanofi Speaker, Amicus Therapeutics, Inc

COURSE DESCRIPTION

This course includes three lectures and one interactive panel: 1. Overview of the shift of radiology practice environment during the pandemic and its impact.This lecture will review the myriad ways in which the radiology practice environment has changed during the pandemic. It will review both the intended effects and discuss some of the potential collateral damage for professional growth.2. How to determine the balance between remote work and in-person work.This lecture will discuss the generational differences in the opportunities for remote work versus in-person work. It will also review the strategies for increasing efficiency of remote working and improving communication with the medical team. 3. Networking strategies to maximize social interactions in the "New Normal".This lecture will discuss methods that can be used to continue to seek out opportunities for networking while adjusting to the "New Normal". This lecture will also discuss how maximizing social interactions can serve as a tool for promoting professional growth. 4. Interactive panel to discuss the opportunities and challenges in the "New Normal".This panel will include radiologists at different stages of their career to discuss the opportunities and challenges they are facing in the "New Normal" and answer questions from the audience.

LEARNING OBJECTIVES

Unprecedented challenges brought on by the COVID-19 pandemic have changed the radiology practice environment. The way in which we practice and interact with our colleagues has never been more challenging 1) This program will discuss changes in the practice of radiology related to the pandemic, and generational differences in facing the opportunities and challenges of the "New Normal" at the workplace 2) We will also discuss strategies to promote professional growth in this new environment*Course Description This course includes three lectures and one interactive panel: 1. Overview of the shift of radiology practice environment during the pandemic and its impact.This lecture will review the myriad ways in which the radiology practice environment has changed during the pandemic. It will review both the intended effects and discuss some of the potential collateral damage for professional growth.2. ASRT@RSNA: Compassionate Communication - Keeping Patients at the Heart of Practice

Tuesday, Nov. 29 3:00PM - 4:00PM Room: NA

Participants
Amy Taylor, PhD, Exeter, United Kingdom (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Back in 2013, how UK healthcare professionals gave care to their patients came under the spotlight with the release of the Francis report. The need to understand compassion and how radiographers can engage in compassionate practices became central in the drive to enhance patient-centred care and experience. This lecture integrates the findings of two UK radiography doctoral projects (one diagnostic and one therapeutic), undertaken independently over the period 2014-2020. The outcome of this will be to illustrate the complexity of a concept which, on the face of it appears straightforward and to emphasise the centrality of communication in giving individualised care to patients undergoing diagnostic imaging and therapy.

LEARNING OBJECTIVES

By the end of the lecture the delegates will: 1) Understand the importance of compassionate communication in radiography and appreciate its role in its clinical delivery 2) Be able to recognise and engage in practices which communicate compassion to patients*Course Description Back in 2013, how UK healthcare professionals gave care to their patients came under the spotlight with the release of the Francis report. The need to understand compassion and how radiographers can engage in compassionate practices became central in the drive to enhance patient-centred care and experience. From the Editors of RADIOLOGY: New Research That Should Impact Your Practice

Tuesday, Nov. 29 3:00PM - 4:00PM Room: NA

Participants
David Bluemke, MD,PhD, Madison, WI (*Presenter*) Nothing to Disclose
Linda Moy, MD, New York, NY (*Presenter*) Grant, Siemens AG ;Advisory Board, Lunit Inc;Advisory Board, iCad, Inc
Birgit Ertl-Wagner, MD, Toronto, ON (*Presenter*) Spouse, Employee, Siemens AG
Kathryn Fowler, MD, San Diego, CA (*Presenter*) Consultant, Bayer AG;Research support, General Electric Company;Research Grant, Pfizer Inc;Institutional Grant, MEDIAN Technologies;Consultant, General Electric Company

COURSE DESCRIPTION

RADIOLOGY is the leading journal for publications leading to new, important and translatable discoveries in imaging research. In the past year, there continue to be new developments in radiology and in the application of imaging, as well as new guidelines and clinical trials in imaging that affect your practice. While COVID-19 remains critically important, overall trends for new scientific studies reflect an increasing number of clinical trials being submitted from around the world in addition to those of North America. Large numbers of study subjects in imaging trials are now common. This results in more robust demonstration of the efficacy of imaging interventions. Advanced artificial intelligence applications increasingly submitted in our publications, as are radiomics studies with large numbers of study subjects. This seminar will highlight the results of key publications in the past year that are most likely to affect your practice in the near future, as well as presenting novel topics that are likely to be important to the field over the next 5 years.

LEARNING OBJECTIVES

1) Identify key publications over the past year that may affect your clinical practice 2) Evaluate new research developments in the field of radiological imaging 3) Describe new developments in radiology that may affect the management of your patients*Course Description RADIOLOGY is the leading journal for publications leading to new, important and translatable discoveries in imaging research. In the past year, there continue to be new developments in radiology and in the application of imaging, as well as new guidelines and clinical trials in imaging that affect your practice. Practical Guide for Publishing Your Research: Data Analysis and Figure Making (Sponsored by the RSNA Resident and Fellow Committee)

Tuesday, Nov. 29 3:00PM - 4:00PM Room: NA

Participants
David Ballard, MD, Saint Louis, MO (*Presenter*) Nothing to Disclose
Ronnie Sebro, MD,PhD, Jacksonville Beach, FL (*Presenter*) Nothing to Disclose
Brian Burkett, MD, MPH, Rochester, MN (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The RSNA Resident Fellow Committee will host a session of expert lectures on the practical aspects of publishing. The session will include a high-yield discussion of data analysis and statistical methods commonly used in imaging research, followed by a presentation on how to generate publication-quality figures with high resolution image files and annotations using common and proprietary software platforms. The lectures will provide participants and especially trainees with the fundamental knowledge and practical skills required to successfully publish academic work.

LEARNING OBJECTIVES

1) To understand the fundamentals of imaging research data analysis methods and learn to choose appropriately statistical analysis techniques 2) To successfully prepare medical imaging and simple illustrations for publication*Course Description The RSNA Resident Fellow Committee will host a session of expert lectures on the practical aspects of publishing. The session will include a high-yield discussion of data analysis and statistical methods commonly used in imaging research, followed by a presentation on how to generate publication-quality figures with high resolution image files and annotations using common and proprietary software platforms. The lectures will provide participants and especially trainees with the fundamental knowledge and practical skills required to successfully publish academic work.

Rapid Fire: 60 Cardiac Cases in 60 Minutes

Tuesday, Nov. 29 4:30PM - 5:30PM Room: NA

Participants
Juan Batlle, MD, Boulder, CO (*Presenter*) Speakers Bureau, Boehringer Ingelheim GmbH
Jordi Broncano, MD, Cordoba, (*Presenter*) Nothing to Disclose
Jean Jeudy JR, MD, Baltimore, MD (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

Enjoy an exciting and fast-paced review of cardiac radiology! With a case review format, the speakers will discuss a diversity of cardiac pathology and imaging-based differential diagnosis. Topics include: coronary and myocardial disease, cardiac masses, pericardial disease, valvular and congenital heart disease.

LEARNING OBJECTIVES

1) Provide a review of interesting cardiac radiology cases, with classic focus on pericardial disease and disease of the coronary arteries and myocardium 2) Highlight and discuss imaging of other diverse myocardial pathological processes including structural heart disease, and cardiothoracic oncology*Course Description Enjoy an exciting and fast-paced review of cardiac radiology! With a case review format, the speakers will discuss a diversity of cardiac pathology and imaging-based differential diagnosis. Topics include: coronary and myocardial disease, cardiac masses, pericardial disease, valvular and congenital heart disease.

Acute and Chronic Lung Injury

Tuesday, Nov. 29 4:30PM - 5:30PM Room: NA

Participants

Travis Henry, MD, Durham, NC (*Presenter*) Advisor, Aer Therapeutics, Inc;Stockholder, Aer Therapeutics, Inc
Demetrios Raptis, MD, Frontenac, MO (*Presenter*) Nothing to Disclose
Ryoko Egashira, MD,PhD, Saga, (*Presenter*) Speakers Bureau, Boehringer Ingelheim GmbH;Speakers Bureau, AstraZeneca PLC;Speakers Bureau, Shionogi & Co, Ltd;Speakers Bureau, KYORIN Holdings, Inc;Speakers Bureau, DAIICHI SANKYO Group;Speakers Bureau, Bayer AG;Speakers Bureau, Otsuka Holdings Co, Ltd;
Anu Brixey, MD, Portland, OR (*Presenter*) Research support, 4D Medical

COURSE DESCRIPTION

This session will review multiple aspects of acute and chronic lung injury. This includes a radiologic and pathologic review of diffuse alveolar damage; imaging of specific causes of lung injury including EVALI, other exposures, and hypersensitivity pneumonitis. The management of patients with lung injury on ECMO will be covered. Finally, pleuroparenchymal fibroelastosis will be reviewed as a long term sequela of lung injury.

LEARNING OBJECTIVES

1) Recognize the common and uncommon imaging manifestations of acute and chronic lung injury 2) Understand the limitations of identifying specific causes of lung injury on imaging and provide a reasonable differential diagnosis*Course Description This session will review multiple aspects of acute and chronic lung injury. This includes a radiologic and pathologic review of diffuse alveolar damage; imaging of specific causes of lung injury including EVALI, other exposures, and hypersensitivity pneumonitis. The management of patients with lung injury on ECMO will be covered. Finally, pleuroparenchymal fibroelastosis will be reviewed as a long term sequela of lung injury.

Patrick Omoumi, MD, Lausanne, Switzerland (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Refine your approach to spine imaging in this one hour course with five global spine imaging experts, where we will discuss both commonly encountered and unusual clinical scenarios. By emphasizing potential pitfalls and near-misses, we hope to increase your confidence in spine imaging interpretation.

LEARNING OBJECTIVES

1) To become familiar with common diagnostic errors and pitfalls in imaging of the spine for degenerative, inflammatory, and infectious conditions 2) To learn about the spectrum of normal and asymptomatic findings in imaging of the spine 3) To broaden the differential diagnosis when interpreting imaging of the spine*Course Description Refine your approach to spine imaging in this one hour course with five global spine imaging experts, where we will discuss both commonly encountered and unusual clinical scenarios. By emphasizing potential pitfalls and near-misses, we hope to increase your confidence in spine imaging interpretation.

Personalized Imaging and Theranostics in 2022

Tuesday, Nov. 29 4:30PM - 5:30PM Room: NA

Participants
Nicole Seiberlich, PhD, Ann Arbor, MI (*Presenter*) Royalties, Siemens AG;Research support, Siemens AG
Agata A. Exner, PhD, Cleveland, OH (*Presenter*) Research Consultant, Akrotome Imaging, Inc
Joseph R. Osborne, MD, New York, NY (*Presenter*) Nothing to Disclose
Vikas Gulani, MD, PhD, Ann Arbor, MI (*Moderator*) Research support, Siemens AG;Consulting, Cook Group Incorporated

COURSE DESCRIPTION

Medicine increasingly aims to provide highly accurate diagnosis, treatment, and treatment monitoring, ideally all personalized for the patient. Recent research has seen significant advancement in image acquisition, reconstruction, analysis, contrast agent development and drug delivery, all of which contribute to this goal of personalized imaging. Specific approaches include quantitative imaging (i.e. use of imaging to objectively measure a disease process or treatment), molecularly targeted imaging and treatment agents (including theranostic agents which serve both diagnostic and treatment purposes), and novel delivery mechanisms such as ultrasound nanobubbles. In this course, we will explore these advances across multiple modalities, and in context of the entire spectrum of diagnosis, treatment delivery, and treatment monitoring.

LEARNING OBJECTIVES

1) Identify imaging approaches to achieving personalized diagnosis and treatment across multiple modalities 2) Understand and describe the concept of theranostics, and some approaches to this goal 3) Identify barriers to translation of cutting edge personalized imaging approaches*Course Description Medicine increasingly aims to provide highly accurate diagnosis, treatment, and treatment monitoring, ideally all personalized for the patient. Recent research has seen significant advancement in image acquisition, reconstruction, analysis, contrast agent development and drug delivery, all of which contribute to this goal of personalized imaging. Specific approaches include quantitative imaging (i.e. use of imaging to objectively measure a disease process or treatment), molecularly targeted imaging and treatment agents (including theranostic agents which serve both diagnostic and treatment purposes), and novel delivery mechanisms such as ultrasound nanobubbles. T8-RCP03 Predicting DCIS Upgrade at Surgery with Ultrafast Imaging

Participants
Rachel Miceli, MD, New York, NY (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Young investigators session papers in Cancer Imaging: This session will focus on the importance of research and technological advances in the field of oncologic imaging. Attendees will be introduced to timely and relevant topics in imaging malignant tumors in a wide range of subspecialties. The session will highlight those achievements made by Young Investigators as defined by NIH Early Stage Investigator guidelines.

LEARNING OBJECTIVES

Paper presentations will: 1) Highlight the current status of original scientific research in multimodality imaging of malignant tumors 2) Emphasize advances in imaging technology and its implications on clinical care 3) Describe optimal practice-based strategies to improve diagnoses and patient management 4) Underscore the achievements and ingenuity of junior physician/scientists in cancer imaging 5) Encourage junior scientists to use their imaging skill sets to solve the most pressing and complex problems in cancer imaging*Course Description Young investigators session papers in Cancer Imaging: This session will focus on the importance of research and technological advances in the field of oncologic imaging. Attendees will be introduced to timely and relevant topics in imaging malignant tumors in a wide range of subspecialties. The session will highlight those achievements made by Young Investigators as defined by NIH Early Stage Investigator guidelines.

Cindy Chew, FRCR, MSc, Glasgow, United Kingdom (*Presenter*) Nothing to Disclose
Reed Omary, MD, Nashville, TN (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Diversity and Inclusion have been discussed increasingly within academic organizations and communities in the past several years. As a result, many academic radiology departments, private practices, and professional societies have created a "diversity committee" to implement various initiatives. A diversity committee is often composed of women and minority backgrounds on race/ethnicity or sexual orientation. However, we must accelerate allyship to build an all-inclusive culture where every voice is heard, and people treat each other with respect. This educational lecture will discuss why allyship is critical to advance EDI missions and how to accelerate allyship from those considered the "majority."

LEARNING OBJECTIVES

1) Understand why diversity and Inclusion are critical for our profession and any organizations2) Identify opportunities to activate allyship and embrace diversity and inclusive culture in the fabric of organizations 3) Learn how other institutions have done to create an inclusive culture*Course Description Diversity and Inclusion have been discussed increasingly within academic organizations and communities in the past several years. As a result, many academic radiology departments, private practices, and professional societies have created a "diversity committee" to implement various initiatives. A diversity committee is often composed of women and minority backgrounds on race/ethnicity or sexual orientation. Loren H. Ketai, MD, Albuquerque, NM (*Presenter*) Nothing to Disclose
Sanjeev Bhalla, MD, Saint Louis, MO (*Moderator*) Advisory Board, Precisa Gravimetrics AG
Ioannis Vlahos, MRCP,FRCR, Houston, TX (*Moderator*) Director, Grayscale Ltd;Co-owner, Grayscale Ltd;

COURSE DESCRIPTION

Have you ever encountered a clinical situation where you wish you could just ask an expert? You try and find the answers in the literature, but you just can't? These are the situations for which this course is designed. This panel discussion will try and answer clinical conundrums pertinent to Cardiothoracic Imaging and will focus on aspects of lung cancer screening, high resolution chest CT and cardiac imaging. This enjoyable discussion will help the learner understand the similarities and differences in specialty practice

LEARNING OBJECTIVES

1) Identify techniques in performing and reporting HRCT 2) Understand the variations of lung cancer screening and reporting 3) Highlight variations and similarities of performing cardiac and thoracic vascular imaging*Course Description Have you ever encountered a clinical situation where you wish you could just ask an expert? You try and find the answers in the literature, but you just can't? These are the situations for which this course is designed. This panel discussion will try and answer clinical conundrums pertinent to Cardiothoracic Imaging and will focus on aspects of lung cancer screening, high resolution chest CT and cardiac imaging. COURSE DESCRIPTION

This education session covers high-yield concepts in Liver Imaging Reporting and Data Systems (LI-RADS). The engaging and informative course, taught by internationally renowned experts in liver imaging, consists of didactic lectures that discuss the pathomolecular subtypes and prognostic imaging features of HCC, recent updates to LI-RADS treatment response algorithm, and the gaps in current knowledge and future directions.The course offers learning opportunities for both novice and experienced LI-RADS users, as the faculty will highlight practical tips along with an overview of the latest scientific evidence, current challenges, and future directions for CT/MR LI-RADS algorithms. In addition, the attendees will be introduced to the concept of the pathomolecular subtypes and prognostic imaging features of HCC

LEARNING OBJECTIVES

1) Overview of the latest scientific evidence supporting the use of CT/MRI diagnostic algorithms 2) Explain the current gaps in knowledge and future direction of all LI-RADS algorithms 3) Explain recent updates of LI-RADS Treatment Response Algorithm application when using different modalities and contrast agents*Course Description This education session covers high-yield concepts in Liver Imaging Reporting and Data Systems (LI-RADS). The engaging and informative course, taught by internationally renowned experts in liver imaging, consists of didactic lectures that discuss the pathomolecular subtypes and prognostic imaging features of HCC, recent updates to LI-RADS treatment response algorithm, and the gaps in current knowledge and future directions.The course offers learning opportunities for both novice and experienced LI-RADS users, as the faculty will highlight practical tips along with an overview of the latest scientific evidence, current challenges, and future directions for CT/MR LI-RADS algorithms. Demystifying Population Health: What Does It Mean for Radiologists in 2023

Wednesday, Nov. 30 8:00AM - 9:00AM Room: NA

Participants
Neville Irani, MD, Stilwell, KS (*Presenter*) Nothing to Disclose
Arun Krishnaraj, MD, MPH, Charlottesville, VA (*Presenter*) Nothing to Disclose
James Rawson, MD, Boston, MA (*Presenter*) Nothing to Disclose
Syed Furqan Zaidi, MD, Washington, DC (*Presenter*) Nothing to Disclose
Elizabeth Rula, PhD, Brentwood, TN (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

Improving population health – the health outcomes and distribution of those outcomes in a population – has gained heightened importance, as reflected in emerging value-based payment models. Radiologists have an opportunity to increase value to health systems looking to capture population health savings. This panel discussion with local and national leaders will discuss major initiatives and share opportunities to demonstrate value within these models and generate collaborative, high-value growth. Come prepared to ask questions and gain insights on how Radiology can both deliver greater value and capture that value tied to improving population health outcomes.

LEARNING OBJECTIVES

1) Understand population health models and supporting payment models in relation to radiology. 2) Recognize opportunities for radiologists to add measurable value in population health. 3) Review goals of the Population Health Blue Ribbon Panel and results of real-world population health initiatives.*Course Description Improving population health – the health outcomes and distribution of those outcomes in a population – has gained heightened importance, as reflected in emerging value-based payment models. Radiologists have an opportunity to increase value to health systems looking to capture population health savings. Integrating O-RADS MRI in Your Practice: Why, When and How?

Wednesday, Nov. 30 8:00AM - 9:00AM Room: NA

Participants
Elizabeth A. Sadowski, MD, Madison, WI (*Presenter*) Nothing to Disclose
Caroline Reinhold, MD, MSc, Westmount, QC (*Presenter*) Research Grant, Imagia Cybernetics Inc
Andrea Rockall, FRCR,MRCP, London, United Kingdom (*Presenter*) Nothing to Disclose
Priyanka Jha, MBBS, San Francisco, CA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This lecture and case-based course will allow the attendee to successfully implement the O-RADS MRI risk stratification system for characterizing ovarian lesions in daily clinical practice. The added value and role of MRI in the evaluation of adnexal masses will be emphasized. Tips on the MR imaging protocol, in particular, generation of the time intensity curves (TIC) as well as highlights of the O-RADS MRI lexicon and risk stratification system will be presented. A case-based review of classical and challenging ovarian lesions will consolidate the knowledge gained during the didactic sessions.

LEARNING OBJECTIVES

1) identify learning strategies to integrate O-RADS MRI into your clinical practice for characterizing ovarian lesions.2) Explain salient aspects of the MR imaging protocol, O-RADS MRI lexicon and risk stratification system.3) Assign risk categories using O-RADS MRI to common and challenging ovarian lesions.*Course Description This lecture and case-based course will allow the attendee to successfully implement the O-RADS MRI risk stratification system for characterizing ovarian lesions in daily clinical practice. The added value and role of MRI in the evaluation of adnexal masses will be emphasized. Innovations in Dual and Multi-Energy CT

Wednesday, Nov. 30 8:00AM - 9:00AM Room: NA

Participants
Megan Jacobsen, PhD, Houston, TX (*Presenter*) Nothing to Disclose
Wei Zhou, PhD, Aurora, CO (*Presenter*) Nothing to Disclose
Daniele Marin, MD, Cary, NC (*Presenter*) Research support, General Electric Company;Research support, Siemens AG;Research support, Bracco Group;Research Consultant, Bracco Group;Research Consultant, Bayer AG

COURSE DESCRIPTION

This session will have three speakers to cover the latest innovations in Dual- and Multi-energy CT. The first talk will introduce the technical approaches of emerging Dual-energy CT technology and systems. The second talk will discuss the experience when implementing Dual- and Multi-energy CT in clinical practice. Finally, the third talk will focus on various clinical applications of Dual- and Multi-energy CT to improve patients' diagnosis.

LEARNING OBJECTIVES

1) Understand the basic principles of Dual and Multi-energy CT 2) Discuss the clinical implementation of Dual- and Multi-energy CT, from acquisitions to post-processing 3) Learn recent clinical applications of Dual- and Multi-energy CT to improve patient care*Course Description This session will have three speakers to cover the latest innovations in Dual- and Multi-energy CT. RSNA/ESR Symposium: Imaging of Neurodegenerative Disorders - Basics of Neuroimaging in Neurodegeneration

Wednesday, Nov. 30 8:00AM - 9:00AM Room: NA

Participants
Yoshimi Anzai, MD,MPH, Salt Lake City, UT (*Presenter*) Nothing to Disclose
Meike W. Vernooij, MD, PhD, Rotterdam, Netherlands (*Presenter*) Nothing to Disclose
Javier Arbizu Lostao, Pamplona, Spain (*Presenter*) Speaker, F. Hoffmann-La Roche Ltd;Speaker, Novartis AG;Speaker, General Electric Company;Research Grant, Siemens AG;Speaker, Life Molecular Imaging GmbH;Speaker, Biogen Idec Inc
Alexander Drzezga, MD, Cologne, Germany (*Moderator*) Research support, Siemens AG ;Research support, Life Molecular Imaging;Research support, General Electric Company;Research support, Eli Lilly and Company;Research support, Eisai Co, Ltd;Consultant, Siemens AG ;Consultant, General Electric Company

COURSE DESCRIPTION

Structural and molecular imaging techniques are able to demonstrate the onset of neurodegenerative and dementing disorders years before the onset of symptoms. This educational course will discuss the structural MRI changes that occur with normal aging and how they relate to specific neurodegenerative disorders. Molecular imaging probes for PET imaging will be discussed that can dissect the molecular pathology associated with neurodegenerative diseases, including parkinsonian syndromes. At the end of the course, the participants will better understand the sequences of molecular and structural imaging findings that may herald the onset of dementia and other neurodegenerative disorders.

LEARNING OBJECTIVES

1) To understand the standard MR Imaging protocol, normal aging findings, as well as Alzheimer disease mimic on structural brain MR imaging 2) To become familiar with existing and new molecular imaging tracers for dementia and parkinsonian disorders 3) To comprehend how molecular imaging features may show the onset of neurodegenerative disease*Course Description Structural and molecular imaging techniques are able to demonstrate the onset of neurodegenerative and dementing disorders years before the onset of symptoms. This educational course will discuss the structural MRI changes that occur with normal aging and how they relate to specific neurodegenerative disorders. COURSE DESCRIPTION

In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.This 90-min pediatric musculoskeletal hands-on session is targeted to general radiologists who aim to get an overview of technical and clinical application perspectives on ultrasound scanning and interpreting pathology of elbows, hands and ankles of children and adolescents. The information provided in this session adds value to the diagnostic tools that can be used for assessment of musculoskeletal disorders that affect growing joints, particularly in young children who may require general anesthesia for MRI assessment of their joints. The session has two parts, a 60-min hands-on part where pre-assigned radiologists scan teenager models' joints in real time and a second 30-min knowledge application part where the audience has the opportunity to scan models' joints by themselves. In the first part of the session lecturers will demonstrate ultrasound protocols for scanning of pediatric elbows, hands and ankles in real-time and will discuss ultrasound findings of pathologies in these joints. In the second part of the session tutoring to scanning by the audience will be provided by assigned radiologists in a controlled educational environment where the audience will have the opportunity to apply the a priori discussed ultrasound protocols into scanning the models' joints.

LEARNING OBJECTIVES

1) Review the anatomy and common pediatric pathologic musculoskeletal conditions in three pediatric joints: the elbow, hand and ankle 2) Use dynamic scanning of the joints to better demonstrate the anatomy of soft tissue and osteochondral components of three pediatric joints and will point out the distinction of soft tissue structures by a compression technique 3) Discuss pathologies in the aforementioned joints as an overview of common pediatric pathologic musculoskeletal conditions*Course Description In Person Session Only. Tickets must be purchased in advance for this course. This course can be added through the registration portal or by stopping by the Registration Desk. Space is limited.This 90-min pediatric musculoskeletal hands-on session is targeted to general radiologists who aim to get an overview of technical and clinical application perspectives on ultrasound scanning and interpreting pathology of elbows, hands and ankles of children and adolescents. MRI of Nonischemic Cardiomyopathies: Case Based Review

Wednesday, Nov. 30 9:30AM - 10:30AM Room: NA

Participants
Jadranka Stojanovska, MD, New York, NY (*Presenter*) Nothing to Disclose
Karen Ordovas, MD, Seattle, WA (*Presenter*) Nothing to Disclose
Bradley Allen, MD, MS, Evanston, IL (*Moderator*) Consultant, Circle Cardiovascular Imaging Inc;Speaker, WebMD LLC

COURSE DESCRIPTION

Cardiac MRI (CMR) is an important tool for providing accurate diagnosis and risk-stratification for non-ischemic cardiomyopathies. In this course, learners will be presented with a broad overview of the current state-of-the-art for CMR evaluation of multiple non-ischemic cardiomyopathies. Topics will be presented in a case-based lecture format highlighting relevant CMR acquisitions and interpretation approaches, with a data-driven focus on current best-practices for providing optimal patient care.

LEARNING OBJECTIVES

1) Review current best-practices for CMR evaluation of non-ischemic cardiomyopathy 2) Discuss CMR interpretation and reporting in non-ischemic cardiomyopathy to provide accurate diagnosis and risk-stratification 3) Highlight areas of uncertainty in the current diagnostic approach and when other tools and modalities can be helpful*Course Description Cardiac MRI (CMR) is an important tool for providing accurate diagnosis and risk-stratification for non-ischemic cardiomyopathies. In this course, learners will be presented with a broad overview of the current state-of-the-art for CMR evaluation of multiple non-ischemic cardiomyopathies. COURSE DESCRIPTION

This session will provide a detailed review of postpartum complications using a multisystem multimodality approach including neurologic, chest, breast, vascular, and pelvic complications.

LEARNING OBJECTIVES

1) Differentiate vascular postpartum complications such as retained products of conception from enhanced myometrial vascularity, pseudoaneurysm, or subinvolution of the placental implantation site, as well as the over-diagnosed but exceedingly rare AVM of the uterus 2) Review breast and chest complications seen in the post-partum setting such as mastitis, breast abscess, breast cancer, PE, COVID, peripartum dilated cardiomyopathy, aortic rupture, aortic dissection 3) Learn the imaging appearance of post-Cesarian section complications such as uterine dehiscence/rupture, pyometra, abscesses, fistula formation, and bladder flap hematoma 4) Understand the myriad neurologic complications that may occur in the brain, spine, and head and neck*Course Description This session will provide a detailed review of postpartum complications using a multisystem multimodality approach including neurologic, chest, breast, vascular, and pelvic complications.

Interactive Course on Statistical Methods for Radiologists

Wednesday, Nov. 30 9:30AM - 10:30AM Room: NA

Participants
Nancy Obuchowski, PhD, Cleveland, OH (*Presenter*) Research Consultant, Siemens AG;Research Consultant, IBM Corporation;Research Consultant, Elucid Bioimaging Inc;Research Consultant, Takeda Pharmaceutical Company Limited
Chaya Moskowitz, PhD, New York, NY (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This course will cover several advanced topics related to statistical methods for evaluating the diagnostic accuracy of imaging tests as well as methods for evaluating quantitative imaging biomarkers. Focusing on methods researchers are likely to use or encounter in their studies, subject matter will include approaches for evaluating data from multi-reader studies, for identifying and validating optimal cut-points, for assessing repeatability and reproducibility, for analyzing multiparametric data, and for understanding bias in the design and analysis of quantitative imaging (radiomic) studies. The format will be interactive with educational questions posed to the audience interspersed with didactic teaching.

LEARNING OBJECTIVES

By the end of this course, the audience should have gained: 1) A better understanding of the appropriate use of statistical analytic methods for evaluating the diagnostic accuracy of imaging tests 2) An awareness of statistical methods necessary for analyzing quantitative imaging biomarkers 3) A deeper appreciation of the elements of study design and study procedures that may lead to bias in quantitative imaging research*Course Description This course will cover several advanced topics related to statistical methods for evaluating the diagnostic accuracy of imaging tests as well as methods for evaluating quantitative imaging biomarkers. Focusing on methods researchers are likely to use or encounter in their studies, subject matter will include approaches for evaluating data from multi-reader studies, for identifying and validating optimal cut-points, for assessing repeatability and reproducibility, for analyzing multiparametric data, and for understanding bias in the design and analysis of quantitative imaging (radiomic) studies. Clinical Demands on Neuroradiologists Outside the Reading Room

Wednesday, Nov. 30 9:30AM - 10:30AM Room: NA

Participants
Nancy J. Fischbein, MD, Stanford, CA (*Presenter*) Nothing to Disclose
Achala Vagal, MD, Cincinnati, OH (*Presenter*) Departmental Research Grant, Johnson & Johnson
Luca Saba, MD, Cagliari, (*Presenter*) Nothing to Disclose
Max Wintermark, MD, San Carlos, CA (*Moderator*) Consultant, Magnetic Insight, Inc;Consultant, icoMetrix NV;Consultant, Subtle Medical, Inc;Consultant, EMTensor Imaging

COURSE DESCRIPTION

The clinical workload for neuroradiologists has increased to reach record numbers of studies to be read, this is addition to growing non-RVU-generating activities. This conflicts with the education and research missions of academic neuroradiologists, challenges recruitment of trainees into neuroradiology and threatens the future of our profession. This sessions will discuss this issues and brainstorms solutions to address them.

LEARNING OBJECTIVES

1) To review the burden of Non RVU generating activities typically performed by neuroradiologists 2) To discuss how to balance clinical workload and education mission for neuroradiologists 3) To discuss how to balance clinical workload and academic endeavors for neuroradiologists*Course Description The clinical workload for neuroradiologists has increased to reach record numbers of studies to be read, this is addition to growing non-RVU-generating activities. This conflicts with the education and research missions of academic neuroradiologists, challenges recruitment of trainees into neuroradiology and threatens the future of our profession. Making Patients and Staff Safer in Interventional Procedures

Wednesday, Nov. 30 9:30AM - 10:30AM Room: NA

Participants
A. Kyle Jones, PhD, Houston, TX (*Presenter*) Nothing to Disclose
Stephen Balter, PhD, New York, NY (*Presenter*) Speakers Bureau, MAVIG, GmbH;Consultant, ControlRad Systems, Inc
David Borrego, PHD, Washington, DC (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will review risks, including radiation-related risks and other risks, to patients undergoing and staff participating in fluoroscopically-guided interventional procedures. Perspective on the magnitude of these risks will be provided, and strategies for managing risk will be discussed. Understanding risks and their magnitude is important for data-driven clinical decision-making, informed consent, and optimization of patient and staff protection.

LEARNING OBJECTIVES

1) Identify risks to patients and staff from fluoroscopically-guided interventions 2) Where possible, quantify the relative magnitudes of these risks 3) Formulate strategies for managing identified risks*Course Description This course will review risks, including radiation-related risks and other risks, to patients undergoing and staff participating in fluoroscopically-guided interventional procedures. Perspective on the magnitude of these risks will be provided, and strategies for managing risk will be discussed. Understanding risks and their magnitude is important for data-driven clinical decision-making, informed consent, and optimization of patient and staff protection.

Multimodal Imaging of Vascular Anatomy and Vascular Variants

Wednesday, Nov. 30 9:30AM - 10:30AM Room: NA

Participants
Sandeep S. Hedgire, MD, Lexington, MA (*Presenter*) Nothing to Disclose
Filipe Caseiro Alves, MD, PhD, Coimbra, Portugal (*Presenter*) Nothing to Disclose
Kedar Sharbidre, MD, Birmingham, AL (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course in lecture format will focus on the vascular anatomy of the chest, abdomen, and pelvis as seen on various imaging modalities. Upon completion of the course, the audience will be able to identify conventional as well as clinically relevant vascular anatomy on imaging.

LEARNING OBJECTIVES

1) Describe the various anatomic variations of the chest, abdomen, and pelvic vasculature 2) Describe the roles of MRI, CT, and ultrasound in the assessment of these vascular variations 3) Discuss the clinical relevance of some of the common variants*Course Description This course in lecture format will focus on the vascular anatomy of the chest, abdomen, and pelvis as seen on various imaging modalities. Upon completion of the course, the audience will be able to identify conventional as well as clinically relevant vascular anatomy on imaging.

RSNA/ESR Symposium: Imaging of Neurodegenerative Disorders - Dementia: Towards an Aetiologic Diagnosis

Wednesday, Nov. 30 9:30AM - 10:30AM Room: NA

Participants
Alexander Drzezga, MD, Cologne, Germany (*Presenter*) Research support, Siemens AG ;Research support, Life Molecular Imaging;Research support, General Electric Company;Research support, Eli Lilly and Company;Research support, Eisai Co, Ltd;Consultant, Siemens AG ;Consultant, General Electric Company
Meike W. Vernooij, MD, PhD, Rotterdam, Netherlands (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This educational session will discuss how in current clinical practice imaging modalities such as MRI and molecular imaging techniques can be used to support an etiologic diagnosis of dementia. This session will give general radiologists and those interested in neuroradiology and nuclear medicine/molecular imaging the knowledge needed for appropriate selection and structured assessment of imaging exams in diagnostic work-up of dementia. The session format consist of in part lectures, followed by an interactive case-based discussion.

LEARNING OBJECTIVES

1) Explain the current use of MRI for etiologic dementia diagnosis 2) Explain the current use of molecular imaging for etiologic dementia diagnosis 3) Demonstrate structured selection and assessment of imaging exams through cases*Course Description This educational session will discuss how in current clinical practice imaging modalities such as MRI and molecular imaging techniques can be used to support an etiologic diagnosis of dementia. Big Data for QI

Wednesday, Nov. 30 11:00AM - 12:00PM Room: NA

Participants
Ronilda Lacson, MD, PhD, Lexington, MA (*Presenter*) Nothing to Disclose
Patricia Balthazar, MD, Atlanta, GA (*Presenter*) Nothing to Disclose
Neena Kapoor, MD, Wellesley, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Big data refers to the use of large data sets for artificial intelligence, advanced analytics, and various research and non-research related applications. Big data is increasingly being used by informatics and quality improvement teams to increase quality, safety, performance standards in radiology. The purpose of this course will be to illustrate how big data is used in various informatics tools to create measurable goals and drive impactful change in radiology departments. The course will consist of several lectures with a question-and-answer portion. At the end of this course, participants will have a greater understanding of informatics tools that can improve their radiology practice.

LEARNING OBJECTIVES

1) Illustrate informatics tools that enable quality, patient safety and performance improvement 2) Describe how informatics tools can be used to create specific metric, communicate performance, and monitor and sustain gains 3) Describe relevance and use of informatics tools to enable various components of a performance improvement initiative*Course Description Big data refers to the use of large data sets for artificial intelligence, advanced analytics, and various research and non-research related applications. ASRT@RSNA: Delivering a Superior Patient Experience

Wednesday, Nov. 30 11:00AM - 12:00PM Room: NA

Participants
Laura Aaron, PhD, RT, Natchitoches, LA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

The patient experience is a common theme in healthcare due to the link with reimbursement. All areas of healthcare must know the ways in which they can create a positive experience for the patient and radiology is no exception. The factors that impact the patient experience will be explored. Attendees at this presentation will learn strategies and techniques that can be used by technologists to create a superior patient experience.

LEARNING OBJECTIVES

1) Discuss the concepts of patient and family-centered care 2) Explain the relationship between the patient experience and the impact on radiology 3) Develop techniques to create a superior patient experience*Course Description The patient experience is a common theme in healthcare due to the link with reimbursement. All areas of healthcare must know the ways in which they can create a positive experience for the patient and radiology is no exception. Essentials of Breast Imaging: Diagnostic Practice on Ultrasound, Tomosynthesis, and MRI

Wednesday, Nov. 30 1:30PM - 2:30PM Room: NA

Participants
Andrew Evans, MRCP, FRCR, Chesterfeild, United Kingdom (*Presenter*) Speaker, Samsung Electronics Co, Ltd
Sophia Zackrisson, Malmo, Sweden (*Presenter*) Speaker, Siemens AG;Speaker, Bayer AG;Speaker,Pfizer Inc;Patent holder, PCT/EP2014/057372;
Katja Pinker-Domenig, MD, PhD, New York, NY (*Presenter*) Speakers Bureau, European Society of Breast Imaging;Speakers Bureau, Siemens AG;Speakers Bureau, IDKD;Speakers Bureau, Canon Medical Systems Corporation;Consultant, F. Hoffmann-La Roche Ltd;Consultant, Merantix Healthcare;Consultant, AURA Health

COURSE DESCRIPTION

This educational course will explain the technique and indications of breast ultrasound, digital breast tomosynthesis and breast MRI and summarize its indications in clinical breast imaging. Upon completion of this course participants will understand the current clinical applications and limitations of the methods.

LEARNING OBJECTIVES

1) To have a basic knowledge of the advantages and limitations of x-ray-based breast imaging methods. 2) To understand when to do ultrasound in symptomatic breast practice and in what situations add-on US techniques are useful. 3) To have a basic understanding of breast MRI techniques, indications, reporting and consequent management recommendations.*Course Description This educational course will explain the technique and indications of breast ultrasound, digital breast tomosynthesis and breast MRI and summarize its indications in clinical breast imaging. Upon completion of this course participants will understand the current clinical applications and limitations of the methods.

COURSE DESCRIPTION

The assessment of fibrotic diffuse lung injury can be problematic for radiologists who are key members of multidisciplinary conferences (MDD). This session is designed to help the radiologist understand the strengths and weaknesses of the MDD. Eight cases of diffuse lung injury will be presented to 4 experienced chest radiologists. The complete DICOM set of images will be displayed to both the panelists and the participants. This will allow the 4 panelists to describe the key features that support a diagnosis. The design of the session will also allow the participants to gauge the degree of agreement between experienced chest radiologists. The chief of pulmonary pathology at the Joint Pathology Center in Silver Spring will also participate giving a more accurate picture of the MDD. The unknown cases can also be viewed on your internet enabled phone, tablet or computer.

LEARNING OBJECTIVES

After participating in the HRCT Interpretation session, the participants will acquire: 1) Capacity to identify key imaging features of multi-compartment lung injury that lead to an understanding of pathophysiology 2) Capacity to analyze the key imaging features of diffuse lung disease that lead to pulmonary fibrosis including: organizing pneumonia, idiopathic pulmonary fibrosis, acute interstitial pneumonia/ARDS, cigarette smoke related fibrosis and sarcoidosis 3) Capacity to better manage and contribute to a multi-disciplinary conference (MDD) that focuses on diffuse lung disease*Course Description The assessment of fibrotic diffuse lung injury can be problematic for radiologists who are key members of multidisciplinary conferences (MDD). This session is designed to help the radiologist understand the strengths and weaknesses of the MDD. Eight cases of diffuse lung injury will be presented to 4 experienced chest radiologists. The complete DICOM set of images will be displayed to both the panelists and the participants. This will allow the 4 panelists to describe the key features that support a diagnosis. AI Governance in Medical Imaging: How to Herd the Cats and Avoid Chaos

Wednesday, Nov. 30 1:30PM - 2:30PM Room: NA

Participants
Jeevesh Kapur, FRCR,MMed, Singapore, Singapore (*Presenter*) Co-founder, Medo.ai Inc;Stock Holder, Medo.ai Inc
Marc Kohli, MD, San Francisco, CA (*Presenter*) Founder, Alara Imaging;Stockholder, Alara Imaging
Paul J. Chang, MD, Chicago, IL (*Moderator*) Research Grant, Koninklijke Philips NV;Advisory Board, Bayer AG;Advisory Board, Aidoc Inc;Advisory Board, Inference Analytics, Inc;Advisory Board, Subtle Medical, Inc;Advisory Board, Gesund.ai

COURSE DESCRIPTION

While there has been significant initial hype and anxiety regarding the application of artificial intelligence approaches to help improve the radiology value proposition, radiologists now have a more realistic and practical perspective with respect to AI in radiology. Many are now beginning to make decisions regarding how best to leverage AI in their practices. This session will discuss the absolute necessity of developing and implementing an appropriate AI governance model as part of any successful AI implementation strategy.

LEARNING OBJECTIVES

1) The importance of AI governance as part of any successful AI implementation will be explained 2) Attendees will be introduced to best practice characteristics of effective and sustainable AI governance 3) Strategies on how to best develop and implement AI governance will be presented*Course Description While there has been significant initial hype and anxiety regarding the application of artificial intelligence approaches to help improve the radiology value proposition, radiologists now have a more realistic and practical perspective with respect to AI in radiology. Many are now beginning to make decisions regarding how best to leverage AI in their practices. COURSE DESCRIPTION

Overview of the role of Interventional Oncology in the management of metastatic disease. The common concepts in the use of local curative therapies for hepatic and pulmonary metastases will be presented. Multidisciplinary discussion will be encouraged. The use of locoregional treatment in the setting of metastatic disease will also be presented and discussed.

LEARNING OBJECTIVES

1) Describe the role of interventional Oncology in the setting of metastatic disease 2) Indications and Expectations of locoregional therapies in oligometastatic disease 3) Liver directed therapies for common metastatic hepatic pathologies*Course Description Overview of the role of Interventional Oncology in the management of metastatic disease. The common concepts in the use of local curative therapies for hepatic and pulmonary metastases will be presented. Multidisciplinary discussion will be encouraged. The use of locoregional treatment in the setting of metastatic disease will also be presented and discussed.

Chest Imaging: When Molecular Imaging Helps

Wednesday, Nov. 30 1:30PM - 2:30PM Room: NA

Participants
Robert K. Zeman, MD, Potomac, MD (*Presenter*) Nothing to Disclose
Pamela Woodard, MD, Saint Louis, MO (*Presenter*) Researcher, Siemens AG;Consulting, Medtronic plc;Researcher, Bayer AG;Patent, Washington University
Rachna Madan, MD, Boston, MA (*Presenter*) Nothing to Disclose
Ryan J. Avery, MD, Chicago, IL (*Presenter*) Research Consultant, Konica Minolta, Inc

COURSE DESCRIPTION

Molecular imaging has the distinct advantage of providing functional and physiologic data that can be interpreted in conjunction with the traditional anatomic imaging. While pulmonary nodules and mediastinal masses have traditionally been assessed with cross sectional imaging, the complementary approach of evaluating tumor characteristics, whether by metabolic activity or tumor marker expression, has fundamentally changed chest imaging. Further, the physiologic detection of functional loss of lung perfusion continues to exemplify the use of molecular imaging techniques for both pulmonary function evaluation and the assessment of pulmonary perfusion abnormalities. Finally, the increasing quantitative assessment of myocardial blood flow and perfusion utilizing nuclear cardiac scintigraphy, including cardiac PET/CT, has become increasingly useful to detect functional assessment of coronary artery disease that can be utilized for chest pain and myocardial injury assessment.

LEARNING OBJECTIVES

1) Identify the increasing availability and use of PET imaging techniques for detection and characterization of lung lesions. This will include a review of important incidental findings on chest CT with emphasis on pulmonary nodule management, discussion of potential clinical significance and appropriate work-up, and a review of guidelines for reporting and management 2) Discuss the persistent role of lung perfusion scintigraphy techniques for both qualitative and quantitative analysis of lung function in the setting of lung transplantation and surgical planning, including planning for resection planning and techniques for assessment and treatment of chronic thromboembolic pulmonary hypertension. 3) Discussion of the mechanism and techniques available for detection of obstructive coronary artery disease, small vessel disease, Covid-19, amyloidosis, and sarcoid related pathology using a multimodality approach in cardiothoracic imaging, to include Nuclear Medicine, PET/CT, CT and MRI.*Course Description Molecular imaging has the distinct advantage of providing functional and physiologic data that can be interpreted in conjunction with the traditional anatomic imaging. While pulmonary nodules and mediastinal masses have traditionally been assessed with cross sectional imaging, the complementary approach of evaluating tumor characteristics, whether by metabolic activity or tumor marker expression, has fundamentally changed chest imaging. Further, the physiologic detection of functional loss of lung perfusion continues to exemplify the use of molecular imaging techniques for both pulmonary function evaluation and the assessment of pulmonary perfusion abnormalities. What Every Radiologist Should Know about Current Payer Issues

Wednesday, Nov. 30 1:30PM - 2:30PM Room: NA

Participants
Melissa Chen, MD, Houston, TX (*Presenter*) Nothing to Disclose
Richard Heller III, MD, Chicago, IL (*Presenter*) Consultant, Gerson Lehrman Group, Inc;
Ed Gaines III, JD, Greensboro, NC (*Presenter*) Officer, Zotec Partners LLC

COURSE DESCRIPTION

To maintain operations, medical practices require reasonable reimbursement for their services. As the expression goes, "no money, no mission". With the United States outspending every other high-income nation on a per capita basis for healthcare, there is increasing pressure to reduce healthcare spending where feasible. Part of those efforts include attempts to reduce reimbursement for certain specialties, including radiology. This session explores these challenges to radiology, examining both private and public payer issues. In addition, artificial intelligence (AI) tools have the potential to re-shape the way radiologic care is delivered. The session will also examine the issue of reimbursement for AI and its impact on radiology.

LEARNING OBJECTIVES

1) Understand the current issues facing patients and medical practices related to the No Surprises Act and construct an approach to deal with these challenges 2) Understand the current issues facing patients and radiology practices related to Medicare reimbursement and construct an approach to deal with these challenges 3) Understand the various mechanisms that are utilized by payers to reimburse for artificial intelligence tools in medical care and distinguish their effects on tool adoption*Course Description To maintain operations, medical practices require reasonable reimbursement for their services. COURSE DESCRIPTION

Explore the world of pediatric chest imaging! From the bubbly lesions to solid masses, a wide breadth of abnormalities of the lung and chest wall will be discussed in this educational lecture to increase familiarity with disease processes and highlight key imaging features of diagnosis.

LEARNING OBJECTIVES

1) Understand the differential diagnosis of lucent chest lesions in pediatric patients based on clinical context and imaging features 2) Apply imaging features of single or multiple solid lung masses to guide management in children based on clinical context 3) Review the differential diagnosis and imaging manifestations of pediatric chest wall abnormalities*Course Description Explore the world of pediatric chest imaging! From the bubbly lesions to solid masses, a wide breadth of abnormalities of the lung and chest wall will be discussed in this educational lecture to increase familiarity with disease processes and highlight key imaging features of diagnosis.

Virtual Clinical Trial

Wednesday, Nov. 30 1:30PM - 2:30PM Room: NA

Participants
Hilde Bosmans, PhD, Leuven, (*Presenter*) Stockholder, Qaelum NV;Research Grant, Siemens AG;Research Grant, General Electric Company
Aldo Badano, PhD, Silver Spring, MD (*Presenter*) Research Grant, Barco nv
Ehsan Samei, PhD, Durham, NC (*Presenter*) Research Grant, General Electric Company;Advisory Board, General Electric Company;Research Grant, Siemens AG;Advisory Board, Siemens AG;Advisory Board, medInt Holdings, LLC;Advisory Board, Metis Health Analytics;Research Consultant, Nanox Imaging Ltd;Royalties, General Electric Company;Royalties, medInt Holdings, LLC;Royalties, 12 Sigma Technologies;Royalties, Mirion Technologies, Inc;Royalties, Cambridge University Press;Royalties, John Wiley & Sons, Inc

COURSE DESCRIPTION

The complexity and diversity of medical imaging technologies have continued to accelerate, outpacing our ability to optimize their use. This has become a significant challenge across the spectra of scientific inquires, product designs, and clinical applications. New imaging technology has been traditionally evaluated through clinical trials. However, such trials are often not feasible or even definitive due to ethical limitations, expense, time requirements, difficulty in accruing enough subjects - especially with low prevalence conditions, or the fundamental lack of ground truth. Virtual Clinical Trials (VCT) provide a new paradigm to assess the impact of medical imaging innovations on patient care. VCTs offer a new disease-known approach to conduct medical trials that can be clinically relevant, timely, and accurate while reflecting the variabilities of human subjects and disease, as well as the complexities of technologies, providing answers that would otherwise be impractical to obtain or simply unattainable. A VCT consists of 1) realistic populations of computational patients spanning ages and a range of phenotypical characteristics including sex and race with realistic models of disease, 2) detailed models of clinical imaging systems, and 3) computational models of the image interpretation processes. This session offers a summary of VCT methods and processes in the field of radiology and highlights applications in clinical practice and in the regulatory assessment of imaging products.

LEARNING OBJECTIVES

1) Understand the role of virtual trials in medicine and in radiology 2) Understand the components of virtual imaging trials 3) Understand the research, clinical, and regulatory potentials of virtual trials*Course Description The complexity and diversity of medical imaging technologies have continued to accelerate, outpacing our ability to optimize their use. This has become a significant challenge across the spectra of scientific inquires, product designs, and clinical applications. New imaging technology has been traditionally evaluated through clinical trials. ASRT@RSNA: A Case for Fluoroscopy

Wednesday, Nov. 30 1:30PM - 2:30PM Room: NA

Participants
Travis Prowant, MS, RT, Mechanicsville, VA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will provide a broader understanding of the principles of fluoroscopy in radiology and a familiarity with the many diagnostic techniques available, their values and limitations, and how they may best be used in the management of the patient. With advancements in other imaging modalities such as CT and MR, many fluoroscopic examinations are no longer performed routinely. This course is designed to express the value of fluoroscopy, in both the dynamic nature whereby clinical questions can be answered, but also in the safety and cost-effectiveness realms.

LEARNING OBJECTIVES

1. Explain how fluoroscopy is used to enhance overall patient care and department efficiency. 2. Describe fluoroscopic operation to include the basic image production chain.3. Explain radiation protection strategies for the patient, radiographer and radiologist during fluoroscopic examination. 4. Recite the patient preparation, various contrast materials used, basic patient positioning and patient education for gastrointestinal and genitourinary procedures.5. Discuss normal anatomy, variants and pathological conditions.6. Summarize the important role of the Registered Technologist (R.T.) and Registered Radiologist Assistant (R.R.A.) in day-to-day fluoroscopy schedules.*Course Description This course will provide a broader understanding of the principles of fluoroscopy in radiology and a familiarity with the many diagnostic techniques available, their values and limitations, and how they may best be used in the management of the patient. With advancements in other imaging modalities such as CT and MR, many fluoroscopic examinations are no longer performed routinely. This course is designed to express the value of fluoroscopy, in both the dynamic nature whereby clinical questions can be answered, but also in the safety and cost-effectiveness realms.

Fakes, Forgeries, and Hidden Repairs in Art and Archaeology - The Role of Forensic Imaging

Wednesday, Nov. 30 1:30PM - 2:30PM Room: NA

Participants
Jonathan Brown, MS, Chicago, IL (*Presenter*) Nothing to Disclose
Vahid Yaghmai, MD, Orange, CA (*Presenter*) Nothing to Disclose
Barry Daly, MD, Baltimore, MD (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

A major challenge in the world of art is the prevalence of faux or stolen treasures or works with concealed repairs. One of the major applications of modern imaging technology in this setting is the ability to non-invasively investigate the 3D structure and hidden internal contents of ancient and fragile treasures, with detail not previously possible. Using a case-based approach, this course addresses the use of advanced imaging techniques to confirm or refute the authenticity of ancient artworks, from 3,000 year old Mezo-American statues to late Renaissance musical instruments and paintings. The implications of forgery, erroneous provenance, and concealed alterations or repairs to ancient artworks are discussed. The use of modern imaging technology in this setting has been shown to promote greater understanding of the cultural value of art treasures among the general public. This work has also helped to better inform the wider community of the very high resolution and 3D capabilities of modern CT machines and of the role of radiology professionals.

LEARNING OBJECTIVES

1) To introduce the use of high resolution CT technology for non-invasive investigation of ancient and fragile cultural treasures 2) To raise awareness of the prevalence of widespread fraud and fakery in the world of historic art and learn how radiology professionals may contribute to this work*Course Description A major challenge in the world of art is the prevalence of faux or stolen treasures or works with concealed repairs. One of the major applications of modern imaging technology in this setting is the ability to non-invasively investigate the 3D structure and hidden internal contents of ancient and fragile treasures, with detail not previously possible. RSNA/ESR Symposium: Imaging of Neurodegenerative Disorders - Movement Disorders

Wednesday, Nov. 30 1:30PM - 2:30PM Room: NA

Participants
Kejal Kantarci, MD, Rochester, MN (*Presenter*) Research support, Eli Lilly and Company;Consultant, Biogen Idec Inc
Val J. Lowe, MD, Rochester, MN (*Presenter*) Research Grant, General Electric Company;Research Grant, Siemens AG;Research Grant, Eli Lilly and Company;Research Consultant, Eli Lilly and Company
Stephane Lehericy, MD, PhD, Clichy, France (*Presenter*) Research Grant, Biogen Idec Inc;Consultant, F. Hoffmann-La Roche Ltd
Meike W. Vernooij, MD, PhD, Rotterdam, Netherlands (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This educational session will discuss how MRI and molecular imaging techniques can be used to understand the underlying pathology in patients with Lewy body disorders. This session will give general radiologists and those interested in neuroradiology and nuclear medicine/molecular imaging the knowledge needed for appropriate selection and structured assessment of imaging exams in diagnostic work-up of movement disorders. The session format consists of in part lectures, followed by an interactive case-based discussion.

LEARNING OBJECTIVES

1) Explain the current use of MRI in Lewy body disease and movement disorders. 2) Explain the current use of molecular imaging in Lewy body disease and movement disorders. 3) Demonstrate structured selection and assessment of imaging exams through cases.*Course Description This educational session will discuss how MRI and molecular imaging techniques can be used to understand the underlying pathology in patients with Lewy body disorders. This session will give general radiologists and those interested in neuroradiology and nuclear medicine/molecular imaging the knowledge needed for appropriate selection and structured assessment of imaging exams in diagnostic work-up of movement disorders. Challenges in Imaging the Very Sick Heart Failure Patient: Imaging in the Peri-transplant Period

Wednesday, Nov. 30 3:00PM - 4:00PM Room: NA

Participants
Daniel Vargas, MD, Denver, CO (*Presenter*) Nothing to Disclose
Carole Dennie, MD, Ottawa, ON (*Presenter*) Research Consultant, AstraZeneca PLC

COURSE DESCRIPTION

This lecture-based session will focus on CT imaging of the severe heart failure patient. We will cover practical tips and tricks to image the heart and coronary arteries in patients who have a low ejection fraction and/or arrhythmias with or without support devices. Imaging of complications of LVAD and RVAD will also be reviewed including pitfalls and technical aspects that help improve image quality. Lectures will be followed by a 20 minute question and answer period

LEARNING OBJECTIVES

1) Recall protocols to improve CT imaging of the heart and coronary arteries in patients with low ejection fraction and/or arrhythmia
2) Explain imaging pitfalls and complications of left and right ventricular assist devices*Course Description This lecture-based session will focus on CT imaging of the severe heart failure patient. We will cover practical tips and tricks to image the heart and coronary arteries in patients who have a low ejection fraction and/or arrhythmias with or without support devices. Image Exchange: How Do We Ditch the Disk by 2024?

Wednesday, Nov. 30 3:00PM - 4:00PM Room: NA

Participants
Gloria Hwang, MD, Hillsborough, CA (*Presenter*) Spouse, Stockholder, Thrombx Medical, Inc;Spouse, Consultant, Terumo Corporation;Spouse, Consultant, Johnson & Johnson;Spouse, Research Grant, Stryker Corporation;Spouse, Research Grant, Siemens AG;Spouse, Research Grant, Route 92 Medical, Inc
Amy Kotsenas, MD, Rochester, MN (*Presenter*) Nothing to Disclose
David Larson, MD, MBA, Portola Valley, CA (*Presenter*) Research Grant, Siemens AG ;Advisor, Bunkerhill Health;Shareholder, Bunkerhill Health
Audrey Verde, MD,PhD, Nashville, TN (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

When most home computers no longer have an external disc drive, why do we continue to provide our patients their images on discs? Join us in this didactic, and panel session to learn about the current state of image sharing, possible models for our field to transition with vendors to fully electronic image sharing, and how vendors can engage in this process.

LEARNING OBJECTIVES

1) Learn the current state of image sharing across the US 2) Learn models for moving forward to full electronic image sharing 3) How to engage with vendors to transition from disk to electronic imaging sharing*Course Description When most home computers no longer have an external disc drive, why do we continue to provide our patients their images on discs? Join us in this didactic, and panel session to learn about the current state of image sharing, possible models for our field to transition with vendors to fully electronic image sharing, and how vendors can engage in this process.

Shaping Your Online Brand through Social Media Use, Analytics, and Research

Wednesday, Nov. 30 3:00PM - 4:00PM Room: NA

Participants
Omer Awan, MD, MPH, Lutherville Timonium, MD (*Presenter*) Nothing to Disclose
Sherry Wang, MBBS, Salt Lake City, UT (*Presenter*) Royalties, RELX
Vinay Prabhu, MD, Brooklyn, NY (*Presenter*) Stockholder, AbbVie Inc;Stockholder, Alphabet Inc;Stockholder, Meta Platforms Inc;Stockholder, Moderna, Inc;Stockholder, Repligen Corporation;Stockholder, Groupe Sanofi

COURSE DESCRIPTION

This lecture will provide radiologists with a strong foundation from which to launch or improve their social media experience, avoid common and problematic errors, and take advantage of unique opportunities available on these platforms.

LEARNING OBJECTIVES

1) Define important facets of a professional social media profile 2) Evaluate social media impact by assessing objective performance metrics 3) Explain common errors in professionalism on social media platforms 4) Perform unbiased research studies utilizing publicly available social media data 5) Formulate ways to positively shape a professional brand on social media*Course Description This lecture will provide radiologists with a strong foundation from which to launch or improve their social media experience, avoid common and problematic errors, and take advantage of unique opportunities available on these platforms.

New Frontiers in Stroke Imaging and Treatment

Wednesday, Nov. 30 3:00PM - 4:00PM Room: NA

Participants
Jeremy Heit, MD,PhD, Los Altos, CA (*Presenter*) Consultant, Medtronic plc;Consultant, Terumo Corporation;Consultant, iSchemaView, Inc;Scientific Advisory Board, iSchemaView, Inc;Medical Advisory Board, iSchemaView, Inc;Committee Member, Vesalio
Sameer A. Ansari, MD,PhD, Chicago, IL (*Presenter*) CEO, Clearvoya;Research Consultant, Boston Scientific Corporation;Research Consultant, Hyperfine Research, Inc;Research Consultant, Imperative Care Inc;Data Safety Monitoring Board, RaPID Medical Technologies, LLC;Data Safety Monitoring Board, Medtronic plc
Jennifer Soun, MD, Irvine, CA (*Presenter*) Research Grant, Canon Medical Systems Corporation
Lily L. Wang, MBBS, Cincinnati, OH (*Presenter*) Committee member, F. Hoffmann-La Roche Ltd

COURSE DESCRIPTION

Acute ischemic stroke is the leading cause of disability in the United States and results in significant mortality worldwide. Recent advances in ischemic stroke patient treatment using both intravenous thrombolysis and endovascular thrombectomy have resulted in improved outcomes and increased utilization of brain imaging. In this course, we will review existing and emerging artificial intelligence platforms to evaluate ischemic stroke patients, novel methods to assess collateral blood flow in ischemic stroke patients, and advances in endovascular thrombectomy treatment of ischemic stroke due to large vessel occlusions.

LEARNING OBJECTIVES

1) To understand how new artificial intelligence and computer assisted imaging platforms are used clinically for the evaluation and treatment triage of ischemic stroke patients 2) To describe how venous outflow and a more comprehensive analysis of collateral blood flow in ischemic stroke patients predicts patient outcomes after treatment 3) To understand how endovascular thrombectomy is used for ischemic stroke patient treatment 4) To describe new frontiers in endovascular thrombectomy and how they may impact ischemic stroke treatment in the near future*Course Description Acute ischemic stroke is the leading cause of disability in the United States and results in significant mortality worldwide. Recent advances in ischemic stroke patient treatment using both intravenous thrombolysis and endovascular thrombectomy have resulted in improved outcomes and increased utilization of brain imaging. In this course, we will review existing and emerging artificial intelligence platforms to evaluate ischemic stroke patients, novel methods to assess collateral blood flow in ischemic stroke patients, and advances in endovascular thrombectomy treatment of ischemic stroke due to large vessel occlusions.

ASRT@RSNA: R(AI)DIOLOGY: An Introduction to Artificial Intelligence, and its Radiologic Future

Wednesday, Nov. 30 3:00PM - 4:00PM Room: NA

Participants
Bradford Gildon, BS, RT, Oklahoma City, OK (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

Artificial intelligence (AI) is a futuristic technology only used in the plots of science-fiction movies—or is it? This presentation will review the historical context of AI, what it is, and the general concepts of how it works. Examples of AI in public use, its use in healthcare, and its use specifically in radiology will also be identified. For example, its role with detecting cases of COVID-19 based on radiographic image data will be discussed. The science and technology of AI continue to make increasing gains in functionality, but ethical/legal implications may quickly outpace these advancements. The implications of AI are profound, and it may change the landscape of not only radiology, but also of future healthcare delivery as a whole.

LEARNING OBJECTIVES

1) Define artificial intelligence (AI), and review a brief history of its development 2) Contrast various aspects of AI, machine learning, and deep learning processes 3) Identify current and emerging applications of AI in everyday life; in healthcare; and in radiology 4) Review ethical and legal implications of the use of AI in healthcare and radiology spaces*Course Description Artificial intelligence (AI) is a futuristic technology only used in the plots of science-fiction movies—or is it? This presentation will review the historical context of AI, what it is, and the general concepts of how it works. Examples of AI in public use, its use in healthcare, and its use specifically in radiology will also be identified. For example, its role with detecting cases of COVID-19 based on radiographic image data will be discussed. The science and technology of AI continue to make increasing gains in functionality, but ethical/legal implications may quickly outpace these advancements. COURSE DESCRIPTION

The full-scale Russian invasion of Ukraine on February 24th, 2022 brought the largest humanitarian disaster since the World Word II to the heart of Europe. Ukraine has lost tens of thousands of civilian lives, out of which many were innocent children. Many more have been wounded, with approximately a third of the population of Ukraine being displaced: 7 million as refugees and 7.1 million as internally displaced people According to Ukraine's Minister of Health, Viktor Liashko, during the first 100 days of war more than 600 healthcare facilities sustained damage, 105 of which were rendered beyond repair. Even if the war stopped today, the damage to the healthcare infrastructure will remain for years to come without world's continuing support.Prior to the full-scale Russian invasion, according to unpublished Ukrainian NCI (Tumor Registry) data, in Ukraine with 44 million population, an estimated 139,000 people were living with newly diagnosed cancer, and between 1,000 and 1,200 children were receiving active cancer treatment. Regarding radiotherapy, Ukraine is classified by DIRAC IAEA as a Low Middle Income country with the level of availability being 2.6 External Beam Radiation Therapy (EBRT) machines per 1 million people. Per DIRAC data, until Russia annexed Crimea and parts of the Donbas region in 2014, Ukraine had 52 radiation therapy centers with 86 Co-60 machines (81%) and 20 linear accelerators (19%). Since 2014 Ukraine has lost control of 10 cancer centers and over 13 EBRT machines in occupied part of Donbas and 5 machines in Crimea (totally 17% of Ukrainian EBRT machines). To address the growing need for cancer treatment, 16 linear accelerators were installed by 2022, and the ratio of Co-60 to linear accelerators became 54% to 46% (without taking into account EBRT machines in the occupied territories since 2014). The Ministry of Health of Ukraine planned to purchase additional 20 linear accelerators, but this plan did not materialize because of the Russian full-scale invasion on February 24th. In the fourth month of the war, the situation in Ukraine is fluid, and as of August 29th, 2022, 3 additional cancer centers are under occupation, 3 cancer centers have suspended operation, and 2 cancer centers are under constant shelling. Some of the centers in the west of Ukraine operate with double the volume of patients.This session will convey the Ukrainian ministry of health perspective on the healthcare situation in Ukraine, provide direct evidence of situation in radiology and radiation oncology in Ukraine, discuss US-led initiatives of to support Ukraine from Ukrainian Medical Association of Northern America (UMANA), Help Ukraine Group (HUG) and offer the call for action on practical ways to help.

LEARNING OBJECTIVES

1. Improve general understanding of the general healthcare challenges facing Ukraine2. Learn about situation in diagnostic radiology and radiation oncology in Ukraine3. Learn about the initiatives to support Ukraine*Course Description The full-scale Russian invasion of Ukraine on February 24th, 2022 brought the largest humanitarian disaster since the World Word II to the heart of Europe. Ukraine has lost tens of thousands of civilian lives, out of which many were innocent children. Many more have been wounded, with approximately a third of the population of Ukraine being displaced: 7 million as refugees and 7.1 million as internally displaced people According to Ukraine's Minister of Health, Viktor Liashko, during the first 100 days of war more than 600 healthcare facilities sustained damage, 105 of which were rendered beyond repair. Case Based Breast Review: Focus on CEM & Mammography including Tomosynthesis

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Maxine S. Jochelson, MD, New York, NY (*Presenter*) Speaker, General Electric Company
Almir Bitencourt, MD, PhD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose
Jonathan James, BMBS, Nottingham, United Kingdom (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This will be a series of 3 lectures using actual cases to discuss the utility and indications of the relatively new Contrast Enhanced Mammography as it compares to mammography including tomosynthesis, ultrasound and MRI. We will discuss the advantages and disadvantages of this technique including potential complications and workflow issues so that the audience can assess its potential role for their practices.

LEARNING OBJECTIVES

1) Compare the added value of contrast enhanced mammography compared with mammography, ultrasound and MRI 2) Describe the limitations of contrast enhanced mammography compared with mammography, ultrasound and MRI*Course Description This will be a series of 3 lectures using actual cases to discuss the utility and indications of the relatively new Contrast Enhanced Mammography as it compares to mammography including tomosynthesis, ultrasound and MRI. We will discuss the advantages and disadvantages of this technique including potential complications and workflow issues so that the audience can assess its potential role for their practices.

CTffr Versus Stress Imaging for Acute Chest Pain Patients

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Christopher Francois, MD, Rochester, MN (*Presenter*) Nothing to Disclose
U. Joseph Schoepf, MD, Charleston, SC (*Presenter*) Research Grant, Bayer AG;Research Grant, Bracco Group;Research Grant, Elucid BioImaging Inc;Consultant, Elucid BioImaging Inc;Research Grant: General Electric Company;Research Grant, Guerbet SA;Research Grant, Heartflow, Inc;Speakers Bureau, Heartflow Inc
Jill Jacobs, MD, New York, NY (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

The course will discuss application of CT FFR and stress imaging for evaluating acute chest pain patients

LEARNING OBJECTIVES

1) To identify some of the advantages of utilizing CTFFR and stress imaging for assessing patients with acute chest pain*Course Description The course will discuss application of CT FFR and stress imaging for evaluating acute chest pain patients

Lung Cancer Screening

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Debra Dyer, MD, Greenwood Village, CO (*Presenter*) Consultant, AstraZeneca PLC;Clinical Advisory Board, IMIDEX Inc
Denise R. Aberle, MD, Los Angeles, CA (*Presenter*) Investigator, Johnson & Johnson;Research Grant, Johnson & Johnson
Terrance Healey, MD, North Scituate, RI (*Presenter*) Nothing to Disclose
Jared D. Christensen, MD,MBA, Durham, NC (*Presenter*) Advisory Board, Riverain Technologies, LLC;Consultant, Coreline Soft, Co Ltd
Reginald F. Munden, MD, DMD, Charleston, SC (*Moderator*) Investor, TheraBionic GmbH;Advisory Board, Optellum Ltd;Stock options, Optellum Ltd

COURSE DESCRIPTION

Lung Cancer Screening with CT is a life saving technique that continues to evolve since adaptation following the publication NLST results in 2011. This session will provide the attendee with the latest information regarding changes in lung cancer screening policies, management of findings and challenges encountered with lung cancer screening.

LEARNING OBJECTIVES

1) Understand the updated USPSTF lung cancer screening guidelines 2) Learn about tools available for tracking lung nodules 3) Explain the challenges and opportunities of Lung-RADS now and in the future 4) Describe the role of Radiologists in mitigating harms of Lung Cancer Screening*Course Description Lung Cancer Screening with CT is a life saving technique that continues to evolve since adaptation following the publication NLST results in 2011. This session will provide the attendee with the latest information regarding changes in lung cancer screening policies, management of findings and challenges encountered with lung cancer screening.

Genitourinary and Gynecological Causes of Acute Abdominal Pain

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Gayatri Joshi, MD, Atlanta, GA (*Presenter*) Nothing to Disclose
Raffaella Basilico, MD, Chieti, Italy (*Presenter*) Nothing to Disclose
Refky Nicola, DO, Pittsford, NY (*Presenter*) Royalties, RELX

COURSE DESCRIPTION

Illustrate the findings of CT and MRI findings of urinary tract emergencies which include obstructive uropathy, infection and renovascular abnormalities.Describe the common and uncommon gynecological emergencies in the non-pregnant patient. Discuss key terminology of early 1st trimester pregnancy and review basic relevant anatomy. Demonstrate common and uncommon types of ectopic pregnancy.Illustrate mimics of ectopic pregnancy with sonographic techniques to make the correct diagnosis.

LEARNING OBJECTIVES

1) To discuss the relevant genitourinary emergencies such as obstructive uropathy and infection 2) To discuss the gynecological emergencies in the non-pregnant and pregnant patient in the first trimester*Course Description Illustrate the findings of CT and MRI findings of urinary tract emergencies which include obstructive uropathy, infection and renovascular abnormalities.Describe the common and uncommon gynecological emergencies in the non-pregnant patient. Discuss key terminology of early 1st trimester pregnancy and review basic relevant anatomy. Demonstrate common and uncommon types of ectopic pregnancy.Illustrate mimics of ectopic pregnancy with sonographic techniques to make the correct diagnosis.

Pancreatic Tumor Imaging

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Michael H. Rosenthal, MD, PhD, Boston, MA (*Presenter*) Nothing to Disclose
Zhen J. Wang, MD, San Francisco, CA (*Presenter*) Stockholder, Nextrast, Inc
Avinash Kambadakone, MD, FRCR, Boston, MA (*Presenter*) Advisory Board, Bayer AG Research Grant, General Electric Company Research Grant, Koninklijke Philips NV Research Grant, PanCAN Research Grant, Bayer
Motoyo Yano, MD, PhD, Scottsdale, AZ (*Presenter*) Nothing to Disclose
Olga R. Brook, MD, Boston, MA (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will review the current and emerging technological advancements in imaging of pancreatic tumors including deep learning based methods. Attendees will also learn updates on screening and surveillance of pancreatic cancer and importance of structured reporting.

LEARNING OBJECTIVES

1) Describe salient imaging manifestations of pancreatic tumors for diagnosis, staging and response assessment 2) Discuss the role of screening and surveillance in early diagnosis of pancreatic cancer 3) Review current and emerging applications of deep learning in pancreatic tumors 4) Explain role of structured reporting in pancreatic tumors and review recent advances in functional imaging tools*Course Description This course will review the current and emerging technological advancements in imaging of pancreatic tumors including deep learning based methods. Attendees will also learn updates on screening and surveillance of pancreatic cancer and importance of structured reporting.

Back to Basics: What Do Rads Need To Know About Radiology AI In 2022?

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Linda Moy, MD, New York, NY (*Presenter*) Grant, Siemens AG ;Advisory Board, Lunit Inc;Advisory Board, iCad, Inc
Dania Daye, MD, PhD, Medford, MA (*Presenter*) Research Consultant, Sigilon Therapeutics, Inc;Research Consultant, Medtronic plc
Katherine Andriole, PhD, Branford, CT (*Presenter*) Nothing to Disclose
Walter Wiggins, MD, PhD, Durham, NC (*Presenter*) Advisor, Qure.ai;

COURSE DESCRIPTION

In this course, learners will review the basic principles of artificial intelligence in radiology and will gain exposure to the main considerations for implementing an AI algorithm into clinical practice. This course will consist of 4 short presentations where the speakers will provide an introduction to AI, will introduce a framework for evaluating AI algorithms and will discuss best practices for implementing AI algorithms clinically. The session will also provide an overview of the most commonly used AI algorithms in clinical practice today.

LEARNING OBJECTIVES

1) Provide an overview of the basic principles of artificial intelligence in radiology 2) Provide a framework for evaluating an AI algorithm for clinical implementation 3) Provide exposure to the most commonly used AI algorithms in clinical radiology*Course Description In this course, learners will review the basic principles of artificial intelligence in radiology and will gain exposure to the main considerations for implementing an AI algorithm into clinical practice. Maureen Kohi, MD, Chapel Hill, NC (*Moderator*) Nothing to Disclose

COURSE DESCRIPTION

This course aims to educate the audience regarding minimally invasive image-guided interventions involving the genitourinary tract. Through didactic and case-based lectures, the audience will learn the clinical presentation, recommended diagnostic imaging, procedural steps, and post-procedural care of patients presenting with uterine, prostate, and pelvic diseases.

LEARNING OBJECTIVES

1) Identify strategies to diagnose and treat patients with uterine artery embolization2) Become familiar with the latest data and procedural steps for prostate artery embolization3) Recognize the clinical presentation and treatment options for pelvic venous disease*Course Description This course aims to educate the audience regarding minimally invasive image-guided interventions involving the genitourinary tract. Through didactic and case-based lectures, the audience will learn the clinical presentation, recommended diagnostic imaging, procedural steps, and post-procedural care of patients presenting with uterine, prostate, and pelvic diseases.

The AI Revolution in MSK: Hot Topics

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Naveen Subhas, MD, Cleveland, OH (*Presenter*) Research support, Siemens AG
John V. Crues III, MD, Los Angeles, CA (*Presenter*) Board Member, Turner Imaging Systems ;Medical Director, RadNet, Inc;
Paul Yi, MD, Baltimore, MD (*Presenter*) Consultant, FH Orthopedics SAS;Consultant, BunkerHill Health
Michael L. Richardson, MD, Seattle, WA (*Presenter*) Nothing to Disclose
David Larson, MD, MBA, Portola Valley, CA (*Presenter*) Research Grant, Siemens AG ;Advisor, Bunkerhill Health;Shareholder, Bunkerhill Health

COURSE DESCRIPTION

Artificial intelligence (AI) is set to transform the practice of musculoskeletal radiology and is already making waves across research and clinical practice. In this course, you'll experience a 'Power Hour' of 5 rapid-fire talks presented by experts in the field. Topics will cover a range of aspects of AI in MSK radiology, ranging from corporate perspectives and regulatory frameworks for AI in radiology to the use of AI to accelerate MRI acquisition and potential pitfalls of AI to a "DIY" data science crash course to get hands-on experience developing AI models. The 'Power Hour' will conclude with a 10 minute Q&A with speakers and audience. Join us in this course to learn more about the AI revolution in MSK!

LEARNING OBJECTIVES

1) To summarize perspectives on AI in MSK radiology from multiple stakeholders' perspectives, including corporate radiology practices and regulatory officials 2) To describe potential uses and pitfalls of AI in MSK radiology 3) To be aware of hands-on "DIY" resources to learn how to develop AI models*Course Description Artificial intelligence (AI) is set to transform the practice of musculoskeletal radiology and is already making waves across research and clinical practice. Neurologic Molecular Imaging: Read with the Experts

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants

Kirk A. Frey, MD, PhD, Ann Arbor, MI (*Presenter*) Nothing to Disclose
Alexander Drzezga, MD, Cologne, Germany (*Presenter*) Research support, Siemens AG ;Research support, Life Molecular Imaging;Research support, General Electric Company;Research support, Eli Lilly and Company;Research support, Eisai Co, Ltd;Consultant, Siemens AG ;Consultant, General Electric Company
Satoshi Minoshima, MD, PhD, Salt Lake City, UT (*Presenter*) Consultant, Hamamatsu Photonics KK;Grant, Hamamatsu Photonics KK;Grant, Nihon Medi-Physics Co, Ltd;Grant, FUJIFILM Holdings Corporation
Peter Herscovitch, MD, Chevy Chase, MD (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

This course will provide case-based presentations of PET and SPECT findings that are often seen in patients with cognitive and movement disorders, discuss current (FDG, amyloid, tau, and dopamine) and emerging radiotracers for molecular brain imaging, and explain current coverage / reimbursement status in the USA. The attendees to this course will be able to gain knowledge of the current status of molecular brain imaging, its clinical applications, and frequent imaging findings.

LEARNING OBJECTIVES

1) Identify PET and SPECT findings that are often seen in patients with cognitive and movement disorders in the clinic 2) Discuss clinical applications of amyloid PET and tau PET imaging 3) Explain emerging tracers for molecular brain imaging and current coverage / reimbursement status in the USA*Course Description This course will provide case-based presentations of PET and SPECT findings that are often seen in patients with cognitive and movement disorders, discuss current (FDG, amyloid, tau, and dopamine) and emerging radiotracers for molecular brain imaging, and explain current coverage / reimbursement status in the USA. Addressing Organizational Bias, Opportunity for Allyship, and Inclusive Leadership

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Carolyn Meltzer, MD, Los Angeles, CA (*Presenter*) Nothing to Disclose
Nabile Safdar, MD, MPH, Milton, GA (*Presenter*) Nothing to Disclose
Miriam A. Bredella, MD, Boston, MA (*Presenter*) Nothing to Disclose
Cheri Canon, MD, Birmingham, AL (*Presenter*) Royalties, The McGraw-Hill Companies

COURSE DESCRIPTION

A diverse biomedical workforce is essential for excellence in patient care. The physician workforce in radiology is predominately male and white. This interactive "Hot Topic" session will address conscious and unconscious biases, identify strategies to create a culture of inclusion with the goal to increase diversity and belonging in radiology.

LEARNING OBJECTIVES

1) Understand bias and how to counter it in yourself and others 2) Develop a culture of inclusivity and belonging 3) Identify strategies to increase diversity in radiology*Course Description A diverse biomedical workforce is essential for excellence in patient care. The physician workforce in radiology is predominately male and white. This interactive "Hot Topic" session will address conscious and unconscious biases, identify strategies to create a culture of inclusion with the goal to increase diversity and belonging in radiology.

Neonatal Imaging

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Emilio Inarejos Clemente, MD, Barcelona, Spain (*Presenter*) Nothing to Disclose
Tamara G. Kreindel, MD, Buenos Aires, Argentina (*Presenter*) Nothing to Disclose
Asef B. Khwaja, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose
Andrea S. Doria, MD, PhD, Toronto, ON (*Moderator*) Baxalta-Shire (Research Grant), Novo Nordisk (Research Grant), Terry Fox Foundation (Research Grant), PSI Foundation (Research Grant), Society of Pediatric Radiology (Research Grant), Garron Family Cancer Centre (Research Grant)

COURSE DESCRIPTION

This course focuses in current and new ultrasound and Doppler techniques used in the neonatal period as well as the ultrasound imaging of common neonatal pathology

LEARNING OBJECTIVES

1) To discuss features helpful differentiating portosystemic shunts, arterioportal fistulas and hepatic hemangiomas from Doppler Ultrasound and their clinical implications and prognosis based on the Doppler ultrasound findings 2) To discuss the current uses of microvascular imaging in neonates and its advantages specially in the follow-up neonates with necrotizing enterocolitis 3) To discuss normal imaging findings in musculoskeletal ultrasound in newborns as well as to discuss hip ultrasound (mainly developmental hip dysplasia) and lumps and bumps commonly seen in this age group and their differential diagnosis*Course Description This course focuses in current and new ultrasound and Doppler techniques used in the neonatal period as well as the ultrasound imaging of common neonatal pathology

Practical Aspects of MRI

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Adam Bush, Austin, TX (*Presenter*) Nothing to Disclose
Walter Witschey, PhD, Philadelphia, PA (*Presenter*) Nothing to Disclose
Nicole Seiberlich, PhD, Ann Arbor, MI (*Presenter*) Royalties, Siemens AG;Research support, Siemens AG
Catherine Moran, PhD, San Jose, CA (*Presenter*) Research support, General Electric Company

COURSE DESCRIPTION

In this course, basic concepts of Magnetic Resonance Imaging which are relevant to clinical practice will be explained. Common image contrasts including T1-weighting, T2-weighting, and diffusion weighting, and how they can be controlled using pulse sequence parameters, will be described. Trade-offs between imaging time and resolution will be considered. Finally, common artifacts, their causes, and mitigation strategies will be explored.

LEARNING OBJECTIVES

1) Describe how altering pulse sequence parameters can lead to T1-weighted images, T2-weighted images, and diffusion-weighted images 2) Assess in clinical practice optimal trade-offs between image resolution and scan time 3) Identify common image artifacts, and understand how to adjust MRI parameters to reduce these artifacts*Course Description In this course, basic concepts of Magnetic Resonance Imaging which are relevant to clinical practice will be explained. Common image contrasts including T1-weighting, T2-weighting, and diffusion weighting, and how they can be controlled using pulse sequence parameters, will be described. Lymphoma Case-based Multidisciplinary Review

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Sarah A. Johnson, MD, Toronto, ON (*Presenter*) Nothing to Disclose
Eugene Yu, MD,FRCPC, Toronto, ON (*Presenter*) Nothing to Disclose
Chelsea Pinnix, MD,PhD, Houston, TX (*Presenter*) Research Grant, Merck & Co, Inc

COURSE DESCRIPTION

Lymphoma comprises a group of malignancies which will in some form be encountered by all radiologists in their practice. This course will review principles of lymphoma diagnosis, staging, and response assessment which will be relevant for diagnostic radiologists involved in these cases. The session is organized in lecture format based on interesting cases of lymphoma drawn from the neuroimaging and body imaging domains. Cases will be further informed by a radiation oncology perspective. Participants will glean an advanced understanding of interpreting CT and PET/CT for lymphoma diagnosis, staging, and response assessment.

LEARNING OBJECTIVES

1) To identify characteristic imaging features of central nervous system and head and neck lymphoma 2) To interpret imaging findings in the context of response assessment 3) To distinguish appropriate uses and benefits of advanced imaging methods in diagnosis of lymphoma 4) To interpret nuances of imaging that will influence or impact treatment approach*Course Description Lymphoma comprises a group of malignancies which will in some form be encountered by all radiologists in their practice. This course will review principles of lymphoma diagnosis, staging, and response assessment which will be relevant for diagnostic radiologists involved in these cases. AOSR-RSNA Joint Symposium: Pediatric Imaging Session

Wednesday, Nov. 30 4:30PM - 5:30PM Room: NA

Participants
Judy Squires, MD, Pittsburgh, PA (*Presenter*) Nothing to Disclose
Timothy Cain, MBBS, FRANZCR, Melbourne, Australia (*Presenter*) Nothing to Disclose
Sanjay Prabhu, FRCR, MBBS, Boston, MA (*Presenter*) Nothing to Disclose
Young Hun Choi, MD, Seoul, Korea, Republic Of (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

The educational session is a series of short pediatric focussed lectures with contributors from North America and the Asia Oceanic region. The contribution from two geographic regions symbolises the common goal of the Radiological Society of North America and the Asian and Oceanic Society of Radiology to improve child health through appropriate medical imaging. Attendees will hear presentations with up to date information on a range of pediatric imaging topics.

LEARNING OBJECTIVES

1) Identify key aspects of MR safety that are particularly important when performing MR studies on paediatric patients 2) Recognise the important MR imaging characteristics of haemorrhagic lesions of the neonatal brain 3) Be aware of the common imaging features of contrast enhanced ultrasound when studying the neonatal brain 4) Understand the significance of metabolic imaging in the staging and treatment of neuroblastoma*Course Description The educational session is a series of short pediatric focussed lectures with contributors from North America and the Asia Oceanic region. Evelyn Carroll, MD, Rochester, NY (*Presenter*) Nothing to Disclose
Florence Doo, MD, MA, Sunset Beach, NY (*Presenter*) Nothing to Disclose
Vaz Zavaletta, MD,PhD, Aurora, CO (*Presenter*) Nothing to Disclose

COURSE DESCRIPTION

There are imaging findings, screening recommendations, and barriers to care that uniquely impact transgender and gender-diverse patients. Through a series of lectures and open discussion, course participants will develop a working knowledge of this information to facilitate the correct interpretation of radiologic studies for transgender and gender-diverse patients across imaging modalities and help create and promote an inclusive diagnostic and interventional radiology department. https://tinyurl.com/yckre8uz

LEARNING OBJECTIVES

1) Recognize and discuss the spectrum of gender identity and define and utilize correct terminology and personal pronouns for transgender and gender-diverse individuals 2) Recognize and describe imaging findings in transgender and gender-diverse patients after gender-affirming surgeries and medical interventions 3) Discuss and apply radiology screening guidelines for transgender and gender-diverse patients after gender-affirming surgeries and medical interventions 4) Discuss and apply strategies and best practices to create an inclusive diagnostic and interventional radiology department*Course Description There are imaging findings, screening recommendations, and barriers to care that uniquely impact transgender and gender-diverse patients. Brett M. Elicker, MD, San Francisco, CA (*Presenter*) Nothing to Disclose
Mini N. Pathria, MD, La Jolla, CA (*Moderator*) Nothing to Disclose

LEARNING OBJECTIVES

1) Identify key abnormal findings on radiologic studies that are critical to making a specific diagnosis. 2) Construct a logical list of differential diagnoses based on the radiologic findings, focusing on the most probable differential diagnoses. 3) Determine which, if any, additional radiologic studies or procedures are needed in order to make a specific final diagnosis. 4) Choose the most likely diagnosis based on the clinical and the radiologic information.*Course Description This session will employ an expert panel to discuss unknown cases in the fields of neuroradiology, musculoskeletal radiology, breast imaging, genitourinary imaging and cardiothoracic radiology. The material will include plain radiography, CT and MRI imaging with an overall theme of cases with unusual appearances that can be solved by carefully analyzing the images and recognized ancillary findings that help establish the correct diagnosis. The five expert readers will provide insights into how they approach challenging clinical cases, pearls and pitfalls during the creation of a differential diagnosis, and keys to a final diagnosis in a light-hearted entertaining format.

LEARNING OBJECTIVES

1. Learn the importance of partnership between radiologists and medical physicists; 2. Learn the experiences from leaders in the field how to work together to make a difference to advance medicine.*Course Description Highlight successful collaboration between AAPM and RSNA for imaging technical development and clinical translations.

LEARNING OBJECTIVES

1) Identify traumatic and nontraumatic emergencies 2) Prioritize workflow scenarios 3) Resolve practice management conflicts*Course Description ER stands for Exciting Radiology! Using a game show format, two teams of emergency radiologists will tackle a spectrum of traumatic and non-traumatic cases, solve clinical workflow scenarios, and address practice management issues. All in a fast-paced, multi-tasking manner representative of life in the ER STAT lane. If you’re a radiologist, emergency radiology is most likely part of your life, day and/or night, and increasing in volumes. Interested in ER? Love ER? This game is for you.

M2-QI-1 Accelerating Radiologist Workflow by Leveraging Hyponyms in Structured Reporting

Participants
Cyrillo R. Araujo, MD, Tampa, FL (*Presenter*) Nothing to Disclose

METHODS

Three radiologists applied available capabilities in the dictation software that ties hyponyms (words that trigger a sentence to a hyponym-hypernym matched field) to higher order hypernym (Fig 1). When predetermined hyponyms are included in a dictated sentence, they are matched to the appropriate hypernym field at the completion of the dictation by the command "apply findings". For example, when a dictated sentence includes "...pulmonary?", it is matched to the "Lung" hypernym field (Fig 2). Once the first set of hyponyms were created for computed tomography body exam templates, additional radiologists adopted hyponym reporting using the established database, while recommending additional hyponyms based on variable reporting styles. We share the time spent creating the hyponyms, training the radiologists and workflow efficiency average time to open, proofread and sign the final report. We applied eye tracking to objectively compare traditional (Fig 3) versus hyponym (Fig 4) reporting attention on images and dictation screens.

RESULTS

The creation of a hyponym database for body imaging took approximately two days. For at least two to four weeks, the database was updated during the workflow to reflect the dictating style of the radiologists. By the end of the first month, the first radiologist dictated 100% of CT reports utilizing hyponyms with > 95% accuracy of matched hyponyms to hypernym fields in final reports. The average time to dictate a body CT study was reduced by more than 30% with more time spent during image interpretation than looking at the dictation screen.*Discussion We present the concept of free form dictating that applies a database of select trigger hyponym words resulting in a final structured report. Our preliminary data shows reduction in time that radiologists spend looking at the non-diagnostic screen with more time interpreting the imaging findings, potentially improving radiologist efficiency and accuracy. Our first several months of hyponym reporting appears to be more efficient with a steep learning curve with a trend toward adoption. We plan on making our hyponym word bank publicly available that may facilitate a more widespread approach, especially with increasing structure reporting demands. Limitations Potential disruption in established radiologist routine, e.g. some radiologists are template and/or macro driven and may use templates and fields as a checklist.

M2-QI-2 Impact of Online MRI Safety Screening Questionnaires on Patient Workflow

Participants
Sheena Chu, (*Presenter*) Nothing to Disclose

METHODS

Safety screening was made available via a patient web portal to all outpatient MRIs prior to appointment. At the check-in desk, all patients receive a pager to alert them when the technologist is ready to initiate their final safety screening and exam. Data were retrospectively collected for all adult outpatient MRIs for one year before and after implementation of online screening, using electronic health records and an analytics platform. Time between page and first MR image (time-to-image) was the primary endpoint. Time-to-image was compared among 3 groups: those who completed online screening, those who did not during the same 1-year period (synchronous control), and all patients from 1 year prior to implementation (historical control). Exams with missing data were excluded. Post-arrival cancellations (patients who checked in but did not undergo MRI) were noted. Student's t-test compared online-screening with each control group; Mood's median test compared medians and analysis of variance compared other values across all three groups; $P<0.05$ was considered significant.

RESULTS

Of 13,626 outpatient MRIs, 113 were excluded. Included were 6,199 and 7,314 MRIs, respectively pre- and post-online screening initiation; 1,931/7,314 completed online screening. Post-arrival cancellations were significantly lower in the online screening group than both controls (0.05% vs. 8.2% 9.4%, $P<0.001$). Online screening group demonstrated a lower median and standard deviation (std) time-to-image, and fewer outliers than both control groups ($P< 0.05$). There was no significant difference in median or std of time-to-image between two control groups ($P=0.28$, 0.24 respectively). There was no difference in age, gender distribution, or fraction of patients with more than one MRI among the three groups (all $P>0.05$).*Discussion We demonstrated a correlation between using an online safety screening and a reduction in post-arrival cancellations as well as workflow delays, with a significant reduction in the number of extreme delays. Our study benefited from a large patient cohort, use of analytic platforms, and two control groups; limitations included its retrospective nature and possible selection bias. Given these promising results, we will address these limitations in future evaluations in larger cohorts and by increasing the use of the online screening tool.

M2-QI-3 Image Quality Improvement of Digital Mammography Using an Artificial Intelligent Real Time Manage System

Awards
Quality Improvement Reports Award

Participants
Ying Guo, (*Presenter*) Nothing to Disclose

METHODS

The AI system uses deep learning technology to detect nine types of abnormalities that will occur during breast X-ray examinations. The intelligent quality control system of mammography includes acquisition module, quality evaluation module and result display module. Image data of 200 cases of digital X-ray mammography before and after quality control were evaluated with the standards of Mammography Quality Standards Act (MQSA). If the image quality meets the diagnostic criteria, it is defined as grade A; if one of standards does not meet the diagnostic criteria, it is defined as grade B; if two, defined as grade C; if more than three, defined as invalid. The two groups were statistically compared before and after quality control for radiation dose, lesion detection rate, image quality and ratio of grade A, B and C.

RESULTS

After the implementation of quality control, rate of grade A increased from 78.5% to 91.4%. The rate of grade B decreased from 21.5% to 3.2%, and the rate of grade C decreased from 5.6% to 1.2%. The invalid rate remained unchanged at 0%. The lesion detection rate of micro calcification and structural distortion after quality control was higher than that before($P < 0.01$). The diagnostic sensitivity of breast lesions increased ($P < 0.01$), and the specificity of breast leisions increased ($P > 0.01$).*Discussion Through quality control and management of breast X-ray imaging by using an artificial intelligent system , the image quality of digital mammography is significantly improved. The diagnostic accuracy of breast lesions increased, so as to provide high-quality image data for clinic. AI has great potential in evaluating breast position in digital mammography by reducing subjectivity. In the future, standardized and evidence-based criteria for definitions, understandings and assessment methods are needed to reach optimal image quality in mammography.

M2-QI-4 Minimizing Phone Call Interruptions in the Emergency Department Reading Room

Participants
Hossam Elbelasi, MD, (*Presenter*) Nothing to Disclose

METHODS

Data was obtained from our campus network and infrastructure specialist. Initial pilot data showed a total of 1885 received phone calls in the emergency department reading room between 7/18/2021 and 8/17/2021. Root cause analysis was performed, and causes were grouped into 4 major categories. Teleradiology related communications was targeted for intervention. We aimed to decrease the total number of phone call interruptions by 30 % by November 2021. This was done through hiring a coordinator to handle Teleradiology related communications. We collected phone records over the course of 1 week before and after the coordinator was hired.

RESULTS

The total number of phone calls during the entire week decreased from 639 to 431 (32.5% decrease). The total time spent on the phone decreased from 853 to 724 minutes (15% decrease). During the coordinator shift (3pm-12am) the total number of phone calls has decreased by 27.5% (from 276 to 200) with average time spent on the phone during a single shift decreased from 52 mins to 36 mins (31%).*Discussion Hiring a coordinator for the Teleradiology communication showed a significant reduction in phone call interruptions. We believe that hiring full time reading room assistant to handle communication to and from the reading room will lead to even significant decrease in interruption and increase radiologist's efficiency.

M2-QI-5 Implementing a Quality Improvement Framework to Reduce Missed Care Opportunities in Screening Mammography

Participants
Adrian Jaramillo-Cardoso, MD, Boston, MA (*Presenter*) Nothing to Disclose

METHODS

Our initiative was guided by a modified health disparities research framework following four steps. Detecting: identifying the possible breakdown areas contributing to MCO by creating a process map with multiple stakeholders; and further organizing identified factors in a driver diagram. Understanding: Surveying our patient population to gain in-depth knowledge about the context of these factors and creating a pareto chart to see their individual contribution. Reducing: Employing an Impact/Effort Matrix we identified key interventions. Evaluating: Including tracking the data from our interventions and identifying challenges in the implementation of our equity efforts.

RESULTS

Key high priority and actionable intervention fronts identified included: 1. Culturally Sensitive Education: we developed educational multilingual (EN, SP, PT) videos and posters addressing SM concerns and providing information of what to expect of the process. 2. Reminder Process Improvement: Contact information was updated in our EMR but no significant statistical difference detected ($p>0.05$), we developed the infrastructure to set up a text messaging reminder process that will include our educational video. 3. Increased Scheduling Flexibility: Weekend appointments were started as a pilot at one of our imaging sites. Showing a significant decrease in MCOs (6% during 4 weekends vs. 43% during weekdays). 4. Transportation: A ride-share program will be implemented to decrease the impact of transportation issues for high risk patients.*Discussion We have developed a multi prong intervention front that attempts to address the most actionable contributing factos found to contribute to MCOs in two high risk sites within our system. Some of our interventions have provided outcomes to help our team reassess our efforts to allocate resources. We have found a modified health disparities research framework as a helpful guide on the design and implementation process of these efforts. Furthermore, using an iterative process including PDSA cycles has strongly informed the implementation of these interventions and increased our focus on mitigating the effect of health disparities in our patient population. Extending this approach to other QI initiatives holds great potential to aid in assuring health equity as a priority.

M2-QI-6 Improving Order to Completion Time for Urgent/STAT Inpatient and ED Pediatric MRI's Requiring Anesthesia/Sedation

Awards
Identified for RadioGraphics
Quality Improvement Reports Award

Participants
Jay K. Pahade, MD, Southport, CT (*Presenter*) Consultant, General Electric Company;Consultant, Clario Medical Imaging, Inc;

METHODS

Multidisciplinary team was created with radiology and pediatric quality and safety teams, MRI operations, pediatric anesthesia, MRI scheduling, and pediatric hospitalists. A3 and Model for Improvement methodology was used with flow map creations, fishbone analysis, 5 why problem solving and PDSA cycles. Interventions included revision of triage process, creating fixed add on MRI anesthesia appointment slots Monday-Friday, and linking pediatric anesthesia NPO orders to the MRI order in our electronic medical record (Epic, Verona WI)

RESULTS

Baseline (07/2020 to 10/2020) weekday mean O to B MRI time for urgent or stat inpatient/ED MRI requiring anesthesia/sedation was 1125 minutes with SD of 1198 minutes. Post intervention (09/2021-2/2022) mean O to B time decreased to 559 minutes (50% reduction) and SD decreased to 388 minutes (68% reduction).*Discussion Delays in completing urgent/stat pediatric MRI with anesthesia are often secondary to disorganized triage process, lack of slot availability in MRI, non-compliance with NPO rules for anesthesia and unclear MRI start times. This QI project redesigned workflow with all relevant stakeholders, created new fixed slots for add-on pediatric MRI anesthesia cases, and integrated expected MRI start time and pediatric anesthesia NPO order set within the MRI order in our EHR. This resulted in 50% reduction in mean order to begin time and a more reproducible process with less variation (SD reduced by 68%). Our program has displayed good sustainment after last key driver implementation in 09/2021.

M2-QI-7 Implementation of Ferrous-Free Dress Code for MRI Personnel - An MRI Safety Initiative

Participants
Julie Johnson, BS, ARRT, Atlanta, GA (*Presenter*) Nothing to Disclose

METHODS

We are a free-standing academic children's hospital. Baseline alarm rate for FMDS was obtained to evaluate frequency of passage of ferromagnetic items through our two most frequently used MRI scanners zone 4 doors. A task force was formed to establish a ferrous-free MRI environment with a focus on MRI personnel (technologists and sedation team) attire. Sub-committees of this task force included: ferrous-free clothing committee to provide resources to staff for ferrous free attire, process committee to screen and identify non-compliant staff, and an engagement committee to gain employee engagement. The engagement committee was also charged with developing a ferrous free campaign logo and posters to remind staff of go-live date. Ferrous-free dress code was implemented on October 11th 2021. Weekly alarm rates from the FMDS were evaluated to determine the impact of the ferrous-free attire initiative on alarm frequency. Processes were developed and implemented that required staff to stop and investigate any alarms produced by the doorway FMDS. Alarm rate data was collected weekly and reported to the task force monthly to serve as our metric.

RESULTS

Baseline alarm rate for the two most frequently used scanners in our pediatric facility was 172 (+/- 37) /week and 253 (+/- 59)/week. Since the implementation of ferrous-free attire, the alarm rate has trended down over time (attached plots) and is currently at 98 (+/- 29)/week and 74 (+/- 17)/week, respectively. Compliance of MRI personnel with ferrous free attire has been excellent. Most alarms are now caused due to non-MRI personnel attire, and proximity of moving zone 3 ferrous objects to the FMDS.*Discussion Implementation of a ferrous-free attire for MRI personnel is feasible with high compliance, and is essential to decrease FMDS alarm rate and resultant alarm fatigue. In the next phase of this project, ferrous-free dress requirement will be expanded to all staff, patients and guardians entering the MRI suites.

M2-QI-8 Improving the Quality of Rectal MRI for Patients With Rectal Cancer Through an Iterative, Multi-Disciplinary Process With MR Physicists, Radiographers, and Radiologists

Participants
Nikhil Shah, MEng, BSc, (*Presenter*) Nothing to Disclose

METHODS

We undertook 3 audits and 2 surveys to measure the image quality of our rectal MRI scans and radiographers' confidence in performing these scans. Each audit reviewed 1 month of rectal MRI scans for rectal adenocarcinoma. The first audit highlighted issues with bowel wall motion artefact and image resolution. The initial survey identified the training limitations of radiology personnel. To address these problems, we performed 4 interventions: 1) protocol development to optimise sequences, and testing involving MR physicists, radiographers and radiologists; 2) radiology personnel training to improve understanding of scanning technique and disease identification, measured by a second survey; 3) 2nd audit: image quality of rectal MRI scans measured against indicators, including (a) use of anterior saturation band, (b) appropriate coil positioning, (c) adequate tumour coverage, (d) imaging of mesorectum to L5/S1, and (e) use of antispasmodics; and 4) 3rd audit: a review of rectal MRI scans after introducing Buscopan and continued case review for radiographers.

RESULTS

Audit Audit results after interventions showed marked improvements in the quality of rectal MRI scans for diagnosis and management. Anterior saturation band used: 0% (1st audit), 100% (2nd audit) and 100% (3rd audit); appropriate coil positioning: 69% (1st audit), 92% (2nd audit) and 100% (3rd audit); adequate tumour coverage: 69% (1st audit), 83% (2nd audit) and 89% (3rd audit); mesorectum imaged to L5/S1: 38% (1st audit), 50% (2nd audit) and 78% (3rd audit); antispasmodic used: 0% (1st audit), 0% (2nd audit) and 67% (3rd audit).Survey Following training sessions, there was an increase in radiographers' confidence in identifying rectal cancer and orientating imaging to the axis of the tumour.*Discussion A limitation of our project was that we considered only patients with adenocarcinoma. However, patients with squamous cell carcinoma also require this level of imaging, as well as additional sequences to study the nature of the inguinal nodes.Our project resulted in significant improvements to the quality of our rectal MRI scans and our team's technical performance. It has optimised the staging of rectal cancer in our department and led to increased confidence in multidisciplinary decision making.

M2-QI-5

Implementing a Quality Improvement Framework to Reduce Missed Care Opportunities in Screening Mammography

Sunday, Nov. 27 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Adrian Jaramillo-Cardoso, MD, Boston, MA (*Presenter*) Nothing to Disclose

METHODS

Our initiative was guided by a modified health disparities research framework following four steps. Detecting: identifying the possible breakdown areas contributing to MCO by creating a process map with multiple stakeholders; and further organizing identified factors in a driver diagram. Understanding: Surveying our patient population to gain in-depth knowledge about the context of these factors and creating a pareto chart to see their individual contribution. Reducing: Employing an Impact/Effort Matrix we identified key interventions. Evaluating: Including tracking the data from our interventions and identifying challenges in the implementation of our equity efforts.

RESULTS

Key high priority and actionable intervention fronts identified included: 1. Culturally Sensitive Education: we developed educational multilingual (EN, SP, PT) videos and posters addressing SM concerns and providing information of what to expect of the process. 2. Reminder Process Improvement: Contact information was updated in our EMR but no significant statistical difference detected ($p>0.05$), we developed the infrastructure to set up a text messaging reminder process that will include our educational video. 3. Increased Scheduling Flexibility: Weekend appointments were started as a pilot at one of our imaging sites. Showing a significant decrease in MCOs (6% during 4 weekends vs. 43% during weekdays). 4. Transportation: A ride-share program will be implemented to decrease the impact of transportation issues for high risk patients.*Discussion We have developed a multi prong intervention front that attempts to address the most actionable contributing factos found to contribute to MCOs in two high risk sites within our system. Some of our interventions have provided outcomes to help our team reassess our efforts to allocate resources. We have found a modified health disparities research framework as a helpful guide on the design and implementation process of these efforts. Furthermore, using an iterative process including PDSA cycles has strongly informed the implementation of these interventions and increased our focus on mitigating the effect of health disparities in our patient population. Extending this approach to other QI initiatives holds great potential to aid in assuring health equity as a priority.

M2-QI-6

Improving Order to Completion Time for Urgent/STAT Inpatient and ED Pediatric MRI's Requiring Anesthesia/Sedation

Sunday, Nov. 27 9:00AM - 9:30AM Room: Learning Center - QI DPS

Awards
Identified for RadioGraphics
Quality Improvement Reports Award

Participants
Jay K. Pahade, MD, Southport, CT (*Presenter*) Consultant, General Electric Company;Consultant, Clario Medical Imaging, Inc;

METHODS

Multidisciplinary team was created with radiology and pediatric quality and safety teams, MRI operations, pediatric anesthesia, MRI scheduling, and pediatric hospitalists. A3 and Model for Improvement methodology was used with flow map creations, fishbone analysis, 5 why problem solving and PDSA cycles. Interventions included revision of triage process, creating fixed add on MRI anesthesia appointment slots Monday-Friday, and linking pediatric anesthesia NPO orders to the MRI order in our electronic medical record (Epic, Verona WI)

RESULTS

Baseline (07/2020 to 10/2020) weekday mean O to B MRI time for urgent or stat inpatient/ED MRI requiring anesthesia/sedation was 1125 minutes with SD of 1198 minutes. Post intervention (09/2021-2/2022) mean O to B time decreased to 559 minutes (50% reduction) and SD decreased to 388 minutes (68% reduction).*Discussion Delays in completing urgent/stat pediatric MRI with anesthesia are often secondary to disorganized triage process, lack of slot availability in MRI, non-compliance with NPO rules for anesthesia and unclear MRI start times. This QI project redesigned workflow with all relevant stakeholders, created new fixed slots for add-on pediatric MRI anesthesia cases, and integrated expected MRI start time and pediatric anesthesia NPO order set within the MRI order in our EHR. This resulted in 50% reduction in mean order to begin time and a more reproducible process with less variation (SD reduced by 68%). Our program has displayed good sustainment after last key driver implementation in 09/2021.

M2-QI-7

Implementation of Ferrous-Free Dress Code for MRI Personnel - An MRI Safety Initiative

Sunday, Nov. 27 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Julie Johnson, BS, ARRT, Atlanta, GA (*Presenter*) Nothing to Disclose

METHODS

We are a free-standing academic children's hospital. Baseline alarm rate for FMDS was obtained to evaluate frequency of passage of ferromagnetic items through our two most frequently used MRI scanners zone 4 doors. A task force was formed to establish a ferrous-free MRI environment with a focus on MRI personnel (technologists and sedation team) attire. Sub-committees of this task force included: ferrous-free clothing committee to provide resources to staff for ferrous free attire, process committee to screen and identify non-compliant staff, and an engagement committee to gain employee engagement. The engagement committee was also charged with developing a ferrous free campaign logo and posters to remind staff of go-live date. Ferrous-free dress code was implemented on October 11th 2021. Weekly alarm rates from the FMDS were evaluated to determine the impact of the ferrous-free attire initiative on alarm frequency. Processes were developed and implemented that required staff to stop and investigate any alarms produced by the doorway FMDS. Alarm rate data was collected weekly and reported to the task force monthly to serve as our metric.

RESULTS

Baseline alarm rate for the two most frequently used scanners in our pediatric facility was 172 (+/- 37) /week and 253 (+/- 59)/week. Since the implementation of ferrous-free attire, the alarm rate has trended down over time (attached plots) and is currently at 98 (+/- 29)/week and 74 (+/- 17)/week, respectively. Compliance of MRI personnel with ferrous free attire has been excellent. Most alarms are now caused due to non-MRI personnel attire, and proximity of moving zone 3 ferrous objects to the FMDS.*Discussion Implementation of a ferrous-free attire for MRI personnel is feasible with high compliance, and is essential to decrease FMDS alarm rate and resultant alarm fatigue. In the next phase of this project, ferrous-free dress requirement will be expanded to all staff, patients and guardians entering the MRI suites.

M2-QI-8

Improving the Quality of Rectal MRI for Patients With Rectal Cancer Through an Iterative, Multi-Disciplinary Process With MR Physicists, Radiographers, and Radiologists

Sunday, Nov. 27 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Nikhil Shah, MEng, BSc, (*Presenter*) Nothing to Disclose

METHODS

We undertook 3 audits and 2 surveys to measure the image quality of our rectal MRI scans and radiographers' confidence in performing these scans. Each audit reviewed 1 month of rectal MRI scans for rectal adenocarcinoma. The first audit highlighted issues with bowel wall motion artefact and image resolution. The initial survey identified the training limitations of radiology personnel. To address these problems, we performed 4 interventions: 1) protocol development to optimise sequences, and testing involving MR physicists, radiographers and radiologists; 2) radiology personnel training to improve understanding of scanning technique and disease identification, measured by a second survey; 3) 2nd audit: image quality of rectal MRI scans measured against indicators, including (a) use of anterior saturation band, (b) appropriate coil positioning, (c) adequate tumour coverage, (d) imaging of mesorectum to L5/S1, and (e) use of antispasmodics; and 4) 3rd audit: a review of rectal MRI scans after introducing Buscopan and continued case review for radiographers.

RESULTS

Audit Audit results after interventions showed marked improvements in the quality of rectal MRI scans for diagnosis and management. Anterior saturation band used: 0% (1st audit), 100% (2nd audit) and 100% (3rd audit); appropriate coil positioning: 69% (1st audit), 92% (2nd audit) and 100% (3rd audit); adequate tumour coverage: 69% (1st audit), 83% (2nd audit) and 89% (3rd audit); mesorectum imaged to L5/S1: 38% (1st audit), 50% (2nd audit) and 78% (3rd audit); antispasmodic used: 0% (1st audit), 0% (2nd audit) and 67% (3rd audit).Survey Following training sessions, there was an increase in radiographers' confidence in identifying rectal cancer and orientating imaging to the axis of the tumour.*Discussion A limitation of our project was that we considered only patients with adenocarcinoma. However, patients with squamous cell carcinoma also require this level of imaging, as well as additional sequences to study the nature of the inguinal nodes.Our project resulted in significant improvements to the quality of our rectal MRI scans and our team's technical performance. It has optimised the staging of rectal cancer in our department and led to increased confidence in multidisciplinary decision making.

M5A-QI

Quality Improvement Reports Monday Poster Discussions - A

Monday, Nov. 28 12:15PM - 12:45PM Room: Learning Center - QI DPS

Sub-Events

M5A-QI-1 Large Scale Implementation of an Artificial Intelligence Software to Improve Patient Experience and Enhance Productivity in Magnetic Resonance Departments

Participants
Augusto B. Antunes, MD, MSc, Nova Lima, Brazil (*Presenter*) Nothing to Disclose

METHODS

The implemented software is fully automatized and compatible with any MRI suite, operating on a local server without outside traffic of patient data. It improves the image's signal-to-noise ratio by using a proprietary volumetric machine-learning assisted image enhancement algorithm. The software was implemented in 2021 in 18 MRI suites located in different clinics pertaining to our teleradiology group, in 4 states in Brazil. Adherence to the optimized protocols increased throughout the year in these machines, reaching in December up to 70% of the imaging protocols of each body region

RESULTS

We compared scan length reduction, patient recall percentages, and the number of newly created slots for patient scheduling in the periods during and after the implementation of the software. An average reduction of 24% in scan length was observed in all imaging protocols in which the software was being used (range 2% to 86%), meaning a reduction from an average of 16 minutes and 14 seconds per scan to 12 minutes and 17 seconds. In 2021, we performed a total of 724476 MRI studies (an average of 60373 studies per month). On average, 667 patients (1,1%) were recalled each month due to various reasons, but mainly to administer intravenous contrast or to repeat sequences that were spoiled by motion artifacts. After software implementation, the patient's re-call number dropped to an average of 458 (0,7%). In addition, with scan length reduction we were able to offer more slots for patient scheduling, going from an average of 487 available machine/hours before software installation to 617 after its installation (an increase of 27%).*Discussion This analysis was limited to a purely operational angle, regarding how improvements in MRI acquisition can lead to better patient experience and enhanced productivity. Patient satisfaction or increase in the total number of patients scanned per month, among other metrics, depends not only on these improvements in protocols but also on a myriad of factors such as confirmation procedures, bureaucratic processes, season, etc

M5A-QI-2 A Novel Breast Imaging Intake Survey Inclusive of Transgender and Non-binary Populations to Foster Inclusion, Improve Breast Care and Better Understand Breast Cancer Risk and Outcomes

Participants
David Ly, (*Presenter*) Nothing to Disclose

METHODS

At our institution, patients who present for breast imaging complete an iPad-administered breast imaging history and breast cancer risk assessment survey. Using the modified International Breast Cancer Intervention Study (IBIS) model, the lifetime risk of developing breast cancer is estimated and additional clinical and family history that may impact breast care and future breast imaging is collected. Under the original survey workflow, patients are identified as either "male" or "female" and complete a corresponding gender-specific survey. The previous existing survey does not capture information specific to TGNB patients. In conjunction with transgender health experts and the MagView survey software development team, we developed a more comprehensive survey to better capture the experiences of TGNB patients.

RESULTS

We revised the survey using gender-inclusive language and developed four different versions to allow patients to separately self-report their sex assigned at birth and gender identity. In addition, we added questions regarding relevant medical history such as exposure to certain hormones and prior pertinent surgical history such as gender-affirming chest/breast surgery that are concordant with six gender-identity groups.*Discussion To our knowledge, this breast cancer risk assessment survey is the first among radiology departments to collect more accurate information among TGNB patients. Our survey may serve as a model for other institutions to develop gender-inclusive surveys. Moreover, long-term collection of this inclusive data by imaging centers will enhance the dataset available to improve breast care and better understand breast cancer risk and outcomes among TGNB populations.

M5A-QI-3HC Are we overdoing it? Optimizing Utilization of Renal Ultrasound in Patients with Recent Cross-Sectional Imaging

Awards
Identified for RadioGraphics

Participants

Selin Ocal, BS, Mineola, NY (*Presenter*) Nothing to Disclose

METHODS

This study was identified as IRB-exempt. 4 trainees (1 medical student, 3 radiology residents) and 2 attending radiologists reviewed electronic medical record data of patients with RUS orders within identified pre- and post-intervention periods. Information documented included: recent CSI within 48 hours, study indication, ordering department, and clinical benefit. Study intervention involved ultrasound technologist (UST) identification of RUS orders in patients with CSI in the past 48 hours and subsequent discussion with ordering team on benefit of RUS given CSI, with cancellation of orders determined to be low-yield. Pre- and post-intervention data was compared via Chi-square test.

RESULTS

Of the pre-intervention group N=210, 9.04% (19/210) of RUS orders were for patients who had undergone CT/MRI CSI in the previous 48 hours. 100% of these RUS orders were for clinical indications already answered on previous imaging. In the post-intervention group (N=714), 6.02% (43/714) of orders were for patients who had undergone recent CSI. For those with recent imaging in the post-intervention group, only 32.56% of US orders were deemed clinically beneficial, as the remaining 67.44% were for indications already answered on CSI studies. Of these post-intervention orders for patients with recent imaging, a majority of 62.79% (27/43) were ordered by internal medicine providers. The percentage of RUS orders for patients with recent CSI decreased from 9.05% to 6.02% with this intervention (p=0.12).*Discussion Intervention of UST review of RUS orders for patients who have undergone CSI within the past 48 hours provides some benefit in reducing redundant RUS studies, though not statistically significant. Following analysis of these findings, a best-practice advisory (BPA) tool was implemented for ordering clinicians that notifies of a recent CT or MRI, and confirms his/her decision to pursue the order. This tool also notifies the receiving UST of recent imaging and encourages communication with the clinician. In the first month of BPA use, 34.5% of RUS orders were canceled after BPA was triggered.Please visit the Learning Center to also view this presentation in hardcopy format.

M5A-QI-4 There's Waldo! Standardized Workflow for Optimizing Communication for Retained Surgical Instruments

Participants
Sheila C. Berlin, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

METHODS

This project was performed at a large academic medical center where call-to-OR times (RSI TAT) for RSI radiographs were inconsistent and often exceeded our target limit of 15 minutes. Technologists (RT) and radiologists were surveyed to determine major factors contributing to delays. They identified that details about the type, expected appearance, and likely location of the potential RSI were frequently missing. This information was noted to be critical given intraoperative radiographs are frequently limited by overlying non-biological material in the surgical field, incomplete visualization of the relevant anatomy and suboptimal technique in a fully-draped patient. To address these problems, a multidisciplinary team of radiologists, surgeons and RT's designed a standardized workflow to optimize identification and minimize RSI TAT. Key workflow components included: 1) two alert notification, 2) a simple OR checklist, and 3) a sample radiograph of the missing RSI (if any) to accompany the intraoperative radiograph. An alert is sent to the radiologist approximately 10 minutes prior to ("RSI Radiograph in Progress") as well as upon image transfer to PACS. The checklist sent to PACS notes: 1) specific surgical procedure 2) anatomy for potential RSI discovery and 3) specific missing item (if any). RT records: 1) time of the final alert and 2) time of the radiologist call to the OR. The impact of these interventions was assessed by comparing 40 consecutive RSI TAT for cases prior to workflow implementation to 40 consecutive RSI TAT for cases following workflow implementation. RSI TAT was measured as the time in minutes from radiologist notification of exam completion to the time a result was called to the OR.

RESULTS

Following implementation of the standardized workflow, the mean TAT for communication with the OR decreased from 17.7±5.7 minutes to 4.3±1.9 minutes. No RSI were reported prior to the workflow; one RSI (white towel with opaque ribbon) was identified using the standardized workflow.*Discussion Our workflow expedited time to surgical site closure by improving TAT for RSI radiograph reporting. A limitation of this study is that we did not have a process (e.g. follow-up imaging) for determining accuracy of identification of RSI. Using the core process improvement tools of standardization and communication, we developed a clear and detailed workflow to expedite results reporting for RSI radiographs.

M5A-QI-5 Use of an Auto-Protocol" Workflow to Decrease Provider and Technologist Protocoling Burden in Radiology

Participants
Daniella Asch, MD, New Haven, CT (*Presenter*) Nothing to Disclose

METHODS

A team composed of subspecialty radiologists, CT technologists and quality improvement specialists formed consensus on CT studies for which manual protocol assignment provides little value. An auto-protocol workflow optimization was created in the EHR (Epic Systems Corp., Verona, WI) using human-centered design principles and iterative Plan-Do-Study-Act cycles. These selected orders were removed from radiologist protocol worklists with programming to automatically label the studies as auto-protocol eligible. A new column was created on CT technologist worklists with a designated icon mapped to the auto-protocol codes and language inserted into protocol instructions stating, "perform as ordered per protocol." This process was tested on four pilot codes and then expanded to include all eligible codes. Percent protocol reduction for all CTs and study order to begin (O-B) time for ED studies were analyzed before and after implementation. Time to protocol a case was measured by stopwatch via human observation.

RESULTS

28% (53/192) of CT codes were selected as eligible for auto-protocol. Baseline data revealed 10,185/13,093 (78%) of all ordered CT scans were manually protocoled. Post intervention data revealed 5,548/10,259 (54%) of exams were manually protocoled (24% absolute, 30% relative reduction from baseline). Percentage of CT orders requiring a manual protocol is depicted in the run chart. Median O-B time for ED CTs decreased from 61 to 56 minutes (8% relative improvement) post intervention. Based on measured mean time to protocol a CT of 15 seconds, an estimated 170 work hours are saved annually.*Discussion This QI project used an automated EHR driven algorithm to reduce protocoling burden and decrease ED CT order-begin time. A limitation is potential for incorrectly ordered exams to result in incorrect or suboptimal imaging. In recognition of this, CT codes were carefully selected for

inclusion and technologists were encouraged to discuss any discrepancies between the order and provided indication with the appropriate radiology service. Following success at our tertiary center, the initiative was expanded to include more CT codes and has been implemented throughout our health system delivery networks. Work is underway to adapt the new auto-protocol workflow to MRI.

M5A-QI-6 The Effect of Radiologist-Patient Interaction: Are Patients Benefiting from Patient-Centered Communication Before Prostate Image-Guided Interventions?

Participants
Zoee D'Costa, BA, Skillman, NJ (*Presenter*) Nothing to Disclose

METHODS

A single-arm pre- and post-intervention study involving 5-10 minute radiologist consultations was performed. Virtual and in-person consultations took place in the pre-procedure holding area while patients awaited image-guided prostate biopsy and entailed basic anatomy, identification of prostate lesions on MRI and their implications. We utilized 5-point rating scales to evaluate patients' understanding of prostate MRI, prostate cancer, and anxiety levels before and after consultations. We also evaluated patients' understanding of the role of radiologists, level of satisfaction with the consultation and preference for receiving MRI results. Responses with ratings (1-5 scale) were analyzed with generalized linear mixed models (GLMM) with cumulative-logit link function. Dichotomous responses were analyzed with GLMM with logit link function. Statistical models were adjusted for age and race/ethnicity.

RESULTS

25 patients were included in the analysis. All patients reported satisfaction with the radiologist consultation. 21 patients (88%) stated they were very likely to return to our department knowing the availability to speak to a radiologist about their MRI was an option. The intervention was associated with significantly higher levels of self-reported understanding of prostate cancer (p=.04) and significantly decreased levels of anxiety prior to biopsy (p=.003). A trend towards improved understanding of the role of the radiologist and MRI was observed post-consultation, though statistically insignificant (p=0.134 and p=0.2, respectively). Most patients reported preference for discussing imaging results with a radiologist or both the radiologist and referrer (n=21, 88%), however the intervention did not have a statistically significant impact on patients' preference (p=0.1).*Discussion Our study seeking to understand the effects of radiology consultation showed the intervention improved quality of care by improving patient's understanding of their illness and by lowering patient anxiety prior to image-guided prostate biopsy. While our study had limited sample size, the findings are supportive of action in favor of implementation of this program, particularly given minimal time requirements and virtual capabilities.

M5A-QI-7HC Optimization of Whole-Body CT Technique for Trauma Patients Presenting to a Level-One Trauma Center

Participants
Nnamdi Udeh, MD, (*Presenter*) Nothing to Disclose

METHODS

The whole-body CT protocol consists of an unenhanced CT of the head and cervical spine, administration of a split contrast bolus with a 1-minute delay, and contrast-enhanced CT of the chest, abdomen, and pelvis. By comparison, organ-specific imaging combines 4 standard protocols with a single-phase contrast bolus. 100 patients, 50 with whole-body CTs and 50 with organ-specific scans, were included in a retrospective analysis. 4 attending radiologists rated image quality and indicated whether traumatic injury was present. Attenuation values of the liver, spleen and aorta were concurrently reported. Statistical analyses to assess for differences in image quality and injury detection included kappa statistics for observer agreement and the Kruskal Wallis test for attenuation measurements.

RESULTS

When compared to organ-specific imaging, there was no significant difference in image quality for the whole-body CT protocol (both protocols with median 3.25 on 4-point scale, Kruskal Wallis test, p = 0.70). There was no significant difference between the two protocols in the rate of injury detection or the interobserver agreement on injury detection (median weighted kappa for protocol 1 = 0.50, 95% CI 0.16-0.85; protocol 2 = 0.47, 95% CI 0.20-0.75). Attenuation values were not significantly different between both protocols for the liver, spleen, or aorta (Kruskal Wallis test, p = 0.07).*Discussion The implementation of a whole-body CT protocol maintains image quality and allows for the acceleration of polytrauma imaging.Please visit the Learning Center to also view this presentation in hardcopy format.

Key workflow components included: 1) two alert notification, 2) a simple OR checklist, and 3) a sample radiograph of the missing RSI (if any) to accompany the intraoperative radiograph. An alert is sent to the radiologist approximately 10 minutes prior to ("RSI Radiograph in Progress") as well as upon image transfer to PACS. The checklist sent to PACS notes: 1) specific surgical procedure 2) anatomy for potential RSI discovery and 3) specific missing item (if any). RT records: 1) time of the final alert and 2) time of the radiologist call to the OR. The impact of these interventions was assessed by comparing 40 consecutive RSI TAT for cases prior to workflow implementation to 40 consecutive RSI TAT for cases following workflow implementation. RSI TAT was measured as the time in minutes from radiologist notification of exam completion to the time a result was called to the OR.

RESULTS

Following implementation of the standardized workflow, the mean TAT for communication with the OR decreased from 17.7±5.7 minutes to 4.3±1.9 minutes. No RSI were reported prior to the workflow; one RSI (white towel with opaque ribbon) was identified using the standardized workflow.*Discussion Our workflow expedited time to surgical site closure by improving TAT for RSI radiograph reporting. A limitation of this study is that we did not have a process (e.g. follow-up imaging) for determining accuracy of identification of RSI. Using the core process improvement tools of standardization and communication, we developed a clear and detailed workflow to expedite results reporting for RSI radiographs.

Use of an Auto-Protocol" Workflow to Decrease Provider and Technologist Protocoling Burden in Radiology

Monday, Nov. 28 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Daniella Asch, MD, New Haven, CT (*Presenter*) Nothing to Disclose

METHODS

A team composed of subspecialty radiologists, CT technologists and quality improvement specialists formed consensus on CT studies for which manual protocol assignment provides little value. An auto-protocol workflow optimization was created in the EHR (Epic Systems Corp., Verona, WI) using human-centered design principles and iterative Plan-Do-Study-Act cycles. These selected orders were removed from radiologist protocol worklists with programming to automatically label the studies as auto-protocol eligible. A new column was created on CT technologist worklists with a designated icon mapped to the auto-protocol codes and language inserted into protocol instructions stating, "perform as ordered per protocol." This process was tested on four pilot codes and then expanded to include all eligible codes. Percent protocol reduction for all CTs and study order to begin (O-B) time for ED studies were analyzed before and after implementation. Time to protocol a case was measured by stopwatch via human observation.

RESULTS

28% (53/192) of CT codes were selected as eligible for auto-protocol. Baseline data revealed 10,185/13,093 (78%) of all ordered CT scans were manually protocoled. Post intervention data revealed 5,548/10,259 (54%) of exams were manually protocoled (24% absolute, 30% relative reduction from baseline). Percentage of CT orders requiring a manual protocol is depicted in the run chart. Median O-B time for ED CTs decreased from 61 to 56 minutes (8% relative improvement) post intervention. Based on measured mean time to protocol a CT of 15 seconds, an estimated 170 work hours are saved annually.*Discussion This QI project used an automated EHR driven algorithm to reduce protocoling burden and decrease ED CT order-begin time. A limitation is potential for incorrectly ordered exams to result in incorrect or suboptimal imaging. In recognition of this, CT codes were carefully selected for inclusion and technologists were encouraged to discuss any discrepancies between the order and provided indication with the appropriate radiology service. Following success at our tertiary center, the initiative was expanded to include more CT codes and has been implemented throughout our health system delivery networks. Work is underway to adapt the new auto-protocol workflow to MRI.

The Effect of Radiologist-Patient Interaction: Are Patients Benefiting from Patient-Centered Communication Before Prostate Image-Guided Interventions?

Monday, Nov. 28 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Zoee D'Costa, BA, Skillman, NJ (*Presenter*) Nothing to Disclose

METHODS

A single-arm pre- and post-intervention study involving 5-10 minute radiologist consultations was performed. Virtual and in-person consultations took place in the pre-procedure holding area while patients awaited image-guided prostate biopsy and entailed basic anatomy, identification of prostate lesions on MRI and their implications. We utilized 5-point rating scales to evaluate patients' understanding of prostate MRI, prostate cancer, and anxiety levels before and after consultations. We also evaluated patients' understanding of the role of radiologists, level of satisfaction with the consultation and preference for receiving MRI results. Responses with ratings (1-5 scale) were analyzed with generalized linear mixed models (GLMM) with cumulative-logit link function. Dichotomous responses were analyzed with GLMM with logit link function. Statistical models were adjusted for age and race/ethnicity.

RESULTS

25 patients were included in the analysis. All patients reported satisfaction with the radiologist consultation. 21 patients (88%) stated they were very likely to return to our department knowing the availability to speak to a radiologist about their MRI was an option. The intervention was associated with significantly higher levels of self-reported understanding of prostate cancer (p=.04) and significantly decreased levels of anxiety prior to biopsy (p=.003). A trend towards improved understanding of the role of the radiologist and MRI was observed post-consultation, though statistically insignificant (p=0.134 and p=0.2, respectively). Most patients reported preference for discussing imaging results with a radiologist or both the radiologist and referrer (n=21, 88%), however the intervention did not have a statistically significant impact on patients' preference (p=0.1).*Discussion Our study seeking to understand the effects of radiology consultation showed the intervention improved quality of care by improving patient's understanding of their illness and by lowering patient anxiety prior to image-guided prostate biopsy. While our study had limited sample size, the findings are supportive of action in favor of implementation of this program, particularly given minimal time requirements and virtual capabilities.

M5A-QI-7HC

Optimization of Whole-Body CT Technique for Trauma Patients Presenting to a Level-One Trauma Center

Monday, Nov. 28 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Nnamdi Udeh, MD, (*Presenter*) Nothing to Disclose

METHODS

The whole-body CT protocol consists of an unenhanced CT of the head and cervical spine, administration of a split contrast bolus with a 1-minute delay, and contrast-enhanced CT of the chest, abdomen, and pelvis. By comparison, organ-specific imaging combines 4 standard protocols with a single-phase contrast bolus. 100 patients, 50 with whole-body CTs and 50 with organ-specific scans, were included in a retrospective analysis. 4 attending radiologists rated image quality and indicated whether traumatic injury was present. Attenuation values of the liver, spleen and aorta were concurrently reported. Statistical analyses to assess for differences in image quality and injury detection included kappa statistics for observer agreement and the Kruskal Wallis test for attenuation measurements.

RESULTS

When compared to organ-specific imaging, there was no significant difference in image quality for the whole-body CT protocol (both protocols with median 3.25 on 4-point scale, Kruskal Wallis test, p = 0.70). There was no significant difference between the two protocols in the rate of injury detection or the interobserver agreement on injury detection (median weighted kappa for protocol 1 = 0.50, 95% CI 0.16-0.85; protocol 2 = 0.47, 95% CI 0.20-0.75). Attenuation values were not significantly different between both protocols for the liver, spleen, or aorta (Kruskal Wallis test, p = 0.07).*Discussion The implementation of a whole-body CT protocol maintains image quality and allows for the acceleration of polytrauma imaging.Please visit the Learning Center to also view this presentation in hardcopy format.

M5B-QI-2 To Investigate the Effect of Combined DLIR Reconstruction Algorithm With Different Concentrations of Contrast Agents on Coronary CTA Image Quality

Participants
Lijuan Zhu, (*Presenter*) Nothing to Disclose

METHODS

Thirty patients who underwent low-voltage coronary CT angiography (CCTA) with a 256-row wide-body detector CT scanner (Revolution Apex CT; GE Healthcare) in our hospital from September 2021 to January 2022 were collected and divided into two groups with 15 cases in each group according to the concentration of contrast agent used. Contrast agent concentration in group 320mg/mL, contrast agent concentration in group B 370mg/mL (conventional), group A medium-grade (DLIR-M), high-grade (DLIR-H) deep learning algorithm for reconstruction, group B using clinical routine 40% weight Adaptive Statistical Iterative Reconstruction (ASIR-V). The image noise of the aortic root and proximal main coronary artery of each group of images was recorded, and the Signal-to-Noise Ratio (SNR) and Contrast-to-Noise Ratio (CNR) were calculated. Subjective image quality was rated on a 5-point scale by two diagnostic radiologists with more than 5 years of experience.

RESULTS

1) Compared with ASIR-V40%, both DLIR-M and DLIR-H performed better noise reduction effect (P value <0.05). The SNR and CNR of DLIR-M and DLIR-H groups were significantly improved by 69.91% %, 67.91% and 120.25%, 119.85%, compared to ASIR-40%, respectively. 2) The scoring results of two observers, physician A and physician B, showed that the noise reduction level increased with the increase of the deep learning image reconstruction technology (DLIR) (P value < 0.05), and both observers believed that the diagnosis effect was the best The one is DLIR-H, and its subjective image quality is significantly improved by 40% compared with ASIR-V, which is 28.52% higher.*Discussion Compare to the CCTA scanning scheme of 370mg/mL contrast agent combined with ASIR-V40% algorithm, the results show that the SNR and CNR of using 320mg/mL contrast agent combined with DLIR-H algorithm group was higher than those of the high contrast agent concentration group, indicating that DLIR had better image correction ability, which has higher clinical application value.

M5B-QI-3 Building Radiology Residents' Confidence in Managing Contrast Reactions: Our Institution's First Ever High-Fidelity Contrast Reaction Simulation

Participants
Kara Demarco, MD, (*Presenter*) Nothing to Disclose

METHODS

In partnership with the Simulation center, we created our institution’s first ever High-Fidelity Contrast Reaction Simulation, in which three scenario algorithms were created to simulate real-life adverse contrast reactions. Learners were first given a short brief on potential reactions, and how to identify and respond to such patient presentations. They were then separated into three groups, rotating through each simulation. The simulations ranged from mild to severe reactions, with the latter evolving into a full code. During the simulations, the residents were challenged to interpret vitals, perform physical examinations, and determine next steps and management. The addition of bronchospasm reaction deliberately extends beyond the ACLS algorithm to challenge learners to identify a reaction that is more specific to contrast reactions, and may occur with asthmatics, particularly children. Each scenario was followed by an immediate debrief emphasizing the salient points of the specific reaction and its safe management.

RESULTS

Using a 10-point scale, participants were asked 7 questions surveying their comfort and knowledge level regarding the identification and management of contrast reactions. Prior to the simulation, the average was 4.3 out of 10. After the simulation, the average was 8.3 out of 10.*Discussion Reactions to contrast media are uncommon but do happen, and often the radiology resident is the first physician to assess the patient. Acting out the management of such reactions is more effective than reading how to do so, and this simulation proved to be a useful endeavor in building the residents’ competency. Moreover, it encouraged teamwork within a group of residents that are more accustomed to operating alone. Our intention is to continue this simulation with future classes, and expand the participation to staff radiologists and technologists, all of whom may be the first provider in saving an anaphylactic patient’s life.

M5B-QI-4 Benefits of a Composite Report Incorporating Interactive Multimedia Reporting Principles

Participants
David J. Vining, MD, (*Presenter*) Royalties, Bracco Group;CEO, VisionSR, Inc;Stockholder, VisionSR, Inc

METHODS

We developed an IMR solution that records medical events (e.g., radiological findings, surgical procedures) and voice descriptions of those events, tags the information with metadata using natural language processing, and assembles an IMR report with related data linked in timelines and presented as a "composite report." A composite report presents the most recent information for each anatomical site of disease, regardless of modality, to create a holistic view of a patient. When a user clicks on a finding, the history of that entity is presented with images, graphs, tables, and related information.

RESULTS

To date the system has been used to generate 2505 composite reports from 1509 patients with a total of 12,943 findings comprising 37,769 items. In this composite reporting concept, a "finding" represents a timeline of connected "items" from individual exams and medical events. The average timeline length consists of 4 items with the longest comprising 24 items.*Discussion Disparate information in an electronic health record (EHR) resides in silos related to the specialty that generated the source data (e.g., radiology, pathology, laboratory, surgery). The review of historical information by radiologists and clinicians in order to mentally construct a history of disease and treatment is often tedious and time-consuming. An IMR composite report can assimilate data from disparate sources and present the information in a logical fashion using visual displays to efficiently communicate information.Quantitative disease graphs assembled from the entire compendium of radiological data can reveal insights that may not be evident when a radiologist only compares a current exam to a limited number of prior exams. The use of metadata to tag related items enables data mining for the derivation of medical outcomes.Furthermore, a composite report has the potential to improve safety by mitigating discrepant results. For example, when a pathologist reports a left upper lung biopsy but that information is linked to a radiological exam indicating a right upper lung biopsy, the system immediately alerts the report author to make necessary corrections.A composite report represents a radical change from traditional independent medical reports, and as such it provides a means to connect data and cultivate knowledge.

M5B-QI-5 Wait, Where are the Apices? Improving Portable Chest Xray Techniques Through Image Review and Education of Radiology Technologists

Participants
Kevin Gilotra, Stony Brook, NY (*Presenter*) Nothing to Disclose

METHODS

From July 12, 2021 to July 25, 2021 pCXRs were evaluated by radiology residents for failures in technical image quality affecting their use for diagnostic interpretation. Figure 1 highlights the criteria used to assess image quality. To address the baseline frequency of technical quality errors, three programs aiming to improve the quality of pCXRs were implemented. First, a curriculum led by experienced technicians didactic sessions were provided to radiology technologists. Second, nursing staff was recruited to assist radiology technologists with patient positioning when obtaining images for pCXRs. Finally, internal medicine residents verified that films were interpretable for pathology once images had been collected. Figure 1 was subsequently used by radiology residents to assess post-intervention films.

RESULTS

Technical errors were present in 231 of the 500 pre-intervention radiographs and in 126 of the 287 post-intervention studies. Using a 0 to 3 scale for evaluating patient rotation (0 being no rotation and 3 being severe rotation), a 0.46-point reduction was observed post-intervention ($p<0.005$). There was also a 25% reduction in films with rotation in the post-intervention pCXRs, but no percentage change in pCXRs with mild rotation. The number of pCXRs with obscured anatomy declined by 20.9% post-intervention. A potential missed diagnosis was observed in 43.5% of studies pre-intervention in comparison to only 12.2% of studies post-intervention.*Discussion In conclusion, our study suggests that the quality of the images post-intervention significantly impacted the ease of interpretation for radiologists. We observed that almost half of the pre-intervention pCXRs had technical issues that could impact diagnostic interpretation, with one-third of the studies having missed a diagnosis as a result of technical errors. The limitations of this study include inter-observer discrepancy in determining what is considered a missed diagnosis, short duration of follow-up after the intervention, and biases associated with a non-blinded study. Our study highlights the importance of educating and creating optimal work environments for technologists to capture high-quality pCXR images.

M5B-QI-6 Peer Learning Program Metrics: A Pediatric Neuroradiology Example

Participants
Nadja Kadom, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

METHODS

Context and Intervention: Transitioning from random score-based peer review to PL. Study of the Intervention: Pilot program designed and implemented. Measures/Metrics: Number of cases submitted per faculty per month; percentage of radiologists meeting PL program targets for case submissions; monthly faculty PL attendance; the number of cases reviewed during the PL session; number and nature of learning points; the number and nature of improvement actions; a faculty survey. Analysis: Descriptive statistics.

RESULTS

Data on measures and outcome: 324 cases were submitted for the PL conference, averaging seven cases per faculty per month, and ranging from 0 to 26 cases for a single faculty member/month. There was no month when more than 80% of the faculty met the submission target of 5 cases. PL meeting attendance was 100%. A total of 179 cases were reviewed throughout the year, approximately 50% of all case submissions. On average, we reviewed 14 cases per PL conference (range 6-24). There were 22 learning points throughout the year. There were 30 documented improvement actions throughout the year. Faculty issued the highest star ratings for ease of meeting the 100% attendance requirement and for learning value. A slightly lower rating was given for feeling safe during case discussions, for the ease of submitting cases, and for the ability to gain CME credit for session participation. The lowest rating was given for effectiveness of improvements as a result of PL discussions.*Discussion Limitations: This study does not provide proof that PL improves physician practice, but we have evidence that our faculty highly value PL. Conclusion: We demonstrate feasibility in PL program design and implementation. We noted considerable time commitment for running a PL program and for documenting program metrics. Survey feedback has been helpful in making changes to certain aspects of the program, such as improving trust in the PL program, including meaningful case submission types, and more thoughtful improvement actions. We are also making changes to decrease the PL faculty leads' time commitment, and are working towards simplifying the case submission system.

M5B-QI-7 The Structure and Support of Robust, System-wide Magnetic Resonance Safety Program

Participants
Randy Parker, ARRT, Grand Rapids, MI (*Presenter*) Nothing to Disclose

METHODS

In a health-care system operating 22 MRI systems, MR exam orders flagged for safety review are tracked electronically. The tracking tool identifies the total number of safety reviews performed, the number of patients with contraindications for MR studies and patients requiring vendor or physician coordination. A lead MRSO is primarily responsible for review and follow-up action, but has support from additional, qualified MRSO recruited from staff. A designated MRMD and MRSE participate along with an MR Safety Expert Improvement Team (EIT). A radiology business support structure is in place to provide data collection and tools to demonstrate benefit achieved through improved use of available MR slots. The primary metrics are avoided last-moment cancellations and delays due to MRSO review.

RESULTS

For 19,878 MR exams scheduled over a three-month period, 3,854 patients were screened by the six members of the MRSO team. 410 (10.6%) of these required review before proceeding with an MR appointment. 203 of 330 patients (61%) were determined to be eligible for an MR study, based on review and investigation by the team, using aligned resources of vendors and leveraging available teams to support MR technologists for pacemakers. 80 studies were completed for non-pacemaker implants/devices and 127 patients were identified with contraindications for MR and flagged in the EMR to avoid future orders. Daily referrals for MR studies range between 275 and 425 per day which results in approximately 50 to 80 daily MRSO reviews. Schedule utilization is consistently maintained at a high rate.Safety culture awareness is reinforced by department staff, radiologists, and administrators. Lessons learned from Zone IV infractions (preventable and non-preventable) and "good catches" are reviewed by the EIT and summarized in a monthly departmental MR operations newsletter.*Discussion The benefits of a comprehensive MR safety program: maximized access to MR technology for patients within and outside our hospital system, standardized and rigorous MR safety screening and awareness, and patient and provider satisfaction. Cost savings based on efficient MR slot utilization defray the operation of a comprehensive institutional MR safety program.

M5B-QI-8 Encouraging the Assignment of LI-RADS Scores by Radiologists via Reporting Template Changes

Participants
Joon Oh, MD, New Brunswick, NJ (*Presenter*) Nothing to Disclose

METHODS

The first template change occurred on 5/30/2018. A pick list at the impression field lets the radiologist select the LI-RADS score based on relevant features determined by the ACR consensus criteria.The second template change occurred on 10/1/2020 and involved an addition of a field that reminds the radiologist whether the patient qualifies for a LI-RADS score by asking whether the patient has a history of HBV, cirrhosis, or prior HCC (conditions that warrant a LI-RADS score). The LI-RADS criteria scoring guide is also attached within the PACS system as a visual aid for the radiologist.To calculate the compliance rate prior to any template changes, May 2018 was chosen as a representative month for data. Studies that met criteria for LI-RADS score or given a score were counted. The same time period (10/1/2020 to 12/22/2020) was used to compare the differences in compliance rates. Nominal and adjusted compliance rates are calculated. Nominal compliance refers to LI-RADS use on patients with history of HBV, cirrhosis, or prior HCC. Adjusted compliance excludes findings not felt to be clinically significant (benign findings, cirrhosis, interval follow up of a known lesion).

RESULTS

Prior to any template changes, the nominal compliance was 3.23% while the adjusted compliance was 35.48%. After the first template change, the nominal compliance was 20.83% while the adjusted compliance was 93.75%. After the second template change, the nominal compliance was 40.91% while the adjusted compliance was 97.73%.*Discussion The introduction of the LI-RADS score was meant to provide clearer management options for referring clinicians. At baseline before any template changes, the compliance rate for LI-RADS score reports was low, with an adjusted compliance rate of 35.48%. However, after two template changes, both the nominal and adjusted compliance rates have increased dramatically. After the second template change, the adjusted compliance rate is 97.7%. In other words, 97.7% of the time where there is a suspicious liver nodule, LI-RADS score was assigned. This shows that the right structured reporting template will increase compliance rates.

Participants
Nadja Kadom, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

METHODS

Context and Intervention: Transitioning from random score-based peer review to PL. Study of the Intervention: Pilot program designed and implemented. Measures/Metrics: Number of cases submitted per faculty per month; percentage of radiologists meeting PL program targets for case submissions; monthly faculty PL attendance; the number of cases reviewed during the PL session; number and nature of learning points; the number and nature of improvement actions; a faculty survey. Analysis: Descriptive statistics.

RESULTS

Data on measures and outcome: 324 cases were submitted for the PL conference, averaging seven cases per faculty per month, and ranging from 0 to 26 cases for a single faculty member/month. There was no month when more than 80% of the faculty met the submission target of 5 cases. PL meeting attendance was 100%. A total of 179 cases were reviewed throughout the year, approximately 50% of all case submissions. On average, we reviewed 14 cases per PL conference (range 6-24). There were 22 learning points throughout the year. There were 30 documented improvement actions throughout the year. Faculty issued the highest star ratings for ease of meeting the 100% attendance requirement and for learning value. A slightly lower rating was given for feeling safe during case discussions, for the ease of submitting cases, and for the ability to gain CME credit for session participation. The lowest rating was given for effectiveness of improvements as a result of PL discussions.*Discussion Limitations: This study does not provide proof that PL improves physician practice, but we have evidence that our faculty highly value PL. Conclusion: We demonstrate feasibility in PL program design and implementation. We noted considerable time commitment for running a PL program and for documenting program metrics. Survey feedback has been helpful in making changes to certain aspects of the program, such as improving trust in the PL program, including meaningful case submission types, and more thoughtful improvement actions. We are also making changes to decrease the PL faculty leads' time commitment, and are working towards simplifying the case submission system.

The Structure and Support of Robust, System-wide Magnetic Resonance Safety Program

Monday, Nov. 28 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Randy Parker, ARRT, Grand Rapids, MI (*Presenter*) Nothing to Disclose

METHODS

In a health-care system operating 22 MRI systems, MR exam orders flagged for safety review are tracked electronically. The tracking tool identifies the total number of safety reviews performed, the number of patients with contraindications for MR studies and patients requiring vendor or physician coordination. A lead MRSO is primarily responsible for review and follow-up action, but has support from additional, qualified MRSO recruited from staff. A designated MRMD and MRSE participate along with an MR Safety Expert Improvement Team (EIT). A radiology business support structure is in place to provide data collection and tools to demonstrate benefit achieved through improved use of available MR slots. The primary metrics are avoided last-moment cancellations and delays due to MRSO review.

RESULTS

For 19,878 MR exams scheduled over a three-month period, 3,854 patients were screened by the six members of the MRSO team. 410 (10.6%) of these required review before proceeding with an MR appointment. 203 of 330 patients (61%) were determined to be eligible for an MR study, based on review and investigation by the team, using aligned resources of vendors and leveraging available teams to support MR technologists for pacemakers. 80 studies were completed for non-pacemaker implants/devices and 127 patients were identified with contraindications for MR and flagged in the EMR to avoid future orders. Daily referrals for MR studies range between 275 and 425 per day which results in approximately 50 to 80 daily MRSO reviews. Schedule utilization is consistently maintained at a high rate.Safety culture awareness is reinforced by department staff, radiologists, and administrators. Lessons learned from Zone IV infractions (preventable and non-preventable) and “good catches” are reviewed by the EIT and summarized in a monthly departmental MR operations newsletter.*Discussion The benefits of a comprehensive MR safety program: maximized access to MR technology for patients within and outside our hospital system, standardized and rigorous MR safety screening and awareness, and patient and provider satisfaction. Cost savings based on efficient MR slot utilization defray the operation of a comprehensive institutional MR safety program.

M5B-QI-8

Encouraging the Assignment of LI-RADS Scores by Radiologists via Reporting Template Changes

Monday, Nov. 28 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Joon Oh, MD, New Brunswick, NJ (*Presenter*) Nothing to Disclose

METHODS

The first template change occurred on 5/30/2018. A pick list at the impression field lets the radiologist select the LI-RADS score based on relevant features determined by the ACR consensus criteria.The second template change occurred on 10/1/2020 and involved an addition of a field that reminds the radiologist whether the patient qualifies for a LI-RADS score by asking whether the patient has a history of HBV, cirrhosis, or prior HCC (conditions that warrant a LI-RADS score). The LI-RADS criteria scoring guide is also attached within the PACS system as a visual aid for the radiologist.To calculate the compliance rate prior to any template changes, May 2018 was chosen as a representative month for data. Studies that met criteria for LI-RADS score or given a score were counted. The same time period (10/1/2020 to 12/22/2020) was used to compare the differences in compliance rates. Nominal and adjusted compliance rates are calculated. Nominal compliance refers to LI-RADS use on patients with history of HBV, cirrhosis, or prior HCC. Adjusted compliance excludes findings not felt to be clinically significant (benign findings, cirrhosis, interval follow up of a known lesion).

RESULTS

Prior to any template changes, the nominal compliance was 3.23% while the adjusted compliance was 35.48%. After the first template change, the nominal compliance was 20.83% while the adjusted compliance was 93.75%. After the second template change, the nominal compliance was 40.91% while the adjusted compliance was 97.73%.*Discussion The introduction of the LI-RADS score was meant to provide clearer management options for referring clinicians. At baseline before any template changes, the compliance rate for LI-RADS score reports was low, with an adjusted compliance rate of 35.48%. However, after two template changes, both the nominal and adjusted compliance rates have increased dramatically. After the second template change, the adjusted compliance rate is 97.7%. In other words, 97.7% of the time where there is a suspicious liver nodule, LI-RADS score was assigned. This shows that the right structured reporting template will increase compliance rates.

R2-QI-1HC Underserved Women Understand the Importance of Screening Mammography Yet Exam Scheduling Still Remains a Barrier

Participants
Jean Mutambuze, MD, (*Presenter*) Nothing to Disclose

METHODS

Our study was a survey of screening mammography-eligible female patients from the federally qualified health centers that utilize the screening mammography services at at Eskanzi Health, a city-county hospital in Indianapolis, IN. This survey queried patients about possible barriers to getting a screening mammogram. Preliminary results are submitted here and statistical analysis of survey results are in progress.

RESULTS

While several hundred patients were invited to the survey, a total of 70 patients answered the survey. The racial and ethnic demographics of the surveyed patients was 44% Black, 48 %white, 4% Hispanic/Latina, 1.5 % Asian-American, 1.4 % multirace/other. Possible barriers that were queried included: scheduling the exam, transportation, need for childcare, lack of insurance, unable to take time off of work, fear of the exam results, absence of a recommendation from primary MD for the exam, or discomfort from the mammography exam. The more frequent barrier cited was scheduling the exam (21/70 patients, 30%). The majority of the surveyed patients: understood the importance of the exam (82.9%), understood that absence of a family history meant they were still at risk for developing breast cancer (72.9%), understood that they needed a mammogram even if they didn't have breast pain (71.4%), and thought that getting a mammogram would reduce their risk of dying from breast cancer (72.8%).*Discussion Internal review surveys such as these allow hospitals to assess local barriers to preventive care, such as screening mammography, and thus allow interventions be performed to improve patient access to preventive health services in the local community.Please visit the Learning Center to also view this presentation in hardcopy format.

R2-QI-2 Enhancement of Safety Barriers in a Magnetic Resonance Unit: A Brazilian Experience

Participants
Suzana Oliveira Latarula Sozza, BMBS, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

METHODS

In order to promote improvements for the safety of patients and healthcare professionals who are subjected to the magnetic field, this project was developed in the MRI unit of a Brazilian tertiary hospital (8 MRI machines) from September 2019 to September 2021. To this end, the following security barriers were implemented: • Barrier 1 - The exam scheduling sector asks a series of questions to ensure that the patient does not have any contraindications. • Barrier 2 - Application of the safety questionnaire and change of clothing removing expendable metallic belongings. • Barrier 3 - Checking the completed safety questionnaires. • Barrier 4 - The technologist confirms the identification data and the safety questionnaire, before entering the examination room with the patient. Upon entering the room, the locker key and belongings such as glasses are removed and stored in an appropriate place. After improving these safety barriers, training was carried out for employees in the area and other care professionals, who could have contact with the sector indirectly (such as the nursing team that sends and transports the hospitalized patient) or directly (employees who have probability of entering or staying in place). The impact of these interventions was evaluated by the number of occurrences of accidents related to undue exposure to the magnetic field. The analysis was performed through the occurrence notification records.

RESULTS

With the improvement of safety barriers, we managed to ensure that during the duration of the project (2 years) we had no accidents related to exposure to the magnetic field.*Discussion Magnetic fields in MRI units can cause dangerous interactions in individual with metallic foreign bodies, including projectile effect, twisting, burning, artifacts, and device malfunction (interference with a pacemaker). Therefore, all patients need to thoroughly be screened individually for foreign bodies before undergoing an MRI scan. All healthcare professionals that work in MRI units must be aware of safety recommendations and educational actions related to MRI safety, such as the presented project, must be carried out periodically. Limitations of our study include the fact that omission of information regarding questions that contraindicate the MRI examination by patients could not be assessed.

R2-QI-3 Setting up a Workflow: Optimizing the Wait Times in the MRI Anesthesia

Participants
Maria Vicente, (*Presenter*) Nothing to Disclose

METHODS

The PDCA method (Plan-Do-Check-Act) was used to understand the main points of improvement and to help to create an MRI anesthesia workflow. In an initial investigation, many points were recognized such opportunities: errors related to call center scheduling, the non-optimized slot usage, health insurance authorization, communication failure between teams, delay in schedules, wrong choice of equipment according to the required magnetic field for specific examinations, incorrect anamnesis about the patient's background and delays associated to choose the appropriate MRI protocol and the choice of anesthetic procedure. According to the PDCA framework, in the next step, several action plans were implemented, such as schedule control sheets, checklist created to be applied during a telephone call for triage with guiding questions that allow filtering failures before the client arrives at the hospital and clarify the patient's doubts regarding anesthesia. The analysis was performed using the quantification of successful MRI performed with anesthesia (numerator) / Month of completion (denominator) and the quantification of optimized schedule times due to prior confirmation (numerator)/ Month of the procedure done (denominator).

RESULTS

After the project implementation, from July 2020 to September 2020, 393 patients who underwent MRI anesthesia were analyzed. Through prior confirmation, we were able to optimize more than 30 hours, making available an average of 45 MRI exams for scheduling.*Discussion This workflow proved to be effective in terms of guidance to the patient in advance, clarifying doubts, humanizing the patient experience focusing on their own individualities, increasing customer satisfaction and loyalty levels, exceeding their expectations. With the information and patient history prior obtained before the exam date, was possible to reduce errors related to exams scheduling, optimizing the wait times and improve throughput caused by absent patients in the MRI department.

R2-QI-4 Increasing Bone Scan Capacity by Optimizing Appointments

Participants
Meedya Sharifpour, FRCR, MS, (*Presenter*) Nothing to Disclose

METHODS

Retrospective review of 12 months bone scans performed for prostate cancer patients across two different hospitals to assess the frequency of SPECT CT performed. We also collected additional data on patients who had recent CT within four weeks prior to the bone scan, prior bone scan, prostate cancer risk group (PSA, Gleason score, and MRI radiological staging) in order to assess the frequency of SPECT CT imaging amongst patients needing a bone scan.

RESULTS

Over the 12 months period, 53% of the patients required planar imaging and therefore only needed a 30-minute appointment slot. We also noted that 24% of the patients needed one body part SPECT CT (45-minute appointment) and 23% of the patients needed two body part SPECT CT (60 minutes appointment). We also identified that none of the patients who had CT scan performed within four weeks of the bone scan required any SPECT CT imaging unless a lesion was identified on the prior scan which needed characterisation.*Discussion The need for optimisation of services is becoming a vital part of any healthcare service. The above retrospective review has resulted in criteria identified for shorter appointment times an example of which included a recent CT scan within four weeks prior to the bone scan. This has resulted in an increase of between 20% to 100% capacity in bone scan imaging within our department. Increasing capacity by 100% on some days was achieved by solely booking patients with recent prior CT imaging and therefore reduction of all appointment times from 60 minutes to 30 minutes. Radiologists do not commonly get involved in all aspects of the radiology department and how appointments are allocated to the patients however, we have demonstrated that the background clinical knowledge can help in risk stratifying patients and therefore optimising healthcare services accordingly.

R2-QI-5HC Bringing Technology and the Human Experience Together: Radiology's Journey to a Digital Check-in Process

Participants
Christina Hertel, BA, (*Presenter*) Nothing to Disclose

METHODS

A multidisciplinary team approached this issue using the Define-Measure-Analyze-Improve-Control (DMAIC) and A3 framework to advise a solution strategy using a series of Plan-Do-Study-Act (PDSA) cycles. Patients, technologists, and desk operations staff were surveyed throughout the process to guide adjustments or further interventions needed for the subsequent cycles. Department on-time starts were monitored as a counterbalance. The results of the surveys guided the team to evaluate four comprehensive areas of improvement. The lobby space, the role of the desk operations staff, the electronic environment, and patient experience. A root cause analysis was performed on each topic to determine possible solutions. Solutions were then put into an impact effort grid to determine the sequence of possible approaches. A detailed review of patient and staff feedback was carefully considered after each PDSA cycle to determine success.

RESULTS

The outcome of this project revealed that it was not the actual digital check-in process patients struggled with but the feelings of losing the human connection. The identification of this core concern guided the team to transform the role of our desk operations staff to create a concierge-type service bringing the staff out from behind the barrier of a formal desk to assist with technology, wayfinding, and promotion of a welcoming environment. We were able to increase the use of digital patient check-in from 45% in December 2021 to 76% in March 2022. In addition, patient and staff satisfaction scores increased by an average of 10%, and the average check-in was reduced from 2.3 to 1.0 minutes without negatively impacting exam on-time starts.*Discussion In the end, maintaining the human experience was key in instituting a successful digital check-in process. Representation from each role was instrumental in detecting any nuances that may arise. Limitations of the project include construction constraints and the timely availability of electronic devices during the PDSA cycles.Please visit the Learning Center to also view this presentation in hardcopy format.

R2-QI-6 Faster CT Scan Protocol Authorization Based on Web Scraping Solutions Improves Patient Care

Participants
Eduardo Caminha Nunes, MD, Sao Paulo, Brazil (*Presenter*) Nothing to Disclose

METHODS

We developed a web scraping tool using Selenium with Python and ChromeDriver to check the HIS and return a text via

WhatsApp® to the resident on call. We calculated the mean averages for the times required to authorize a new CT scan protocol with and without our tool and then performed the Mann-Whitney U test to assess statistical significance.

RESULTS

The mean average for the authorization time without our tool was 52.28 minutes and 14.71 minutes using our solution. The estimated p-value calculated with the Mann-Whitney U test was 0.0075.*Discussion We observed a decrease in time between exam order and authorization. This resource is able to shorten the time between exam authorization and execution, which facilitates the hospital workflow and improves patient care.

R2-QI-7 Streamlining an MRI Implant Clearance Process to Improve Radiology Workflow

Participants
Stephanie Shieh, MSN,RN, Orange, CA (*Presenter*) Nothing to Disclose

METHODS

This study was performed in the Department of Radiology at a quaternary academic medical center. A centralized HIPAA-compliant Excel tracker was created in May 2021 to document the following data for patients receiving an outpatient MRI: date requested, scheduler, reason for clearance, clearance status (cleared, in progress, or not cleared), date request completed, appointment scheduled date, and additional notes. A Radiology Quality Team consisting of MRI technologists (Supervisor, Lead Tech, and Senior Tech), Nursing (Quality Nurse and Radiology Nurse), and Scheduling (Lead Schedulers) were able to access and update this tracker to ensure proper implant clearance. Our metrics for quality improvement included average time from notification of an implant to implant clearance ("notification-to-clearance") and average time from implant clearance to scheduling time ("clearance-to-scheduling").

RESULTS

From May 2021 to April 2022, there were 440 implant requests that needed clearance for MRI. The average number of days for "notification-to-clearance" was less than 6 days, with 291 requests completed in 3 days or less. The median "clearance-to-scheduling" time was 19 days for outpatients.*Discussion The implementation of implant clearance process by a centralized database has streamlined the scheduling and completion of MRI studies. The shared tracker ensures that implant requests are cleared prior to patient arrival in the department. It has also facilitated collaboration among the Quality Team in addressing this patient safety issue. A limitation of this study is exclusion of other factors that affect MRI availability.

R2-QI-7

Streamlining an MRI Implant Clearance Process to Improve Radiology Workflow

Thursday, Dec. 1 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Stephanie Shieh, MSN,RN, Orange, CA (*Presenter*) Nothing to Disclose

METHODS

This study was performed in the Department of Radiology at a quaternary academic medical center. A centralized HIPAA-compliant Excel tracker was created in May 2021 to document the following data for patients receiving an outpatient MRI: date requested, scheduler, reason for clearance, clearance status (cleared, in progress, or not cleared), date request completed, appointment scheduled date, and additional notes. A Radiology Quality Team consisting of MRI technologists (Supervisor, Lead Tech, and Senior Tech), Nursing (Quality Nurse and Radiology Nurse), and Scheduling (Lead Schedulers) were able to access and update this tracker to ensure proper implant clearance. Our metrics for quality improvement included average time from notification of an implant to implant clearance ("notification-to-clearance") and average time from implant clearance to scheduling time ("clearance-to-scheduling").

RESULTS

From May 2021 to April 2022, there were 440 implant requests that needed clearance for MRI. The average number of days for "notification-to-clearance" was less than 6 days, with 291 requests completed in 3 days or less. The median "clearance-to-scheduling" time was 19 days for outpatients.*Discussion The implementation of implant clearance process by a centralized database has streamlined the scheduling and completion of MRI studies. The shared tracker ensures that implant requests are cleared prior to patient arrival in the department. It has also facilitated collaboration among the Quality Team in addressing this patient safety issue. A limitation of this study is exclusion of other factors that affect MRI availability.

Ryan Misseldine, BS, MBA, (*Presenter*) Nothing to Disclose

METHODS

Treatment planning at our facility is performed using liver cross sectional imaging (CT/MRI) followed by intraarterial delivery of 5mCi Tc99m-MAA to the lesion(s) of interest. Treatment area volume calculation is then determined using the preprocedure CT/MRI. Nuc med images are used to assess the lung-shunt fraction and any other extrahepatic shunting. After treatment with Y90, patients are imaged using PET/CT to verify site of dose delivery. Our facility decided to track cases after the vendor informed our team that outside facilities were discontinuing the use of pre-therapeutic imaging. These facilities would skip the Tc-99m-MAA SPECT/CT for treatment localization and treat the patient using an assumed lung shunt fraction. We felt it prudent to track cases to determine the validity of this practice. We followed patients where the additional nuc med imaging showed elevated lung-shunting and nontarget extrahepatic activity to assess whether the patient's treatment plan was modified. Modifications included reduction in dose delivered, splitting the dose angiographically between different arteries (Case 1), or changes in treatment plan if patients were precluded from Y90 therapy due to unacceptably high levels of lung shunting (Case 2 3).Case 1: Modified/Split Dose. No Cystic Artery in Angio, visualized gallbladder on SPECT/CT resulted in modified interventional approach and split dose. See Case Image 1. Case 2: Elevated Lung-Shunt: See Case Image 2. Case 3: Elevated Lung-Shunt: - See Case Image 3.

RESULTS

Case evaluation confirmed utilizing advanced imaging techniques (preplanning angiography, Geometric lung-shunt evaluation, SPECT/CT, and PET/CT) lead to improved image quality, interventional approach, and patient safety. This is achieved via reduced dose, splitting the dose between different lobar arteries, and validation that dose was delivered without significant exposure to non-target organs.*Discussion Our facility utilized advanced imaging techniques. It should be noted that all facilities performing Y90s may not have access to a hybridized SPECT/CT, PET/CT, etc.

R5A-QI-2 Improving Communication of Unexpected Findings: The Radiology Actionable Findings Tracking (RAFT) System

Participants
Surbhi Trivedi, MD, (*Presenter*) Nothing to Disclose

METHODS

The Radiology Actionable Findings Tracking (RAFT) program was developed at our institution to compile and track unexpected findings on imaging reports and their follow up. The first step of the pipeline occurs when the reading radiologist integrates a special macro in the report to flag an unexpected finding. The macro includes four fields including the acuity, status of communication, finding and clinical relevance, and recommended follow-up. These macros are then compiled by our EMR into a spreadsheet of findings which is monitored daily by a medically trained coordinator. The coordinator notifies the ordering provider with a message via the EMR. The patient is also contacted within three days of the radiology report via the EMR patient portal notification, traditional mail, or phone. If no action is taken by 8 days, the message is escalated to the ordering provider as well as the primary care provider. In cases when a follow up study was recommended, the task is automatically marked complete and the communication loop closed when the recommended study is ordered. When the coordinator messages the provider within our EMR, the provider can communicate with the staff and also immediately order a follow up study if one was recommended. Additionally, a pop-up notification occurs in the chart as an advisory for the provider to follow up with the recommended order similar to when critical vitals prompt an alert for sepsis work-up.

RESULTS

This program has been in use for 2 years and has been adopted among radiologists due to the ease of the macro within the dictation system. On average, 86 unexpected findings were acted on by the provider per month due to the RAFT program. Additionally, an average of 10 findings were escalated per month to an additional provider. Cases of improved patient outcomes include diagnosis of an early-stage pancreatic tumor as well as a suspicious lung nodule found to be early-stage lung cancer.*Discussion The implementation of the RAFT tracking program for incidental and unexpected findings has likely reduced missed follow-ups with a focus on improving patient outcomes. Limitations include follow up beyond the best efforts to escalate findings. Overall, this is a promising program for tracking data from our high-volume department and ensuring that every unexpected finding is effectively handled to ensure optimal patient health and safety.

R5A-QI-3 Contrast Enhanced Mammography - A Potential Game Changer for Breast Conservation Surgery in Developing Nations

Participants
Haleema Sherene, MBBS, Coimbatore, India (*Presenter*) Nothing to Disclose

METHODS

This project was undertaken by the Breast imaging division in a developing urban tertiary academic hospital. 161 women with breast cancer underwent CEM. The number of mastectomy and BCS and re-surgeries for patients in early and advanced stages were analysed.

RESULTS

153 patients (Stage 1: 18, Stage 2: 95, Stage 3: 28 and Stage 4: 11) completed their treatment at the same hospital, of which 72 underwent mastectomy and 78 underwent breast conservation surgery and 11 had metastasis. CEM detected additional lesions and converted to mastectomies in 10 and thereby avoided re-surgeries. CEM defined the extent of lesions better in 14 patients and resulted in negative surgical margins. CEM influenced patient management and avoided re-surgery in 24/153 (15.7%) patients.3/78 had re-surgeries (3.9%) after CEM due to positive margins.*Discussion The total procedure cost was 50dollars compared to 200dollars spent for patients who underwent mammography and MRI with contrast. The total time each of these patients spent in the department was less than 4 hours to give them a final decision on surgery.Contrast enhanced mammography may change the perception of breast conservation surgery in a developing country, especially for the lower-income groups.

R5A-QI-6 Implementation of a Protocol for Non-Conditional Cardiac Implantable Electronic Devices

Participants
Cyndy Kao, BSN, Orange, CA (*Presenter*) Nothing to Disclose

METHODS

This was a pilot program performed from April 2021 until April 2022 at a quarternary academic hospital in both inpatient and outpatient settings. The radiology (Radiology Nurse, Quality Nurse) and electrophysiology (EP) (cardiologists, Nurse Practitioner) departments created a protocol to screen and scan patients with non-conditional CIEDs based off the MagnaSafe Registry multicentered study. For the workflow, the Radiology Nurse trained in CIED programing determined appropriate MR labeling and safety using CIED information obtained by schedulers. The appropriate radiologist, ordering provider and patient were notified, and EP evaluation was performed. An EP provider determined if a CIED was appropriate for scanning and documented program parameters in the consultation note. The patient was provided the appropriate educational materials explaining the risks of scanning a CIED off-label prior to the scan. Prior to the scan, the device was interrogated and programmed into the MRI safe mode as specified by the cardiologist. During the MRI, the patient was monitored by the Radiology Nurse while connected to physiologic monitoring equipment (Figure 1A and 1B), We evaluated the number of requests that were obtained in this workflow and how many were able to be scanned safely.

RESULTS

Out of 226 CIED requests, 43 (19%) were determined to be non-conditional, while the rest were MRI conditional. 15 of the non-conditional patients were successfully scanned under this new protocol. The remaining 28 patients were not scanned due to various factors including: alternate imaging recommended instead of MRI, insurance denials, permanent epicardial or abandoned/fractured leads, patient declination in participating in protocol due to safety concerns, patient opting to be scanned offsite, and provider cancellation of exam. No adverse events were noted intra or post MRI scan.*Discussion The implementation of this protocol has increased access to MRI for patients with implanted CIED. We successfully expanded a key imaging modality to 7% of the sample population who previously would not have been considered for MR scan. Patient and staff education were key to the success of this program.

R5A-QI-7HC Quality of Communications; the Unintended Consequences of Decision Support in Advanced Abdominal Imaging

Participants
Lillian Dominguez-Konicki, MD, Lebanon, NH (*Presenter*) Nothing to Disclose

METHODS

A retrospective review was conducted of all consecutive orders for Abdominal CT exams performed at our institution over a 30-day period following institution of DS, a new, mandatory field in CT imaging orders. Content assessed included the presence/absence of DS free text clinical history (FTCH), the ordering practitioner degree, ordering location, and ordering specialty. Concordance of the DS vs FTCH was assessed by two radiologists. The DS history provided was scored with regard to confidence in protocol selection by an abdominal radiologist with 20 years of experience.

RESULTS

450 individual abdominal CT orders were assessed, and in 20%, the FTCH was left blank; DS history was the only history provided. The DS history did not provide sufficient information to enable selection of the optimal CT protocol 24% of the time. When FTCH was provided, it was discordant with the DS history 15% of the time.Orders placed through the emergency department, surgical clinics, and internal medicine subspecialty clinics neglected to include FTCH the most often (23%, 22%, 17%). Inpatient orders failed to include FTCH only 8% of the time.Orders placed by MD/DO failed to provide FTCH 25% of the time compared with 13% for associate providers.*Discussion This study quantified the unintended consequences to the implementation of DS at our institution, specifically showing a lack of adequate and accurate clinical histories in a substantial number of orders for Abdominal CT exams. We have identified subgroups of providers who could be targeted for initiatives to improve the quality of CI provided in imaging orders. This work is important because safe, high quality patient care in radiology relies on accurate and complete communications from the ordering providers, primarily obtained through the imaging orders. Inaccurate and incomplete clinical information may lead to inappropriate or suboptimal imaging techniques, exposure to ionizing radiation and contrast agents, and negatively impact work efficiency.Please visit the Learning Center to also view this presentation in hardcopy format.

R5A-QI-8 Increasing Utilization of 3D Reconstructions in Pediatric Head CTs for Trauma through Order Set Modification: A Simple Way to Improve Fracture Detection

Participants
Thomas Marini, MD, (*Presenter*) Nothing to Disclose

METHODS

A root cause analysis was performed to identify factors as to why reconstructions were not being ordered by providers. Based on the results, we implemented modifications to the order set for pediatric trauma. Modifications included automatic selection of the 3D reconstruction, explanation as to how the reconstruction assists in fracture detection, and specification that no additional radiation was needed. We performed an audit of pediatric head CTs from patients aged 0-5 for 3 months before and 3 months after our intervention to assess for the number with a reconstruction and compare the utilization rates.

RESULTS

In the 3 months prior to our intervention, of the 60 pediatric head CTs ordered for trauma in patients ages 0-5, 5 patients had a 3D reconstruction ordered (8% utilization rate). In the 3 months after our intervention, there were 41 pediatric head CTs ordered with 15 of them having reconstructions (37% utilization rate). The difference in utilization rates was statistically significant (chi-square statistic of 12.2 ($p = <0.001$)).*Discussion Simple modifications to an order set for pediatric trauma can increase utilization of 3D reconstructions. As 3D reconstructions increase diagnostic accuracy for fracture in pediatric head CTs without increased scan time, increased radiation exposure, or increased cost, incorporating their usage into regular clinical practice is a simple way to increase quality of care. By making these simple changes in order sets, we can significantly improve the quality of patient care by aiding in accurate diagnosis of fractures.

R5B-QI-1 A Clear Picture: Leveraging Automated Technology to Gain Insight into Real-Time Workflows

Participants
Ayman Abunimer, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

METHODS

The intervention was performed in two high volume interventional suites in a large academic center. IRB approval was waived. HIPPA compliant depth detection sensors installed in each room were trained to identify the following states: "patient in (I)", "patient on table (OT)", "patient off table (FT)", "patient out (O)". For ground truth, images were labeled by the study team. A ML algorithm was developed to generate timestamps for the states from the images. Timestamps from the RIS were accessed. We compared the ML and RIS data to ground truth. Deviation is measured as minutes in excess of the ground truth average. Z-testing was used to determine significance.

RESULTS

511 procedures were performed in the IR suites between May 11, 2021 and December 9, 2021. We found gaps in data 38% of the time with the ML data and 48% of the time with RIS data. Gaps in the ML data occurred due to unplugging and/or moving of the equipment and computer memory storage. Gaps in the RIS were due to missing data entries, e.g. human error.At ground truth patients transited the room at the following average times: room A I=0, OT=6, FT=105, O=110 minutes; room B [0, 3, 76, 78] minutes. Data from the ML algorithm was closer to ground truth than from the RIS data. Deviation from ground truth for each state was: ML: room A I=1, OT=3, FT=2, O=4 minutes, 5% average error; room B [2, 3, 4, 3, 8% error rate] minutes; RIS room A [1, 6, 21, 17, 28% error rate] and room B [1, 3, 14, 13, 24% error rate]. Z-test confirmed that the mean differential of the ML data is lower than the mean for the institutional data source beyond 3 standard deviations (P<0.001).*Discussion ML algorithm data was more accurate than the manually entered RIS data in evaluating IR room utilization. Although gaps in data were found in the ML generated data, these are all easily solved by increased computing memory and device location redesign.

R5B-QI-2 A New Era of Quality Improvement: Creating a Digital Twin of the Radiology Department to Drive Efficiencies in Operations and Workflow

Participants
Robert MacDougall, PhD, (*Presenter*) Employee, Quantivly Inc

METHODS

We used a commercially available software platform, Quantivly, that harmonizes radiology metadata to provide a unified data layer describing MRI operations. The unified data layer is the basis of the digital twin which can be used to simulate intervention without the cost of real-world experimentation. We identified exams that would have the biggest impact, ordered exams by cumulative duration, i.e. the sum in hours for a given exam, over a 90 day period. The top exam in the "body" section was "MR PROSTATE WITH AND WITHOUT CONTRAST" by a wide margin - 123 hours vs. 50.4 hours for the second highest. We compared slot sizes ranging from 30 - 60 mins to quantify the benefit (additional patients per week) and risk (number of exams delayed and median delay time). We identified the top 10 longest instances to investigate methods to further reduce delays in the schedule.

RESULTS

We calculated results for each potential slot size over the analysis period of 90 days (197 exams total). At the current slot size (60 min), no patients that exceeded the slot. At 45 mins, the cumulative time saved was 49.3 hours, representing 5 additional patients per week, with 15 (9.6%) patients exceeding the slot size with a median delay of 4.3min. *Discussion While there were no delays with our current slot, this does not represent the best trade-off in terms of patient access. Through simulation, we were able to predict the benefit and risks of changing a scheduled slot size for the top body exam from 60 min to 45 min, creating slots for 5 additional patients per week, reducing wait times, and increasing department revenue. In the future, by troubleshooting the longest instances, we plan to identify the clinical, technical, and demographic factors that lead to longer exam durations which can lead to additional improvements in MRI operations and workflow.

R5B-QI-3 Identification of Health Literacy Disparity - Delivering Patient-friendly Radiology Reports to Spanish-speaking Populations

Participants
Jennifer Kemp, MD, Denver, CO (*Presenter*) Stockholder, Scanslated, Inc

METHODS

At 10 outpatient imaging centers in a metropolitan city, patients receive a notification when their radiology report is available to be viewed on a web-based interactive patient portal with lay language definitions and diagrams. The interactive report has a toggle

switch that patients can use to display the content in Spanish (Figure 1). The population in this city is 31% Latino and 57% of those identify Spanish as their primary language. Based on local population data we would expect up to 17% of our patient population to prefer to view patient-friendly explanations in Spanish. We analyzed data to determine what percentage of our patients were using the Spanish translation feature, and compared this with demographics of the local population.

RESULTS

95 patients utilized our Spanish language content over a 1.5 year period, which is 0.1% of all patients who viewed a patient-friendly report. These 95 patients viewed 1,670 plain language definitions in Spanish. During this same time period, 402,445 definitions were viewed in English. The Feedback from patients utilizing spanish language content was favorable, with 96% indicating that the definitions and diagrams help them to understand their report.*Discussion Health equity is a priority for RSNA and ACR, and the identification of specific healthcare disparities is the first step in addressing them. Our analysis found that only 0.1% of patients viewing a patient-friendly radiology report have utilized the available Spanish language content, despite Pew research data showing that 17% identify Spanish as their preferred language. This discrepancy has motivated efforts to improve accessibility for our Spanish speaking patients. Beyond providing a toggle switch for Spanish translation, efforts need to be made to educate patients that this tool is available. Educated and informed patients make better healthcare decisions and have improved health outcomes. Helping Spanish speaking patients to better understand imaging results through access to patient-friendly reports may help address current disparities in this patient population.

R5B-QI-4HC Investigating Optimal Protocol for Image-Guided Tissue Sampling in Cases of Suspected Lymphoid Neoplasm

Participants
Mathew Smith, MD, (*Presenter*) Nothing to Disclose

METHODS

Context and Intervention: No institutional standardized process was in place for image-guided tissue sampling in cases of suspected or possible lymphoid neoplasm with significant variability in tissue sampling, tissue processing, and subsequent results between cases. To identify the significant factors which contributed to obtaining a diagnosis and WHO classification in these cases, the relevant cases from 2018 were identified using the Illuminate InSight search engine and the discoverable variables were collected. Study of the Intervention: We compare various features of specimen collection based on the classification outcome (diagnosis of LN with WHO classification, diagnosis of LN without WHO classification, and Indeterminate) Measures/Metrics: We provide descriptive statistics, including mean (standard deviation), median (interquartile range), range for continuous variables, and counts/percentages for categorical variables. We test for a significant difference between the three groups using univariate tests. For continuous variables, we use the Kruskal-Wallis test; for categorical variables, we use the Fisher's Exact Test. We consider a p-value of less than 0.05 to be significant.

RESULTS

Table 1 compares the specimen collection characteristics between cases which resulted in LN diagnosis plus WHO classification (LN +WHO), LN diagnosis without WHO classification (LN - WHO), and indeterminate samples from the first 6 months of data collection. There is a significant difference in the type of analysis performed, core minimal length, core gauge, and flow.*Discussion The preliminary results from the first 6 months of data collection suggest that specimen with a diagnosis and WHO classification have a larger core biopsy gauge and length, use both core biopsy and fine-needle aspiration, and provide adequate sampling for flow cytometry. Limitations to the study were mainly secondary to a lack of standardized reporting, limiting the number of factors that were able to be teased out retrospectively.Please visit the Learning Center to also view this presentation in hardcopy format.

R5B-QI-5 Improving Consistency in Physician Performance in Cardiac Fluoroscopic Procedures within Six Facilities Using Outlier Analyses

Participants
James Winslow, PhD, Glenwood, IL (*Presenter*) Nothing to Disclose

METHODS

This project was performed for six different hospitals. Twelve months of fluoroscopic procedure data was collected for each facility using two dose monitoring software products, Landauer OPTIMIZE(Fluke Health Solution, Glenwood, IL) and Radimetrics(Bayer HealthCare, Leverkusen, Germany). The data fields collected/analyzed included facility, scanner model, performing physician, study description, and reference point dose(RPD). For each facility, the most frequently performed cardiac procedure and scanner model was identified. For these procedures, means and standard deviations for RPD were calculated for each facility. Outliers for each facility were defined as procedures having dose values more than three standard deviations greater than the mean value. The percentage of outliers of total procedures were calculated for each facility and for each individual physician. Calculated data from all facilities were combined and sorted by Performing Physician from greatest percentage of outliers to least. Cumulative percentage values for total exams and total outliers were then calculated.

RESULTS

Facility outlier percentage ranged from 1.5-2.7%. From this, an achievable target for percentage of outliers at three percent was selected. For physicians with >10 procedures, individual physician outlier percentage values ranged from 0-16.7%(Figure 1). A subset of performing physicians who exceeded the achievable target for outlier percentage were identified at each facility for quality review (Table 1). For 5 of 6 facilities, more than 70% of outliers were performed by physicians marked for quality review even though those physicians performed fewer than 43% of the total procedures(Table 1). After sorting physicians from highest to lowest by individual percentage of outliers, cumulative percentages of exams and outliers were calculated. 17% of physicians were responsible for 100% of outliers (Figure 2).*Discussion The data analyzed is sufficient to give valuable physician feedback to improve fluoroscopy patient doses. Use of this data in a quality improvement context would yield improved clinical outcomes This approach identifies physicians who may benefit from shared education from physicians identified as less prone to having high dose procedures. One limitation of our study is that it presumes physicians using the same study description and system are performing similar procedures.

R5B-QI-6 Development and Optimization of Multiparametric MRI for Bladder Cancer: Opportunities for Standardization and Quality Improvement

Participants

Chris Walker, PhD, Houston, TX (*Presenter*) Researcher, Siemens AG

METHODS

Once an initial protocol was developed from the VI-RADS literature(2,3,5), more nuanced optimization of performance used (n =5) healthy volunteers. The image quality and scan time optimized protocol was run with an initial sample of patients by a niche technologist team trained and supervised by the radiologist and MR physics team. Image quality metrics, including SNR and CNR were calculated on acquired images using open source software MRQy(6). All scanning was performed on either 750w or Premier 3T MRIs (GE Healthcare Chicago, IL). Three iterations of the protocol are displayed in Table 1 and Figure 1. The initial protocol, an intermediate protocol optimized based upon an image quality review of the protocol performed in volunteers and the, final protocol.

RESULTS

Protocol changes include improving DWI SNR by increasing slice thickness from 3 to 4 mm. Additionally, the synthetic b-value image was found to be of limited use and was not included in the final protocol. Small FOV T2 resolution was improved by reducing the FOV and increasing the frequency encode matrix. Due to scan time limitations no other offsets were made which resulted in a reduction of SNR, seen in Figure 2b. Optimization of resolution and SNR improved the quality of both T2 and DWI imaging of the bladder (Figure 2, 3).*Discussion VI-RADS compliant multiparametric bladder MR imaging provides a standardized approach for imaging bladder lesions that improves the quality of care for patients with suspected bladder cancer. The development and optimization of this protocol necessitates an iterative approach incorporating phantom, volunteer and patient imaging for quantitative assessments of image quality and validation. This workflow illustrates key considerations pertinent to protocol development.

R5B-QI-7 Impact of PET/MR Imaging in Patients with Gynecologic Cancers Undergoing Same-Day PET/CT: A Patient-Centric Approach

Participants
Dhakshina Ganeshan, FRCR,MBBS, , (*Presenter*) Nothing to Disclose

METHODS

In this traditional model, apart from the actual lengthy scanning time, the patients had to wait for a significant amount of time between the procedures, contributing to patient discomfort. In our project, combined PET/MR imaging was only performed in those patients who were undergoing same-day PET/CT, utilizing the same radioactivity as required for a stand-alone PET/CT study. We evaluated the time taken for performing the PET/CT, standard pelvic MRI, and the combined PET/MR. We also evaluated the diagnostic performance of the PET/CT and PET/MRI for TNM staging. The McNemar test was employed for statistical analysis.

RESULTS

49 patients were included in the final analysis of this HIPAA-compliant, prospective quality improvement board approved, and IRB-approved retrospective study. The time spent in the imaging area for undergoing a diagnostic PET/CT was 143 minutes and that for a pelvic MRI was 134 minutes. The combined overall time spent in the imaging area for a PET/CT followed by pelvic MR was 277 minutes. In contrast, the patients spent only 170 minutes on the combined PET/MR procedure. Hence, performing a PET/MR reduced the time spent by the patient in the imaging department by 38.6%. PET/MRI was superior to the PET/CT in nodal staging, as PET/MRI detected adenopathy in 5 patients, which was missed on the PET/CT (P=0.031). Furthermore, PET/MRI detected pelvic metastases in 10 patients that were missed using PET/CT, and PET/CT also falsely upstaged pelvic metastasis in 4 patients. However, this was not statistically significant (P=0.12)..*Discussion Our study indicates that in patients with gynecologic cancers who are scheduled to undergo both PET/CT and MRI, it may be feasible to consider performing combined PET/MR. Performing a PET MR will reduce the time spent by the patient in the hospital and may improve patient experience and satisfaction. Performing a PET/MR reduced the time spent by the patient in the department by 38.6%.

A Clear Picture: Leveraging Automated Technology to Gain Insight into Real-Time Workflows

Thursday, Dec. 1 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Ayman Abunimer, MD, Atlanta, GA (*Presenter*) Nothing to Disclose

METHODS

The intervention was performed in two high volume interventional suites in a large academic center. IRB approval was waived. HIPPA compliant depth detection sensors installed in each room were trained to identify the following states: "patient in (I)", "patient on table (OT)", "patient off table (FT)", "patient out (O)". For ground truth, images were labeled by the study team. A ML algorithm was developed to generate timestamps for the states from the images. Timestamps from the RIS were accessed. We compared the ML and RIS data to ground truth. Deviation is measured as minutes in excess of the ground truth average. Z-testing was used to determine significance.

RESULTS

511 procedures were performed in the IR suites between May 11, 2021 and December 9, 2021. We found gaps in data 38% of the time with the ML data and 48% of the time with RIS data. Gaps in the ML data occurred due to unplugging and/or moving of the equipment and computer memory storage. Gaps in the RIS were due to missing data entries, e.g. human error.At ground truth patients transited the room at the following average times: room A I=0, OT=6, FT=105, O=110 minutes; room B [0, 3, 76, 78] minutes. Data from the ML algorithm was closer to ground truth than from the RIS data. Deviation from ground truth for each state was: ML: room A I=1, OT=3, FT=2, O=4 minutes, 5% average error; room B [2, 3, 4, 3, 8% error rate] minutes; RIS room A [1, 6, 21, 17, 28% error rate] and room B [1, 3, 14, 13, 24% error rate]. Z-test confirmed that the mean differential of the ML data is lower than the mean for the institutional data source beyond 3 standard deviations (P<0.001).*Discussion ML algorithm data was more accurate than the manually entered RIS data in evaluating IR room utilization. Although gaps in data were found in the ML generated data, these are all easily solved by increased computing memory and device location redesign.

R5B-QI-2

A New Era of Quality Improvement: Creating a Digital Twin of the Radiology Department to Drive Efficiencies in Operations and Workflow

Thursday, Dec. 1 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Robert MacDougall, PhD, (*Presenter*) Employee, Quantivly Inc

METHODS

We used a commercially available software platform, Quantivly, that harmonizes radiology metadata to provide a unified data layer describing MRI operations. The unified data layer is the basis of the digital twin which can be used to simulate intervention without the cost of real-world experimentation. We identified exams that would have the biggest impact, ordered exams by cumulative duration, i.e. the sum in hours for a given exam, over a 90 day period. The top exam in the "body" section was "MR PROSTATE WITH AND WITHOUT CONTRAST" by a wide margin - 123 hours vs. 50.4 hours for the second highest. We compared slot sizes ranging from 30 - 60 mins to quantify the benefit (additional patients per week) and risk (number of exams delayed and median delay time). We identified the top 10 longest instances to investigate methods to further reduce delays in the schedule.

RESULTS

We calculated results for each potential slot size over the analysis period of 90 days (197 exams total). At the current slot size (60 min), no patients that exceeded the slot. At 45 mins, the cumulative time saved was 49.3 hours, representing 5 additional patients per week, with 15 (9.6%) patients exceeding the slot size with a median delay of 4.3min. *Discussion While there were no delays with our current slot, this does not represent the best trade-off in terms of patient access. Through simulation, we were able to predict the benefit and risks of changing a scheduled slot size for the top body exam from 60 min to 45 min, creating slots for 5 additional patients per week, reducing wait times, and increasing department revenue. In the future, by troubleshooting the longest instances, we plan to identify the clinical, technical, and demographic factors that lead to longer exam durations which can lead to additional improvements in MRI operations and workflow.

R5B-QI-3

Identification of Health Literacy Disparity - Delivering Patient-friendly Radiology Reports to Spanish-speaking Populations

Thursday, Dec. 1 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Jennifer Kemp, MD, Denver, CO (*Presenter*) Stockholder, Scanslated, Inc

METHODS

At 10 outpatient imaging centers in a metropolitan city, patients receive a notification when their radiology report is available to be viewed on a web-based interactive patient portal with lay language definitions and diagrams. The interactive report has a toggle switch that patients can use to display the content in Spanish (Figure 1). The population in this city is 31% Latino and 57% of those identify Spanish as their primary language. Based on local population data we would expect up to 17% of our patient population to prefer to view patient-friendly explanations in Spanish. We analyzed data to determine what percentage of our patients were using the Spanish translation feature, and compared this with demographics of the local population.

RESULTS

95 patients utilized our Spanish language content over a 1.5 year period, which is 0.1% of all patients who viewed a patient-friendly report. These 95 patients viewed 1,670 plain language definitions in Spanish. During this same time period, 402,445 definitions were viewed in English. The Feedback from patients utilizing spanish language content was favorable, with 96% indicating that the definitions and diagrams help them to understand their report.*Discussion Health equity is a priority for RSNA and ACR, and the identification of specific healthcare disparities is the first step in addressing them. Our analysis found that only 0.1% of patients viewing a patient-friendly radiology report have utilized the available Spanish language content, despite Pew research data showing that 17% identify Spanish as their preferred language. This discrepancy has motivated efforts to improve accessibility for our Spanish speaking patients. Beyond providing a toggle switch for Spanish translation, efforts need to be made to educate patients that this tool is available. Educated and informed patients make better healthcare decisions and have improved health outcomes. Helping Spanish speaking patients to better understand imaging results through access to patient-friendly reports may help address current disparities in this patient population.

R5B-QI-4HC

Investigating Optimal Protocol for Image-Guided Tissue Sampling in Cases of Suspected Lymphoid Neoplasm

Thursday, Dec. 1 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Mathew Smith, MD, (*Presenter*) Nothing to Disclose

METHODS

Context and Intervention: No institutional standardized process was in place for image-guided tissue sampling in cases of suspected or possible lymphoid neoplasm with significant variability in tissue sampling, tissue processing, and subsequent results between cases. To identify the significant factors which contributed to obtaining a diagnosis and WHO classification in these cases, the relevant cases from 2018 were identified using the Illuminate InSight search engine and the discoverable variables were collected. Study of the Intervention: We compare various features of specimen collection based on the classification outcome (diagnosis of LN with WHO classification, diagnosis of LN without WHO classification, and Indeterminate) Measures/Metrics: We provide descriptive statistics, including mean (standard deviation), median (interquartile range), range for continuous variables, and counts/percentages for categorical variables. We test for a significant difference between the three groups using univariate tests. For continuous variables, we use the Kruskal-Wallis test; for categorical variables, we use the Fisher's Exact Test. We consider a p-value of less than 0.05 to be significant.

RESULTS

Table 1 compares the specimen collection characteristics between cases which resulted in LN diagnosis plus WHO classification (LN +WHO), LN diagnosis without WHO classification (LN - WHO), and indeterminate samples from the first 6 months of data collection. There is a significant difference in the type of analysis performed, core minimal length, core gauge, and flow.*Discussion The preliminary results from the first 6 months of data collection suggest that specimen with a diagnosis and WHO classification have a larger core biopsy gauge and length, use both core biopsy and fine-needle aspiration, and provide adequate sampling for flow cytometry. Limitations to the study were mainly secondary to a lack of standardized reporting, limiting the number of factors that were able to be teased out retrospectively.Please visit the Learning Center to also view this presentation in hardcopy format.

Improving Consistency in Physician Performance in Cardiac Fluoroscopic Procedures within Six Facilities Using Outlier Analyses

Thursday, Dec. 1 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
James Winslow, PhD, Glenwood, IL (*Presenter*) Nothing to Disclose

METHODS

This project was performed for six different hospitals. Twelve months of fluoroscopic procedure data was collected for each facility using two dose monitoring software products, Landauer OPTIMIZE(Fluke Health Solution, Glenwood, IL) and Radimetrics(Bayer HealthCare, Leverkusen, Germany). The data fields collected/analyzed included facility, scanner model, performing physician, study description, and reference point dose(RPD). For each facility, the most frequently performed cardiac procedure and scanner model was identified. For these procedures, means and standard deviations for RPD were calculated for each facility. Outliers for each facility were defined as procedures having dose values more than three standard deviations greater than the mean value. The percentage of outliers of total procedures were calculated for each facility and for each individual physician. Calculated data from all facilities were combined and sorted by Performing Physician from greatest percentage of outliers to least. Cumulative percentage values for total exams and total outliers were then calculated.

RESULTS

Facility outlier percentage ranged from 1.5-2.7%. From this, an achievable target for percentage of outliers at three percent was selected. For physicians with >10 procedures, individual physician outlier percentage values ranged from 0-16.7%(Figure 1). A subset of performing physicians who exceeded the achievable target for outlier percentage were identified at each facility for quality review (Table 1). For 5 of 6 facilities, more than 70% of outliers were performed by physicians marked for quality review even though those physicians performed fewer than 43% of the total procedures(Table 1). After sorting physicians from highest to lowest by individual percentage of outliers, cumulative percentages of exams and outliers were calculated. 17% of physicians were responsible for 100% of outliers (Figure 2).*Discussion The data analyzed is sufficient to give valuable physician feedback to improve fluoroscopy patient doses. Use of this data in a quality improvement context would yield improved clinical outcomes This approach identifies physicians who may benefit from shared education from physicians identified as less prone to having high dose procedures. One limitation of our study is that it presumes physicians using the same study description and system are performing similar procedures.

Quality Improvement Reports Sunday Poster Discussions - A

Sunday, Nov. 27 11:45AM - 12:15PM Room: Learning Center - QI DPS

Sub-Events

S3A-QI-1 Can an Artificial Intelligence System (AIS) help human readers in a Digital Mammography (DM) Breast Screening Program (BSP)? Our preliminary experience.

Participants
Claudia M. Weiss, MD, Treviso, Italy (*Presenter*) Nothing to Disclose

METHODS

From November 2021 to March 2022, 19310 women attended BSP of Treviso (Italy) (range age 50-74yrs, mean age 60.6 yrs) using different DM units (Hologic, Fuji, Philips) and analyzed with AIS Lunit INSIGHT MMG. ExSs were grouped into four levels: normal/benign/probably benign (=10%) as group 1 (G1); moderate suspicion of malignancy (>10%-=50%) as group 2 (G2); high suspicion of malignancy (>50%-<95%) as group 3 (G3); highly suggestive of malignancy (=95%) as group 4 (G4). Except for ExS =10%, all suspicious lesions were marked and % reported. After being processed, all DMs were successively assessed by five Dedicated Breast Radiologists (DBRs) with at least two years of experience (median 10.8 yrs). Arbitration of discordant reports of HBDR was used in cases of disagreement. During AIS-aided HBDR, ExS was visible to DBRs. The positive predictive values (PPV), negative predictive values (NPV), sensitivity, and specificity of AIS were calculated using the ExS cutoff of >10% as positive.

RESULTS

The distribution of ExS among the different groups was: G1 79.5%(15359/19310), G2 17.3%(3350/19310), G3 2.7%(512/19310), G4 4%(80/19310). In a subgroup analysis, 12570/19310 (65%) were scored =5%. AIS classified 20.4%(3942/19310) of the DMs as positive (>10%), while AIS-aided HBDR recalled patients were 447/19.310(RR 2.3%). The detected biopsy-confirmed BCs were 127(DR 6.6‰): 80% (102/127; DR 5.3‰) detected by both readers, the remaining 20% (25/127) only by one reader; AIS correctly identified 98%(125/127; DR 6.5‰) BCs. The average ExS of the BCs was 84% (range 5.97%-99.89%) with following distribution: G1 1.6% (2/127), G2 10.2% (13/127), G3 36.2% (46/127), G4 52% (66/127). The AIS demonstrates a sensitivity of 98.43%, specificity of 80.10%, NPV of 99.99%, and PPV of 3.2% against AIS-aided HBDR PPV of 28.4%. No BC was detected in exams with ExS =5% (NPV 100%).*Discussion The very low AIS PPV makes it challenging to propose a BSP with only AIS standalone reading. Human reading compensates for the very low PPV of AIS because DBRs also have access to previous mammograms. However, the exceptional AIS's NPV in the subgroup of exams with Exs =5% allows us to hypothesize their automatic preselection for DBRs single reading, thus significantly reducing the BSP workload while maintaining the overall sensitivity.

S3A-QI-2 Improving Rates of Breast Cancer Risk Assessment Completion at Time of Screening Mammography

Participants
Jocelyn Cheng, (*Presenter*) Nothing to Disclose

METHODS

This project was performed at a high volume quaternary breast imaging center in addition to two community imaging centers. The study sample was all women presenting for screening mammography. Beginning November 2, 2020, patients who presented for screening mammography began receiving breast cancer risk assessment (CRA), specifically, the Tyrer-Cuzick risk assessment model. the first month of administration, 9% of patients completed CRA screening. CRA administrators were surveyed to determine major factors contributing to low rates of CRA screening completion. Common responses included window of assessment availability during business, hours, English-only administration, limited options for completing CRA screening tool at time of mammography, and insufficient training in explaining CRA screening to patients. To address these barriers to screening, multiple interventions were performed: CRA screening was emailed to participants prior to mammography visit, patients were actively encouraged to complete screening by staff at time of mammogram, forms with multiple languages were offered in both virtual (iPad) and paper format, and screening completion was double-checked by a technologist and administrator to ensure correct entry of data. The impact of these interventions was assessed by comparing the number of successfully completed CRA screening surveys at time of mammography visit to total number of mammograms using an interrupted time series model in MATLAB.

RESULTS

Analysis demonstrated that our interventions resulted in an immediate increase in CRA completion rates. The percent of patients with successful CRA completion increased from 8.8% to 50% in the first four months ($p<0.01$) and to 71% at 18 months ($p<0.01$).*Discussion Limitations in our study include generalizability and difficulty in ascribing increase in CRA completion rates to a single intervention. Using classic process improvement tools and a multi-step intervention focused largely on removing patient barriers to CRA completion, we significantly increased the rate of CRA completion at our three breast imaging centers.

S3A-QI-3 The FIND Program: Improving Follow-Up of Incidental Imaging Findings

Participants
Kaitlin Zaki-Metias, MD, Pontiac, MI (*Presenter*) Nothing to Disclose

METHODS

This study was approved by the institutional review board. A retrospective analysis of 2000 patients with computed tomographic cross-sectional imaging was performed; 1000 patients prior to implementation of the FIND Program and 1000 patients one year after establishment of the program. Data collected included the frequency of incidental findings, inclusion of follow-up recommendations in the radiology report, and adherence to suggested follow-up. These metrics were analyzed using the SPSS statistics software version 25.0.

RESULTS

There was a higher rate of completion of recommended follow-up imaging in the post-implementation group (47/104, 45.2%) compared to the pre-implementation group (41/128, 32.0%) (p=0.043), of which 88.2% (30/34) occurred within the recommended time frame, compared to 56.3% (18/32) in the pre-implementation group (p=0.005).*Discussion Implementation of an incidental findings tracking program resulted in improved follow-up of incidental imaging findings and adherence to follow-up within the recommended time frame. This has the potential to reduce the burden of clinically significant incidental findings on the healthcare system due to lack of follow-up possibly resulting in later presentation of advanced disease. Given its value, further studies should explore the utility of more sophisticated artificial intelligence softwares in incidental findings tracking programs.

S3A-QI-4 Untangling the Spaghetti: Improving Retrieval Time for CT Supplies Using 5S

Awards
Identified for RadioGraphics
Quality Improvement Reports Award

Participants
Theresa Pham, MD, BS, Salt Lake City, UT (*Presenter*) Nothing to Disclose

METHODS

This project was performed in the Huntsman Cancer Hospital (HCH) CT room which stores supplies for two CT scanners, including a busy interventional procedure scanner. Images were taken of the supplies in the CT closet, workroom, and procedure room before and after storage reorganization. Storage reorganization was based off the Lean 5S Methodology (Sort, Set in order, Shine, Standardize, and Sustain). Analysis of the impact of supply reorganization and labeling was performed using three methods: 1) spaghetti diagrams of participants during a 10-item supply retrieval scavenger hunt before and after, 2) timed 10-item supply retrieval scavenger hunt before and after, 3) satisfaction surveys of medical providers/staff before and after. Items participants were asked to retrieve for the timed scavenger hunt included commonly used items such as: sterile gloves, sterile gauze, 50 mL syringe, sterile gown, 18G needle, biopsy tray, Christmas tree adapter, sterile saline/water, a mask, and a 3-way stopcock.

RESULTS

Seven radiology residents voluntarily participated in the timed supply scavenger hunt before and after our intervention. Spaghetti diagrams demonstrated a reduction in redundant foot traffic with supply retrieval after storage reorganization. Additionally, there was a 61.7% decrease in the average amount of time it took to find the 10 items in the scavenger hunt with a p-value of 0.0013. Satisfaction surveys after the intervention had overall more positive responses.*Discussion Using the 5S Methodology for storage reorganization, we were able to achieve our goal of reducing the time to find supplies and increasing satisfaction scores from both CT technicians and medical providers. We were also able to decrease redundant foot traffic throughout the storage areas. Future directions include extending the organization/labeling system to other CT storage areas within our academic institution, implementing a Kanban system, and working with management to maintain this current level of organization.

S3A-QI-5 Use of Bunker shifts alleviates Long List Anxiety Syndrome (LLAS)

Awards
Quality Improvement Reports Award

Participants
Eric A. Brandser, MD, (*Presenter*) Owner, Shift Procurement Services, LLC

METHODS

The group created several voluntary and additionally compensated Bunker shifts, including a shift based on a fixed number of wRVU, a short time-based shift, and a time and productivity hybrid shift. Bunkers were deployed sparingly at first, with increased usage in each subsequent year. In 2020 the group added "ad hoc" bunkers, with a group text system to anyone interested in helping if needed when the list of cases to read became long. Ad hoc bunkers would be called by a member of the scheduled team on a given day whose job included watching the workload for imbalances.

RESULTS

The Bunker shifts have significantly improved practice scheduling on our busier days, allowing ad hoc recruitment of reading capacity when needed on a day by day and hour by hour basis. Use of Bunker shifts has increased every year since inception in 2018. Number of days where day shift stays longer than 30 minutes beyond expected end of day has been reduced dramatically. Group productivity increased every year. wRVU/FTE/year (total wRVU in a given year divided by FTE in the group) increased 12% in 2018, 21% in 2019, 13% in 2020 and 29 % in 2021 when compared to 2017 values. Group bonus increased every year since 2017, with increases of 7% in 2018, 26% in 2019, 22% in 2020, and 37% in 2021 compared to baseline 2017.*Discussion Implementation and expansion of the Bunker shifts has had several group benefits. The publishing of individual wRVU data has stopped, as the group abandoned the idea that slower readers can or should read faster. Morale of the group has improved, with significantly fewer tough and late days. Group productivity has increased by shifting more cases to readers in highly efficient shifts. The increased efficiency has translated to improved bonus compensation, which has increased every year comparing to 2017 (pre bunker).

S3A-QI-7 Clinical Implementation of an AI-driven Lung Nodule Algorithm QA Project in the ED Setting

Awards
Quality Improvement Reports Award

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

METHODS

An innovative workflow tool previously developed by our team in collaboration with AIDOC, the proprietary company that created the lung nodule detection algorithm, was implemented in the emergency radiology division of our academic, tertiary center. Data was collected in accordance with the HIPAA Privacy Rule using our institution's EMR, and an IRB waiver was granted. Our project's process map can be found in figure 1.

RESULTS

15750 CT scans were analyzed between October 1, 2021, to April 9, 2022. Aidoc identified pulmonary nodules not referenced by the radiologist in radiology reports of CT scans of 26 patients: 16 females and 10 males. Our group found an odds ratio of 2.65 for algorithm detection of missed lung nodules in patients in which the CT scan included the full chest in comparison to those in which only a portion of the chest was imaged. The average age at the time of CT was 64.3 years (range: 41-87 years). Addendums were issued for 16 patients (61.5%), and the time from the original report to the addendum was 1 day and 9 hours, or 1980 minutes, on average. The average size of the nodules in which an addendum was issued was 6 mm (range 3-10 mm).*Discussion The intervention was non-intrusive, with only 0.17% of all CTs requiring additional review. Based on the prevalence of incidental pulmonary nodules, it can be estimated that thousands of ultimately irrelevant notifications were avoided, greatly reducing the time spent by the reading radiologist to adjudicate AI findings during interpretation. Relevant addendums were issued promptly, when necessary. The actual impact on patient outcomes is unclear at this point but can be further explored over time. Until such time as AI programs become sophisticated enough to incorporate comparison imaging and clinical history into their assessment in real-time, a QA program such as the one utilized by this department provides a nonobtrusive means for ensuring appropriate reporting and follow-up of incidental pulmonary nodules in the emergent setting with minimal disruption to radiologist workflow.

S3A-QI-8 Creation and Implementation of a PACS-Integrated Vasari Feature Classification Tool

Participants
Irene Dixe de Oliveira Santo, MD, New Haven, CT (*Presenter*) Nothing to Disclose

METHODS

The manual approach for VASARI feature extraction involved online consulting of the VASARI set, evaluation of the images on the PACS, and entering the information for each individual patient into an excel sheet prior to sharing with other users. For the creation of our tool, the VASARI feature set was integrated into the PACS application programming interface. After clicking the VASARI tool icon in the PACS, the features appear in a separate pop-up window, with options to be selected by the user. The answers can then be saved directly into the PACS and reviewed by other users.

RESULTS

Our PACS-integrated tool allows for dramatically improved efficiency, resulting in a 50 minute decrease in the time needed to complete VASARI feature extraction, from the 1 hour required by the previously used multi-platform approach to approximately 10 minutes. Furthermore, our tool allows batch exporting of the VASARI features simultaneously for multiple patients prior to data analysis and processing.*Discussion Integration of a VASARI features classification tool into PACS substantially improves workflow of both physicians and data scientists involved in the classification of brain tumors and the creation and validation of machine learning algorithms. This allows for much-needed time efficient radiomic feature extraction and has numerous potential applications in the clinical setting.

S3A-QI-1

Can an Artificial Intelligence System (AIS) help human readers in a Digital Mammography (DM) Breast Screening Program (BSP)? Our preliminary experience.

Sunday, Nov. 27 11:45AM - 12:15PM Room: Learning Center - QI DPS

Participants
Claudia M. Weiss, MD, Treviso, Italy (*Presenter*) Nothing to Disclose

METHODS

From November 2021 to March 2022, 19310 women attended BSP of Treviso (Italy) (range age 50-74yrs, mean age 60.6 yrs) using different DM units (Hologic, Fuji, Philips) and analyzed with AIS Lunit INSIGHT MMG. ExSs were grouped into four levels: normal/benign/probably benign (=10%) as group 1 (G1); moderate suspicion of malignancy (>10%-=50%) as group 2 (G2); high suspicion of malignancy (>50%-<95%) as group 3 (G3); highly suggestive of malignancy (=95%) as group 4 (G4). Except for ExS =10%, all suspicious lesions were marked and % reported. After being processed, all DMs were successively assessed by five Dedicated Breast Radiologists (DBRs) with at least two years of experience (median 10.8 yrs). Arbitration of discordant reports of HBDR was used in cases of disagreement. During AIS-aided HBDR, ExS was visible to DBRs. The positive predictive values (PPV), negative predictive values (NPV), sensitivity, and specificity of AIS were calculated using the ExS cutoff of >10% as positive.

RESULTS

The distribution of ExS among the different groups was: G1 79.5%(15359/19310), G2 17.3%(3350/19310), G3 2.7%(512/19310), G4 4%(80/19310). In a subgroup analysis, 12570/19310 (65%) were scored =5%. AIS classified 20.4%(3942/19310) of the DMs as positive (>10%), while AIS-aided HBDR recalled patients were 447/19.310(RR 2.3%). The detected biopsy-confirmed BCs were 127(DR 6.6‰): 80% (102/127; DR 5.3‰) detected by both readers, the remaining 20% (25/127) only by one reader; AIS correctly identified 98%(125/127; DR 6.5‰) BCs. The average ExS of the BCs was 84% (range 5.97%-99.89%) with following distribution: G1 1.6% (2/127), G2 10.2% (13/127), G3 36.2% (46/127), G4 52% (66/127). The AIS demonstrates a sensitivity of 98.43%, specificity of 80.10%, NPV of 99.99%, and PPV of 3.2% against AIS-aided HBDR PPV of 28.4%. No BC was detected in exams with ExS =5% (NPV 100%).*Discussion The very low AIS PPV makes it challenging to propose a BSP with only AIS standalone reading. Human reading compensates for the very low PPV of AIS because DBRs also have access to previous mammograms. However, the exceptional AIS's NPV in the subgroup of exams with Exs =5% allows us to hypothesize their automatic preselection for DBRs single reading, thus significantly reducing the BSP workload while maintaining the overall sensitivity.

S3A-QI-2

Improving Rates of Breast Cancer Risk Assessment Completion at Time of Screening Mammography

Sunday, Nov. 27 11:45AM - 12:15PM Room: Learning Center - QI DPS

Participants
Jocelyn Cheng, (*Presenter*) Nothing to Disclose

METHODS

This project was performed at a high volume quaternary breast imaging center in addition to two community imaging centers. The study sample was all women presenting for screening mammography. Beginning November 2, 2020, patients who presented for screening mammography began receiving breast cancer risk assessment (CRA), specifically, the Tyrer-Cuzick risk assessment model. the first month of administration, 9% of patients completed CRA screening. CRA administrators were surveyed to determine major factors contributing to low rates of CRA screening completion. Common responses included window of assessment availability during business, hours, English-only administration, limited options for completing CRA screening tool at time of mammography, and insufficient training in explaining CRA screening to patients. To address these barriers to screening, multiple interventions were performed: CRA screening was emailed to participants prior to mammography visit, patients were actively encouraged to complete screening by staff at time of mammogram, forms with multiple languages were offered in both virtual (iPad) and paper format, and screening completion was double-checked by a technologist and administrator to ensure correct entry of data. The impact of these interventions was assessed by comparing the number of successfully completed CRA screening surveys at time of mammography visit to total number of mammograms using an interrupted time series model in MATLAB.

RESULTS

Analysis demonstrated that our interventions resulted in an immediate increase in CRA completion rates. The percent of patients with successful CRA completion increased from 8.8% to 50% in the first four months ($p<0.01$) and to 71% at 18 months ($p<0.01$).*Discussion Limitations in our study include generalizability and difficulty in ascribing increase in CRA completion rates to a single intervention. Using classic process improvement tools and a multi-step intervention focused largely on removing patient barriers to CRA completion, we significantly increased the rate of CRA completion at our three breast imaging centers.

S3A-QI-3

The FIND Program: Improving Follow-Up of Incidental Imaging Findings

Sunday, Nov. 27 11:45AM - 12:15PM Room: Learning Center - QI DPS

Participants
Kaitlin Zaki-Metias, MD, Pontiac, MI (*Presenter*) Nothing to Disclose

METHODS

This study was approved by the institutional review board. A retrospective analysis of 2000 patients with computed tomographic cross-sectional imaging was performed; 1000 patients prior to implementation of the FIND Program and 1000 patients one year after establishment of the program. Data collected included the frequency of incidental findings, inclusion of follow-up recommendations in the radiology report, and adherence to suggested follow-up. These metrics were analyzed using the SPSS statistics software version 25.0.

RESULTS

There was a higher rate of completion of recommended follow-up imaging in the post-implementation group (47/104, 45.2%) compared to the pre-implementation group (41/128, 32.0%) (p=0.043), of which 88.2% (30/34) occurred within the recommended time frame, compared to 56.3% (18/32) in the pre-implementation group (p=0.005).*Discussion Implementation of an incidental findings tracking program resulted in improved follow-up of incidental imaging findings and adherence to follow-up within the recommended time frame. This has the potential to reduce the burden of clinically significant incidental findings on the healthcare system due to lack of follow-up possibly resulting in later presentation of advanced disease. Given its value, further studies should explore the utility of more sophisticated artificial intelligence softwares in incidental findings tracking programs.

S3A-QI-4

Untangling the Spaghetti: Improving Retrieval Time for CT Supplies Using 5S

Sunday, Nov. 27 11:45AM - 12:15PM Room: Learning Center - QI DPS

Awards
Identified for RadioGraphics
Quality Improvement Reports Award

Participants
Theresa Pham, MD, BS, Salt Lake City, UT (*Presenter*) Nothing to Disclose

METHODS

This project was performed in the Huntsman Cancer Hospital (HCH) CT room which stores supplies for two CT scanners, including a busy interventional procedure scanner. Images were taken of the supplies in the CT closet, workroom, and procedure room before and after storage reorganization. Storage reorganization was based off the Lean 5S Methodology (Sort, Set in order, Shine, Standardize, and Sustain). Analysis of the impact of supply reorganization and labeling was performed using three methods: 1) spaghetti diagrams of participants during a 10-item supply retrieval scavenger hunt before and after, 2) timed 10-item supply retrieval scavenger hunt before and after, 3) satisfaction surveys of medical providers/staff before and after. Items participants were asked to retrieve for the timed scavenger hunt included commonly used items such as: sterile gloves, sterile gauze, 50 mL syringe, sterile gown, 18G needle, biopsy tray, Christmas tree adapter, sterile saline/water, a mask, and a 3-way stopcock.

RESULTS

Seven radiology residents voluntarily participated in the timed supply scavenger hunt before and after our intervention. Spaghetti diagrams demonstrated a reduction in redundant foot traffic with supply retrieval after storage reorganization. Additionally, there was a 61.7% decrease in the average amount of time it took to find the 10 items in the scavenger hunt with a p-value of 0.0013. Satisfaction surveys after the intervention had overall more positive responses.*Discussion Using the 5S Methodology for storage reorganization, we were able to achieve our goal of reducing the time to find supplies and increasing satisfaction scores from both CT technicians and medical providers. We were also able to decrease redundant foot traffic throughout the storage areas. Future directions include extending the organization/labeling system to other CT storage areas within our academic institution, implementing a Kanban system, and working with management to maintain this current level of organization.

S3A-QI-5

Use of Bunker shifts alleviates Long List Anxiety Syndrome (LLAS)

Sunday, Nov. 27 11:45AM - 12:15PM Room: Learning Center - QI DPS

Awards
Quality Improvement Reports Award

Participants
Eric A. Brandser, MD, (*Presenter*) Owner, Shift Procurement Services, LLC

METHODS

The group created several voluntary and additionally compensated Bunker shifts, including a shift based on a fixed number of wRVU, a short time-based shift, and a time and productivity hybrid shift. Bunkers were deployed sparingly at first, with increased usage in each subsequent year. In 2020 the group added "ad hoc" bunkers, with a group text system to anyone interested in helping if needed when the list of cases to read became long. Ad hoc bunkers would be called by a member of the scheduled team on a given day whose job included watching the workload for imbalances.

RESULTS

The Bunker shifts have significantly improved practice scheduling on our busier days, allowing ad hoc recruitment of reading capacity when needed on a day by day and hour by hour basis. Use of Bunker shifts has increased every year since inception in 2018. Number of days where day shift stays longer than 30 minutes beyond expected end of day has been reduced dramatically. Group productivity increased every year. wRVU/FTE/year (total wRVU in a given year divided by FTE in the group) increased 12% in 2018, 21% in 2019, 13% in 2020 and 29 % in 2021 when compared to 2017 values. Group bonus increased every year since 2017, with increases of 7% in 2018, 26% in 2019, 22% in 2020, and 37% in 2021 compared to baseline 2017.*Discussion Implementation and expansion of the Bunker shifts has had several group benefits. The publishing of individual wRVU data has stopped, as the group abandoned the idea that slower readers can or should read faster. Morale of the group has improved, with significantly fewer tough and late days. Group productivity has increased by shifting more cases to readers in highly efficient shifts. The increased efficiency has translated to improved bonus compensation, which has increased every year comparing to 2017 (pre bunker).

Sub-Events

S3B-QI-2 Breast Interventions e-Consent

Participants
Haydee Ojeda-Fournier, MD, San Diego, CA (*Presenter*) Research Consultant, View Point Medical, Inc;Stock options, CureMetrix, Inc

METHODS

A gap analysis was performed as part of a lean sigma six green belt project to identify the root cause and guide improvement. We performed a "5 Whys" and completed a fishbone diagram. Why is there a problem (use of paper consent forms)?: Not aware that EPIC has a solution and that we could do e-Consents. The target conditions identified were Zero paper, Zero scans. The countermeasures proposed were: using e-Consent and documenting brief procedure notes in Epic. Purchase of Topaz for ease of obtaining the patient's signature. No further purchasing of duplicate paper consent forms or paper progress notes. Not involving six team members to achieve one task and removing the courier service, shredding service, scanning, storage of paper forms. Investing in training in the use of e-Consent and Epic documenting. Creation of "standard work" documents for e-Consent and EPIC progress notes. The plan included: visiting divisions that were currently using e-Consent. Meet with information technology representative specializing in EPIC to learn how to use e-Consent and to make sure it is available to breast radiologists. Purchase and set up of Topaz. Made sure all radiologists were trained on e-Consent EPIC. Additional training of technologists and RNs in creating and bringing up e-Consent. Discussion with risk management to confirm the process for signature. Creation of template for brief procedure note in EPIC. Coordinate with EPIC topaz.

RESULTS

Safely changed to e-Consents. Cost of Topaz signature pad $1,000/unit. Culture changed rather quickly as the radiologist saw the value once a completed swim lane and spaghetti diagram were presented to them. The target condition was achieved. No longer ordering paper consent forms or assembling packages for biopsy. No longer utilizing currier service.*Discussion Breast imaging centers at institutions that utilize EPIC EMR can leverage the e-Consent features to reduce waste and streamline operations. Future steps include an audit to ensure that consent forms are being signed. Also, convening with other procedural divisions in radiology to share best practices and lessons learned and considering an alternative to Topaz signature capture device: tablet for e-Consent or utilizing iPhone to capture signatures.

S3B-QI-3 Strategies for Improving the Impact and Outcomes of the Peer Learning and Improvement Meeting

Participants
Jonathan Kruskal, MBChB, Boston, MA (*Presenter*) Nothing to Disclose

METHODS

In an ongoing IRB-approved project, we used standard data collection and analytical tools to identify hurdles to the effective introduction and function of peer learning across our enterprise. Tools included a steering think tank, direct observation of PLI meetings, surveys of meeting participants and leaders, and analysis of case review data submitted after each meeting. Data sources were from monthly section PLI forums (9 sections), modality operations meetings, and data submitted into a PLI platform (almost 18,000 cases). Once hurdles were identified, practice leaders and quality officers developed strategies for their mitigation.

RESULTS

We identified 10 hurdles to effective PLI practice. (1) The need to educate radiologists about the structural components of PLI, the specific criteria for meeting accreditation requirements, and differences between PLI and peer review. 2) Implement effective strategies to foster submissions and participation. (3) Identify and train PLI meeting leaders. A wide variation of PLI meeting moderating approaches was identified. We designed a PLI leader training curriculum. (4) Building enduring learning repositories. We implemented strategies for minimizing perceptual and interpretive biases, built enduring and expanding collections of recognized pearls and pitfalls, and engaged trainees in PLI practices. (5) Foster academic advancement in the teaching and education track for PLI leaders. (6) Structure personal case reviews. We developed programs on bias awareness, personal reflection and personal bias profiles. (7) Identification and management of PQI opportunities. We trained and tasked a group of radiologists in systems thinking to identify improvement opportunities. (8) Ensure workflow automation and minimal interruptions to work processes. (9) Sharing and communicating the benefits and outcomes of PLI case submission and review. (10) Address the fact that PLI requirements are perceived as yet another "moral insult".*Discussion We identified 10 hurdles to implementation of effective PLI practices, then designed and implemented specific and novel strategies to mitigate their impact.

S3B-QI-4 Driving Mammography Image Quality Improvement Using A.I. In Guyana During the COVID-19 Pandemic

Participants
Mohamed Abdolell, MSc, Halifax, NS (*Presenter*) Founder and CEO, Densitas Inc

METHODS

In-person MIT training by RAD-AID breast radiologists is restricted during the COVID-19 pandemic, impeding critical MG positioning feedback. An A.I. mammography quality platform (Densitas® intelliMammo™), introduced at GPHC in August 2022, provides technologists (trained on software use 9/2021) with positioning feedback. Pre-adoption, positioning error rates on 897 mammograms (8/1/2020-10/31/2021) were retrospectively evaluated. Post-adoption error rates were assessed prospectively on 585 mammograms (11/1/2021-4/15/2022). Five common positioning errors (CC exaggeration, inadequate pectoralis muscle length, inframammary fold (IMF) missing, nipple not in profile and pectoralis muscle concave) were evaluated. A test of equal proportions was used to test the null hypothesis of equality of proportions for each positioning error prior to and following adoption; four MITs utilized the software and one did not. Two RAD-AID radiologists were interviewed to understand quality improvement experiences, workflows and challenges pre/post software adoption.

RESULTS

MG positioning error rates were statistically significant (plt0.05) pre/post-software adoption for four MITs who used A.I. software compared to one that did not (Fig. 1a). MG positioning error rates were statistically significant (plt0.05) for 4 out of 5 positioning errors for four MITs utilizing AI compared to one that did not (Fig. 1b).Prior to A.I. adoption, MITs infrequently communicated challenges with positioning and radiologists' feedback was subjective. Post-adoption, MIT-radiologist communication improved and A.I. quantitative results sparked development of educational training videos to improve MG image quality.*Discussion A.I. drives MG image quality improvements in Guyana by reducing MG positioning error rates and enhancing MIT-radiologist communications to guide effective, remote, MG positioning training. A study limitation is the low number of MITs (one in the control arm and four in the intervention arm).

S3B-QI-8 Increasing Utilization and Improving Documentation in a Radiology Critical Alert System

Participants
Robert W. Morris, MD, (*Presenter*) Nothing to Disclose

METHODS

Context Intervention: This project was performed at a 720-bed academic medical center. Our system utilizes 3 alert levels: Red (emergency), Orange (requires attention) and Yellow (follow-up needed). Prior to intervention, an average of 662 monthly critical alerts were submitted, with a time compliance rate of 99%, and with 89.8% of alerts to providers with current contact info in our system. Compliance with Red alert documentation requirements was 83.3%. Our intervention was as follows: We distributed a streamlined critical results policy to radiology faculty residents, with periodic policy reminders. Event reports were generated for inadequate documentation. To address the provider contact database, we engaged providers and leadership to increase submission of current contact info.Study of the Intervention: The intervention was studied by our Critical Results Coordinators using our critical results software. As there were no other interventions involving our critical alert system, we were able to attribute all changes to our interventions.?Measures/Metrics Over 15 months, we tracked the numbers of critical alerts, radiologic exams, and alerts to providers without contact info. We also tracked compliance with Red alert documentation and communication times.Analysis: The data was plotted versus time, and trendlines were generated for each parameter. The trendline slopes were interpreted as the average monthly change. Change-point analysis was performed to assess statistical significance.

RESULTS

There was an average increase of 23 alerts per month (95% CI: 13.2-33.2). Yellow alerts increased by 17 per month, which was statistically significant (p=0.033). Red alert documentation compliance increased 0.65% per month. Alerts to providers with current contact information increased 0.5% per month. Closed-loop communication time compliance remained =99%.*Discussion Implementation of a quality project to increase usage of the critical alert system showed an increase in the number of alerts generated. In particular, alerts for follow-up recommendations increased, helping to ensure that patients receive follow-up care. The major limitation of our project was that it did not evaluate for findings that should have generated an alert but did not. Our intervention improved documentation for emergency alerts, and improved our provider contact database. Compliance with communication time goals was not sacrificed to achieve these results.

RESULTS

We identified 10 hurdles to effective PLI practice. (1) The need to educate radiologists about the structural components of PLI, the specific criteria for meeting accreditation requirements, and differences between PLI and peer review. 2) Implement effective strategies to foster submissions and participation. (3) Identify and train PLI meeting leaders. A wide variation of PLI meeting moderating approaches was identified. We designed a PLI leader training curriculum. (4) Building enduring learning repositories. We implemented strategies for minimizing perceptual and interpretive biases, built enduring and expanding collections of recognized pearls and pitfalls, and engaged trainees in PLI practices. (5) Foster academic advancement in the teaching and education track for PLI leaders. (6) Structure personal case reviews. We developed programs on bias awareness, personal reflection and personal bias profiles. (7) Identification and management of PQI opportunities. We trained and tasked a group of radiologists in systems thinking to identify improvement opportunities. (8) Ensure workflow automation and minimal interruptions to work processes. (9) Sharing and communicating the benefits and outcomes of PLI case submission and review. (10) Address the fact that PLI requirements are perceived as yet another "moral insult".*Discussion We identified 10 hurdles to implementation of effective PLI practices, then designed and implemented specific and novel strategies to mitigate their impact.

Driving Mammography Image Quality Improvement Using A.I. In Guyana During the COVID-19 Pandemic

Sunday, Nov. 27 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Mohamed Abdolell, MSc, Halifax, NS (*Presenter*) Founder and CEO, Densitas Inc

METHODS

In-person MIT training by RAD-AID breast radiologists is restricted during the COVID-19 pandemic, impeding critical MG positioning feedback. An A.I. mammography quality platform (Densitas® intelliMammo™), introduced at GPHC in August 2022, provides technologists (trained on software use 9/2021) with positioning feedback. Pre-adoption, positioning error rates on 897 mammograms (8/1/2020-10/31/2021) were retrospectively evaluated. Post-adoption error rates were assessed prospectively on 585 mammograms (11/1/2021-4/15/2022). Five common positioning errors (CC exaggeration, inadequate pectoralis muscle length, inframammary fold (IMF) missing, nipple not in profile and pectoralis muscle concave) were evaluated. A test of equal proportions was used to test the null hypothesis of equality of proportions for each positioning error prior to and following adoption; four MITs utilized the software and one did not. Two RAD-AID radiologists were interviewed to understand quality improvement experiences, workflows and challenges pre/post software adoption.

RESULTS

MG positioning error rates were statistically significant (plt0.05) pre/post-software adoption for four MITs who used A.I. software compared to one that did not (Fig. 1a). MG positioning error rates were statistically significant (plt0.05) for 4 out of 5 positioning errors for four MITs utilizing AI compared to one that did not (Fig. 1b).Prior to A.I. adoption, MITs infrequently communicated challenges with positioning and radiologists' feedback was subjective. Post-adoption, MIT-radiologist communication improved and A.I. quantitative results sparked development of educational training videos to improve MG image quality.*Discussion A.I. drives MG image quality improvements in Guyana by reducing MG positioning error rates and enhancing MIT-radiologist communications to guide effective, remote, MG positioning training. A study limitation is the low number of MITs (one in the control arm and four in the intervention arm).

S3B-QI-8

Increasing Utilization and Improving Documentation in a Radiology Critical Alert System

Sunday, Nov. 27 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Robert W. Morris, MD, (*Presenter*) Nothing to Disclose

METHODS

Context Intervention: This project was performed at a 720-bed academic medical center. Our system utilizes 3 alert levels: Red (emergency), Orange (requires attention) and Yellow (follow-up needed). Prior to intervention, an average of 662 monthly critical alerts were submitted, with a time compliance rate of 99%, and with 89.8% of alerts to providers with current contact info in our system. Compliance with Red alert documentation requirements was 83.3%. Our intervention was as follows: We distributed a streamlined critical results policy to radiology faculty residents, with periodic policy reminders. Event reports were generated for inadequate documentation. To address the provider contact database, we engaged providers and leadership to increase submission of current contact info.Study of the Intervention: The intervention was studied by our Critical Results Coordinators using our critical results software. As there were no other interventions involving our critical alert system, we were able to attribute all changes to our interventions.?Measures/Metrics Over 15 months, we tracked the numbers of critical alerts, radiologic exams, and alerts to providers without contact info. We also tracked compliance with Red alert documentation and communication times.Analysis: The data was plotted versus time, and trendlines were generated for each parameter. The trendline slopes were interpreted as the average monthly change. Change-point analysis was performed to assess statistical significance.

RESULTS

There was an average increase of 23 alerts per month (95% CI: 13.2-33.2). Yellow alerts increased by 17 per month, which was statistically significant (p=0.033). Red alert documentation compliance increased 0.65% per month. Alerts to providers with current contact information increased 0.5% per month. Closed-loop communication time compliance remained =99%.*Discussion Implementation of a quality project to increase usage of the critical alert system showed an increase in the number of alerts generated. In particular, alerts for follow-up recommendations increased, helping to ensure that patients receive follow-up care. The major limitation of our project was that it did not evaluate for findings that should have generated an alert but did not. Our intervention improved documentation for emergency alerts, and improved our provider contact database. Compliance with communication time goals was not sacrificed to achieve these results.

Quality Improvement Reports Tuesday Poster Discussions

Tuesday, Nov. 29 9:00AM - 9:30AM Room: Learning Center - QI DPS

Sub-Events

T2-QI-1 Effectiveness of Palm Vein Recognition Biometric Technology to Prevent Patient Misidentification Errors

Participants
Rekha Mody, MD, Cleveland, OH (*Presenter*) Nothing to Disclose

METHODS

Palm vein recognition devices which integrated with the health system's electronic health record (EHR) were installed at an imaging center's front desk and at workstations on wheels (WOWs) throughout the department. We conducted a 4 week pilot to test the accuracy of a palm vein recognition device to: 1. Re-identify patients at the point of care when the imaging study was performed on the same date 2. Re-identify patients at the front desk who had a repeat appointment on a different date during the pilot time period. The pilot program was performed at a hospital with intermediate imaging exam volume and scope included outpatient imaging only. This site provided a small, controlled environment with quick throughput, a cross section of most imaging studies, and exams performed with IV contrast. The unique environment allowed for the patient to undergo initial enrollment with the device at the front desk and authentication when the patient's imaging exam was performed later in the same encounter. Patients were queried on desire to participate in the pilot with initial enrollment utilizing a palm vein biometric recognition device as the patient commenced the check-in process at the front desk. Subsequently, the patient was escorted to the imaging exam area and both the standard process, confirmation of the patient's name and date of birth via the EHR, and the test process, re-identification of the patient via the palm vein recognition device, were done prior to the imaging exam being performed.

RESULTS

During the 4 week pilot time period, approximately 570 unique patients were seen with a total of 596 patient visits (total of 3.5% enrolled patients had repeat encounters). Total exams performed (including 8 imaging modalities) was 759 with a total enrollment of 455 unique patients. The enrollment rate was 80% and authentication rate at the point of care was 75%. 88% of repeat patients were re-authenticated at the front desk and 50% of repeat patient were re-authenticated at the point of care. The pilot demonstrate 100% accurate identification of re-authenticated repeat patient (at the front desk registration and the point of care when imaging exam was performed).*Discussion 100% of re-authenticated repeat patient (at the front desk registration and the point of care) were identified accurately using palm vein recognition biometric technology. Thus, this technology can serve as a safe, accurate and consistent method to prevent patient misidentification errors at imaging front desks and re-authentication of a patient's identity prior to imaging exam point of care and may help to decrease or eliminate wrong patient and wrong site, side or contrast administration type imaging safety events.

T2-QI-3 Optimizing the Abdominal CT Oral Contrast Service in the Covid-19 Pandemic

Participants
Mary Renton, MBBCh, (*Presenter*) Nothing to Disclose

METHODS

Leveraging a multidisciplinary stakeholder collaboration, we optimized the oral contrast service by 2 interventions:1) Creation of 'oral contrast policy' document and revision of standardized CT protocols with judicious use of oral contrast only when supported by literature evidence.2) Creation of a new shorter oral contrast regime (30 minutes vs 60 minutes previously).We conducted a multicentre retrospective service evaluation of our outpatient (OP) CT at baseline (pre-pandemic, pp), baseline pandemic prior to intervention(p), and post-intervention. Time-efficiency was assessed using patient waiting times. A blinded image quality review was conducted on the old and new oral contrast regimes by 2 abdominal radiologists. Cost evaluation was performed. Patient experience was evaluated with a voluntary survey. Statistical analysis was performed to compare the baseline and evaluation outcomes.

RESULTS

Over one-month periods, OP CT scans were assessed in baseline(pp) n = 302, baseline(p) n=228 and post-intervention n=270 groups. There was a significant reduction in oral contrast use, from 57.6% to 16.7%, p<0.001 (Intervention 1). The wait time was significantly reduced by 17 minutes per patient, p<0.001 (Interventions 12). The diagnostic quality did not statistically differ between the new shortened oral contrast regime and the baseline regime (Intervention 2). No repeat CTs were needed due to lack of oral contrast (Intervention 1) or poor opacification (Intervention 2). We made significant cost reductions, with an average monthly reduction of over $5000 across the service, p<0.001. Patient's reported their overall experience was improved post-intervention, compared to baseline (Interventions 12).*Discussion Optimising CT oral contrast use through judicious use of oral contrast and using a shorter regime, reduced patient wait times which helped decongesting the crowded waiting rooms and decreased the time the patient spent in the hospital for OP CT. In addition, these interventions also reduced costs and improved patient experience. A decreased proportion of patients required oral contrast and diagnostic quality was comparable with the shorter regime. The multifactorial success of our quality improvement project demonstrates how radiology pandemic response

initiatives can positively impact patient care.

T2-QI-4 The Clinical Factors Most Likely to Result in an Abnormal CT Head - A UK Trauma Centre Experience

Participants
Abul Haque, (*Presenter*) Nothing to Disclose

METHODS

Retrospective data collection looking at all CT Heads for acute head injury performed within the Emergency Department (ED) over the course of four months between 15th October 2021 - 15th January 2022. Reports were analysed for the presence of intracranial and/or extracranial injuries and commonly related clinical indicators identified to look for trends between these factors.

RESULTS

1542 CT Heads were analysed in total of which 15.3% (n=236) were abnormal. Almost 82% of these patients had a Glasgow Coma Scale (GCS) score of 14 or more. Approximately 10% had GCS between 8-13 and less than 8% of patients had GCS <8. Within these groups, the proportion of CT scans with an intracranial abnormality (used as a marker of more severe injury - compared to extracranial injury alone) was 39%, 72% and 94% respectively. 44% of patients were on some form of anticoagulation and this was the most common indication for requesting a CT Head. Retrograde amnesia was second most common (20%). Most clinical indicators demonstrated intracranial abnormalities on 40-50% of scans. However, Bruising around the ears/eyes was found to be of least value as a clinical factor with a positivity rate of only 22%. In comparison, Post-traumatic seizure was the indicator most commonly associated with intracranial abnormality (present in 75% of CTs with this factor).*Discussion For acute head injury CT scans, GCS has clear prognostic value as the lower it is, the greater the likelihood of an abnormal scan. Within our Trust, being on anticoagulation is the most common indication for a CT Head overall, followed by Retrograde amnesia. Together these factors constitute almost 2/3 of our study population. Post-traumatic seizure is the clinical indicator most likely to be associated with intracranial abnormalities (75% correlation). In contrast, Bruising around the ears or eyes is the least useful clinical indicator with just over 20% of these patients demonstrating intracranial findings. This study was limited to a single centre and data from other centres would be useful to ascertain if results are similar.

T2-QI-5 Long Term Follow-up of Patients With Indeterminate Breast (B3) Lesions: A 10 Year Prospective Review

Participants
Nerys Forester, MBBCh, PhD, (*Presenter*) Nothing to Disclose

METHODS

Prospective review B3 lesions (with no previous or concurrent malignancy) identified between 01/12-12/16 for subsequent breast cancer diagnoses in comparison to control group of women with screen-detected benign lesions from 2012.

RESULTS

514 B3 lesions identified (radial scar/complex sclerosing lesions (22.2%), atypical intraepithelial ductal proliferation (21.4%), papillomas (21.8%), lobular neoplasia (18.3%), flat epithelial atypia (8.4%), misc (5.3%)). 391 patients underwent VAE, with 36 (9.2%) upgraded to B5. 18 patients upgraded to B5 following diagnostic excision (overall upgrade 10.5%). Remaining 460 patients had surveillance mammography, yearly or 3 yearly. Patients had mean of 3.4 follow-up mammograms (range 0-8). 44 had no further follow up (age/personal choice). 14 deaths (1 breast cancer). 33 women (7.2%) subsequently developed breast cancer (24 invasive), with 23 identified on mammography. One developed lymphoma detected on mammography. Median time-to-diagnosis was 4 years (range 1-11 years). 10 cancers were at the site of the initial B3 lesion. No significant difference between cancer development in B3 lesion subgroups was observed.147 women had benign lesions identified at screening during 2012 (B2/C2 pathology). 8 (5.5%) subsequently developed cancer. No significant difference between rate of subsequent cancer between B3 lesions or controls at 5 years was identified.*Discussion 7.2% of women with prior B3 lesions subsequently develop breast cancer. Cancer occurred at original B3 site in less than one third and was screen detected in approximately two thirds of cases. Rate of cancer development was not significantly higher than that in screened controls. As such, enhanced surveillance strategies do not offer additional cancer detection over usual screening and may result in over diagnosis and increased patient anxiety. Therefore a safe follow-up strategy of indeterminate breast lesions could comprise a mammographic review at one year followed by return to routine breast screening.

T2-QI-6 Improving Non-targeted Native Renal Biopsy Specimen Adequacy: A Province-Wide, Multicenter and Interdepartmental Quality Initiative

Participants
James Nugent, MD, Vancouver, BC (*Presenter*) Nothing to Disclose

METHODS

In our province, the vast majority of non-targeted adult native renal biopsies are performed at 13 hospitals by radiologists, and samples are sent to a central lab for analysis, averaging 850 biopsies per year. Prior to this project, adequacy was subjectively assessed by a pathologist, which depended on tissue allocation and disease-specific histological features. Four adequacy categories were defined from the perspective of tissue collection rather than tissue allocation or disease specific guidelines, to help guide in real-time how many cores should be obtained: inadequate (< 15 glomeruli and no diagnosis), suboptimal (< 15 glomeruli but diagnosis possible), minimally adequate (15-24 glomeruli) and ideally adequate (> 25 glomeruli, allowing classification and prognostication). Intervention 1 was to display the specimen adequacy category on the formal pathology report. Specimen adequacy was defined retrospectively through the pathology database that tracked number of glomeruli. Subsequent interventions and QI cycles are in progress. Two targets were evaluated. Target 1 was combined inadequate and suboptimal rate < 10%, and Target 2 was ideally adequate rate > 80%. Inferential statistics included mean and standard deviation adequacy rates. Control charts were employed to determine if there was sustained variability in adequacy.

RESULTS

Pre-intervention, Target 1 was nearly achieved with a rate of 10.5%. Control chart analysis revealed sustained process change in the ideally adequate rate following intervention 1. The ideally adequate rate improved from a baseline of 66% to 73%, nearing Target 2.*Discussion Limitations included not being able to compare adequacy rates to other institutions because there was no standard definitions in the literature. In summary, by defining specimen adequacy objectively, adequacy rates were measured,

reported and performance relative to targets was assessed. This resulted in sustained improvement in the mean rate of ideally adequate biopsies following intervention 1.

T2-QI-7 Can AI Support Mammography Image Quality Improvement?

Participants
Elle Spear, Park Ridge, IL (*Presenter*) Intern, Densitas Inc

METHODS

At NorthShore University HealthSystem, population-level positioning error rates are unknown. MG positioning was assessed on 188,609 mammograms from September 1, 2021 to April 15, 2022, to establish reference positioning error benchmarks. Error rates were measured using automated MG quality A.I. software (densitas® intelliMammo™) to assess CC exaggeration, missing inframammary fold (IMF), inadequate pectoralis muscle, and concave pectoralis muscle. Error rates were measured and stratified by body habitus and acquisition parameters (compression pressure, laterality, patient age, and breast size). A test of equal (independent) proportions tested the null hypothesis of equality in proportions (error rates) to assess sensitivity of the software to detect expected relationships.

RESULTS

CC exaggeration error rate was 0.22 and differed by laterality ($p<0.001$). IMF missing error rate was 0.46 and differed by breast density ($p<0.001$), breast volume ($p<0.001$) and compression pressure ($p<0.001$). Nipple not in profile error rate was 0.59 and differed by breast volume ($p<0.001$) and breast area ($p<0.001$). Sagging error rate was 0.07 and differed by compression pressure ($p<0.001$). Inadequate pectoralis muscle length error rate was 0.18 and differed by breast thickness ($p<0.001$). Concavity of pectoralis muscle error rate was 0.08 and differed by breast thickness ($p<0.001$).*Discussion AI decision tools may help establish population-based reference benchmarks of positioning error rates on MG. Face-validity of the decision tool is demonstrated by its sensitivity to varying patient and acquisition parameters reflected in the expected differences in error rates. This supports evidence-based quality improvement with training and educational interventions to improve positioning technique. Standardized and comprehensive application of this tool supports equitable service delivery and quality of care.A limitation of this study is that it did not attribute positioning error rates to patient characteristics versus radiological technologist technique.

T2-QI-8 Development of a Patient Face Recognition System in the Radiology Department(Patient Recognition Accuracy of a Face Mask-Enabled Face Recognition System in a CT Examination Environment)

Participants
Hiroyuki Ota, RT, Kashiwa, Japan (*Presenter*) Nothing to Disclose

METHODS

The facial recognition system used was PFAS with mask (Canon Medtec Supply, Kawasaki, Japan). The subjects were 142 patients (mean age 59+/-11 years, male/female ratio 59:41) who gave written consent between March and April 2022. Cameras were installed to capture the patients when they entered the CT room (walking) and when they were positioned (supine), and recognition was possible in both situations. The recognition task was performed with the face mask worn, and the success rate was calculated from the recognition score. In addition, a significant difference test was conducted using Welch's t test for the recognition scores obtained in the two situations. In this system, an authentication score of 550 or higher is considered as a successful authentication.

RESULTS

Of 142 patients, 136 were successfully recognized, for a success rate of 96%. The reasons for the unsuccessful cases were that the patients were wearing hats too deeply, 3 cases of overlapping with staff members, and 2 cases of unknown cause. Of the 136 patients, 113 (83%) were recognized when entering the room (walking) and 23 (17%) when positioning (supine). The mean recognition scores (mean +/- standard deviation) at entry and positioning were 648+/-66 and 643+/- 64, with no significant difference ($p>0.05$) between the two.*Discussion We conducted an authentication test of a newly developed face mask-enabled face recognition system under actual CT examination environments, and found that the accuracy of face recognition was ensured even when the patient wore a face mask. In addition, by enabling recognition in both walking and supine positions, the practical application of patient recognition using a face recognition system has been realized.

Improving Non-targeted Native Renal Biopsy Specimen Adequacy: A Province-Wide, Multicenter and Interdepartmental Quality Initiative

Tuesday, Nov. 29 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
James Nugent, MD, Vancouver, BC (*Presenter*) Nothing to Disclose

METHODS

In our province, the vast majority of non-targeted adult native renal biopsies are performed at 13 hospitals by radiologists, and samples are sent to a central lab for analysis, averaging 850 biopsies per year. Prior to this project, adequacy was subjectively assessed by a pathologist, which depended on tissue allocation and disease-specific histological features. Four adequacy categories were defined from the perspective of tissue collection rather than tissue allocation or disease specific guidelines, to help guide in real-time how many cores should be obtained: inadequate (< 15 glomeruli and no diagnosis), suboptimal (< 15 glomeruli but diagnosis possible), minimally adequate (15-24 glomeruli) and ideally adequate (> 25 glomeruli, allowing classification and prognostication). Intervention 1 was to display the specimen adequacy category on the formal pathology report. Specimen adequacy was defined retrospectively through the pathology database that tracked number of glomeruli. Subsequent interventions and QI cycles are in progress. Two targets were evaluated. Target 1 was combined inadequate and suboptimal rate < 10%, and Target 2 was ideally adequate rate > 80%. Inferential statistics included mean and standard deviation adequacy rates. Control charts were employed to determine if there was sustained variability in adequacy.

RESULTS

Pre-intervention, Target 1 was nearly achieved with a rate of 10.5%. Control chart analysis revealed sustained process change in the ideally adequate rate following intervention 1. The ideally adequate rate improved from a baseline of 66% to 73%, nearing Target 2.*Discussion Limitations included not being able to compare adequacy rates to other institutions because there was no standard definitions in the literature. In summary, by defining specimen adequacy objectively, adequacy rates were measured, reported and performance relative to targets was assessed. This resulted in sustained improvement in the mean rate of ideally adequate biopsies following intervention 1.

T2-QI-7

Can AI Support Mammography Image Quality Improvement?

Tuesday, Nov. 29 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Elle Spear, Park Ridge, IL (*Presenter*) Intern, Densitas Inc

METHODS

At NorthShore University HealthSystem, population-level positioning error rates are unknown. MG positioning was assessed on 188,609 mammograms from September 1, 2021 to April 15, 2022, to establish reference positioning error benchmarks. Error rates were measured using automated MG quality A.I. software (densitas® intelliMammo™) to assess CC exaggeration, missing inframammary fold (IMF), inadequate pectoralis muscle, and concave pectoralis muscle. Error rates were measured and stratified by body habitus and acquisition parameters (compression pressure, laterality, patient age, and breast size). A test of equal (independent) proportions tested the null hypothesis of equality in proportions (error rates) to assess sensitivity of the software to detect expected relationships.

RESULTS

CC exaggeration error rate was 0.22 and differed by laterality ($p<0.001$). IMF missing error rate was 0.46 and differed by breast density ($p<0.001$), breast volume ($p<0.001$) and compression pressure ($p<0.001$). Nipple not in profile error rate was 0.59 and differed by breast volume ($p<0.001$) and breast area ($p<0.001$). Sagging error rate was 0.07 and differed by compression pressure ($p<0.001$). Inadequate pectoralis muscle length error rate was 0.18 and differed by breast thickness ($p<0.001$). Concavity of pectoralis muscle error rate was 0.08 and differed by breast thickness ($p<0.001$).*Discussion AI decision tools may help establish population-based reference benchmarks of positioning error rates on MG. Face-validity of the decision tool is demonstrated by its sensitivity to varying patient and acquisition parameters reflected in the expected differences in error rates. This supports evidence-based quality improvement with training and educational interventions to improve positioning technique. Standardized and comprehensive application of this tool supports equitable service delivery and quality of care.A limitation of this study is that it did not attribute positioning error rates to patient characteristics versus radiological technologist technique.

T2-QI-8

Development of a Patient Face Recognition System in the Radiology Department(Patient Recognition Accuracy of a Face Mask-Enabled Face Recognition System in a CT Examination Environment)

Tuesday, Nov. 29 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Hiroyuki Ota, RT, Kashiwa, Japan (*Presenter*) Nothing to Disclose

METHODS

The facial recognition system used was PFAS with mask (Canon Medtec Supply, Kawasaki, Japan). The subjects were 142 patients (mean age 59+/-11 years, male/female ratio 59:41) who gave written consent between March and April 2022. Cameras were installed to capture the patients when they entered the CT room (walking) and when they were positioned (supine), and recognition was possible in both situations. The recognition task was performed with the face mask worn, and the success rate was calculated from the recognition score. In addition, a significant difference test was conducted using Welch's t test for the recognition scores obtained in the two situations. In this system, an authentication score of 550 or higher is considered as a successful authentication.

RESULTS

Of 142 patients, 136 were successfully recognized, for a success rate of 96%. The reasons for the unsuccessful cases were that the patients were wearing hats too deeply, 3 cases of overlapping with staff members, and 2 cases of unknown cause. Of the 136 patients, 113 (83%) were recognized when entering the room (walking) and 23 (17%) when positioning (supine). The mean recognition scores (mean +/- standard deviation) at entry and positioning were 648+/-66 and 643+/- 64, with no significant difference ($p>0.05$) between the two.*Discussion We conducted an authentication test of a newly developed face mask-enabled face recognition system under actual CT examination environments, and found that the accuracy of face recognition was ensured even when the patient wore a face mask. In addition, by enabling recognition in both walking and supine positions, the practical application of patient recognition using a face recognition system has been realized.

T5A-QI

Quality Improvement Reports Tuesday Poster Discussions - A

Tuesday, Nov. 29 12:15PM - 12:45PM Room: Learning Center - QI DPS

Sub-Events

T5A-QI-1 The RQM(R): Redefining Value in Peer Review

Participants
Emilie Albee, St Louis Park, MN (*Presenter*) Nothing to Disclose

METHODS

In RQM®, review cases are randomly selected throughout the network, manually vetted for appropriateness, and assigned via an algorithm of ~3% interpretation volume per subspecialty on a rotating monthly schedule. After assignment, the radiologist selects from: Agree, Agree w/comment, Disagree 1, Disagree 2 or Cannot review. If Agree, case is closed. If Agree w/comment, case is discussed amongst reviewer and interpreter. If Disagree 1 or 2, feedback can be accepted or disputed; if the latter, a 3rd-party reviewer provides input. This reviewer is an elected subspecialty section leader or an experienced exam interpreter. Data is compiled via an in-house reporting system and can be accessed at any time. Formalized reporting occurs on a scheduled cycle, with metrics including quantity of reviews per modality and subspecialty, conclusions tracking, and participation rate (number of reviews submitted/ total reviews assigned per radiologist). Individual participation rates make up total participation rates for a radiology group, and an aggregate rate for all RQM® participants is also calculated. In general, reports blind the names of individual radiologists and radiology groups, preserving peer review protection and the purpose of a non-punitive learning environment. In 2021, an RQM® Accuracy Assessment was launched. This assessment utilizes data from the conclusions tracking report by comparing the quantity of Disagree 1 and 2 review conclusions to the number of total reviews.

RESULTS

In 2021, a total of 240 reviewers from 32 independent rad groups completed 14,501 reviews, with an overall participation rate of 95%. This included 7,148 MRI, 3,250 CT, and 2,018 mammography cases, distributed by subspecialty (MSK=3,547; spine=3,227; body=2,931; breast=2,216; neuro=1,788; other=792). The 2021 Accuracy Assessment error rate was 1.42%; lower than the industry average (3-5% in the peer-reviewed literature).*Discussion Unlike other systems, the RQM® provides discussion among physicians and selects only current cases, organized by subspecialty for more meaningful mentorship. The program also blinds names, removing partiality from the process to encourage candid responses, and gives radiologists the opportunity to review cases from outside of their own practice. The RQM® Accuracy Assessment also revealed a below industry average error rate for participants, leading to more critical findings at earlier stages.

T5A-QI-2 Simplifying the AI Consumption Process Through the Implementation of a Standard-Based AI Platform

Participants
Alberto F. Goldszal, PhD, MBA, (*Presenter*) Nothing to Disclose

METHODS

As healthcare organizations interface with different AI solutions, it becomes imperative to streamline and control the transfer of images to multiple AI engines as well as standardize the returning AI results. The AI engines, in turn, may be hosted within the institutional LAN, may be cloud-based or hybrid. Regardless of the architecture, the AI platform provides data flow orchestration to the AI engines: it automates the export of cases, it creates queues based on study priority and improves hardware scalability through load balancing.The AI platform also supports flexible integration profiles for the incoming AI results, including an open API, HL7 and DICOM profiles like GSPS, DICOM SC, DICOM SEG, CAD SR. Through these standards, AI results display directly into the PACS viewer as overlays which can be toggle on or off. Notifications in the worklist indicate AI processing status, AI algorithm utilized and any triage assignment based on AI findings.

RESULTS

We have used an AI platform to orchestrate the exporting of imaging data and incorporation of results from two distinct AI engines processing breast tomography and CTA studies, respectively. In the 1st quarter of 2022, we successfully processed 15,200 breast exams and 4,500 CTA's. Returning AI results consisted of an imaging overlay and associated AI score.It is interesting to note that for diagnostic breast exams where the interpretation occurs in near real-time, the entire processing pipeline takes an average of 3 minutes from study acquisition to AI results reported. This is critical in order to provide the AI results prior to the radiologist's start of interpretation.*Discussion We have implemented an AI platform to orchestrate the exchange of imaging data and AI results in a standardized and simplified manner. This standard-based platform provides AI-vendor independence, therefore, facilitating the consumption of best-of-breed AI solutions. It is tightly integrated with our PACS, delivering AI overlays into the imaging viewer and notifications into the worklist. The AI platform is highly scalable to any number of downstream, commercially-available AI solutions, including algorithms developed within our own organization.

T5A-QI-3 Increasing Utilization of Contrast-Enhanced Ultrasound During Abdominal Biopsies: Impact of an Educational Training Program

Participants
Lisa Ho, MD, Durham, NC (*Presenter*) Nothing to Disclose

METHODS

Two educational training interventions were performed to increase use of UCA. First, radiologists and sonographers attended an educational event which included didactic teaching and case presentations on the use of UCA. Second, direct hands-on teaching on how to use UCA during procedures was provided to the same group. To determine the efficacy of these two interventions, the percentage of UCA assisted biopsies (number of UCA assisted targeted liver and renal biopsies divided by total number of liver and renal biopsies) was compared for the 6 months before and 6 months after the educational training. In addition, radiologists completed anonymous surveys to determine the level of understanding and acceptability of using UCA before and 6 months after initiating UCA educational training.

RESULTS

UCA-assisted targeted liver and renal biopsies increased from 5.8% (10/172) to 10.0% (16/160) (p=0.09, 1-sided Boschloo test) after educational intervention. Before training, 3/14 attending radiologists reported using UCA versus 8/14 attending radiologists after training (p=0.03). After training, 5/8 were new UCA users (never used or infrequent use). Pre-training survey was completed by 11 abdominal radiology attendings (63.6% > 10 years interventional experience) and 7 abdominal radiology fellows (1 year fellowship). Unfamiliarity on how to use it was the main reason (70.6%) for not using UCA, followed by doubt of its utility (17.7%). Before educational training, only 10.5% of survey responders use UCA routinely whereas 47.4% never used it, and 42.1% used it rarely. Post-intervention survey was completed by 9 attendings (66.6% > 10 years of experience) and 4 fellows. Educational training increased radiologists understanding (40.0%) and acceptability (30.0%) of UCA and decreased concern about risks (15.0%). After training, 53.8% of respondents were new users of UCA. For those respondents who did not use UCA after the training program, only 25.0% reported unfamiliarity as the reason for not using UCA, whereas 25.0% reported no cases needed it and 37.5% reported they planned to use it in the future if needed.*Discussion An educational training program increased utilization of UCA during targeted US-guided liver and renal biopsies. Increasing use of UCA improves patient care by increasing target visibility and biopsy success rates when performing ultrasound-guided targeted liver and renal biopsies.

T5A-QI-4 Moving Beyond Alphabet Soup - Using Root Cause Analysis (RCA) and Failure Mode and Effect Analysis (FMEA) to Learn from Errors in the Breast Imaging Clinic

Participants
Tanya W. Moseley, MD, PhD, Houston, TX (*Presenter*) Consultant, Hologic, Inc;Consultant, Merit Medical Systems, Inc;Owner, TW Moseley, LLC;CEO, TW Moseley, LLC

METHODS

Root Cause Analysis (RCA) is a technique used to deduce the cause of unfavorable occurrences that have already occurred. The Joint Commission now requires that all sentinel occurrences occurring in a clinical department undergo an RCA within 45 days. Failure Mode and Effect Analysis (FMEA) is a proactive risk assessment technique used to identify areas of vulnerability. FMEA establishes strategies for preventing and mitigating errors. FMEA is less commonly used in medicine despite its military and industrial origins dating back to WWII.

RESULTS

FMEAs and RCAs are effective tools for enhancing patient safety. When the names are repeated in court alongside evidence demonstrating that the operations they represent were performed, they may protect individuals and institutions from lawsuit expenses and damages by demonstrating that appropriate steps were taken to avoid a patient's avoidable injury.*Discussion The objective of using comprehensive systemic analyses such as RCA and FMEA is to analyze medical errors, find the root causes or reasons for such failures, learn from them and try to prevent their recurrence. Even though they’re quite different, FMEA and RCA cannot be separated. FMEA seeks to know the effects of each of all possible causal sets. RCA seeks to know the causal set of each of all possible effect FMEA is the temporal mirror of RCA reflected in the “now” moment.

T5A-QI-5 Adding Friction to the Electronic Health Record to Improve Adherence With Best Practices for Diagnostic Testing Across Multiple Hospital System Intensive Care Units

Participants
Sherry Knott, BS, Aurora, CO (*Presenter*) Nothing to Disclose

METHODS

This project was performed at an urban quaternary academic hospital. We hypothesized that modification of the electronic health record, wherein we added friction by eliminating Daily as a frequency option when ordering CXRs would reduce the frequency of daily CXRs. The impact of this intervention was tracked by recording the number of repeat ICU CXR that were ordered simultaneously for 3 months both before and after making EHR change intervention. We also surveyed radiology technologists’ level of stress and burnout after EHR changes were made.

RESULTS

Between Sept 1, 2021 and Dec 30, 2021 there were 9307 ICU CXR orders, of which 3923 (42%) were ordered as standing daily orders. Since the process change there were 4832 CXR orders from Jan 13, 2021, to Mar 31, 2021, of which 2 (4%) were ordered as a standing daily order. This is a reduction in standing orders of 93%. As a result, ICU CXR volume decreased from 76 CXR per day to 62 CXR per day, for a decrease of 18.5% in total daily ICU CXR. Surveys were sent to radiology technologists who participate in ICU morning CXRs after the change was made asking about their job satisfaction and burnout since the change was made. Of technologist respondents 87% stated they were more satisfied or much more satisfied with their jobs since the change, and 75% described much less or less burnout than before the change was made.*Discussion Limitations of our study include that we did not test if there were other factors that may have affected ordering habits of ICU physicians during this time. In addition, we surveyed technologists about their job satisfaction burnout only after the change was made. Adding friction to the electronic health record, by eliminating daily as a frequency option when ordering CXRs, effectively significantly reduced low-value care, to the benefit of patients healthcare professionals.

T5A-QI-6 How to Transition From Transrectal to Transperineal Prostate Biopsy - Experience After 1000 TP Biopsies

Participants
Jack Power, MBBCh, MRCPI, DUBLIN, Ireland (*Presenter*) Nothing to Disclose

METHODS

In 2019 our hospital had a post TRUS sepsis rate of 3.9%, including two prolonged HDU admissions. Following review of these data, and cognisant of the arguments being made for a move away from TRUS, a decision was made to introduce TP biopsy under local anaesthetic in our radiology department. Two radiologists with experience in guiding transperineal brachytherapy for radiation oncologists assisted in the training of other radiologists in the procedure. Funding for equipment was obtained on the basis of savings predicted by a reduction in post procedure admissions for sepsis and haemorrhage. A centre experienced in outpatient TP biopsy was visited by radiologists and nursing staff and protocols were established locally. Initially, TP biopsy was offered to a small number of patients and TRUS continued to be the main biopsy method. With the onset of the COVID-19 pandemic, the decision to transition completely to TP biopsy was made in an effort to avoid the risk of post biopsy admission with the resultant demand on hospital services.

RESULTS

Radiologists experienced in TP procedures worked with other GU radiologists to train them in the technique of TP biopsy under local anaesthetic. Initially 2 cases per morning were performed taking up to 90 minutes per case. After 6 months, 4-6 cases per morning are performed taking 30 minutes per case. All radiologists previously performing TRUS now perform TP biopsy exclusively. Radiology residents are now being trained in the technique. 13.5% of men require sedation. The sepsis rate has been less than 1% in 1000 cases (0.17%). No cases of significant haemorrhage have occurred.*Discussion Our department successfully transitioned completely from TRUS biopsy to TP biopsy with a marked reduction in post procedure sepsis and no cases of severe sepsis seen. We outline the barriers to making the switch and address these in turn (set-up cost, increased time required, reimbursement issues, perceived difficulty of procedure, perceived increased invasiveness of procedure, additional personnel required). The elimination of severe sepsis makes continued use of TRUS medico-legally untenable and transition to TP biopsy is inevitable even if it is taking a long time.

T5A-QI-7 Oxford Tertiary Hospital Referral Pathway for Urgent Radiological Investigations for Paediatric Septic Arthritis: Are We Sensitive and Specific Enough?

Participants
Anuja Joshi, MBBS, BSc, (*Presenter*) Nothing to Disclose

METHODS

A retrospective search of the radiology reporting system identified patients under 16 years who had US examinations of hips, knees, ankles, shoulders, or elbows between 01/01/19 to 30/11/21. The key word 'septic' pinpointed requests for possible SA. The electronic patient record was used to obtain data about presenting signs and symptoms. Patients who presented with at least two red flags of; Fever >38.5degC in the last week, non-weight bearing/reduced range of joint movement, CRP >20mg/L / ESR >40mm/h or WCC >12k/mm^3 as per Kocher's criteria were deemed as an appropriate referral for urgent US +/- percutaneous aspiration. Microbiology results confirmed positive SA cases. Kocher's criteria were assigned a number for data entry and recorded on the database according to the patient's presentation. Entries were assigned "Yes" if presented with at least 2 red flags and "No" otherwise. The "No" entries were counted, signifying cases which did not meet the pathway standard for urgent US.

RESULTS

Over the time period, 76 urgent US examinations were performed. 22% of scans were confirmed SA cases, all presenting with more than two red flags. Despite presenting less than 2 red flags, 9% of cases underwent urgent US. All but 1 of these cases were reviewed by senior specialists and deemed high risk. There were no missed cases of SA.In the first review in 2016 prior to the current guideline, 142 US were performed in 12 months, with only 4% positive for SA.*Discussion Children can present with unusual symptoms which do not follow criteria and high clinical suspicion of senior clinicians may result in urgent US. Awareness to accommodate exceptions to the pathway is necessary. Our trust has demonstrated good pathway adherence. This retrospective review shows the pathway accurately identifies those with SA and correctly refers them for urgent US without missed cases. The proportion of positive cases scanned has significantly increased compared to before our guideline implementation, indicating this has streamlined the workload without compromising patient care.

T5A-QI-8 Improving Compliance of Post-Procedural Documentation in the Electronic Health Record at a Medium-Sized Community Hospital

Participants
David Berezovsky, DO, (*Presenter*) Nothing to Disclose

METHODS

Thirteen IR providers (10 physicians and 3 PAs) performed all IR procedures at this medium-sized community teaching hospital which uses Paragon as its EHR. A standardized EHR post-procedural note template containing all necessary elements, some of which auto-populated, was created and could not be signed unless all required elements were filled. A new workflow was created to nudge providers to write their note in the EHR immediately after the procedure. Buy-in from providers, technologists, nurses, and administrators was obtained at a pre-implementation meeting. Laminated directions were attached to every workstation to remind providers to write the note and help them navigate the EHR. Baseline data from one year prior and during the eight weeks leading to implementation were obtained. Weekly analyses were conducted after implementation. Feedback and progress were sent weekly to all stakeholders. Individual scorecards were sent to select providers to highlight their compliance or non-compliance for encouragement.

RESULTS

Baseline compliance was 27% one year prior to implementation and 72% during the eight weeks prior to implementation. Mean weekly procedures excluding PICCs was 47. After implementation, compliance was nearly consistently above 85%.*Discussion The keys to success in this project were obtaining buy-in from the entire team, designing a simple workflow with nudges, and delivering prompt feedback on progress. A barrier to compliance was provider perception of redundancy of routine post-procedural notes in addition to the radiology dictation. This was addressed with education about its importance for patient safety and regulatory compliance. An additional barrier was the lack of standardization of the post-procedural note in the EHR. The newly designed note template made it easy to quickly write notes that captured required information. Weekly team feedback with select individual

scorecards encouraged everyone to be an active participant. Limitations included not verifying the accuracy of the notes and verifying that the note was written prior to the patient leaving the IR suite. Assessment for continued compliance is planned at 3 months and every 6 months thereafter.

Moving Beyond Alphabet Soup - Using Root Cause Analysis (RCA) and Failure Mode and Effect Analysis (FMEA) to Learn from Errors in the Breast Imaging Clinic

Tuesday, Nov. 29 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Tanya W. Moseley, MD, PhD, Houston, TX (*Presenter*) Consultant, Hologic, Inc;Consultant, Merit Medical Systems, Inc;Owner, TW Moseley, LLC;CEO, TW Moseley, LLC

METHODS

Root Cause Analysis (RCA) is a technique used to deduce the cause of unfavorable occurrences that have already occurred. The Joint Commission now requires that all sentinel occurrences occurring in a clinical department undergo an RCA within 45 days. Failure Mode and Effect Analysis (FMEA) is a proactive risk assessment technique used to identify areas of vulnerability. FMEA establishes strategies for preventing and mitigating errors. FMEA is less commonly used in medicine despite its military and industrial origins dating back to WWII.

RESULTS

FMEAs and RCAs are effective tools for enhancing patient safety. When the names are repeated in court alongside evidence demonstrating that the operations they represent were performed, they may protect individuals and institutions from lawsuit expenses and damages by demonstrating that appropriate steps were taken to avoid a patient's avoidable injury.*Discussion The objective of using comprehensive systemic analyses such as RCA and FMEA is to analyze medical errors, find the root causes or reasons for such failures, learn from them and try to prevent their recurrence. Even though they’re quite different, FMEA and RCA cannot be separated. FMEA seeks to know the effects of each of all possible causal sets. RCA seeks to know the causal set of each of all possible effect FMEA is the temporal mirror of RCA reflected in the “now” moment.

Adding Friction to the Electronic Health Record to Improve Adherence With Best Practices for Diagnostic Testing Across Multiple Hospital System Intensive Care Units

Tuesday, Nov. 29 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Sherry Knott, BS, Aurora, CO (*Presenter*) Nothing to Disclose

METHODS

This project was performed at an urban quaternary academic hospital. We hypothesized that modification of the electronic health record, wherein we added friction by eliminating Daily as a frequency option when ordering CXRs would reduce the frequency of daily CXRs. The impact of this intervention was tracked by recording the number of repeat ICU CXR that were ordered simultaneously for 3 months both before and after making EHR change intervention. We also surveyed radiology technologists' level of stress and burnout after EHR changes were made.

RESULTS

Between Sept 1, 2021 and Dec 30, 2021 there were 9307 ICU CXR orders, of which 3923 (42%) were ordered as standing daily orders. Since the process change there were 4832 CXR orders from Jan 13, 2021, to Mar 31, 2021, of which 2 (4%) were ordered as a standing daily order. This is a reduction in standing orders of 93%. As a result, ICU CXR volume decreased from 76 CXR per day to 62 CXR per day, for a decrease of 18.5% in total daily ICU CXR. Surveys were sent to radiology technologists who participate in ICU morning CXRs after the change was made asking about their job satisfaction and burnout since the change was made. Of technologist respondents 87% stated they were more satisfied or much more satisfied with their jobs since the change, and 75% described much less or less burnout than before the change was made.*Discussion Limitations of our study include that we did not test if there were other factors that may have affected ordering habits of ICU physicians during this time. In addition, we surveyed technologists about their job satisfaction burnout only after the change was made. Adding friction to the electronic health record, by eliminating daily as a frequency option when ordering CXRs, effectively significantly reduced low-value care, to the benefit of patients healthcare professionals.

T5A-QI-6

How to Transition From Transrectal to Transperineal Prostate Biopsy - Experience After 1000 TP Biopsies

Tuesday, Nov. 29 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Jack Power, MBBCh, MRCPI, DUBLIN, Ireland (*Presenter*) Nothing to Disclose

METHODS

In 2019 our hospital had a post TRUS sepsis rate of 3.9%, including two prolonged HDU admissions. Following review of these data, and cognisant of the arguments being made for a move away from TRUS, a decision was made to introduce TP biopsy under local anaesthetic in our radiology department. Two radiologists with experience in guiding transperineal brachytherapy for radiation oncologists assisted in the training of other radiologists in the procedure. Funding for equipment was obtained on the basis of savings predicted by a reduction in post procedure admissions for sepsis and haemorrhage. A centre experienced in outpatient TP biopsy was visited by radiologists and nursing staff and protocols were established locally. Initially, TP biopsy was offered to a small number of patients and TRUS continued to be the main biopsy method. With the onset of the COVID-19 pandemic, the decision to transition completely to TP biopsy was made in an effort to avoid the risk of post biopsy admission with the resultant demand on hospital services.

RESULTS

Radiologists experienced in TP procedures worked with other GU radiologists to train them in the technique of TP biopsy under local anaesthetic. Initially 2 cases per morning were performed taking up to 90 minutes per case. After 6 months, 4-6 cases per morning are performed taking 30 minutes per case. All radiologists previously performing TRUS now perform TP biopsy exclusively. Radiology residents are now being trained in the technique. 13.5% of men require sedation. The sepsis rate has been less than 1% in 1000 cases (0.17%). No cases of significant haemorrhage have occurred.*Discussion Our department successfully transitioned completely from TRUS biopsy to TP biopsy with a marked reduction in post procedure sepsis and no cases of severe sepsis seen. We outline the barriers to making the switch and address these in turn (set-up cost, increased time required, reimbursement issues, perceived difficulty of procedure, perceived increased invasiveness of procedure, additional personnel required). The elimination of severe sepsis makes continued use of TRUS medico-legally untenable and transition to TP biopsy is inevitable even if it is taking a long time.

T5A-QI-7

Oxford Tertiary Hospital Referral Pathway for Urgent Radiological Investigations for Paediatric Septic Arthritis: Are We Sensitive and Specific Enough?

Tuesday, Nov. 29 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Anuja Joshi, MBBS, BSc, (*Presenter*) Nothing to Disclose

METHODS

A retrospective search of the radiology reporting system identified patients under 16 years who had US examinations of hips, knees, ankles, shoulders, or elbows between 01/01/19 to 30/11/21. The key word 'septic' pinpointed requests for possible SA. The electronic patient record was used to obtain data about presenting signs and symptoms. Patients who presented with at least two red flags of; Fever >38.5degC in the last week, non-weight bearing/reduced range of joint movement, CRP >20mg/L / ESR >40mm/h or WCC >12k/mm^3 as per Kocher's criteria were deemed as an appropriate referral for urgent US +/- percutaneous aspiration. Microbiology results confirmed positive SA cases. Kocher's criteria were assigned a number for data entry and recorded on the database according to the patient's presentation. Entries were assigned "Yes" if presented with at least 2 red flags and "No" otherwise. The "No" entries were counted, signifying cases which did not meet the pathway standard for urgent US.

RESULTS

Over the time period, 76 urgent US examinations were performed. 22% of scans were confirmed SA cases, all presenting with more than two red flags. Despite presenting less than 2 red flags, 9% of cases underwent urgent US. All but 1 of these cases were reviewed by senior specialists and deemed high risk. There were no missed cases of SA.In the first review in 2016 prior to the current guideline, 142 US were performed in 12 months, with only 4% positive for SA.*Discussion Children can present with unusual symptoms which do not follow criteria and high clinical suspicion of senior clinicians may result in urgent US. Awareness to accommodate exceptions to the pathway is necessary. Our trust has demonstrated good pathway adherence. This retrospective review shows the pathway accurately identifies those with SA and correctly refers them for urgent US without missed cases. The proportion of positive cases scanned has significantly increased compared to before our guideline implementation, indicating this has streamlined the workload without compromising patient care.

T5A-QI-8

Improving Compliance of Post-Procedural Documentation in the Electronic Health Record at a Medium-Sized Community Hospital

Tuesday, Nov. 29 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
David Berezovsky, DO, (*Presenter*) Nothing to Disclose

METHODS

Thirteen IR providers (10 physicians and 3 PAs) performed all IR procedures at this medium-sized community teaching hospital which uses Paragon as its EHR. A standardized EHR post-procedural note template containing all necessary elements, some of which auto-populated, was created and could not be signed unless all required elements were filled. A new workflow was created to nudge providers to write their note in the EHR immediately after the procedure. Buy-in from providers, technologists, nurses, and administrators was obtained at a pre-implementation meeting. Laminated directions were attached to every workstation to remind providers to write the note and help them navigate the EHR. Baseline data from one year prior and during the eight weeks leading to implementation were obtained. Weekly analyses were conducted after implementation. Feedback and progress were sent weekly to all stakeholders. Individual scorecards were sent to select providers to highlight their compliance or non-compliance for encouragement.

RESULTS

Baseline compliance was 27% one year prior to implementation and 72% during the eight weeks prior to implementation. Mean weekly procedures excluding PICCs was 47. After implementation, compliance was nearly consistently above 85%.*Discussion The keys to success in this project were obtaining buy-in from the entire team, designing a simple workflow with nudges, and delivering prompt feedback on progress. A barrier to compliance was provider perception of redundancy of routine post-procedural notes in addition to the radiology dictation. This was addressed with education about its importance for patient safety and regulatory compliance. An additional barrier was the lack of standardization of the post-procedural note in the EHR. The newly designed note template made it easy to quickly write notes that captured required information. Weekly team feedback with select individual scorecards encouraged everyone to be an active participant. Limitations included not verifying the accuracy of the notes and verifying that the note was written prior to the patient leaving the IR suite. Assessment for continued compliance is planned at 3 months and every 6 months thereafter.

Sub-Events

T5B-QI-1 An Educational Intervention with a Radiology-Based Ordering Checklist Can Expedite the Evaluation of Acute Pulmonary Embolism

Participants
Christopher Husson, MD, (*Presenter*) Nothing to Disclose

METHODS

The project took place throughout the hospital and satellite clinics. Our institution is a tertiary, academic, military treatment facility with undergraduate/graduate medical trainees. We included CT pulmonary angiograms (CTPA) and deep venous thrombosis ultrasounds (DVTUS) in our project.At baseline, 68% of CTPA’s and 61% of DVTUS's were ordered STAT. CTPA's took over an hour to complete (67 minutes) from when the order was placed, defined as OST. Extreme instances for CTPA's and DVTUS's were also documented with some OST's exceeding 8 hours.A panel of 2 staff radiologists, 3 radiology residents, and 3 technologists determined the most common reasons for delayed exams. The main issues identified were: “non-STAT” order, improper IV access, inadequate communication, incorrect order, and patient transportation.To address these problems, we created a streamlined “ordering checklist” as a reference tool for our providers. A QR code was also provided with a link to the ACR appropriateness criteria for PE imaging.The checklist was electronically disseminated throughout the hospital system. Subsequently, our team presented educational sessions to several departments that frequently order PE imaging.

RESULTS

We collected anonymized data for CTPA's and DVTUS's from our hospital PACS in five-week time periods, both pre and post intervention. In the five weeks after intervention, STAT orders for CTPA demonstrated a statistically significant increase from 68% to 90% (p=0.02). The median OST decreased by 21 minutes, from 67 minutes to 46 minutes. DVTUS's demonstrated no significant change in the percentage of STAT orders (61% to 63%) nor in median OST (31 vs 42 minutes).*Discussion Through a radiology-based ordering checklist and educational intervention, we expedited the performance of CTPA’s and evaluation for patients with acute PE. Our intervention also demonstrates key qualitative benefits, such as inter-departmental communication and improved patient safety. Important limitations of our project include lack of generalizability, small sample size, and lack of patient outcome data.

T5B-QI-2 Improving the Quality of Ultrasound Reporting forPediatric Breast Massesthrough Implementation of an Investigation and Management Algorithm.

Participants
Tracee Wee, MD, BSc, Vancouver, BC (*Presenter*) Nothing to Disclose

METHODS

A retrospective audit of breast ultrasound reports was performed of female patients aged 8-20 years at initial presentation, at a single tertiary pediatric hospital between April 1, 2011 and March 31, 2021. Reports were excluded if no lesion was identified. Reports were evaluated for the presence of lesion descriptors, diagnosis/differential diagnoses, and management recommendations. Pathology reports of patients who underwent breast mass biopsy/excision were also reviewed. Electronic medical records were reviewed for the presence of breast cancer risk factors. An evidence-based algorithm for pediatric breast mass investigation management was developed in collaboration with the pediatric general surgeons pediatric oncologists at our institution. The audit data algorithm were presented at the Radiology department's quality improvement rounds in July 2021. The project targets were 80% of reports having adequate lesion descriptors, and 90% of reports containing diagnosis/differential diagnosis and recommendations concordant with the algorithm. The second cycle audit of breast mass ultrasound reports between July 2021 and March 2022 was undertaken to evaluate quality of ultrasound reports concordance with management recommendations.

RESULTS

At initial audit cycle, 87 breast ultrasound reports identified a breast lesion. 47 were solid or mixed solid-cystic (complex) masses, which is the most common presentation of malignancy in this population. Size is the most consistent descriptor reported (94%). 67% of reports for solid/complex masses included diagnosis/differential diagnosis, while 35% provided management recommendations. At the second cycle review, 6 of 31 breast ultrasound exams reported solid/complex masses. There was significant improvement of reporting lesion descriptors (Fig. 1). All 6 reports provided a diagnosis/differential diagnosis, but only 3 offered recommendations, all concordant with the algorithm (Fig. 1).*Discussion This project shows, with education an algorithm, pediatric breast mass ultrasound reports can be improved by consistent inclusion of diagnosis/differential diagnosis management recommendations. Limitations of our study include the small number of subjects, due to the low incidence of pediatric breast masses.

T5B-QI-3 Saving Time Without Compromising Quality: Using an Abbreviated MR Brain Protocol in Melanoma Surveillance

Participants
Isabel Cornell, MD, MSc, (*Presenter*) Nothing to Disclose

METHODS

The Plan Do Study Act method was used within a single tertiary referral cancer centre. An abbreviated MRI head protocol was constructed (volumetric T1 post contrast, axial FLAIR post contrast and diffusion weighted MRI; omitting standard axial T2 and pre contrast T1 volumetric sequences) and inclusion criteria agreed (high risk asymptomatic melanoma patients with previous normal standard MRI head). The abbreviated MRI head protocol was used for 3 months. Data recorded included number of abbreviated protocols conducted, scan findings, recalls, follow up findings. Reviews were conducted bimonthly. Following data review this was selected as standard practice. A sustainability/follow on review was conducted at 2 years.

RESULTS

In 2019, 144 patients were scanned over 3 months with the abbreviated MR head protocol: 0 recalls, 2% positive for intracranial metastases and 36 scanning hours were saved compared to standard MRI. In 2021, 127 patients were scanned over 3 months with the abbreviated protocol: 0 recalls, 1% were positive for intracranial metastases and 32 scanning hours were saved.*Discussion The use of an abbreviated MRI Brain protocol in the surveillance of asymptomatic high risk melanoma patients is effective and efficient saving on average, 34 hours of MRI scanning time over 3 months in a tertiary referral cancer centre.

T5B-QI-5 Reduction in Technical Repeat and Recall Rate After Implementation of Artificial Intelligence Driven Quality Improvement Software

Participants
Peter Eby, MD, Seattle, WA (*Presenter*) Nothing to Disclose

METHODS

In 2019, Analytics™ AI software (Volpara Health) was rolled out across 9 clinics at our institution. Techs could review dashboards and reports that provided metric-, image-, and study-level IQ feedback alongside vendor-neutral display images, to identify areas for improvement and monitor performance against institution/global benchmarks. IQ metrics and aggregated patient demographics were extracted per Tech (i.e. quality score (QS), percentage of images scored as Perfect or Good (%PG) or in the target compression pressure (%TCP) range of 7-15 kPa (pressure=force/contact area), median age, breast volumes (BV) and volumetric breast densities (VBD)). Between April 2019 to March 2022, TR data was extracted for 40 Techs (>198K images) (Centricity, GE Healthcare) and AI IQ metrics were available for 42 Techs (>205K images). Diagnostic and digital breast tomosynthesis (DBT) images and implant cases were excluded. Using Chi2 and paired t-tests, AI IQ metrics and TR rates were compared for the initial to most recent 12-month periods following AI software implementation (i.e. "baseline" April 2019-March 2020 vs "current" April 2021-March 2022). To evaluate if IQ improvement was associated with reduced TR, 22 Techs were identified who acquired images in both baseline and current periods. Current TR was compared for Techs with >3% of Inadequate scored images in baseline to <3% in current (improvers) against those whose rate stayed at >3% (non-improvers).

RESULTS

Comparing baseline to current, TR reduced from 0.77% to 0.17% ($p<0.001$) and overall mean QS improved by 6% (2.28 vs 2.42; $p=0.001$). The %PG (56% vs 60%, $p<0.001$) and %TCP (59% vs 64%, $p<0.001$) also increased significantly. Current TR was significantly lower for improvers vs non-improvers (0.12% vs 0.47%, $p<0.001$)]. Although patient demographics differed between baseline and current ($p<0.001$), median age (63/62 y), BV (804/791 cm3) and VBD (5.6/5.3%) were similar.*Discussion AI software facilitated mammographic IQ evaluation and feedback on a massive scale not previously feasible with conventional manual assessment, and produced significant, objectively measured improvements in IQ. Limitations included the exclusion of DBT and inability to match TR and IQ data exactly.

T5B-QI-6 Systematic Analysis of Chest Radiographs and Their Dose Exceedances - How Can We Get Better?

Participants
Andrea Steuwe, PhD, Dusseldorf, Germany (*Presenter*) Nothing to Disclose

METHODS

In this IRB approved, retrospective study planar radiographs of the chest acquired between October and November 2021 on a single x-ray modality were evaluated. X-ray examinations with dose exceedance were filtered and the reason of dose exceedance was documented. As a basis for dose alerts national diagnostic reference levels for p.a. and planar chest radiographs served as the standard of reference. The following data were documented: patient height and weight to calculate body-mass-index, type of projection (lateral or p.a.), tube potential and tube-current-time product, dose area product (cGycm²), as well as the reason for dose exceedance.

RESULTS

A total of 677 adult patients (427 male, 250 female, range 18-95 years) were included, resulting in a total of 1354 radiographs. BMI was as follows: not available (26%), BMI <18kg/m²: 1%, BMI 18.5-24.9 kg/m²: 26%, BMI 25-29.9 kg/m²: 29%, and BMI >30kg/m²: 18%. 24% of all examinations (lateral and p.a.) resulted in dose exceedances. 85% of these dose exceedances were documented in lateral projections, whereas only 15% of the p.a. projections resulted in dose exceedances. For lateral projections, the major reasons for dose exceedance were collimation (52%), obesity (25%), their combination (8%), and low arm positioning (6%). For p.a. projections, the major reasons were obesity (50%) and collimation (28%).*Discussion Diagnostic reference levels are applicable for patients with a weight of 70 ± 3kg. Thus, a relevant number of overweight and obese patients in every-day patient populations explains dose exceedances to some degree in order to maintain proper image quality. Despite patient weight, collimation is a strong influencing factor on radiation exposure. Collimation and patient arm positioning need to be improved by regular supportive feedback of technicians, training, and mentoring of new team members. Repetitive training must be considered mandatory, especially in a larger department with rotating staff.

T5B-QI-7HC Optimizing Radiology Ablation Access Through Utilization of a Predictive Scheduling Matrix

Participants
Molly Boelter, MBA, (*Presenter*) Nothing to Disclose

METHODS

A team of radiology nurses, schedulers, physicians, and quality improvement personnel utilized the DMAIC (Define, Measure, Analyze, Improve, Control) and A3 problem-solving methodologies. The current condition of the practice was studied through data analysis with measures such as: patient lead time, procedure duration, and on-time starts. A Fishbone Diagram was utilized to better understand root causes. Analysis of procedure durations showed significant differences between how long the procedure was predicted to take and how long it actually took. Patient report times were based on radiologists' prediction of when the preceding case would end, as there was not an available data-driven tool to anticipate procedure length.

RESULTS

From root cause analysis, the team identified two issues: longer than necessary procedure slots and report times (resulting in an average lead time of 113 minutes) and white space between procedures. These issues precluded the addition of a third procedure to the schedule. The team devised several PDSA cycles to streamline these processes. Report times were modified from 90 minutes prior to appointment to 60 minutes. A predictive scheduling matrix was created using previous case data. The scheduling matrix was tested over several months for accuracy showing that 66% of cases were accurately predicted within 30 minutes, 80% within 45 minutes, and 92% within 60 minutes. The average end-of-day time decreased also, allowing for a third procedure to be scheduled, reducing the backlog of procedure requests. The team selected safety events as a counterbalance measure, there was not an increase in safety events related to ablation procedures from the pre-intervention to post-intervention time periods.*Discussion Radiology ablation procedures have highly variable procedure times, however utilizing a predictive scheduling matrix positively impacted patient lead times, resulting in a decrease of almost 33%, allowing for a third procedure to be scheduled most days, thereby reducing the backlog of body ablation requests. This project is limited by sample size, the predictive scheduling matrix has been tested with 333 patients over seven months. Data analysis was also manual, which limited the depth of analysis and could inhibit future study. Protracted lead times along with non-standardized scheduling practices led to a backlog of ablation procedure requests. The practice was hesitant to believe that procedure durations could be predicted, but this team has proven that it's possible.Please visit the Learning Center to also view this presentation in hardcopy format.

T5B-QI-8 Data Driven Optimization and Monitoring of MR Scheduling

Participants
Leo Tsai, MD, PhD, Boston, MA (*Presenter*) Stockholder, Agile Devices Inc;Consultant, Agile Devices Inc

METHODS

Outpatient MR exam durations, defined as the time between the first and last image of an exam, were extracted using Quantivly, a software application that harmonizes DICOM header data across all MR scanners and platforms. The timeliness of exams was classified as one of the following: "ideal"- duration 10-25 minutes less than the nominal time slot; "acceptable"- duration within 10 minutes of the nominal time slot; "too long" - duration longer than the nominal time slot; and "too short" - duration more than 25 minutes less than the nominal time slot. The distinction between ideal and acceptable prioritizes leaving some buffer to turn the room over between patients. Prostate w/wo contrast was identified as a candidate to move from a 60 to 45 min. slot provided that exams could be preferentially scheduled on our more efficient 3T scanner. MRCP w/wo contrast was found to have a relatively high percentage of exams considered too long and was a candidate for a time slot increase from 30 to 45 min. Preferential scheduling of prostate exams was monitored for 23 weeks after which the schedule changes were made. The effectiveness of the schedule changes was evaluated by analyzing the change in the timeliness of exams and the net amount of time made available on the outpatient schedule over a 6-week period.

RESULTS

Preferential scheduling of prostate exams was successful with over 95% of exams scheduled on the more efficient scanner. (Figure 1a) The percentage of ideally timed prostate exams increased from 11.0% to 86.1% while the percentage of exams considered too short decreased from 87.7% to 0.8%. (Figure 1a-b) The percentage of ideally timed MRCP exams increased from 9.3% to 79.1% while reducing the number of exams considered too long from 25.4% to 2.5%. (Figure 1c-d) The difference in volumes and time slot changes resulted in a net gain of 3.2 hours/week for scheduling other exams*Discussion Retrospective analysis of exam durations is a useful tool for optimizing MR scheduling. A disparity in efficiency between our two 3-Tesla scanners was known previously but the feasibility and benefits of reducing the time slot was difficult to quantify. The initial performance of MRCP exams was likely caused by an underestimation of the time required to perform breath holds and respiratory triggered sequences which is challenging to estimate without true exam duration data.

Reduction in Technical Repeat and Recall Rate After Implementation of Artificial Intelligence Driven Quality Improvement Software

Tuesday, Nov. 29 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Peter Eby, MD, Seattle, WA (*Presenter*) Nothing to Disclose

METHODS

In 2019, Analytics™ AI software (Volpara Health) was rolled out across 9 clinics at our institution. Techs could review dashboards and reports that provided metric-, image-, and study-level IQ feedback alongside vendor-neutral display images, to identify areas for improvement and monitor performance against institution/global benchmarks. IQ metrics and aggregated patient demographics were extracted per Tech (i.e. quality score (QS), percentage of images scored as Perfect or Good (%PG) or in the target compression pressure (%TCP) range of 7-15 kPa (pressure=force/contact area), median age, breast volumes (BV) and volumetric breast densities (VBD)). Between April 2019 to March 2022, TR data was extracted for 40 Techs (>198K images) (Centricity, GE Healthcare) and AI IQ metrics were available for 42 Techs (>205K images). Diagnostic and digital breast tomosynthesis (DBT) images and implant cases were excluded. Using Chi2 and paired t-tests, AI IQ metrics and TR rates were compared for the initial to most recent 12-month periods following AI software implementation (i.e. "baseline" April 2019-March 2020 vs "current" April 2021-March 2022). To evaluate if IQ improvement was associated with reduced TR, 22 Techs were identified who acquired images in both baseline and current periods. Current TR was compared for Techs with >3% of Inadequate scored images in baseline to <3% in current (improvers) against those whose rate stayed at >3% (non-improvers).

RESULTS

Comparing baseline to current, TR reduced from 0.77% to 0.17% ($p<0.001$) and overall mean QS improved by 6% (2.28 vs 2.42; $p=0.001$). The %PG (56% vs 60%, $p<0.001$) and %TCP (59% vs 64%, $p<0.001$) also increased significantly. Current TR was significantly lower for improvers vs non-improvers (0.12% vs 0.47%, $p<0.001$)]. Although patient demographics differed between baseline and current ($p<0.001$), median age (63/62 y), BV (804/791 cm3) and VBD (5.6/5.3%) were similar.*Discussion AI software facilitated mammographic IQ evaluation and feedback on a massive scale not previously feasible with conventional manual assessment, and produced significant, objectively measured improvements in IQ. Limitations included the exclusion of DBT and inability to match TR and IQ data exactly.

Systematic Analysis of Chest Radiographs and Their Dose Exceedances - How Can We Get Better?

Tuesday, Nov. 29 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Andrea Steuwe, PhD, Dusseldorf, Germany (*Presenter*) Nothing to Disclose

METHODS

In this IRB approved, retrospective study planar radiographs of the chest acquired between October and November 2021 on a single x-ray modality were evaluated. X-ray examinations with dose exceedance were filtered and the reason of dose exceedance was documented. As a basis for dose alerts national diagnostic reference levels for p.a. and planar chest radiographs served as the standard of reference. The following data were documented: patient height and weight to calculate body-mass-index, type of projection (lateral or p.a.), tube potential and tube-current-time product, dose area product (cGycm²), as well as the reason for dose exceedance.

RESULTS

A total of 677 adult patients (427 male, 250 female, range 18-95 years) were included, resulting in a total of 1354 radiographs. BMI was as follows: not available (26%), BMI <18kg/m²: 1%, BMI 18.5-24.9 kg/m²: 26%, BMI 25-29.9 kg/m²: 29%, and BMI >30kg/m²: 18%. 24% of all examinations (lateral and p.a.) resulted in dose exceedances. 85% of these dose exceedances were documented in lateral projections, whereas only 15% of the p.a. projections resulted in dose exceedances. For lateral projections, the major reasons for dose exceedance were collimation (52%), obesity (25%), their combination (8%), and low arm positioning (6%). For p.a. projections, the major reasons were obesity (50%) and collimation (28%).*Discussion Diagnostic reference levels are applicable for patients with a weight of 70 ± 3kg. Thus, a relevant number of overweight and obese patients in every-day patient populations explains dose exceedances to some degree in order to maintain proper image quality. Despite patient weight, collimation is a strong influencing factor on radiation exposure. Collimation and patient arm positioning need to be improved by regular supportive feedback of technicians, training, and mentoring of new team members. Repetitive training must be considered mandatory, especially in a larger department with rotating staff.

T5B-QI-7HC

Optimizing Radiology Ablation Access Through Utilization of a Predictive Scheduling Matrix

Tuesday, Nov. 29 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Molly Boelter, MBA, (*Presenter*) Nothing to Disclose

METHODS

A team of radiology nurses, schedulers, physicians, and quality improvement personnel utilized the DMAIC (Define, Measure, Analyze, Improve, Control) and A3 problem-solving methodologies. The current condition of the practice was studied through data analysis with measures such as: patient lead time, procedure duration, and on-time starts. A Fishbone Diagram was utilized to better understand root causes. Analysis of procedure durations showed significant differences between how long the procedure was predicted to take and how long it actually took. Patient report times were based on radiologists' prediction of when the preceding case would end, as there was not an available data-driven tool to anticipate procedure length.

RESULTS

From root cause analysis, the team identified two issues: longer than necessary procedure slots and report times (resulting in an average lead time of 113 minutes) and white space between procedures. These issues precluded the addition of a third procedure to the schedule. The team devised several PDSA cycles to streamline these processes. Report times were modified from 90 minutes prior to appointment to 60 minutes. A predictive scheduling matrix was created using previous case data. The scheduling matrix was tested over several months for accuracy showing that 66% of cases were accurately predicted within 30 minutes, 80% within 45 minutes, and 92% within 60 minutes. The average end-of-day time decreased also, allowing for a third procedure to be scheduled, reducing the backlog of procedure requests. The team selected safety events as a counterbalance measure, there was not an increase in safety events related to ablation procedures from the pre-intervention to post-intervention time periods.*Discussion Radiology ablation procedures have highly variable procedure times, however utilizing a predictive scheduling matrix positively impacted patient lead times, resulting in a decrease of almost 33%, allowing for a third procedure to be scheduled most days, thereby reducing the backlog of body ablation requests. This project is limited by sample size, the predictive scheduling matrix has been tested with 333 patients over seven months. Data analysis was also manual, which limited the depth of analysis and could inhibit future study. Protracted lead times along with non-standardized scheduling practices led to a backlog of ablation procedure requests. The practice was hesitant to believe that procedure durations could be predicted, but this team has proven that it's possible.Please visit the Learning Center to also view this presentation in hardcopy format.

T5B-QI-8

Data Driven Optimization and Monitoring of MR Scheduling

Tuesday, Nov. 29 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Leo Tsai, MD, PhD, Boston, MA (*Presenter*) Stockholder, Agile Devices Inc;Consultant, Agile Devices Inc

METHODS

Outpatient MR exam durations, defined as the time between the first and last image of an exam, were extracted using Quantivly, a software application that harmonizes DICOM header data across all MR scanners and platforms. The timeliness of exams was classified as one of the following: "ideal"- duration 10-25 minutes less than the nominal time slot; "acceptable"- duration within 10 minutes of the nominal time slot; "too long" - duration longer than the nominal time slot; and "too short" - duration more than 25 minutes less than the nominal time slot. The distinction between ideal and acceptable prioritizes leaving some buffer to turn the room over between patients. Prostate w/wo contrast was identified as a candidate to move from a 60 to 45 min. slot provided that exams could be preferentially scheduled on our more efficient 3T scanner. MRCP w/wo contrast was found to have a relatively high percentage of exams considered too long and was a candidate for a time slot increase from 30 to 45 min. Preferential scheduling of prostate exams was monitored for 23 weeks after which the schedule changes were made. The effectiveness of the schedule changes was evaluated by analyzing the change in the timeliness of exams and the net amount of time made available on the outpatient schedule over a 6-week period.

RESULTS

Preferential scheduling of prostate exams was successful with over 95% of exams scheduled on the more efficient scanner. (Figure 1a) The percentage of ideally timed prostate exams increased from 11.0% to 86.1% while the percentage of exams considered too short decreased from 87.7% to 0.8%. (Figure 1a-b) The percentage of ideally timed MRCP exams increased from 9.3% to 79.1% while reducing the number of exams considered too long from 25.4% to 2.5%. (Figure 1c-d) The difference in volumes and time slot changes resulted in a net gain of 3.2 hours/week for scheduling other exams*Discussion Retrospective analysis of exam durations is a useful tool for optimizing MR scheduling. A disparity in efficiency between our two 3-Tesla scanners was known previously but the feasibility and benefits of reducing the time slot was difficult to quantify. The initial performance of MRCP exams was likely caused by an underestimation of the time required to perform breath holds and respiratory triggered sequences which is challenging to estimate without true exam duration data.

Quality Improvement Reports Wednesday Poster Discussions

Wednesday, Nov. 30 9:00AM - 9:30AM Room: Learning Center - QI DPS

Sub-Events

W2-QI-1 Augmented Reality and On-Site Projections: Taking Pediatric CT Examinations to the Next Level

Participants
Adriano Tachibana, PhD, MBA, Sao Paulo, Brazil (*Presenter*) Research Grant, Guerbet SA

METHODS

First, a field research was carried out to choose the characters that would most please children in a group of n=25 outpatient individuals ranging from 2 to 12 years old. Second, a field survey was carried out with the leadership of the TC department to understand the main problems that the CT sector had in relation to processes. And finally, the development of designs, scenes and script by the 3D animation team, in addition to the physical structuring, and installation of equipment. (Figure 1) To measure patient satisfaction with the new technology, a survey was carried out with five questions.

RESULTS

The projet began in February 2022, 14 patients aged between 2 and 12 years have used the new setting. Through the satisfaction survey "Ambiance and digital personalization in examination rooms and preparation of computed tomography for pediatric care" we could observe that the exams performed had an average duration of 10 minutes, and the results showed that 92.8% (13) of the respondents considered the environment "pleasant", 7.2% (1) considered it "indifferent", 71.4% (10) reported a feeling of "tranquility", 14.2% (2), "no interference" and 14.2% (2) reported feelings of "happiness". On the satisfaction scale, the average was 9.4. In addition, 100% of respondents reported that they prefer the personalized environment "with ambience".(Table 1)*Discussion Although we did not perform comparisons before and after the new concept of digital personalized ambience of the CT room, we can already perceive a very positive reaction from the patient and parents perspective. We see as a potential confounder the differences of care in the setting by the tech and nursery staff. We expect, as the number of examinations increase over time, to be able to measure other important indicators such as anesthesia rates, total time in the CT room and CT image quality.

W2-QI-2 Official Radiology Policies for Residents in a Hurry: Increasing the Confidence of Radiology Residents Answering Policy-Based Questions on Call and Injection Coverage Shifts

Participants
Sanna Herwald, MD, PhD, Menlo Park, CA (*Presenter*) Nothing to Disclose

METHODS

The 54 Radiology residents in our quaternary academic hospital routinely answer after-hours policy-based questions. The anonymous baseline survey of our Radiology residents demonstrated that junior residents were less confident answering after-hours policy-based questions than senior residents. Reported on a 1-5 Likert scale, the baseline mean confidence was 1.6, 2.8, 3.5, and 4.0 for the R1, R2, R3, and R4 respondents, respectively. Root cause analysis with frontline team members revealed that the challenges facing residents answering policy-based questions included the lack of a central policy resource, the need to answer these questions quickly during busy shifts, and the unclear mechanism for residents to ask questions about an official policy. During a structured quality improvement course, these challenges were addressed with three interventions: 1) Establishing a central online repository of Radiology-relevant policies, 2) Sharing a brief FAQ document about imaging potentially-pregnant patients, and 3) Creating an official policy feedback page on the online repository. The impact of these interventions was assessed through anonymously-reported resident confidence answering after-hours policy-based questions on a 1-5 Likert scale. No other improvement projects focused on Radiology policies or resident after-hours experience occurred during this project, and the changes in reported confidence were attributed to our specific interventions.

RESULTS

Our run chart shows that our interventions significantly increased resident confidence answering after-hours policy-based questions, from an average of 2.9 at baseline to 4.0 post-intervention on a 1-5 Likert scale ($p = 0.009$, with a similar distribution of residency years in both respondent groups). Confidence also increased in each residency class except the R4 class (baseline vs. post-intervention confidence of 1.6 vs. 3.0 for R1, 2.8 vs. 4.0 for R2, 3.5 vs. 4.7 for R3, and 4.0 vs. 4.0 for R4).*Discussion Limitations of our study include generalizability, and limited ability to track which repository resources are most frequently used by residents. With interventions focused on policy centralization and ease-of-access, we increased resident confidence answering after-hours policy-based questions within every residency class except the fourth-year residents.

W2-QI-3 An Audit of Nasogastric Tube Check Chest Radiographs to Assess Safe and Timely Reporting

Participants
Abhinav Jha, MBBS, BSc, London, United Kingdom (*Presenter*) Nothing to Disclose

METHODS

The audit standards are as follows; all CXRs for NGT tube check should be flagged on Soliton Radiology Information System (RIS) to be prioritised for urgent reporting; 90% of NGT check CXRs should be reported within 3 hours; and all reports should give a definitive statement on the position of the NGT. Retrospective data analysis of chest radiographs (excluding paediatrics and neonates) was carried out, using RIS. Data sets were collected over 8 day periods in 2020 (cycles 1, 2 and 3) and 2021 (cycle 4). Following cycle 1, radiographers were encouraged to flag CXRs for NGT check on RIS at the time of image acquisition (manual process). Following cycle 2, departmental and trust wide interventions included: implementation of a standardised NGT check reporting template; inclusion of the entire NGT on the CXR if the study is flagged for NGT check; and mandatory NGT check tick box on the electronic request form for CXRs.

RESULTS

The average number of NGT check CXRs increased from 4 per day in 2018, to 19 in cycle 1, and to 29 in cycle 4, coinciding with the COVID-19 peaks. All examinations for NGT check were flagged on RIS following the introduction of mandatory NGT tick box on electronic requests. The median time to report NGT check CXRs has decreased from 12 hours in cycle 1, to 4 hours in cycle 4 due to automated flagging. In total, the standardised template was used to report 67.0% and 76.5% of all radiographs flagged for NGT check in cycles 3 and 4 respectively. The percentage of NGT check CXRs reported within 3 hours ranged between 20-35%.*Discussion There has been excellent uptake of the standardised template for NGT CXR reporting amongst reporters. CXRs in a series, or with other findings commonly limited usage of the template. The mandatory tick box has resulted in 100% flagging of NGT check CXRs, which may contribute to the reduction in time taken to report these studies. The 3-hour turnaround target for NGT check CXRs has not been met. This is likely secondary to a 625% percentage increase in radiographs conducted for NGT check since 2018, coinciding with the increase in number of critically unwell admissions during the COVID-19 pandemic.

W2-QI-4HC Improving Compliance of Barcode Medication Administration of Contrast in CT

Participants
Molly Boelter, MBA, (*Presenter*) Nothing to Disclose

METHODS

A team of CT technologists, nurses, and quality improvement personnel approached this issue with the DMAIC (Define, Measure, Analyze, Improve, Control) and A3 problem-solving methodologies. The current condition of the practice was reviewed and studied via observational audits. Relevant policies, procedures, and standards were reviewed. Analysis of baseline audits was completed along with a Fishbone Diagram to assist in understanding the root causes of issues and barriers. The team devised several PDSAs (Plan, Do, Study, Act) to find the most effective and efficient way to improve compliance. Compliance with the barcode medication administration policy related audit, as well as exam durations, were monitored throughout.

RESULTS

A root cause analysis yielded several themes. The practice was utilizing a standard laminated sheet containing barcodes for contrast media as opposed to scanning the contrast bottles. This workaround was being utilized due to a change in EHR with insufficient time and resources to devise a compliant workflow without extending exam durations. There was a lack of understanding among team members as to what is and is not compliant when it comes to barcode medication administration. Scanning equipment was not accessible to the staff in the exam room where contrast was being administered. There was variation in the workflow between the different CT locations related to who administered and documented contrast. Four different PDSA cycles were completed with variation in the location and type of technology used for barcode medication administration of contrast. PDSAs one through three all yielded compliance rates of 100%, and exam durations ranging from 11 to 24.5 minutes. PDSA #4 is still ongoing.*Discussion Barcode scanning allows frontline staff an opportunity to catch medication errors before they reach the patient. This team came together with the goal of improving the workflow and compliance for barcode medication administration of contrast in the CT practice. Currently the scope of this project limited, it is taking place in only one of the four CT locations due to variations in roles and responsibilities across the different locations. Introducing appropriate technology at the site where work is being done resulted in barcode compliance improvement from 9% to 100% without extending exam durations. Utilizing a team-based cooperative method for addressing non-compliance was highly effective in this project.Please visit the Learning Center to also view this presentation in hardcopy format.

W2-QI-5HC Assessment of an Artificial Intelligence (AI) System in Indicating Breast Laterality for Breast Cancer Detection Within a Service Evaluation

Participants
Jonathan Nash, San Francisco, CA (*Presenter*) Medical Director, Kheiron Medical Technologies Ltd;Stockholder, Kheiron Medical Technologies Ltd

METHODS

A commercially available AI system (Mia; Kheiron Medical Technologies) was employed at a BCS provider in the NHS within a service evaluation. The first phase was a retrospective local validation. The AI's standalone laterality performance was assessed on 25,547 examinations, randomly sampled from 2014-2018, from two device vendors (GE, Hologic). All screen-detected cancers were pathology-confirmed.

RESULTS

The dataset included 205 screen-detected cancers (cancer prevalence 0.8%), of which the AI correctly recalled 187 (91.2% sensitivity, 7.2% positive predictive value). Among the correctly recalled, the AI: A) indicated laterality agreed with pathology in 85.6% (1.6% bilateral, 84.0% unilateral), B) recalled unilateral cases as bilateral in 11.2%, C) recalled one side in bilateral cancer cases in 2.1%, and D) indicated the opposite side not assessed in 1.1%. For category D, it is unknown if an early abnormality could be present as the AI-indicated side was not assessed by biopsy nor by additional diagnostic imaging.*Discussion The AI demonstrated accurate laterality performance in the majority of its correct recalls (85.6%) as evidenced in scenario A, making the AI's laterality indication relevant for screening and diagnostic use at this centre. While the AI provided uncertain laterality in scenario B, it covered the side of concern. In scenario C, the AI indicated one of two sides of concern, which is sufficient for women to be correctly recalled. Scenarios A-C comprise 98.9% of the AI's correct recalls for which it provides screening utility. This evaluation goes beyond binary recall suggestions, typical of aggregate level AI validations, to show that, in this BCS service, AI can support the clinical workflow with laterality information for follow-up assessments.Please visit the Learning Center to also view this presentation in hardcopy format.

W2-QI-6 Design, Implementation, and Evaluation of an Education Program for Medical and Undergraduate

Students to Advocate Diversity, Equity, and Inclusion in Radiology

Participants
Divya Surabhi, MPH, (*Presenter*) Nothing to Disclose

METHODS

A series of virtual and in-person events were conducted at an urban, academic medical school and affiliated university. Events for medical students included one faculty-led career advising event, two M4-led post-MATCH panels, three radiology skills workshops, and one procedure workshop; one introduction to radiology event was for undergraduate students. Students were invited to participate in a survey, consisting of a demographics questionnaire and a knowledge questionnaire, at the end of each event.The demographics questionnaire gathered information regarding gender, race/ethnicity, training level, and radiology exposure; the knowledge questionnaire gathered thoughts on how effective the event was at addressing misconceptions and work-life balance along with event satisfaction and future interests in radiology. Responses were obtained using a Likert scale to gauge agreement with questions. Completed surveys were analyzed for trends based upon survey type, question type, race/ethnicity, and gender. Across all events, there were 97 attendees with a 52% survey completion rate (50 responses). 50 responses consisted of 39 individual students. One-tailed test assessed statistical significance for race/ethnicity and gender trends.

RESULTS

Events demonstrate a statistically significant positive impact in elucidating misconceptions and increasing URM's interest in radiology. Although not statistically significant, trends demonstrate a positive impact in combating women's misconceptions of radiology.*Discussion Limitations include limited emphasis on coaching and collaborating factors of the 5C's. Future programming will identify mentors, host a women and minorities in radiology panel, and schedule more in-person procedure workshops. Events will be repeated in the upcoming academic year to increase participation. Future data analysis includes identifying which modality is most effective at increasing women's and URM's interest.

W2-QI-7HC The Automated Inline Delivery to PACS of Abdominal and Hepatic Fat Imaging-Derived Phenotypes using Cloud-based Machine Learning Software

Participants
Ameena Elahi, MA, ARRT, Philadelphia, PA (*Presenter*) Nothing to Disclose

METHODS

Figure 1a. Shows the AI end-to-end pipeline workflow that begins after the CT technologist completes the study and sends the images from the scanner to PACS. After verifying that the images have arrived in PACS, the CT technologist ends the study in the Electronic Medical Record (EMR). After the study is ended, the EMR sends an order final HL7 message to the Vendor Neutral Archive (VNA). The order final message then triggers the VNA to send a command to PACS to move the study to the AI server. The AI system processes the images and outputs the AI images to PACS.

RESULTS

Three tests were conducted during two-hour periods of peak work hours of a tertiary care radiology practice. All CT studies conforming to two current procedural terminology (CPT) codes were transferred. There were 11 studies transferred with 1029±674 instances per study (896±1018 MB per study) in 7.3±8.8 min. The transfer rate was 123 MB/min. The minimum study had 553 instances (284 MB) transferred in <2 min, and the maximum study had 1518 instances (3.4 GB) in 31 minutes. In subsequent two two-hour periods, CT studies with 10 CPT codes were transferred. During that period, we received a total of 86 studies.*Discussion One limitation is how dependent the workflow is on the technologist ending the study in the EHR after all images arrive in PACS. If the technologist ends the study before all images arrive in PACS, the AI output will not be fully processed and would require a manual push from the VNA to trigger the illustrated workflow.Conclusion We developed a high performance cloud-based software for inline annotation and quantification of imaging derived phenotypes. It was feasible to receive and analyze studies inline during high traffic periods. This work shows the potential to automatically obtain quantitative data using machine learning from multiple heterogeneous CT scanners with radiologists "in-the-loop".Please visit the Learning Center to also view this presentation in hardcopy format.

An Audit of Nasogastric Tube Check Chest Radiographs to Assess Safe and Timely Reporting

Wednesday, Nov. 30 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Abhinav Jha, MBBS, BSc, London, United Kingdom (*Presenter*) Nothing to Disclose

METHODS

The audit standards are as follows; all CXRs for NGT tube check should be flagged on Soliton Radiology Information System (RIS) to be prioritised for urgent reporting; 90% of NGT check CXRs should be reported within 3 hours; and all reports should give a definitive statement on the position of the NGT. Retrospective data analysis of chest radiographs (excluding paediatrics and neonates) was carried out, using RIS. Data sets were collected over 8 day periods in 2020 (cycles 1, 2 and 3) and 2021 (cycle 4). Following cycle 1, radiographers were encouraged to flag CXRs for NGT check on RIS at the time of image acquisition (manual process). Following cycle 2, departmental and trust wide interventions included: implementation of a standardised NGT check reporting template; inclusion of the entire NGT on the CXR if the study is flagged for NGT check; and mandatory NGT check tick box on the electronic request form for CXRs.

RESULTS

The average number of NGT check CXRs increased from 4 per day in 2018, to 19 in cycle 1, and to 29 in cycle 4, coinciding with the COVID-19 peaks. All examinations for NGT check were flagged on RIS following the introduction of mandatory NGT tick box on electronic requests. The median time to report NGT check CXRs has decreased from 12 hours in cycle 1, to 4 hours in cycle 4 due to automated flagging. In total, the standardised template was used to report 67.0% and 76.5% of all radiographs flagged for NGT check in cycles 3 and 4 respectively. The percentage of NGT check CXRs reported within 3 hours ranged between 20-35%.*Discussion There has been excellent uptake of the standardised template for NGT CXR reporting amongst reporters. CXRs in a series, or with other findings commonly limited usage of the template. The mandatory tick box has resulted in 100% flagging of NGT check CXRs, which may contribute to the reduction in time taken to report these studies. The 3-hour turnaround target for NGT check CXRs has not been met. This is likely secondary to a 625% percentage increase in radiographs conducted for NGT check since 2018, coinciding with the increase in number of critically unwell admissions during the COVID-19 pandemic.

Improving Compliance of Barcode Medication Administration of Contrast in CT

Wednesday, Nov. 30 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Molly Boelter, MBA, (*Presenter*) Nothing to Disclose

METHODS

A team of CT technologists, nurses, and quality improvement personnel approached this issue with the DMAIC (Define, Measure, Analyze, Improve, Control) and A3 problem-solving methodologies. The current condition of the practice was reviewed and studied via observational audits. Relevant policies, procedures, and standards were reviewed. Analysis of baseline audits was completed along with a Fishbone Diagram to assist in understanding the root causes of issues and barriers. The team devised several PDSAs (Plan, Do, Study, Act) to find the most effective and efficient way to improve compliance. Compliance with the barcode medication administration policy related audit, as well as exam durations, were monitored throughout.

RESULTS

A root cause analysis yielded several themes. The practice was utilizing a standard laminated sheet containing barcodes for contrast media as opposed to scanning the contrast bottles. This workaround was being utilized due to a change in EHR with insufficient time and resources to devise a compliant workflow without extending exam durations. There was a lack of understanding among team members as to what is and is not compliant when it comes to barcode medication administration. Scanning equipment was not accessible to the staff in the exam room where contrast was being administered. There was variation in the workflow between the different CT locations related to who administered and documented contrast. Four different PDSA cycles were completed with variation in the location and type of technology used for barcode medication administration of contrast. PDSAs one through three all yielded compliance rates of 100%, and exam durations ranging from 11 to 24.5 minutes. PDSA #4 is still ongoing.*Discussion Barcode scanning allows frontline staff an opportunity to catch medication errors before they reach the patient. This team came together with the goal of improving the workflow and compliance for barcode medication administration of contrast in the CT practice. Currently the scope of this project limited, it is taking place in only one of the four CT locations due to variations in roles and responsibilities across the different locations. Introducing appropriate technology at the site where work is being done resulted in barcode compliance improvement from 9% to 100% without extending exam durations. Utilizing a team-based cooperative method for addressing non-compliance was highly effective in this project.Please visit the Learning Center to also view this presentation in hardcopy format.

W2-QI-5HC

Assessment of an Artificial Intelligence (AI) System in Indicating Breast Laterality for Breast Cancer Detection Within a Service Evaluation

Wednesday, Nov. 30 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Jonathan Nash, San Francisco, CA (*Presenter*) Medical Director, Kheiron Medical Technologies Ltd;Stockholder, Kheiron Medical Technologies Ltd

METHODS

A commercially available AI system (Mia; Kheiron Medical Technologies) was employed at a BCS provider in the NHS within a service evaluation. The first phase was a retrospective local validation. The AI's standalone laterality performance was assessed on 25,547 examinations, randomly sampled from 2014-2018, from two device vendors (GE, Hologic). All screen-detected cancers were pathology-confirmed.

RESULTS

The dataset included 205 screen-detected cancers (cancer prevalence 0.8%), of which the AI correctly recalled 187 (91.2% sensitivity, 7.2% positive predictive value). Among the correctly recalled, the AI: A) indicated laterality agreed with pathology in 85.6% (1.6% bilateral, 84.0% unilateral), B) recalled unilateral cases as bilateral in 11.2%, C) recalled one side in bilateral cancer cases in 2.1%, and D) indicated the opposite side not assessed in 1.1%. For category D, it is unknown if an early abnormality could be present as the AI-indicated side was not assessed by biopsy nor by additional diagnostic imaging.*Discussion The AI demonstrated accurate laterality performance in the majority of its correct recalls (85.6%) as evidenced in scenario A, making the AI's laterality indication relevant for screening and diagnostic use at this centre. While the AI provided uncertain laterality in scenario B, it covered the side of concern. In scenario C, the AI indicated one of two sides of concern, which is sufficient for women to be correctly recalled. Scenarios A-C comprise 98.9% of the AI's correct recalls for which it provides screening utility. This evaluation goes beyond binary recall suggestions, typical of aggregate level AI validations, to show that, in this BCS service, AI can support the clinical workflow with laterality information for follow-up assessments.Please visit the Learning Center to also view this presentation in hardcopy format.

W2-QI-6

Design, Implementation, and Evaluation of an Education Program for Medical and Undergraduate Students to Advocate Diversity, Equity, and Inclusion in Radiology

Wednesday, Nov. 30 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Divya Surabhi, MPH, (*Presenter*) Nothing to Disclose

METHODS

A series of virtual and in-person events were conducted at an urban, academic medical school and affiliated university. Events for medical students included one faculty-led career advising event, two M4-led post-MATCH panels, three radiology skills workshops, and one procedure workshop; one introduction to radiology event was for undergraduate students. Students were invited to participate in a survey, consisting of a demographics questionnaire and a knowledge questionnaire, at the end of each event.The demographics questionnaire gathered information regarding gender, race/ethnicity, training level, and radiology exposure; the knowledge questionnaire gathered thoughts on how effective the event was at addressing misconceptions and work-life balance along with event satisfaction and future interests in radiology. Responses were obtained using a Likert scale to gauge agreement with questions. Completed surveys were analyzed for trends based upon survey type, question type, race/ethnicity, and gender. Across all events, there were 97 attendees with a 52% survey completion rate (50 responses). 50 responses consisted of 39 individual students. One-tailed test assessed statistical significance for race/ethnicity and gender trends.

RESULTS

Events demonstrate a statistically significant positive impact in elucidating misconceptions and increasing URM’s interest in radiology. Although not statistically significant, trends demonstrate a positive impact in combating women’s misconceptions of radiology.*Discussion Limitations include limited emphasis on coaching and collaborating factors of the 5C’s. Future programming will identify mentors, host a women and minorities in radiology panel, and schedule more in-person procedure workshops. Events will be repeated in the upcoming academic year to increase participation. Future data analysis includes identifying which modality is most effective at increasing women’s and URM’s interest.

W2-QI-7HC

The Automated Inline Delivery to PACS of Abdominal and Hepatic Fat Imaging-Derived Phenotypes using Cloud-based Machine Learning Software

Wednesday, Nov. 30 9:00AM - 9:30AM Room: Learning Center - QI DPS

Participants
Ameena Elahi, MA, ARRT, Philadelphia, PA (*Presenter*) Nothing to Disclose

METHODS

Figure 1a. Shows the AI end-to-end pipeline workflow that begins after the CT technologist completes the study and sends the images from the scanner to PACS. After verifying that the images have arrived in PACS, the CT technologist ends the study in the Electronic Medical Record (EMR). After the study is ended, the EMR sends an order final HL7 message to the Vendor Neutral Archive (VNA). The order final message then triggers the VNA to send a command to PACS to move the study to the AI server. The AI system processes the images and outputs the AI images to PACS.

RESULTS

Three tests were conducted during two-hour periods of peak work hours of a tertiary care radiology practice. All CT studies conforming to two current procedural terminology (CPT) codes were transferred. There were 11 studies transferred with 1029±674 instances per study (896±1018 MB per study) in 7.3±8.8 min. The transfer rate was 123 MB/min. The minimum study had 553 instances (284 MB) transferred in <2 min, and the maximum study had 1518 instances (3.4 GB) in 31 minutes. In subsequent two two-hour periods, CT studies with 10 CPT codes were transferred. During that period, we received a total of 86 studies.*Discussion One limitation is how dependent the workflow is on the technologist ending the study in the EHR after all images arrive in PACS. If the technologist ends the study before all images arrive in PACS, the AI output will not be fully processed and would require a manual push from the VNA to trigger the illustrated workflow.Conclusion We developed a high performance cloud-based software for inline annotation and quantification of imaging derived phenotypes. It was feasible to receive and analyze studies inline during high traffic periods. This work shows the potential to automatically obtain quantitative data using machine learning from multiple heterogeneous CT scanners with radiologists “in-the-loop”.Please visit the Learning Center to also view this presentation in hardcopy format.

Quality Improvement Reports Wednesday Poster Discussions - A

Wednesday, Nov. 30 12:15PM - 12:45PM Room: Learning Center - QI DPS

Sub-Events

W5A-QI-1 Leveraging Process Redesign Techniques to Improve Workflow, Patient Care and Reimbursement of Second Opinions in Radiology

Participants
Zarine K. Shah, MD, (*Presenter*) Nothing to Disclose

METHODS

The original process was evaluated and several opportunities for improvement were identified. The redesigned process started with automating the importation outside imaging studies leveraging a patient reconciliation tool that harmonizes patient identifiers and links studies to the appropriate patient's chart. Details of the process provided in the schematic. A second opinion order is then placed. Support staff (reading room assistants) monitor a worklist for second opinions first ensuring that the second opinion request meets departmental criteria (report availability and study performed within a specific time-frame - 30 days initially and 3 months more recently). Once these initial steps are completed, the study automatically populates a specialty-specific radiologist worklist, beyond which the reporting process is exactly like a study performed in-house. Standardized reporting templates are used, similar to studies performed at our institution, and billing second opinion uses the original CPT code of outside study performed.

RESULTS

The second opinion process has integrated well into our routine radiology workflow allowing radiologists to use the same worklists, PACS, and dictation software as used for all internal studies. As a part of this model we have been able to implement effective coding, billing and successful collections supporting and sustaining this effort. Prior to our process improvement we performed an average of 10 second opinion interpretations per month and were not able to bill for these. Our process improvement initiative has led to an average of 22 second opinions per month and successful reimbursement from payers with a low denial rate of 6% for the 178 studies successfully interpreted to date.*Discussion Our new second opinion workflow has led directly to increases in efficiency, quality and sustainability by standardizing and automating workflows, using structured reporting to enhance clinical quality and support successful reimbursement.

W5A-QI-2 Management of Clinical Trial Imaging Data with Structured Voice Recognition Reports and Cloud Processing: A Novel Clinical Approach

Participants
Levi Sokol, MD, (*Presenter*) Nothing to Disclose

METHODS

An anonymous survey was sent out to the oncologist and research coordinators who have experience using the software. The survey was designed to gauge the effectiveness of the software. Questions asked included the decrease in turnaround time between initiation of scan and completion of research protocol calculations, and regarding the decrease in time the oncologists personally need to make calculations. Additionally, respondents were inquired regarding the accuracy of the data, and how much time they had to spend verifying the integrity of the data. Finally, users were also asked if there were any changes regarding the number of audit requests.

RESULTS

The survey was sent to approximately 170 recipients, with 46 respondents. 82.3% of respondents said they strongly agreed or agreed that there was a decreased turnaround time between scan initiation, and completion of research protocol calculations, and 17.8% were neutral. 81.2% strongly agreed or agreed that there was a decreased time they personally performed the calculations, and 18.2 % were neutral. 23.8% said they saved less than 5 minutes per time point personally performing the calculations, 35.7% said 5-15 minutes, 21.43% 15 to 30 minutes, 14.3% 30-60 minutes, and 4.8% of people responded that they saved greater than 60 minutes per time point. Users were also asked regarding their time spend verifying the data. 68.9% of people spent less than 5 minutes per time point verifying the integrity and quality of the data. 17.8% spent 5-15 minutes, 11.1% spent 15-30 minutes, and 2.2% 30-60 minutes. No one spent greater than 60 minutes verifying the data. 67.4% of people strongly agreed that they were confident in the accuracy of the data, 23.4% agreed, and 8.7% neither agreed or disagreed.*Discussion We have piloted an approach to provide clinical trials imaging metrics to oncologists using non-proprietary technology that runs from any standard radiology voice recognition system and PACS. The majority of respondents agreed that they would recommend this system for its time-saving, automated calculation and ease of use, user features.

W5A-QI-3 3D Printed Vascular Model to Improve Resident Exposure and Time to Perform Coil Embolization in a Community Hospital

Participants
Cristina Olivas Chacon, MD, (*Presenter*) Nothing to Disclose

METHODS

A model of an abdominal aorta with its branches extending to the common femoral arteries with a splenic artery aneurysm was manufactured using fused deposition modelling (FDM) 3D printing technology. The 3D printer used to produce our model was an Artillery Sidewinder X1. A non-flexible thermoplastic PVB filament. The model was printed in parts given its complex configuration to allow for shorter printing times. The separate parts where put together and fused using a cautery. Each radiology resident for a total of 10 residents was given an introducer sheath, a cobra catheter, a magic torque wire, a 10mL saline push, and a 3mm coil. The residents were given the task to use the 3D printed vascular model with the goal of deploying an embolization coil on the splenic aneurysm in 3 attempts. None of the residents had previously observed or assisted an embolization procedure in the past. The resident's timings were recorded in minutes including time to cannulate the celiac trunk, time to cannulate the splenic artery and time to successfully deploy a coil within the aneurysm. The time in minutes was converted to decimal points.Data was presented using summary statistics of mean time to attain target cannulation for each of the attempts. Comparison of their mean times to success was performed using the paired t-test. Only two tail p-values were reported using a predetermined statistically significant level of $p<0.05$ for all our comparisons. All analysis was performed in STATA version 11.2 (StataCorp College Station, Texas).

RESULTS

There was a significant improvement in the times to success after the first attempt as evidenced by reduction in the total time taken for each of those participants to deploy the coil within the targeted splenic aneurysm. The mean time taken for them to success after one attempt decreased from 11.5 min to 5.97 minutes with a significant P value of 0.004.*Discussion Thanks to the advancement in the technology with subsequent decreased costs, entry-level 3D printing can now be within the reach of community hospitals. 3D printing presents an opportunity to community hospitals to increase resident exposure to complex vascular procedures that otherwise are rare in the community setting and more common in large academic institutions. 3D printing also offers an opportunity to improve the manual skills of radiology trainees by increasing their exposure to manipulation of IR equipment such as catheters and wires.

W5A-QI-4HC Decreasing Time From Pediatric MRI/CT Order Placement to Protocol Completion

Participants
Evan Zucker, MD, Palo Alto, CA (*Presenter*) Research Consultant, F. Hoffmann-La Roche Ltd

METHODS

This project was performed in the radiology department of an academic children's hospital. Based on staff discussions, Gemba walks, and root cause analysis, the following key drivers of protocolling delays were identified: (1) mismatch between official protocols and selectable protocol options in the electronic health record (EHR); (2) frequent radiologist reliance on custom, free text protocols; (3) numerous manual technologist selection steps (4) inefficient routing order; and (5) heterogeneous radiologist (often trainee) protocol knowledge.To address these issues, the EHR protocolling interface was overhauled with a more intuitive appearance and updated to achieve as close as possible a 1:1 correspondence between selectable protocol options and official protocols. Hard stops were implemented to minimize free text protocolling without an actual protocol selection. Moreover, the protocol routing order was automated based on exam/protocol type and the order changed from radiologist first to nurse (rather than technologist) second, as nurses were key in determining sedation needs. Prior tasks of the technologist (e.g., choosing magnet type and exam length) were now auto-selected based on the protocol. In addition, senior experienced technologists were enlisted to pre-protocol exams prior to radiologist signoff, leading to more accurate selections. Training/coaching was provided to all involved staff regarding process changes with feedback and iterative updates. The time from MRI/CT order placement to protocol completion by all parties was tracked monthly via a run chart and shared at regular huddles to maintain vigilance.

RESULTS

From the pre-intervention 5-month baseline mean of 4.2 days from MRI/CT order placement to protocol completion, the post-intervention mean decreased to 1.9 days within 6 months, exceeding the project goal. The mean has been sustained at 1.5-2.2 days in the recent 9 months after project completion.*Discussion By streamlining inefficiencies, automating manual workflows, encouraging standardized rather than customized processes where possible, and leveraging personnel expertise through a team approach, this project was successful in substantially decreasing protocolling time, leading to likely downstream gains in departmental throughput, patient access, and overall satisfaction.Please visit the Learning Center to also view this presentation in hardcopy format.

W5A-QI-6HC Improve Reject Rate for Portable Chest Imaging Exams

Participants
Ben C. Wandtke, MD,MS, Rochester, NY (*Presenter*) Clinical Advisory Board, CAK Tech, Inc

METHODS

This project was performed in the diagnostic radiology division of an urban academic center, level one trauma hospital with over 800 beds and was exclusive to adult portable chest imaging. Over the past year, 11.4% of portable chest x-rays per month were rejected and repeated to ensure diagnostic quality. An average of 4,500 bedside portable chest x-rays were performed per month, resulting in an average of 513 additional radiation exposures to patients each month to obtain diagnostic images. The goal of our project was to decrease the monthly portable chest x-ray reject rate from 11.4% to 8% by March 2022.Using several performance improvement methodologies including, rapid PDSA cycles, Gemba walks, surveys, fishbone diagram, and pareto and run charts, we identified multiple opportunities for improvement.

RESULTS

Figure 1. Pareto chart validates clipped anatomy and patient positioning as responsible for 85% of PCXR rejections.Figure 2. Fishbone diagram demonstrates several key drivers. These included clear and consistent portable assignments, education and orientation processes, standardization of key components of diagnostic images, and routinely sharing reject data.Figure 3. Over 5 months, reject rates reduced from 11.4% to 8.2% (38% decrease). We updated our orientation process, developed education that was shared with technologist staff, and modified existing workflows to reduce technologist travel time between inpatient units. To ensure non-diagnostic images were not accepted, cardiothoracic radiologists defined a diagnostic portable chest x-ray and used this standard to develop education materials. To ensure sustainability, PCXR reject rate is now shared with staff on a monthly basis.*Discussion The sustainable reduction in PCXR reject rate achieved required a multi-faceted approach. We defined a diagnostic study, technologists were trained and educated on key components of diagnostic portable chest imaging exams, and

staffing schedules were modified. Additionally, the results of the monthly reject data were shared with staff.A limitation of the project included the inability to directly measure the impact on labor efficiency and turnaround times. Staff did not have access to the electronic medical record on inpatient units to log start and end times, which would have allowed us to directly measure these additional outcomes.Please visit the Learning Center to also view this presentation in hardcopy format.

W5A-QI-7HC Reduce Patient No Show Rate and Improperly Prepared Patients for DaTscan Exams

Participants
Ben C. Wandtke, MD,MS, Rochester, NY (*Presenter*) Clinical Advisory Board, CAK Tech, Inc

METHODS

This project was performed in the Nuclear Medicine Division of an urban, academic hospital. Utilizing A3 process improvement methodology, a review of the current problem and processes revealed several key drivers and interventions. We created a standard workflow for pre-calls for patients or caregiver to discuss the need to withhold interfering medications prior to the appointment. We added an interfering medication list to appear in the EMR when DaTscans exams are ordered. A list of interfering medications was provided as a reference for referring providers. Additionally, radiology residents were educated on interfering medications and required to review medications prior to DaTscan exam protocolling.

RESULTS

From June to December 2020 (Figure 1), 5.6 % of DaTscan patients did not show for their appointment, and 32% were inadequately prepared on the day of their exam (interfering medication not held). From January to June 2021, (Figure 2) inadequately prepared patients for DaTscans decreased from 32% to 3.8% (89% decrease) after implementing stated interventions. The number of no shows dropped from 5.6% to 1.9% (66% decrease).Patient scans were more confidently interpreted due to new consistency with which interfering medications were held prior to the exam. Patients were no longer regularly rescheduled after arriving for their appointments improving patient experience and reducing radiopharmaceutical waste.*Discussion With an average radiotracer expense for one exam of $2,570, no show/unprepared patients prior to interventions resulted in $102,800 in wasted pharmaceutical costs annually. The 84% waste reduction created through this project yielded an $86,350 annual cost savings. Additionally, the Imaging Department benefits by utilizing time slots more efficiently and effectively.By ensuring standardized patient preparation and communication, optimal and timely diagnosis for the patient was obtained more consistently while reducing waste, and improving scheduling efficiency and the patient experience. We believe similar interventions could be replicated at other sites performing DaTscan examinations.Please visit the Learning Center to also view this presentation in hardcopy format.

W5A-QI-8HC Fast-Track protocol: a patient-centered approach to improved radioactive iodine therapy for Graves' Disease patients

Participants
Kyle Stevens, DO, JBSA Ft Sam Houston, TX (*Presenter*) Nothing to Disclose

METHODS

In the FT protocol, suspected GD patients discuss treatment options with Endocrinology. Endocrinologists place a dual order for RAIU and RAIA for patients desiring RAIA. The patient receives an appointment for RAIU and potential RAIA on the same day as the RAIU scan. If the patient's RAIU scan is consistent with GD, the NM physician counsels and consents the patient for RAIA and then administers the RAIA treatment dose.We collected basic demographic data and outcome measures for 19 patients before (6/2019 - 9/2020) and 10 patients after implementation of the FT protocol (12/2020 - 1/2022). We obtained patient experience survey results by oral interview.The primary study outcome measure was the median time from RAIU to RAIA. A secondary study outcome measure was patient experience survey results on the GD therapy process. Another secondary study outcome measure was the median number of total clinic visits before RAIA. There were four patients (two before and two after FT intervention) that were not reachable for the patient surveys.Wilcoxson/Kruskal-Wallis non-parametric tests of significance were performed on the median outcome measures before and after initiation of the FT protocol.

RESULTS

Before FT protocol implementation, GD patients waited a median 36 days between their RAIU and RAIA, which significantly decreased to 0 days post implementation (Figure 1A, p-value < 0.001). The number of total visits decreased from a median 4 to 3 visits (Figure 1B, p-value < 0.05). Importantly, on a three-point satisfaction scale, more patients reported increased satisfaction with their wait time after (100%), compared to before the FT protocol intervention (76.5%). There were no reported patient safety concerns during the FT protocol implementation.*Discussion We successfully implemented a FT protocol to treat GD patients with RAIA on the same day as their RAIU scan. The process significantly reduced the time between RAIU and RAIA, decreased patient visits, and improved patient satisfaction, without an observed reduction in patient safety. Limitations include a small sample size and the inability to obtain survey results on four patients.Please visit the Learning Center to also view this presentation in hardcopy format.

Decreasing Time From Pediatric MRI/CT Order Placement to Protocol Completion

Wednesday, Nov. 30 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Evan Zucker, MD, Palo Alto, CA (*Presenter*) Research Consultant, F. Hoffmann-La Roche Ltd

METHODS

This project was performed in the radiology department of an academic children's hospital. Based on staff discussions, Gemba walks, and root cause analysis, the following key drivers of protocolling delays were identified: (1) mismatch between official protocols and selectable protocol options in the electronic health record (EHR); (2) frequent radiologist reliance on custom, free text protocols; (3) numerous manual technologist selection steps (4) inefficient routing order; and (5) heterogeneous radiologist (often trainee) protocol knowledge.To address these issues, the EHR protocolling interface was overhauled with a more intuitive appearance and updated to achieve as close as possible a 1:1 correspondence between selectable protocol options and official protocols. Hard stops were implemented to minimize free text protocolling without an actual protocol selection. Moreover, the protocol routing order was automated based on exam/protocol type and the order changed from radiologist first to nurse (rather than technologist) second, as nurses were key in determining sedation needs. Prior tasks of the technologist (e.g., choosing magnet type and exam length) were now auto-selected based on the protocol. In addition, senior experienced technologists were enlisted to pre-protocol exams prior to radiologist signoff, leading to more accurate selections. Training/coaching was provided to all involved staff regarding process changes with feedback and iterative updates. The time from MRI/CT order placement to protocol completion by all parties was tracked monthly via a run chart and shared at regular huddles to maintain vigilance.

RESULTS

From the pre-intervention 5-month baseline mean of 4.2 days from MRI/CT order placement to protocol completion, the post-intervention mean decreased to 1.9 days within 6 months, exceeding the project goal. The mean has been sustained at 1.5-2.2 days in the recent 9 months after project completion.*Discussion By streamlining inefficiencies, automating manual workflows, encouraging standardized rather than customized processes where possible, and leveraging personnel expertise through a team approach, this project was successful in substantially decreasing protocolling time, leading to likely downstream gains in departmental throughput, patient access, and overall satisfaction.Please visit the Learning Center to also view this presentation in hardcopy format.

Improve Reject Rate for Portable Chest Imaging Exams

Wednesday, Nov. 30 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Ben C. Wandtke, MD,MS, Rochester, NY (*Presenter*) Clinical Advisory Board, CAK Tech, Inc

METHODS

This project was performed in the diagnostic radiology division of an urban academic center, level one trauma hospital with over 800 beds and was exclusive to adult portable chest imaging. Over the past year, 11.4% of portable chest x-rays per month were rejected and repeated to ensure diagnostic quality. An average of 4,500 bedside portable chest x-rays were performed per month, resulting in an average of 513 additional radiation exposures to patients each month to obtain diagnostic images. The goal of our project was to decrease the monthly portable chest x-ray reject rate from 11.4% to 8% by March 2022.Using several performance improvement methodologies including, rapid PDSA cycles, Gemba walks, surveys, fishbone diagram, and pareto and run charts, we identified multiple opportunities for improvement.

RESULTS

Figure 1. Pareto chart validates clipped anatomy and patient positioning as responsible for 85% of PCXR rejections.Figure 2. Fishbone diagram demonstrates several key drivers. These included clear and consistent portable assignments, education and orientation processes, standardization of key components of diagnostic images, and routinely sharing reject data.Figure 3. Over 5 months, reject rates reduced from 11.4% to 8.2% (38% decrease). We updated our orientation process, developed education that was shared with technologist staff, and modified existing workflows to reduce technologist travel time between inpatient units. To ensure non-diagnostic images were not accepted, cardiothoracic radiologists defined a diagnostic portable chest x-ray and used this standard to develop education materials. To ensure sustainability, PCXR reject rate is now shared with staff on a monthly basis.*Discussion The sustainable reduction in PCXR reject rate achieved required a multi-faceted approach. We defined a diagnostic study, technologists were trained and educated on key components of diagnostic portable chest imaging exams, and staffing schedules were modified. Additionally, the results of the monthly reject data were shared with staff.A limitation of the project included the inability to directly measure the impact on labor efficiency and turnaround times. Staff did not have access to the electronic medical record on inpatient units to log start and end times, which would have allowed us to directly measure these additional outcomes.Please visit the Learning Center to also view this presentation in hardcopy format.

W5A-QI-7HC

Reduce Patient No Show Rate and Improperly Prepared Patients for DaTscan Exams

Wednesday, Nov. 30 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Ben C. Wandtke, MD,MS, Rochester, NY (*Presenter*) Clinical Advisory Board, CAK Tech, Inc

METHODS

This project was performed in the Nuclear Medicine Division of an urban, academic hospital. Utilizing A3 process improvement methodology, a review of the current problem and processes revealed several key drivers and interventions. We created a standard workflow for pre-calls for patients or caregiver to discuss the need to withhold interfering medications prior to the appointment. We added an interfering medication list to appear in the EMR when DaTscans exams are ordered. A list of interfering medications was provided as a reference for referring providers. Additionally, radiology residents were educated on interfering medications and required to review medications prior to DaTscan exam protocolling.

RESULTS

From June to December 2020 (Figure 1), 5.6 % of DaTscan patients did not show for their appointment, and 32% were inadequately prepared on the day of their exam (interfering medication not held). From January to June 2021, (Figure 2) inadequately prepared patients for DaTscans decreased from 32% to 3.8% (89% decrease) after implementing stated interventions. The number of no shows dropped from 5.6% to 1.9% (66% decrease).Patient scans were more confidently interpreted due to new consistency with which interfering medications were held prior to the exam. Patients were no longer regularly rescheduled after arriving for their appointments improving patient experience and reducing radiopharmaceutical waste.*Discussion With an average radiotracer expense for one exam of $2,570, no show/unprepared patients prior to interventions resulted in $102,800 in wasted pharmaceutical costs annually. The 84% waste reduction created through this project yielded an $86,350 annual cost savings. Additionally, the Imaging Department benefits by utilizing time slots more efficiently and effectively.By ensuring standardized patient preparation and communication, optimal and timely diagnosis for the patient was obtained more consistently while reducing waste, and improving scheduling efficiency and the patient experience. We believe similar interventions could be replicated at other sites performing DaTscan examinations.Please visit the Learning Center to also view this presentation in hardcopy format.

Fast-Track protocol: a patient-centered approach to improved radioactive iodine therapy for Graves' Disease patients

Wednesday, Nov. 30 12:15PM - 12:45PM Room: Learning Center - QI DPS

Participants
Kyle Stevens, DO, JBSA Ft Sam Houston, TX (*Presenter*) Nothing to Disclose

METHODS

In the FT protocol, suspected GD patients discuss treatment options with Endocrinology. Endocrinologists place a dual order for RAIU and RAIA for patients desiring RAIA. The patient receives an appointment for RAIU and potential RAIA on the same day as the RAIU scan. If the patient's RAIU scan is consistent with GD, the NM physician counsels and consents the patient for RAIA and then administers the RAIA treatment dose.We collected basic demographic data and outcome measures for 19 patients before (6/2019 - 9/2020) and 10 patients after implementation of the FT protocol (12/2020 - 1/2022). We obtained patient experience survey results by oral interview.The primary study outcome measure was the median time from RAIU to RAIA. A secondary study outcome measure was patient experience survey results on the GD therapy process. Another secondary study outcome measure was the median number of total clinic visits before RAIA. There were four patients (two before and two after FT intervention) that were not reachable for the patient surveys.Wilcoxson/Kruskal-Wallis non-parametric tests of significance were performed on the median outcome measures before and after initiation of the FT protocol.

RESULTS

Before FT protocol implementation, GD patients waited a median 36 days between their RAIU and RAIA, which significantly decreased to 0 days post implementation (Figure 1A, p-value < 0.001). The number of total visits decreased from a median 4 to 3 visits (Figure 1B, p-value < 0.05). Importantly, on a three-point satisfaction scale, more patients reported increased satisfaction with their wait time after (100%), compared to before the FT protocol intervention (76.5%). There were no reported patient safety concerns during the FT protocol implementation.*Discussion We successfully implemented a FT protocol to treat GD patients with RAIA on the same day as their RAIU scan. The process significantly reduced the time between RAIU and RAIA, decreased patient visits, and improved patient satisfaction, without an observed reduction in patient safety. Limitations include a small sample size and the inability to obtain survey results on four patients.Please visit the Learning Center to also view this presentation in hardcopy format.

Quality Improvement Reports Wednesday Poster Discussions - B

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - QI DPS

Sub-Events

W5B-QI-1 Clinician's Ability to Accurately Determine Patient Angulation in Portable Chest Radiography With a More Quantitative Marker

Participants
Kurt Lee, MD, (*Presenter*) Nothing to Disclose

METHODS

As part of a quality improvement initiative, the X-clometer was used to obtain patient positioning in portable chest X-rays for one week at a level 1 trauma center in a metropolitan academic institution. Images were retrospectively reviewed to identify those with CT exams within one day of chest radiograph. A physician-directed survey encompassing five such cases was administered to radiologist and non-radiologist volunteers. A total of 27 responses were collected, including eight radiology residents, thirteen non-radiology residents, four fellowship trained cardiothoracic radiologists, and two non-cardiothoracic radiologists. Respondents were tasked with estimating each patient's angle of inclination based on conventional markers alone. Additionally, they were asked to identify findings in each case twice: first with the X-clometer reading withheld, and again with a visible X-clometer reading. Responses were compared to each case's corresponding CT report. Nonparametric and descriptive statistics were used for evaluation of collected data.

RESULTS

Estimation of the patient's position based on BB markers and technician labels alone was highly inaccurate: respondents estimated correctly only 23% of the time (defined as being within 15 degrees of the true angle per X-clometer). In one case, an image labeled "upright" drew 90° as the most frequent estimate, while in fact the true angle was 50°. Respondents accurately identified the correct findings 66% of the time on average across all five cases when the X-clometer angulation reading was withheld. After being shown the angle of inclination for each case, this figure was 59% on second evaluation. Attending radiologists scored 73% at first, and 70% on the second attempt.*Discussion Traditional labels were highly unreliable and in some cases misleading in conveying accurate information about patient position. It is clear that subjective markers are inadequate and a more precise method of communicating patient angulation, such as the X-clometer, is needed. Respondents, especially radiologists, were relatively successful at identifying findings even before being given angle information.

W5B-QI-2 Improving Protocol Turnaround Time in Nuclear Medicine Division at a Tertiary Referral Medical Center

Participants
Hong Song, MD, PhD, Stanford, CA (*Presenter*) Nothing to Disclose

METHODS

Our team established pre-intervention baseline of protocol turnaround time for the month of August, 2021. We then employed a LEAN A3 problem solving approach to analyze the problem of inefficient protocolling. We performed process observations, root cause analysis and stakeholder interviews for the current workflow. Using Key Driver Diagram, we identified several key drivers to the protocol process and interventions that could impact the most key drivers.

RESULTS

The key drivers of the protocol process include Radiologist/Technologist workflow, communication to community referral physician, division policy clearly defining roles of trainees, Radiologist, technologists and reading room assistance in the protocol process, limitation of electronic medical record system to identify wrong study order or indication. So far, we implemented interventions in technologist workflow and division policy. More specifically, for technologist workflow, we created a two-tiered protocol review system where new protocols that require immediate review is put into one folder while the protocols that were reviewed but not completed including wrong orders to be cancelled, research protocol, treatment protocols requiring special review will be put into a second folder. This new workflow will enable the technologists to review and complete the protocols more efficiently. We also revised our division policy to clarify roles of trainees in the protocol process. We analyzed more than three thousand studies and found that the protocol turnaround time improved from 2.7 days/study in August 2021 to 1.6 days/study in December 2021 after we implemented these initial changes in September 2021.*Discussion We employed a LEAN A3 problem solving approach to identify root causes and key drivers that caused delays in outpatient protocol turnaround time. We showed that a simple task of protocol for imaging studies can be the ramification of multiple complex factors in the modern healthcare system. Additional interventions include improving communication to community referral provides, establishing built-in feedback for orders on electronic medical record system are necessary to further improve protocol efficiency.

W5B-QI-4 Improving MRI Order-to-Scan" Times in an Inpatient Quaternary Academic Hospital Setting: Our Revitalization Project.

Participants
Ritesh Patel, MD, Manhasset, NY (*Presenter*) Nothing to Disclose

METHODS

This project was performed in an inpatient, quaternary, academic hospital setting. At the start of 2022, >20% of all inpatient (IP) MRIs had an OTS time of >48 hours, some exceeding over 100 hours. Scanner utilization data was acquired and used to identify cases contributing to extended OTS times. Identified problems included a single radiologist managing all complex clinical conversations with ordering providers, inappropriate use of standing orders by ordering providers, and incomplete MRI screening forms. To target these problems, the following pilot interventions were implemented at the start of March 2022. An MRI scanning supervisor was transitioned to a non-scanning manager role with expert level fund of knowledge and the ability to manage the workflow directly. The MRI manager reviewed all cases with >36 hours pending time as well as identified "problem" cases and actively addressed ongoing concerns, only escalating to the radiologist when necessary. In addition, the radiology service line collaborated with ED/IP service line and the EMR team to design MRI screening questions that were required to be completed at the time of an order. Sample questions include the presence of a pacemaker, history of claustrophobia, and the patient's ability to communicate. The impact of these interventions was assessed by tracking OTS time.

RESULTS

Prior to the enactment of these interventions, the average OTS times were 28.7 and 29.1 hours, with 25% and 23% of IP MRIs having an OTS time >48 hours, in January and February 2022, respectively. After the implementation of our interventions in March 2022, our analysis demonstrated a significant reduction in cases >48 hours, down to 5% of all IP MRIs, previously 23%. Even with a stable IP MRI case volume between February and March 2022, there was a significant decrease in OTS time from 29 to 18 hours. This decrease in OTS times was maintained for the month of April 2022 despite a 10% increase in IP MRI case volume.*Discussion This study demonstrates a significant reduction in IP MRI OTS times after the implementation of an MRI manager with increased privileges to manage the workflow in conjunction with a detailed MRI screening questionnaire at the time of ordering has led to a significant decrease in OTS times despite increasing IP MRI case volumes. This data is limited to 2 months; however, data collection and re-evaluation is ongoing.

W5B-QI-5 Investigating the Feasibility of Using A.I. For Population-Level Mammography Image Quality Improvement Initiatives at Leeds Teaching Hospitals NHS Trust

Participants
Nisha Sharma, MBChB, FRCR, Leeds, United Kingdom (*Presenter*) Nothing to Disclose

METHODS

An AI IQ tool (densitas® intelliMammo™) was used to assess mammography positioning errors aligning with the NHS criteria on all mammograms acquired at our institution from December 2021 to March 2022. Population-based error rates were assessed using means and time plots. Agreement between radiographers and the AI IQ tool was assessed using the Kappa statistic on a set of 50 exams (100 CC and 100 MLO images).

RESULTS

There were 59264 studies (29964 CC and 29300 MLO images) acquired during the study period. The agreement between radiographers and the AI tool ranged from Kappa=0.70 (95%CI: 0.502, 0.898) to 0.95 (95%CI: 0.756, 1.00) (Table 1). Positioning error rate means over the study period were stable (fig 1) and ranged from 11% to 51% (Table 1)*Discussion A study limitation was that results were not stratified by screening and diagnostic exams. With the differences in imaging requirements, there may be variation in the error rates. This project establishes that A.I. can provide reliable and reproducible quantitative mammography IQ assessments that make it feasible to evaluate population-wide IQ improvement initiatives. Future work will focus on radiograher-tailored quality improvement initiatives to enhance mammography quality at LTHT.

W5B-QI-6 Automatic Assessment of the Quality of Patient Positioning in Mammography Using an Artificial Intelligent System

Participants
Huizhi Cao, PhD, (*Presenter*) Nothing to Disclose

METHODS

The system uses deep learning technology to find nine types of abnormalities that will occur during breast X-ray examinations. The intelligent quality control system of mammography includes acquisition module, quality evaluation module and result display module. The automatic detection of landmarks in medio-lateral oblique (MLO) and cranio-caudal (CC) mammograms, named incomplete gland, incomplete pectoralis major muscle, and over or insufficient exposure for overall evaluation and skin fold, nipple not in the contour line, shoulder overlap shadow, abdominal skin, contralateral breast and foreign body for partial evaluation in the image. Finally, the relations between the detected landmarks are investigated to assess the positioning quality and results of the assessment are compared to ground truth collected from expert readers. External validation was performed by four radiographers on 1223 examinations of women to evaluate the performance of AI system and determine the agreement between AI system and radiographers.

RESULTS

The AUC of poor imaging quality prediction by AI system according to incomplete gland, incomplete pectoralis muscle, over or insufficient exposure was 0.903 vs 0.937 vs 982. The intraclass correlation for the pectoral nipple line between the radiographers and AI was >0.80. A substantial to almost perfect agreement (? > 0.85) was observed between the radiographers and AI on the nipple in profile criterion. We observed a slight to moderate agreement for the other criteria (? = 0.40-0.65) and generally a higher agreement between the two pairs of radiographers (mean ? = 0.70) than between the radiographers and AI (mean ? = 0.61).*Discussion Breast position with AI system has great importance for quality control of mammography and are great value to reach optimal image quality in mammography.AI system has great potential in evaluating breast position criteria in mammography by reducing subjectivity. However, varying agreement between radiographers and AI was observed. Future research should focus on the clinical impact of the automized quality ratings and investigate to what extent the low quality mammograms lead to more

interval detected cancers.

W5B-QI-8 Implementation of Radiology E-Consults at an Academic Medical Center

Awards
Identified for RadioGraphics

Participants
Kulpana Suresh, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

METHODS

Beginning in October 2020 we piloted the utilization of radiology e-consults with a subset of primary care providers at our institution. An order was built into our Electronic Medical Record (EMR) to deliver a message for review by one of two body radiologists - responses were returned via EMR. The e-consult order asked the ordering provider how much they spent preparing the request and if a specialist referral would have been used had the e-consult been unavailable.

RESULTS

Between October 2020 and March 2022, 294 e-consults were placed, of which 285 were completed and 9 were cancelled. In 62 consults (21%), the providers indicated they would have referred the patient to a subspecialist had the service been unavailable. Placing an e-consult took less than 15 minutes in 94% of cases. 76% of consults were placed by physicians, the remainder by advanced practice providers. Questions most often pertained to body imaging (36.5%), neuro (20.7%), chest (17.5%) and MSK imaging (7%). Common themes included guidance for follow-up imaging and which study to order. Provider feedback has been overall positive.*Discussion Our study shows that there is clear demand for radiology e-consults from primary care providers. It also shows that such a service can reduce specialist referrals and likely improve patient and provider experience. Further work is needed to confirm these savings and to identify a sustainable reimbursement model. Based on the experience, our institution plans to expand this service to additional radiologists and primary care practices.

Automatic Assessment of the Quality of Patient Positioning in Mammography Using an Artificial Intelligent System

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - QI DPS

Participants
Huizhi Cao, PhD, (*Presenter*) Nothing to Disclose

METHODS

The system uses deep learning technology to find nine types of abnormalities that will occur during breast X-ray examinations. The intelligent quality control system of mammography includes acquisition module, quality evaluation module and result display module. The automatic detection of landmarks in medio-lateral oblique (MLO) and cranio-caudal (CC) mammograms, named incomplete gland, incomplete pectoralis major muscle, and over or insufficient exposure for overall evaluation and skin fold, nipple not in the contour line, shoulder overlap shadow, abdominal skin, contralateral breast and foreign body for partial evaluation in the image. Finally, the relations between the detected landmarks are investigated to assess the positioning quality and results of the assessment are compared to ground truth collected from expert readers. External validation was performed by four radiographers on 1223 examinations of women to evaluate the performance of AI system and determine the agreement between AI system and radiographers.

RESULTS

The AUC of poor imaging quality prediction by AI system according to incomplete gland, incomplete pectoralis muscle, over or insufficient exposure was 0.903 vs 0.937 vs 982. The intraclass correlation for the pectoral nipple line between the radiographers and AI was >0.80. A substantial to almost perfect agreement (? > 0.85) was observed between the radiographers and AI on the nipple in profile criterion. We observed a slight to moderate agreement for the other criteria (? = 0.40-0.65) and generally a higher agreement between the two pairs of radiographers (mean ? = 0.70) than between the radiographers and AI (mean ? = 0.61).*Discussion Breast position with AI system has great importance for quality control of mammography and are great value to reach optimal image quality in mammography.AI system has great potential in evaluating breast position criteria in mammography by reducing subjectivity. However, varying agreement between radiographers and AI was observed. Future research should focus on the clinical impact of the automized quality ratings and investigate to what extent the low quality mammograms lead to more interval detected cancers.

Implementation of Radiology E-Consults at an Academic Medical Center

Wednesday, Nov. 30 12:45PM - 1:15PM Room: Learning Center - QI DPS

Awards
Identified for RadioGraphics

Participants
Kulpana Suresh, MD, Philadelphia, PA (*Presenter*) Nothing to Disclose

METHODS

Beginning in October 2020 we piloted the utilization of radiology e-consults with a subset of primary care providers at our institution. An order was built into our Electronic Medical Record (EMR) to deliver a message for review by one of two body radiologists - responses were returned via EMR. The e-consult order asked the ordering provider how much they spent preparing the request and if a specialist referral would have been used had the e-consult been unavailable.

RESULTS

Between October 2020 and March 2022, 294 e-consults were placed, of which 285 were completed and 9 were cancelled. In 62 consults (21%), the providers indicated they would have referred the patient to a subspecialist had the service been unavailable. Placing an e-consult took less than 15 minutes in 94% of cases. 76% of consults were placed by physicians, the remainder by advanced practice providers. Questions most often pertained to body imaging (36.5%), neuro (20.7%), chest (17.5%) and MSK imaging (7%). Common themes included guidance for follow-up imaging and which study to order. Provider feedback has been overall positive.*Discussion Our study shows that there is clear demand for radiology e-consults from primary care providers. It also shows that such a service can reduce specialist referrals and likely improve patient and provider experience. Further work is needed to confirm these savings and to identify a sustainable reimbursement model. Based on the experience, our institution plans to expand this service to additional radiologists and primary care practices.
